Publication 408/2020
SPECIFICATIONS

PREFACE

Contents:

Publication 408/2020 contains current Construction Specifications for PennDOT projects. Publication 408/2020 is located on the PennDOT website at www.penndot.gov, select “Forms, Publications, and Maps”. Updated semiannually, each new Change will contain all previous Edition/Change(s) in their entirety, with changed pages integrated. The changed pages for each new Change are also located on the PennDOT website.

Standard Special Provisions (SSPs) and Master Construction Items that apply to Publication 408/2020:

SSPs and Master Items are maintained in PennDOT’s Engineering and Construction Management System (ECMS) and accessible on the PennDOT website to both PennDOT Business Partners and Public Users. This is the only access provided to these documents and lists to all users. Public Users should go to the ECMS website, login as a Guest, and then navigate to “Construction Projects” > “Resources”. “Resources” provides access to both Master Items and SSPs. Business Partners can login before selecting “Construction Projects” > “Resources” if they want access to other more complete ECMS data and information applying to PennDOT projects and schedules.

Use of Dimension Values:

Publication 408/2020 is a single set of Construction Specifications that contains measurements in English values. Metric values may be shown for informational purposes and/or generally accepted industry use. Dual values will not be indicated on design drawings, renderings, or in details and instructions that are project specific. Similarly, there will not be a mixing of values in formulating calculations or in presentation. In addition, to provide clarification, each project bid proposal will contain a Special Provision that will specify the dimension value to be used.

Changes and their Effective Dates:

Publication 408/2020 will be available only as an online document. Hardcopy versions will not be made available. Each semiannual change will be updated with new pages incorporated into the document and a separate Change Packet and Transmittal Letter will indicate the most recent changes and will contain a list of the current changes and an Index of Changes listing all changes to date. The full specifics of each Change can be found within the Section to this Publication entitled: *Change Letters and Indices to Publication 408/2020*. Effective date(s) are:

- Pub 408/2020, Initial Edition (Pub 408/2020-IE) – projects let after April 10, 2020.
- Pub 408/2020, Change No. 1 (Pub 408/2020-1) – projects let after October 2, 2020.
- Pub 408/2020, Change No. 2 (Pub 408/2020-2) – projects let after April 9, 2021.
- Pub 408/2020, Change No. 3 (Pub 408/2020-3) – projects let after October 8, 2021.
- Pub 408/2020, Change No. 4 (Pub 408/2020-4) – projects let after April 1, 2022.
- Pub 408/2020, Change No. 5 (Pub 408/2020-5) – projects let after October 7, 2022.
- Pub 408/2020, Change No. 6 (Pub 408/2020-6) – projects let after April 14, 2023.
- Pub 408/2020, Change No. 7 (Pub 408/2020-7) – projects let after October 6, 2023.

SECTION 100 – GENERAL PROVISIONS			
Section		Page	
		From	To
101	ABBREVIATIONS AND DEFINITIONS OF TERMS	101 – 1	101 – 9
102	BIDDING REQUIREMENTS AND CONDITIONS	102 – 1	102 – 6
103	AWARD AND EXECUTION OF CONTRACT	103 – 1	103 – 3
104	SCOPE OF WORK	104 – 1	104 – 5
105	CONTROL OF WORK	105 – 1	105 – 10
106	CONTROL OF MATERIAL	106 – 1	106 – 17
107	LEGAL RELATIONS AND RESPONSIBILITY TO THE PUBLIC	107 – 1	107 – 15
108	PERFORMANCE AND PROGRESS	108 – 1	108 – 13
109	MEASUREMENT OF QUANTITIES	109 – 1	109 – 2
110	PAYMENT	110 – 1	110 – 35
111	DELAY CLAIMS	111 – 1	111 – 2
112	PROJECT RECORDS	112 – 1	112 – 2

SECTION 200 – EARTHWORK			
Section		Page	
		From	To
201	CLEARING AND GRUBBING	201 – 1	201 – 2
202	TOTAL DEMOLITION OR PARTIAL DEMOLITION OF BUILDINGS AND OTHER STRUCTURES	202 – 1	202 – 4
203	CLASS 1, CLASS 1A, CLASS 1B, AND CLASS 1C EXCAVATION	203 – 1	203 – 3
204	CLASS 2, CLASS 3, CLASS 4, AND EXISTING DITCH CLEANING EXCAVATION	204 – 1	204 – 2
205	BORROW EXCAVATION	205 – 1	205 – 2
206	PLACEMENT AND COMPACTION OF EMBANKMENT AND FILL	206 – 1	206 – 7
207	BLASTING FOR ROCK CUT SLOPE EXCAVATION	207 – 1	207 – 10
208	SPECIAL ROLLING	208 – 1	208 – 3
210	SUBGRADE	210 – 1	210 – 2
212	GEOTEXTILES	212 – 1	212 – 2
213	TEMPORARY PROJECT AIR POLLUTION CONTROL	213 – 1	213 – 1
214	SEALING ABANDONED WATER WELLS AND SPRINGS	214 – 1	214 – 1
219	GEOFOAM LIGHTWEIGHT FILL	219 – 1	219 – 6
220	FLOWABLE BACKFILL	220 – 1	220 – 4
221	EXTENSIBLE REINFORCEMENT FOR MSE WALLS	221 – 1	221 – 2
222	GEOCELL LOAD DISTRIBUTION MAT	222 – 1	222 – 2
223	GEOSYNTHETIC REINFORCED SOIL SLOPE(GRS)	223 – 1	223 – 7

SECTION 300 – BASE COURSES			
Section		Page	
		From	To
301	PLAIN CEMENT CONCRETE BASE COURSE	301 – 1	301 – 2
303	CEMENT TREATED PERMEABLE BASE COURSE	303 – 1	303 – 2
310	CRUSHED AGGREGATE BASE COURSE	310 – 1	310 – 3
312	CRUSHED AGGREGATE BASE COURSE, TYPE DG	312 – 1	312 – 4

SECTION 300 – BASE COURSES			
Section		Page	
		From	To
313	SUPERPAVE ASPHALT MIXTURE DESIGN, STANDARD CONSTRUCTION, BASE COURSE	313 – 1	313 – 1
316	FLEXIBLE BASE REPLACEMENT	316 – 1	316 – 1
323	ROLLER COMPACTED CONCRETE BASE COURSE	323 – 1	323 – 1
341	COLD RECYCLED ASPHALT BASE COURSE, COLD-IN-PLACE	341 – 1	341 – 3
342	COLD RECYCLED ASPHALT BASE COURSE, CENTRAL PLANT MIX	342 – 1	342 – 2
344	FULL DEPTH RECLAMATION	344 – 1	344 – 6
350	SUBBASE	350 – 1	350 – 2
360	ASPHALT TREATED PERMEABLE BASE COURSE	360 – 1	360 – 4

SECTION 400 – FLEXIBLE PAVEMENTS			
Section		Page	
		From	To
404	EVALUATION OF ASPHALT PAVEMENT RIDE QUALITY AND PAYMENT OF INCENTIVE	404 – 1	404 – 4
405	EVALUATION OF ASPHALT PAVEMENT LONGITUDINAL JOINT DENSITY AND PAYMENT OF INCENTIVE/DISINCENTIVE	405 – 1	405 – 3
410	SUPERPAVE MIXTURE DESIGN, STANDARD AND RPS CONSTRUCTION OF PLANT-MIXED HMA FINE-GRADED COURSES	410 – 1	410 – 1
412	SUPERPAVE MIXTURE DESIGN, CONSTRUCTION OF PLANT-MIXED 6.3 MM THIN ASPHALT OVERLAY COURSES	412 – 1	412 – 12
413	SUPERPAVE MIXTURE DESIGN, STANDARD AND RPS CONSTRUCTION OF PLANT-MIXED ASPHALT COURSES WITH PERCENT WITHIN LIMITS AND LTS TESTING (PWL-LTS)	413 – 1	413 – 29
419	STONE MATRIX ASPHALT MIXTURE DESIGN, RPS CONSTRUCTION OF PLANT-MIXED WEARING COURSES	419 – 1	419 – 17
420	PERVIOUS ASPHALT PAVEMENT SYSTEM	420 – 1	420 – 5
450	MANUAL ASPHALT PATCHING	450 – 1	450 – 2
460	ASPHALT TACK COAT	460 – 1	460 – 2
461	ASPHALT PRIME COAT	461 – 1	461 – 1
466	ASPHALT PAVING FABRIC	466 – 1	466 – 2
467	HEAVY DUTY MEMBRANES	467 – 1	467 – 1
469	ASPHALT JOINT AND CRACK SEALING	469 – 1	469 – 1
470	ASPHALT SEAL COAT	470 – 1	470 – 2
471	ASPHALT SEAL COAT USING PRECOATED AGGREGATE	471 – 1	471 – 2
472	ASPHALT FOG SEAL FOR ASPHALT SEAL COATS	472 – 1	472 – 2
473	ASPHALT SEAL COAT USING AGGREGATE FROM RAP	473 – 1	473 – 2
480	ASPHALT SURFACE TREATMENT	480 – 1	480 – 2
481	ASPHALT SURFACE TREATMENT USING PRECOATED AGGREGATE	481 – 1	481 – 1
482	SLURRY SEAL	482 – 1	482 – 3
483	POLYMER-MODIFIED EMULSIFIED ASPHALT PAVING SYSTEM (MICRO SURFACING)	483 – 1	483 – 6

SECTION 400 – FLEXIBLE PAVEMENTS			
Section		Page	
		From	To
489	ULTRA-THIN BONDED WEARING COURSE	489 – 1	489 – 5
490	REMOVAL OF EXISTING SURFACE COURSE	490 – 1	490 – 1
491	MILLING OF ASPHALT PAVEMENT SURFACE	491 – 1	491 – 1
492	PROFILE MILLING OF ASPHALT PAVEMENT SURFACES	492 – 1	492 – 2
496	ASPHALT CONCRETE PAVEMENT, 60-MONTH WARRANTY	496 – 1	496 – 8

SECTION 500 – RIGID PAVEMENTS			
Section		Page	
		From	To
501	REINFORCED OR PLAIN CEMENT CONCRETE PAVEMENTS	501 – 1	501 – 18
502	ROLLER COMPACTED CONCRETE PAVEMENT	502 – 1	502 – 6
503	PROTECTIVE COATING FOR CEMENT CONCRETE PAVEMENT	503 – 1	503 – 1
504	PAVEMENT RELIEF JOINT	504 – 1	504 – 2
505	BRIDGE APPROACH SLABS	505 – 1	505 – 1
506	REINFORCED OR PLAIN CEMENT CONCRETE PAVEMENTS, RPS	506 – 1	506 – 6
507	EVALUATION OF CONCRETE PAVEMENT RIDE QUALITY AND PAYMENT OF INCENTIVE	507 – 1	507 – 3
509	NEXT GENERATION CONCRETE SURFACE	509 – 1	509 – 2
510	LONGITUDINAL GROOVING OF EXISTING CONCRETE PAVEMENT	510 – 1	510 – 1
511	PRESSURE RELIEF JOINT	511 – 1	511 – 1
512	LONGITUDINAL JOINT CLEANING AND SEALING	512 – 1	512 – 1
513	JOINT REHABILITATION	513 – 1	513 – 1
514	DIAMOND GRINDING OF CONCRETE PAVEMENT	514 – 1	514 – 2
515	SAWING AND SEALING OF ASPHALT OVERLAYS	515 – 1	515 – 2
516	CONCRETE PAVEMENT PATCHING	516 – 1	516 – 5
517	TRANSVERSE GROOVING OF CONCRETE PAVEMENT FOR RETEXTURING	517 – 1	517 – 1
518	CONTINUOUSLY REINFORCED CONCRETE PAVEMENT PATCHING	518 – 1	518 – 2
519	FULL DEPTH LONGITUDINAL CONCRETE JOINT REPAIR	519 – 1	519 – 2
520	PERVIOUS CONCRETE PAVEMENT SYSTEM	520 – 1	520 – 3
521	TRANSVERSE JOINT CLEANING AND SEALING	521 – 1	521 – 1
523	ULTRA-THIN PORTLAND CEMENT CONCRETE OVERLAY	523 – 1	523 – 3
525	CONCRETE PAVEMENT PARTIAL-DEPTH REPAIR	525 – 1	525 – 4
526	RUBBLIZING OF CONCRETE PAVEMENTS	526 – 1	526 – 2
527	DOWEL RETROFIT	527 – 1	527 – 2
528	CONCRETE PAVEMENT CROSS-STITCHING	528 – 1	528 – 2
529	FULL DEPTH PRECAST/PRESTRESSED CONCRETE PAVEMENT SLABS	529 – 1	529 – 10
530	LONG-LIFE CONCRETE PAVEMENT (LLCP)	530 – 1	530 – 9
540	BONDED CONCRETE OVERLAY OF ASPHALT-SURFACED PAVEMENT	540 – 1	540 – 5
545	BONDED CONCRETE OVERLAY OF CONCRETE-SURFACED PAVEMENTS	545 – 1	545 – 5

SECTION 500 – RIGID PAVEMENTS			
Section		Page	
		From	To
548	UNBONDED CONCRETE OVERLAY OF CONCRETE-SURFACED PAVEMENTS	548 – 1	548 – 5
590	CRACK CLEANING AND SEALING	590 – 1	590 – 1
591	MILLING OF CEMENT CONCRETE PAVEMENT SURFACE	591 – 1	591 – 1

SECTION 600 – INCIDENTAL CONSTRUCTION			
Section		Page	
		From	To
601	PIPE CULVERTS	601 – 1	601 – 17

SECTION 100 GENERAL PROVISIONS

SECTION 101—ABBREVIATIONS AND DEFINITIONS OF TERMS

101.01 MEANING OF TERMS—These Specifications are generally written in the imperative mood. In sentences using the imperative mood, the subject, “the Contractor,” is implied. Also implied in this language are “shall,” “shall be,” or similar words and phrases. In the Material sections, the subject may also be a Vendor, Fabricator, or Manufacturer, who may be supplying material, products, or equipment for use on the project. The word “will” generally pertains to decisions or actions of the Department or its Representative.

In these Specifications or on the drawings, the following words or similar words refer to actions of the Department or its Representative, unless otherwise stated: “directed,” “required,” “permitted,” “ordered,” “designated,” “prescribed.” Also, the words “approved,” “accepted,” “acceptable,” “satisfactory,” “considered,” or words with similar intent, mean by or to the Department or its Representative, subject in each case to the final determination of the Secretary, and subject to further review, as permitted by law or permitted elsewhere in these Specifications.

In these Specifications, reference to a subsection of the Specifications includes all general requirements of the section of which the subsection is a part.

In these Specifications, the words “or equal,” referring to a product, material, or process, mean “equal as determined by the Department or its Representative.”

In these Specifications, the words, “as indicated,” or “indicated” mean “as indicated or indicated on the prepared contract plans.”

101.02 ABBREVIATIONS—The following is a list of abbreviations used in these Specifications, in the proposal, and on the drawings. The list includes the meanings along with the abbreviations.

AAN	American Association of Nurserymen
AAR	Association of American Railroads
AASHTO	American Association of State Highway and Transportation Officials
ACI	American Concrete Institute
AGC	Associated General Contractors of America
AI	Asphalt Institute
AIA	American Institute of Architects
AISC	American Institute of Steel Construction
AISI	American Iron and Steel Institute
AITC	American Institute of Timber Construction
ANSI	American National Standards Institute
API	American Petroleum Institute
ARA	American Railway Association
AREA	American Railway Engineering Association
ASCE	American Society of Civil Engineers
ASLA	American Society of Landscape Architects
ASME	American Society of Mechanical Engineers
ASNT	American Society for Nondestructive Testing
ASTM	American Society for Testing and Materials
AWG	American Wire Gage
AWPA	American Wood Preservers Association
AWS	American Welding Society
AWWA	American Water Works Association
BDTD	Bridge Design and Technology Division
BOPD	Bureau of Project Delivery
BOMO	Bureau of Maintenance and Operations

FHWA	Federal Highway Administration, U.S. Department of Transportation
FSS	Federal Specifications and Standards (General Service Administration)
HAR	Highway Advisory Radio
HDD	Highway Delivery Division
HMA	Hot Mix Asphalt
ICEA	Insulated Cable Engineers Association
IEEE	Institute of Electrical and Electronic Engineers
IEC	International Electrotechnical Commission
IES	Illuminating Engineering Society
IMSA	International Municipal Signal Association
IP	Internet Protocol
ISO	Insurance Services Organization
ITE	Institute of Transportation Engineers
ITS	Intelligent Transportation System
JMF	Job Mix Formula
LRFD	Load and Resistance Factor Design
LTS	Laboratory Testing Section, Bureau of Project Delivery, Pennsylvania Department of Transportation
MTL	Materials Testing Laboratory
MUTCD	Manual on Uniform Traffic Control Devices (FHWA)
NBFU	National Board of Fire Underwriters
NCSA	National Crushed Stone Association
NEC	National Electrical Code
NELA	National Electric Light Association
NEMA	National Electrical Manufacturing Association
NESC	National Electrical Safety Code
NFPA	National Fire Prevention Association
NTCIP	National Transportation Communications for Intelligent Transportation Systems
OSHA	Occupational Safety & Health Administration
PCA	Portland Cement Association
PCI	Prestressed Concrete Institute
PennDOT	Pennsylvania Department of Transportation
PEI	Porcelain Enamel Institute, Incorporated
PTM	Pennsylvania Test Method
PVC	Polyvinyl Chloride
QA	Quality Assurance
QC	Quality Control
RAM	Reclaimed Aggregate Material
RAP	Reclaimed Asphalt Pavement
RPS	Restricted Performance Specification
RTMC	Regional Traffic Management Center
SAE	Society of Automotive Engineers

SMS	Structural Materials Section
SRL	Skid Resistance Level
SSPC	Society for Protective Coatings
TMC	Traffic Management Center
UL	Underwriters Laboratories, Incorporated
UNC	Unified National Coarse
U.S.C.	United States Code
WMA	Warm Mix Asphalt

101.03 DEFINITIONS—

ACCEPTANCE CERTIFICATE—The certificate of the Department, certifying that the project has been satisfactorily completed and accepted.

ACTIVE WORK ZONE: The portion of a work zone where construction, maintenance, or utility workers are on the roadway or on the shoulder of the highway and is adjacent to an open travel lane.

ADDITIONAL WORK—Work, of a type already provided by the contract and for which the contract has established a unit price.

ADVERTISEMENT—The public announcement, required by law, inviting bids for work to be performed or for materials to be furnished.

AGENCY HEAD—The Secretary.

AIR TEMPERATURE—The measured temperature in the degrees Fahrenheit (F) in the shade, not in the direct rays of the sun, and away from artificial heat.

AWARD—The Department's written acceptance of a bid.

BID—The offer of a bidder, using the internet, to construct the project, at the prices bid or predetermined.

BIDDER—Any individual, firm, partnership, corporation, or joint venture, submitting a bid for the work contemplated and acting either directly or through an authorized representative.

BRIDGE—A structure, including supports, spanning and providing passage over a waterway, a railroad, a highway, or other obstruction; more than 20 feet long, measured along the center of the roadway or railroad, between the faces of abutments. In the case of boxes or arches, the length is measured between the faces of the sidewalls and, in the case of multiple boxes, between the inside faces of the outside walls.

BULLETINS—Publications, prepared by the Department, indicating requirements for material and processes, listing approved material suppliers. A list of these bulletins follows:

Bulletin 14—Aggregate Producers (Publication 34)

Bulletin 15—Qualified Products List for Construction (Publication 35)

Bulletin 25—Specifications for Bituminous Materials (Publication 37)

Bulletin 27—Bituminous Concrete Mixtures, Design Procedures, and Specifications for Special Bituminous Mixtures (Publication 27)

Bulletin 41—Producers of Bituminous Mixtures (Publication 41)

Bulletin 42—Producers of Ready-Mixed Concrete (Publication 42)

BUSINESS PARTNER—An individual, firm, partnership, or corporation that has a valid Registered Business Partner Identification Number issued by the Department through ECMS.

CALENDAR DAY—Every day shown on the standard calendar.

CENTRAL OFFICE—The central office of the Department in Harrisburg, Pennsylvania.

CHIEF BRIDGE ENGINEER—The Engineer in charge of bridge design for the entire Department, or authorized designee.

CONTRACT—The written agreement between the Department and the Contractor for the construction of the project. The contract includes the following: Proposal; Plans; Specifications; Agreement; Performance Bond; Payment Bond; Insurance Certificates; Notice to Proceed; and all work orders and supplemental agreements that are required to complete the construction of the project.

CONTRACT ITEM (PAY ITEM)—A specifically described unit of work for which a price is provided in the contract. Individual units in the component item schedule of a lump sum payment item are not considered contract items.

CONTRACTING OFFICER—The District Executive.

CONTRACTOR—The individual, firm, partnership, corporation, or joint venture awarded the contract; acting directly through agents or employees, or the Surety in case of default; or each participant in a joint venture.

CROSS SECTIONS—Graphic representations of the original ground and the proposed highway, at right angles to the centerline or base line.

CULVERT—Any structure, not classified as a bridge, that provides an opening under the roadway.

DEPARTMENT—Pennsylvania Department of Transportation.

DIRECTOR OF PROJECT DELIVERY—The Engineer(s) in charge of all highway activities in the central office, or authorized designee.

DISTRICTS—Geographic divisions of the Department for the purposes of management, design, construction, and maintenance.

DISTRICT EXECUTIVE—The Engineer or Administrator in charge of an engineering district of the Department.

DRAWINGS—See PLANS.

ECMS WEBSITE – www.dot14.state.pa.us/ECMS

ELECTRONIC FILE—Any data digitally formatted, e.g., landXML.

ENGINEER—An individual licensed and registered under the Laws of the Commonwealth of Pennsylvania designated by the Deputy Secretary for Highway Administration, acting directly or through a duly authorized representative, acting within the scope of the particular duties assigned or the authority given.

EXTRA WORK—Work arising from changes that result in a significant increase or decrease in the cost of performing the work and work having no quantity and/or price included in the contract, that is determined by the District Executive to be necessary or desirable to complete the project.

FABRICATOR—A firm, company, or individual supplying fabricated material for the project.

FALSEWORK – Any temporary construction structure, and/or structural elements, utilized to support vertical loads and loads from wind and temperature. Falsework is utilized as temporary support for construction loads such as

people, materials, and equipment, as well as the loads from the structure being constructed, until the permanent structure becomes self-supporting. Temporary construction loads include, but are not limited to; the plastic concrete, equipment and placement of the concrete, any concrete that has not yet reached sufficient strength to carry the required loads, as well as steel or other structural elements under erection, not yet in final permanent load carrying condition. Falsework would include steel or timber beams, girders, columns, piles and foundations, and any proprietary equipment including modular shoring frames, post shores, and horizontal shoring.

FORMWORK – Any temporary construction structure utilized to retain and mold plastic or fluid concrete until it achieves sufficient strength to retain its shape. Formwork is vertical, and used to construct walls, columns, piers, abutments, beam-sides, and other vertical concrete surfaces.

FINAL SETTLEMENT CERTIFICATE—The certification made by the Secretary to the State Treasurer; of the amount due in final payment and settlement of the contract, after making all legal and equitable additions and deductions, including the amounts previously paid.

FINAL INSPECTION—The inspection, conducted by the Representative, to determine if the project or any substantial portion thereof, has been satisfactorily completed, according to contract requirements.

GRADE LINE—The profile of the finished roadway surface along the proposed construction centerline or base line.

HIGHWAY—The area between right-of-way lines, and/or between limit of slope lines, as ordained and/or indicated.

HINGE POINT—A slope-staking term for the point where cut or fill slope begins.

HOLIDAYS—Days designated by the Department as holidays, which include, but are not limited to: New Year's Day, Dr. Martin Luther King, Jr.'s Birthday, Presidents' Day, Memorial Day, Independence Day, Labor Day, Columbus Day, Veterans' Day, Thanksgiving Day, Day after Thanksgiving, and Christmas Day.

INSPECTOR—The person authorized and assigned by the Representative to make inspections of contract performance and of material furnished.

INSPECTOR-IN-CHARGE—The person authorized by the Representative to be in immediate charge of inspecting the performance of work on the project.

INVITATION FOR BIDS—The advertisement for bids for work or material. The advertisement will state, with reasonable accuracy, the quantity and location of the work to be done, the character and quantity of the material to be furnished, and the time and place of the opening of bids.

IN WRITING—Communication between parties delivered or sent, and received, in the form of a written letter, e-mail, or facsimile.

JOB-MIX FORMULA—A specific mixture of material established by test procedures, then adhered to during construction using the mixture.

JOINT VENTURE—A legal association of contractors, limited to three participants, formed for the purpose of bidding and executing a common contract identified in ECMS as Joint Venture Prime and Joint Venture Partner. Prequalification is required of each contractor, as specified in Section 102.01.

JOINT VENTURE PRIME—The lead contractor in a joint venture.

LABORATORY—Testing laboratories of the Department, or any other designated testing laboratories.

LOCALIZATION—A localization is a series of mathematical computations that transform World Geodetic System84 coordinates into local grid coordinates. A localization typically consists of a horizontal and a vertical adjustment.

LOCAL TRAFFIC—Vehicular traffic that originates or terminates within the project limits.

LOT—An isolated quantity of specified material from a single source, or a measured amount of specified construction, to be produced by the same process.

MANUFACTURER—A firm, company, or individual manufacturing material for the project.

MAJOR ITEM OF WORK—Any Item having a unit of measure of other than Lump Sum, Call, Dollar, or Predetermined Amount (PDA).

MATERIAL—Substances specified for use in the project construction.

MATERIALLY UNBALANCED BID—A bid that generates a reasonable doubt that awarding a contract to the bidder submitting a mathematically unbalanced bid will result in the lowest ultimate cost to the Department.

MATHEMATICALLY UNBALANCED BID—A bid containing lump sum or unit prices, which do not reflect reasonable actual costs plus a reasonable proportionate share of the bidder's anticipated profit, overhead costs, and other indirect costs.

MILESTONE DATE—The date on which a specific portion of physical contract work is to be completed, before the Required Completion Date of all contract work.

MULTIPLE DEFICIENCY—Deficiency in more than one characteristic within the same lot.

NOTICE TO PROCEED DATE—The date, established in writing by the Department, on which work is to begin.

ONLINE BID—A bid submitted via the internet using the Department's Engineering and Construction Management System (ECMS).

PAVEMENT STRUCTURE—The combination of subbase, base course, and surface course placed on a subgrade to support the traffic load and to distribute the load to the roadbed.

PAYMENT BOND—The approved form of security, furnished by the Contractor and the Surety, as a guaranty to pay promptly, or cause to be paid promptly, in full, such sums as may be due for all material furnished, labor supplied or performed, rental of equipment used, and services rendered by public utilities in, or in connection with, the work under contract.

PennDOT'S HOMEPAGE – <http://www.penndot.gov>

PERFORMANCE BOND—The approved form of security, furnished by the Contractor and the Surety, as a guaranty on the part of the Contractor to execute the work, according to the terms of the contract.

PLANS—The approved documents or drawings, or exact reproductions of them, for construction of the project. The plans show the location, character, dimensions, approximate quantities, and other details of the prescribed work, including layouts, profiles, and cross sections; plans also include cited Standard Drawings. However, subsurface soil and geological data (e.g., the Soil Survey Report and Profile and Core Borings) are excluded from this definition.

PREQUALIFICATION—The system for establishing a qualification rating, determining the maximum amount of contract and one or more of the classified types of work on which a Contractor will be eligible to bid or subcontract, and the maximum amount the Contractor may have under contract and incomplete at any one time.

PRINTOUT—The processed data issued in printed form by a computer.

PROFILE GRADE—The elevation or gradient of a trace of a vertical plane intersecting the proposed surface, usually along the longitudinal centerline or base line of the roadway.

PROJECT—All of the work described in the contract.

PROPOSAL—The documents, designated by the Department, containing project requirements and other information upon which a bid for the project to be constructed is to be based. The proposal includes the Plans, Specifications, Special Provisions, referenced Standard Drawings, Addenda, and all other documents referred to therein, whether or not attached.

QUALITY CONTROL (QC) PLAN—A Contractor's or Vendor's prepared plan, submitted to and reviewed by the Representative, describing the proposed QC system. This plan contains, as a minimum, an inspection schedule, sample schedule, testing schedule, and required laboratory inspection reports.

QUALITY CONTROL (QC) SYSTEM—A system of controls, inspection, and tests, fully documented, providing reasonable assurance that all materials, products, and completed construction submitted for acceptance, conform to specifications.

REPRESENTATIVE—The authorized representative acting on behalf of the Secretary.

REQUIRED COMPLETION DATE—The date on which all physical contract work, including any authorized additional or extra work, is to be completed. The Required Completion Date is the completion date shown in the contract plus any time extensions issued in writing by the Representative less any time reductions issued in writing by the Representative.

RESTRICTED PERFORMANCE SPECIFICATION (RPS)—A presentation of required results, statistically verifiable as meeting specified criteria, and free of unnecessary construction limitations.

RIGHT OF WAY—The area that has been secured and reserved by the Department for highway purposes.

ROADSIDE DEVELOPMENT—Items for seeding, sodding, mulching, topsoiling, planting of ground covers, other planting, and items for erosion control.

SECOND-TIER OR LOWER-TIER SUBCONTRACTOR—Any individual, partnership, firm, or corporation, complying with the requirements of Section 102.01, who/which undertakes, with prior consent of the Department, the partial or total construction of one or more items of project work, under the terms of the contract, with and reasonable to the prime Contractor by virtue of an agreement with a subcontractor to the prime by virtue of an agreement.

SECRETARY—The Secretary of Transportation or a Deputy Secretary of Transportation of Pennsylvania.

SHOP DRAWINGS—See WORKING DRAWINGS.

SINGLE DEFICIENCY—Deficiency in one characteristic in a lot.

SKID RESISTANCE LEVEL (SRL)—The friction rating of a surface course material.

SPECIAL PROVISIONS—Additions and revisions to the Standard Specifications covering conditions pertaining to an individual project.

SPECIFICATIONS—This publication and all publications to which it refers. Also, special provisions and bulletins referred to in, or bound with, the proposal; together with all written agreements made or to be made, pertaining to the method and manner of performing the work, or to the quantities or qualities of material to be furnished under the contract.

SITE CALIBRATION—A site calibration is a series of mathematical computations that transform World Geodetic System84 coordinates into local grid coordinates. A site calibration typically consists of a horizontal and a vertical adjustment.

STANDARD DRAWINGS—Approved drawings, showing standard details, produced to be used repeatedly on projects. Publications that contain Standard Drawings are:

Publication 6M—Standards For Hardwood Glulam Timber Bridge Design

Publication 72M—Roadway Construction (RC) Standards

Publication 111—Traffic Control Standards-Pavement Markings and Signing (TC-8600 and 8700 Series)

Publication 148—Traffic Control Standards-Signals (TC-8800 Series)

Publication 218M—Bridge Design Standards - BD-600M Series

Publication 219M—Bridge Construction Standards - BC-700M Series

Publication 647—Intelligent Transportation Systems-Standard Drawings

STATE—The Commonwealth of Pennsylvania.

STRUCTURES—Bridges, culverts, storm sewer appurtenances, slope and retaining walls, sign support structures, and other similar items.

SUBCONTRACTOR—Any individual, partnership, firm, or corporation, complying with the requirements of Section 102.01, who/which undertakes, with prior consent of the Department, the partial or total construction of one or more items of project work, under the terms of the contract, with and responsible to the prime Contractor by virtue of an agreement.

SUBSTRUCTURE—That part of the structure not deemed as superstructure.

SUPERINTENDENT—The Contractor's authorized representative in charge of the work.

SUPERSTRUCTURE—All portions of the bridge, above the bridge seat, including bearings, bearings and anchors sunk in the substructure, abutment backwalls, cheekwalls, shear blocks, bridge drainage down to but not including the drain box, and portions of the wings and appurtenances above the horizontal construction joint nearest the bridge seat.

SUPPLIER—A firm, company, or individual supplying material for the project.

SURETY—A corporate body, which is bound with and for the Contractor, for the satisfactory performance of the Contractor's work and for the prompt payment in full for material, labor, equipment rentals, and utility services, as provided in the bonds.

TRAFFIC CONTROL PLAN—A developed method or scheme for safely and efficiently moving traffic through or around a highway work zone.

UTILITY ADJUSTMENT— The act of placing, setting, replacing, resetting, relocating, adjusting, reconstructing, altering, or removing a Utility Infrastructure.

UTILITY INFRASTRUCTURE— A public or private facility or structure, whether or not owned by a utility, that is or will be in, on, under, or over the project site or a waste or borrow area designated in the proposal, and that either must be placed, set, replaced, reset, relocated, adjusted, reconstructed, altered, or removed in order for the contract work to be performed or otherwise interferes with the performance of the contract work.

VALUE ENGINEERING—The identification of the function(s) of a contract item, establishing the cost of the function(s), considering life cycle costs, and providing the required functions at the lowest cost with no reduction in required quality or performance.

VENDOR—A firm, company, or individual supplying material or services for the project.

WORK—The furnishing of material, labor, equipment, and other incidentals necessary or convenient to successful project completion, plus the fulfillment of all duties and obligations imposed by the contract.

WORKING DRAWINGS—Required shop drawings, erection plans, falsework plans, stress sheets, framework plans, cofferdam plans, bending diagrams for reinforcing steel, and any other supplementary plans or similar data, all prepared by the Contractor.

WORK ORDER—An order, signed by the Representative, authorizing the performance of additional or extra work, or extra work on a force-account basis, as specified in Sections 110.02 and 110.03.

WORK ZONE: The area of a highway where construction, maintenance, or utility work activities are being conducted and which should have traffic-control devices installed according to Title 67 of the Vehicle Code.

SECTION 102—BIDDING REQUIREMENTS AND CONDITIONS

102.01 PREQUALIFICATION OF CONTRACTORS AND SUBCONTRACTORS—

(a) **General.** Unless otherwise stated in the proposal, contractors are required to prequalify before the date fixed for the opening of bids for State highway construction work. To do so, establish proof of competency and responsibility, according to 67 PA Code Chapter 457, Regulations Governing Prequalification of Prospective Bidders. Subcontractors are required to prequalify in the same manner, if listed in the proposal or if they subsequently undertake the partial or total construction of one or more items of work. To obtain a complete set of application forms, either download them from the ECMS website or contact the Prequalification Officer, Contract Management Section, Highway Delivery Division, Bureau of Project Delivery, Pennsylvania Department of Transportation, Harrisburg, Pennsylvania, 17120.

(b) **Business Partner Registration.** Unless otherwise stated, contractors are required to register with the Department as a business partner. To become a business partner, go to the ECMS website. Instructions for registration are available on the website.

102.02 CONTENTS OF PROPOSAL—The proposal will specify the place for delivery of a bid; the date, time, and place of bid opening; and the location and description of the project to be constructed. The proposal will also show the approximate quantities of work to be performed and/or material to be furnished, the contract time in which the project is to be completed. The proposal will include any special provisions and attachments pertaining to the project.

102.03 ISSUANCE OF PROPOSAL—The proposal and plans will be published on the ECMS website. The proposal will include any special provisions and attachments pertaining to the project. Any addenda will also be published on the ECMS website. These documents can be downloaded and printed. Copies of the proposal and plans can be purchased by contacting one of the printing partners listed under business partner search in ECMS.

Specifications or Standard Drawings listed or referred in the proposal are available for purchase upon request from the PennDOT Sales Store, P.O. Box 3451, Harrisburg, PA 17105-3451 (Telephone 717-787-6746).

102.04 INTERPRETATION OF APPROXIMATE ESTIMATE OF QUANTITIES—The estimate of quantities, shown on the proposal, and in the contract, is approximate and is shown only as a basis for the calculation upon which the contract award is to be made. The Department does not assume any responsibility that the quantities will actually be required in the project construction, nor will the Contractor be allowed to plead misunderstanding or deception because of the quantity estimates or because of the character of the work, the location, or other conditions. The Department reserves the right to increase, to decrease, or to omit any of the quantities of work. An increase or decrease of the quantities of the items will not be sufficient grounds for granting an increase in the unit prices bid, except as specified in Section 110.02.

102.05 EXAMINATION OF PROPOSAL, PLANS, SPECIFICATIONS, SPECIAL PROVISIONS, AND SITE OF WORK—The Department's plans and specifications are complete and are prepared so any competent contractor is able to complete the proposed work. The bidder is required to carefully examine the proposal, plans, specifications, and project site before submitting a bid. The submission of a bid will be considered proof that the bidder has made such examination and understands the conditions to be encountered; the character, quality, and quantities of work to be performed; the material to be furnished; and the requirements of the plans, specifications, and proposal. The Department will make no allowance or concession for a bidder's failure to make the required examination.

The proposed slope lines shown on the cross sections are approximate and are subject to revision and change by the Representative, depending upon the stability of material encountered during construction.

Subsurface soil and geological information indicated is based upon soundings, dug test pits, and/or test borings. Such information concerning the character of subsurface material is of an exploratory nature and has been obtained, for the Department's use, as an aid in the project design. The information provided is representative of subsurface conditions only at the locations and depths where such information was obtained, and there is no expressed or implied agreement that uniformity of material exists between explored locations.

Preliminary construction schedules are intended to provide a general overview of the sequence of construction operations, based on currently available data. Such information is developed, for the Department's use, as an aid in the project design. Available construction scheduling information, if any, is being provided for informational purposes only. The Department makes no expressed or implied representation as to the completeness, accuracy, or correctness of the data, and accepts no responsibility for consequences resulting due to any actions undertaken based on the information provided. These schedules are not considered a part of the proposal.

102.06 PREPARATION OF BIDS—

- (a) Submit properly completed bids for Department construction work in the electronic bidding format, online.
- (b) Configure the electronic file for bidding to include Registered Business Partner Identification Number. For a joint venture bid, the lead joint venture will be required to furnish this information on behalf of the joint venture.

(c) Unless otherwise stated in the proposal, the Department will only accept bids from contractors who are prequalified on the date of the bid opening, as specified in Section 102.01, and who bid for work which, based on their available financial capacity and approved work classification codes, does not exceed their prequalification eligibility. Unless otherwise approved by the Chief of Highway Delivery Division (Prequalification Office), prequalification eligibility with regard to work classification will be determined using the applicable Work Classification Code(s) shown on the Design Items screen in the WCC column for the corresponding contract item number. The Design Items screen is accessed via the Project Items link on the ECMS Bid Package screen. If a bid item has multiple Work Classification Codes, the bidder must be prequalified for only one of the Codes listed.

In accordance with the provisions of 67 Pa Code 457.5(d), a prequalified contractor is: "eligible to bid on projects in which the types of work for which he is classified constitute at least 50% of the project." Items of work that are coded X or ZZ on the bid package Design Items will be excluded from the total bid price when determining compliance with the 50% requirement. Only the classification codes listed in the bid package Design Items will be credited towards meeting the 50% requirement. To determine compliance with the 50% requirement, all bidders will be credited for the Q and Z items. For lump sum contract items requiring a Component Item Schedule (CIS), neither the work code classifications for component items on the CIS nor the component item dollar values submitted by the contractor on the CIS will be considered in evaluating compliance with the 50% requirement.

In accordance with the provisions of 67 Pa Code 457.8(b): "...the types of work on which the contractor has been classified and eligible to bid on do not constitute over 50% of the total bid price, the bid will be excluded and rejected."

With regard to available financial capacity, prequalification eligibility will be determined by ensuring that the bidder's current maximum financial capacity exceed the total amount of the bid, less any credit for subletting as specified in Section 108.01(a), plus the total amount of all uncompleted work a bidder has under contract at the time of bid opening.

- (d) Execute bids as follows:

When an item in the bid contains a choice to be made by the bidder, indicate this choice, according to the specifications for that particular item. When preparing the bid, leave blank the unit price(s) of the alternate(s) that are not bid. Thereafter, no further choice will be allowed.

Submit an online bid via the ECMS website by using a business partner password with the security level of an authorized general partner or corporate officer properly designated to execute and attest to bids. For a joint venture bid, submit an online bid via the ECMS website by using a business partner password with the security level of an authorized general partner or corporate officer properly designated to execute and attest to bids of the lead joint venture.

For a joint venture bid, only one Joint Venture Business Partner is required to submit and electronically sign the bid and will be considered the Joint Venture Prime.

(e) All electronic data files to be made available will be included in the bid package. In order to access electronic data files made available in the bid package, potential bidders must sign a one-time legal agreement, in ECMS, to acknowledge that the information being provided is for informational purposes only. (NOTE: The agreement can be found by logging into ECMS and clicking on the link entitled "Pre-Bid Design Files Agreement" under Bulletins.) Make no assumption of available files if not included in the bid package. Perform necessary conversion of the files for the selected grade control equipment.

(f) Anti-Collusion Requirements. The authorized signer of the bid, under penalty of perjury as provided in 18 Pa. C.S.A. Section 4904, or if applicable, 18 U.S.C., Section 1020, certifies that they are authorized to make and does make the following statement on behalf of the bidder:

1. The bid item prices and the total bid amount have been arrived at independently and without consultation, communication, or agreement for the purpose of restricting competition with any other contractor, bidder, or potential bidder.

2. Neither the item prices nor the total bid amount, and neither the approximate bid item prices nor approximate total bid amount, have been disclosed to any other firm or person who is a bidder or potential bidder, and they will not be disclosed before bid opening.

3. No attempt has been made or will be made to solicit, cause, or induce any firm or person to refrain from bidding on this project, or to submit a bid higher than this bid, or to submit any intentionally high or noncompetitive bid or other form of complementary bid.

4. The bid submitted by the bidder is made in good faith and not pursuant to any agreement or discussion with, or inducement from, any firm or person to submit a complementary or other noncompetitive bid.

5. The bidder has not offered or entered into a subcontract or agreement regarding the purchase of materials or services from any firm or person, or offered, promised, or paid cash or anything of value to any firm or person, whether in connection with this or any other project, in consideration for an agreement or promise by any firm or person to refrain from bidding or to submit a complementary bid on this project.

6. The bidder has not accepted or been promised any subcontract or agreement regarding the sale of materials or services to any firm or person, and has not been promised or paid cash or anything of value to any firm or person, whether in connection with this or any other project, in consideration for this firm's submitting a complementary bid, or agreeing to do so, on this project.

7. The authorized signer of the bid has made a diligent inquiry of all members, officers, employees, and agents of the bidder with responsibilities relating to the preparation, approval, or submission of this firm's bid on the project and has been advised by each of them that the authorized signer has not participated in any communication, consultation, discussion, agreement, collusion, act, or other conduct inconsistent with any of the statements and representations made in this Statement.

8. No attempt has been made to take any action in restraint of free competitive bidding in connection with the bid.

9. It is understood that if any incidents resulting in conviction or being found liable are specified in Section 102.06(f)10, the Pennsylvania Anti Bid Rigging Act, 73 P.S. 1611 et. seq. provided that it does not prohibit a governmental agency from accepting a bid from or awarding a contract to that person, but may be a ground for administrative suspension or debarment at the discretion of a governmental agency under rules and regulations of that agency.

10. The bidder, its affiliates, subsidiaries, officers, directors, and employees are not aware that they are currently under investigation by any governmental agency and have not in the last 3 years been convicted or found liable for any act prohibited by State or Federal law in any jurisdiction, involving conspiracy or collusion with respect to bidding on any public contract, except as indicated on a separate page attached to the bid document.

The authorized signer of the bid hereby states that they understand and acknowledges that the above representations are material and important, and will be relied on by PennDOT, in awarding the contract for which the bid is submitted. The authorized signer and their firm understands that any misstatement in this statement is and shall be treated as fraudulent concealment from PennDOT of the true facts relating to the submission of bids for this contract.

(g) Contract Unit Price. Wherever an identical item number and description are used more than once, provide the same unit bid price for each bid entry. If the bidder provides different bid prices for an identical item number and description, the bid will be rejected.

102.07 NON-ECMS (Paper Let) Bids—Wherever references are made to ECMS or electronic submission, for the purpose of a non-ECMS/paper let contract, it will mean the paper let process identified in the proposal.

The DBE commitment (Attachment A) is to be submitted via Fax to 717-705-1504.

Bid the unit price. The extension and total bid amount are for informational purposes but may be used by the Department to determine bidder's intent if the unit price is left blank.

102.08 BID GUARANTY FOR EXECUTION OF CONTRACT—Bid guaranty is associated and supported by the bidder's prequalification requirements.

102.09 DELIVERY OF BIDS—Submit bid(s) to the location designated, before the hour of the opening date shown in the proposal.

Electronic online bids will not be accepted after the time for the opening date of the bids shown in the proposal. Bid(s) received after the time for opening of bids will be returned unopened to the bidder.

102.10 WITHDRAWAL OR REVISION OF BIDS—

(a) Withdrawal of Bids Before Bid Opening. Each bidder who submits a bid waives any right to withdraw it, except as provided herein. Bidders will be given permission to withdraw any bid, after it has been submitted to the Department, if the bidder electronically withdraws or makes the request in person or by an accredited personal representative, by telephone, or in writing to the Secretary. Deliver requests for withdrawal to the Secretary's office before the time set for opening bids.

A bidder may withdraw any bids, which have not been read, after having been declared the apparent low bidder on any other project. In withdrawing bids, make the withdrawal request to the official in charge of the bid opening, either in person or by an authorized representative, before any such bids are read. Provide satisfactory credentials, showing authority to act for the interested bidder, at the time that the official in charge requests that any contemplated withdrawals be made. The bid withdrawn by such a request will be deleted in ECMS and will not be considered by the Department.

(b) Revision of Bids Before Bid Opening. A bidder will be allowed to revise a bid after it has been submitted, if the bidder electronically withdraws the bid, or appears in person or provides an accredited personal representative to make the revision. Present all such requests to the Secretary's office expeditiously so that the revision can be completed and the bid resubmitted before the time set for opening bids.

(c) Withdrawal of Bids After Bid Opening. Withdrawal of erroneous bids after the bid opening but before award based on bid mistakes will be allowed by the written determination of the Secretary when the bidder requests relief and presents credible evidence that the reason for the lower bid price was a clerical mistake as opposed to a judgment mistake and was actually due to an unintentional arithmetical error or an unintentional omission of a substantial quantity of work, labor, material, or services made directly in the compilation of the bid. The request for relief and the supporting evidence must be received by the Secretary's office within 3 business days after the bid opening but before the award of the contract.

The Secretary will not allow a withdrawal of a bid if the withdrawal of the bid would result in the awarding of the contract on another bid of the same bidder, its partner or a corporation or business venture owned by or in which the bidder has a substantial interest. No bidder who is allowed to withdraw a proposal shall supply any material or labor to or perform any subcontract or other work agreement for any person to whom a contract or subcontract is awarded in the performance of the contract for which the withdrawn bid was submitted without the written approval of the Secretary.

102.11 JOINT VENTURE—A joint venture bid will be considered a bid by each of the participants, jointly and individually, for the entire contract performance as a joint venture, according to the proposal terms and conditions. The number of participants in a joint venture is limited to three.

In the proposal, contract, specifications, drawings, or any writing constituting a part of these, the term "Bidder" or

“Contractor,” or any other term intending to refer to “Bidder” or “Contractor,” as defined in Section 101, will include and mean each participant in any joint venture.

(a) Line Item Joint Venture. Initiate a Joint Venture bid in ECMS. Select the Joint Venture Business Partner. Add the items to be undertaken by each Joint Venture Business Partner. For each item added, specify the Quantity and Unit Price in whole or in part.

Each Joint Venture Business Partner will be evaluated for prequalification work classifications and capacity based on the items designated, as specified in Section 102.01.

(b) Percent Joint Venture (Two Party). Initiate a two-party 50/50 Joint Venture bid in ECMS. Select the Joint Venture Business Partner. Each two-party 50/50 Joint Venture Business Partner will be evaluated for prequalification work classifications for all items, as specified in Section 102.01. Capacity will be calculated using 50% for all items.

(c) Percent Joint Venture (Three Party). Initiate a three-party 34/33/33 Joint Venture bid in ECMS. Select the Joint Venture Business Partners. Each three-party 34/33/33 Joint Venture Business Venture will be evaluated for prequalification work classifications for all items, as specified in Section 102.01. Capacity will be calculated using 34% for the lead joint venture and 33% for the second and third partners of the joint venture for all items.

102.12 OPENING OF BIDS—Bids will be opened and announced publicly at the time, on the date, and at the place shown in the proposal. Bidders and/or their authorized representatives and other interested persons are invited to be present.

In case of an emergency, which causes evacuation of the building at the time of the bid opening, the official in charge of the bid opening will publicly announce any necessary changes in the time of depositing, opening, and announcing of bids.

102.13 DISQUALIFICATION OF BIDDERS AND REJECTION OF BIDS—

(a) The following may be considered sufficient reasons for bidder disqualification and the rejection of the bids(s):

1. submittal of more than one bid for the same work from an individual, a firm, a partnership, an association, a subsidiary, an affiliate, or a corporation under the same or different name;
2. evidence of collusion among bidders. Any participant in such collusion will receive no recognition as a bidder for future work of the Department until the participant has been reinstated as a qualified bidder;
3. lack of competency, of adequate machinery, plant, or of other equipment;
4. inability, in the judgment of the Department, to promptly complete the project, because of uncompleted work;
5. failure to pay, or satisfactorily settle, all bills due for material furnished, for labor supplied or performed, for rental of equipment used, and for services rendered by public utilities;
6. failure to comply with any Department prequalification regulations;
7. judgment of default under a previous contract;
8. contractor currently debarred by Federal or State Authority; or
9. material or intentional failure to comply with contract, drawings, or specifications, or material or intentional failure to adequately maintain and control traffic during construction on a previous contract.

(b) In addition to rights under 67 Pa. Code, Chapter 457, the Secretary reserves the right to reject any or all bids if, in his or her judgment, the rejection is in the State's best interest.

1. In addition, bids will be rejected for any of the following reasons:

- 1.a** failure to submit the bid using the electronic format furnished or approved by the Department;
 - 1.b** failure to properly sign the bid, the required affidavits, or certificates, or any other required documents as specified in the proposal;
 - 1.c** failure to include a price for each item on the bid schedule, except in the case of alternate bidding; in alternate bidding, failure to include a price for one of the required alternate items on the bid schedule;
 - 1.d** failure to submit Diverse Business Participation Requirements as specified in the proposal;
 - 1.e** failure to submit Disadvantaged Business Enterprise Participation Requirements as specified in the proposal; or
- 2.** In addition, bids may be rejected for the following reasons:
- 2.a** the proposal was not furnished or approved by the Department;
 - 2.b** part of the bid is detached;
 - 2.c** the bid contains omission(s) or alteration(s), addition(s) not specified, or deviation(s) of any other kind;
 - 2.d** the bid is materially unbalanced;
 - 2.e** the bid is not submitted under the name listed on the prequalification certificate;
 - 2.f** the bidder provides different bid prices for an identical item number and description; or
 - 2.g** failure to properly execute, approve, and return the contract, together with the Surety Bonds and the Insurance Certificate(s), as specified in Section 103.05.

SECTION 103—AWARD AND EXECUTION OF CONTRACT

103.01 CONSIDERATION OF BIDS—After the bids are opened, the total bid amount and the name of the apparent low bidder will be publicly announced. Bids will then be promptly verified and, if determined by the Secretary to be satisfactory, the results of the determination of the lowest responsive and responsible bidder will be made available to the public.

(a) Submission of Component Item Schedule. The apparent low bidder is required to complete and submit a Component Item Schedule for each lump sum item requiring a Component Item Schedule (CIS) in the bid, providing quantities and unit prices for the component items associated with that lump sum pay item. The completed CIS becomes part of the contract.

The proposal will include a CIS for each applicable “as-designed,” lump sum item. When the proposal indicates that an equivalent structure or facility of an alternate design may be constructed in lieu of the “as-designed” structure or facility and the alternate design is bid, the necessary CIS must be prepared by the bidder.

The apparent low bidder is required to submit CIS electronically using the ECMS website after the bid opening. No payments will be made for any item of work until the CIS is submitted and approved.

In the event a deficiency is discovered in the information provided on the CIS, the bidder will be notified to correct the deficiency. In the event the apparent low bid is rejected, the next lowest bidder will be notified to prepare and submit the CIS in the manner as specified herein.

103.02 AWARD OF CONTRACT—When a bid received has been determined by the Secretary to be satisfactory, a contract will be awarded in writing to the lowest responsive and responsible bidder within 60 days from the opening date of the bids. Thirty-day extensions of the award date may be made by the mutual written consent of the Representative and the lowest responsive and responsible bidder. The Department will base the award exclusively on the total in the bid schedule and on compliance with all the bidding requirements. No prices will be negotiated due to any extensions.

Contract award on a joint venture bid will place upon the joint participants complete liability, jointly and individually, for contract performance.

Contracting corporations, which are chartered in a state other than Pennsylvania, as well as individuals or firms doing business under fictitious names, are required to register with the Secretary of the Commonwealth and obtain a certificate authorizing them to do business in Pennsylvania, before they can be awarded a contract.

103.03 CANCELLATION OF AWARD—The Secretary reserves the right to cancel the award of any contract at any time before its approval by the Chief Counsel, the General Counsel, and/or the Attorney General, or their designees, when such cancellation is in the best interests of the State. In the event of such cancellation, payment will be made for the documented costs of insurance and surety bonds required under Sections 103.04 and 103.05, and the documented cost of actual expenses reasonably incurred in accordance with a Letter of Intent, when specified and issued by the Deputy Secretary for Highway Administration. No payment will be made for damages of any other kind including, but not limited to, lost profits.

103.04 SURETY BONDS—When awarded the contract, furnish an electronic Performance Bond using ECMS, with sufficient surety or sureties, in an amount equal to 100% of the contract price. Have the bond specify that the contracted work will be completed in a manner satisfactory to the Secretary. Have the bond state that the State is not liable for any expenses incurred through the failure to complete the work as specified, nor liable for any damages growing out of the carelessness of the Contractor, the Contractor’s employees, or subcontractors. Also furnish an electronic Payment Bond using ECMS in the amount of 100% of the contract price. Have a corporate surety, legally authorized to transact business in the State and satisfactory to the Secretary, execute both bonds. If the Secretary decides the bond surety is unsatisfactory, promptly furnish any additional required security to protect the State’s interests and the interests of all persons, firms, or corporations who/which have furnished material, provided equipment on rental, or supplied/performed labor or services on, or in connection with, the performance of the work for this contract.

Have each participant in a joint venture submit a separate electronic Performance Bond and a separate electronic Payment Bond using ECMS. Have a corporate surety, legally authorized to transact business in the State and satisfactory to the Secretary, execute all bonds.

103.05 EXECUTION AND APPROVAL OF CONTRACT—Electronically sign the awarded contract and properly executed surety bonds, and return them to the Secretary of Transportation, Harrisburg, Pennsylvania, within 10 days after notification by the Secretary. Within the 10 days, provide an insurance certificate or certificates, listing the project number, naming the State as an additional insured party and saved harmless (if local authority/sponsor project, name the local authority/sponsor as additional insured), and proving property damage and public liability insurance is adequate to cover any loss that might accrue.

Procure only occurrence-based insurance coverage with general aggregate limit on a per project basis and so note on the certificate or demonstrate exhaustive efforts to purchase such insurance where it is unavailable. If able to demonstrate factual impossibility of obtaining occurrence-based insurance, then purchase insurance in a form and amount to be determined by the Department. Provide a minimum 30 day cancellation notice with a minimum 15 days cancellation notification for non-payment. The insurance certificate can be emailed to certificateofinsurance@pa.gov or faxed to 717-265-7206.

(a) When the joint bidder returns the signed contract for a joint venture, to be signed by the Secretary, a certified copy of a resolution of the board of directors of each participating corporation must be included. Have the resolution authorize the joint venture with the other party participant(s) for the specific contract. Have the corporation also submit a copy of its corporate powers. Have the participants in any joint venture make the designation in writing, addressed to the Secretary, with a copy directed to the Deputy Secretary for Highway Administration.

The designations are as follows:

1. The name of the person who will be in charge of the project for the joint contractors. Give this person complete authority to speak for and bind the joint contractors in all matters relating to the contract. It is this person to whom all notices, orders, directions, and determinations concerning the project may be given by the Secretary or the Representative. Notices, orders, directions, or determinations given to this designated person, or to one of the joint contractors, will be considered to have been given to all parties.

No change in the person designated to be in charge of the project will be recognized by or be binding upon the Secretary or the Representative, until the participants in the joint venture give written notice of such change. In the event of the death or disability of the person in charge of the project, it is the responsibility of the joint contractors to advise the Secretary or the Representative, in writing, over their joint signatures, of such death or disability within 24 hours after the occurrence, and then to designate a successor.

2. A mailing address for the receipt of all estimates, acceptance and final settlement certificates, payments, notices, orders, directions, and determinations for the performance of the work. The mailing address will be considered the joint contractors' address and any communications directed to such address will be considered to have been received by the joint contractors.

All checks for the payment of estimates and the final settlement certificate will be made to the order of the joint contractors in the same form in which they have signed the contract and will be mailed to the designated mailing address.

Change of the mailing address will not be recognized by or be binding upon the Secretary or the Representative, until written notice, signed by the joint contractors, has been received by the Secretary or the Representative.

(b) No bid will be considered binding upon the State or fully executed until the form and legality of the contract is approved by the Chief Counsel, the General Counsel, and/or the Attorney General, or their designee. If any proposal includes work to be contracted with more than one agency, the contracts will be entered into as specified in the proposal.

103.06 FAILURE TO EXECUTE CONTRACT—If the contract, together with the Surety Bonds and the Insurance Certificate(s) providing adequate insurance coverage, as provided in Section 103.05, is not properly executed and returned, liquidated damages may be assessed and/or the Contractor's prequalification may be suspended according to 67 PA Code, Chapter 457, Regulations Governing Prequalification of Prospective Bidders.

103.07 CANCELLATION OF CONTRACT—The contract may be canceled by either party if the Notice to Proceed is not issued on or before the Anticipated Notice to Proceed Date specified in the bid package or within 30 days of the Award of the contract, whichever is later. Extension(s) of the cancellation period will be made only by mutual written consent of the parties to the contract provided such written consent is given before the expiration of the cancellation

period. Prices will not be renegotiated. The Secretary also reserves the right to cancel the contract any time before the actual Notice to Proceed Date. If the contract is canceled, payment will be made for the documented costs of insurance and surety bonds required under Sections 103.04 and 103.05, and the documented cost of actual expenses reasonably incurred in accordance with a Letter of Intent, when specified and issued by the Deputy Secretary for Highway Administration. No payment will be made for damages of any other kind including, but not limited to, lost profits.

103.08 ASSIGNMENT OF ANTI-TRUST CLAIMS—It is recognized that in actual economic practice, overcharges by suppliers resulting from violations of State or Federal antitrust laws are in fact borne by the State. As part of the consideration for the award of the contract, and intending to be legally bound, the Contractor assigns to the State all right, title, and interest in and to any current claims or claims hereafter acquired under State or Federal anti-trust laws relating to the subject matter of the contract.

103.09 RECIPROCAL LIMITATIONS—For projects that do not include any Federal Funding, see the Reciprocal Limitations Act, found at Section 107 of the Commonwealth Procurement Code, 62 Pa.C.S. §107, and any successor or related statutes enacted by the Commonwealth's General Assembly, for certain prohibitions and limitations relating to supplies produced in states other than Pennsylvania and non-resident bidders and offerors that may apply to the solicitation and award of certain contracts incorporating these specifications.

SECTION 104—SCOPE OF WORK

104.01 INTENT OF PLANS AND SPECIFICATIONS—The intent of the plans and specifications is to prescribe a complete project undertaken according to the contract. Therefore, according to the contract, furnish material, equipment, tools, labor, and incidental work complete in place, unless otherwise provided, and be responsible for the complete supervision, performance, and completion of the work.

104.02 ALTERATION OF DRAWINGS OR WORK—The Department reserves the right to order, at any time during the progress of the work, increases or decreases in quantities and alterations in the construction drawings or specifications, including alterations in the grade or alignment of the road or structures. Any such order will be in writing by the Representative. Also, should any item contained in the proposal and contract be found unnecessary for the proper completion of the work, a written order will be given to eliminate such item from the contract. Such increases, decreases, eliminations, and/or alterations will not invalidate the contract, nor release the surety.

If the aforementioned changes in quantities or alterations of the construction drawings will significantly increase or decrease the cost of performing the work directly affected, perform such work only when authorized in writing, as specified in Section 110.03(a). Payment for such work will be made under Section 110.03.

With the exception of advance warning signs, detour signs, work zone traffic control devices, and other items specified in the contract, perform no work beyond the limits of the project, except as authorized in writing by the Deputy Secretary for Highway Administration.

When an item of work is eliminated, reimbursement of actual expenses will be made as specified in Section 110.03(d). If the aforementioned changes in the quantities or alterations of the drawings are of such magnitude as to require a change in the time to complete the project, a time adjustment will be made as specified in Section 108.06.

104.03 EXTRA WORK—Anticipate that extra work might be necessary in order to complete the project as contemplated. Perform extra work according to the specifications and only when authorized in writing, as specified in Section 110.03. Compensation will be made as specified in Section 110.03.

104.04 VALUE ENGINEERING—Value engineering applies to cost reduction proposals that are initiated, developed, and submitted to the Department for modifying the plans, the specifications, or other contract requirements. These provisions do not apply to a proposal unless it is identified as a value engineering proposal at the time it is submitted. The Department is not required to accept or act upon submitted value engineering proposals.

Value engineering proposals are those that would require a change in the contract and would result in either no cost increase or a net cost savings to the Department. They are initiated by the Contractor who proposes to provide the function of an improved product or service at the same cost or a lower cost, and to accomplish the original purpose of the project without impairing essential functions and characteristics.

Submit the following minimum information through the PennDOT Project Collaboration Center's (PPCC) Value Engineering-Concept workflow with each conceptual value engineering proposal, allowing enough time for Department investigation and implementation without interfering with the project schedule.

- Conceptual value engineering summary which includes contract information; narrative description of the conceptual value engineering proposal; estimated net cost savings, including one-half of the engineering and development costs; adjustments to existing contract items; any additional items or materials with cost justification; and estimated contract time savings if applicable;
- Conceptual plan drawings;
- If the conceptual value engineering proposal includes design changes, provide supporting technical design criteria;
- If the conceptual value engineering proposal would result in an estimated contract time savings, include a revised project schedule illustrating the impacts of the proposal; and

- If the conceptual value engineering proposal requires the ordering of materials, provide documentation from the suppliers of lead time to order and justification of the material cost.

When preparing the estimate of the net savings in construction costs that will result from the adoption of the proposal, the cost estimate and supporting analysis must include:

- A life-cycle cost comparison between the original contract requirements versus the proposed value engineering modifications, including any increase in future maintenance or operational costs. The life-cycle period is determined by the design life of the contract requirement that is modified by the value engineering proposal.
- One-half of the engineering and development costs incurred may also be included.

The Department reserves the right to make the changes, without compensation, if a value engineering proposal is based upon, or similar to, standard specifications, standard special provisions, or standard drawings adopted before the award date for the contract.

The Department will review the acceptability of a value engineering proposal and the estimated net cost savings to be realized from adoption of all or any part of the proposal. In evaluating the estimated net cost savings, the Department may disregard the contract bid prices if, in the judgment of the Department, such prices do not represent a fair measure of the value of the work to be performed or to be deleted. Within 14 calendar days after receipt of the required minimum information, as specified herein, the Department will review and provide notification of its acceptance or rejection of the conceptual value engineering proposal.

If the conceptual value engineering proposal is accepted in whole or in part, such acceptance will be by accepting the submission in PPCC. If the acceptance of the Department is conditional, the conditions will be noted in the comment section of the PPCC approval. Conceptual approval does not imply Department approval of detailed construction value engineering proposal. Set up a project meeting within 2 weeks of receiving conceptual acceptance including all applicable parties involved to determine the necessary steps in developing, submitting, and reviewing the detailed value engineering proposal. Provide a record of the meeting. Provide meeting minutes to the Representative for review within 7 calendar days after the meeting.

After the project meeting, submit a detailed value engineering proposal to the Department for review and acceptance through PPCC's value engineering-Detailed Proposal workflow. Before implementing any changes into the project, obtain acceptance by the District either as a whole, in part, or conditionally as outlined in the District's acceptance in PPCC.

Include the following with the detailed value engineering proposal:

- A narrative description of the difference between the existing contract requirements and the proposed change, with the comparative advantages and disadvantages of each;
- An itemized list of the contract requirements which are to be changed if the proposal is adopted, with a recommendation for making each change;
- If the detailed value engineering proposal includes design changes, provide revised plan drawings and design computations signed and sealed by a Professional Engineer, registered in the Commonwealth of Pennsylvania;
- A detailed estimate of the net savings in construction costs that will result from the adoption of the proposal. Include estimated costs the Department will incur for consultant review of the proposal if applicable;
- A prediction of any effects the proposed change will have on other Department costs, such as maintenance and operations, and rehabilitation;
- A statement of the deadline for adopting the change in order to obtain maximum cost reduction during the remainder of the contract, noting any effect on the Required Completion Date or any specified Milestone Date(s) and any other schedule impacts; and

- The contract items of work affected by the proposed change, including quantity changes and extra work items to be established, including prices and back-up data.

Continue to perform the work according to the requirements of the contract until the Department processes a work authorization incorporating the value engineering proposal, into the project.

Acceptance and/or preparation of the value engineering proposal and performance of the work will not extend the Required Completion Date and/or any specified Milestone Date(s) unless a request for an adjustment is submitted, as specified in Section 108.03(b), and accepted by the Representative. Construction acceleration will not be allowed as part of any value engineering proposal.

No contract adjustment as specified in Section 110.02(d) will be allowed for changes in quantities of original contract items affected by the acceptance of the value engineering proposal.

If the value engineering proposal results in contract time savings, the time saved due to the implementation of the value engineering proposal will be shared evenly between the contractor and the Department. A time reduction with or without Milestone adjustments for half of the saved time will be submitted by the Department.

The Department reserves the right to adopt all, or any part, of a value engineering proposal for general use on other contracts.

Value engineering proposals that are either identical or similar to previously submitted proposals, will be eligible for consideration and compensation under the provisions of this section if the previously submitted proposals were not adopted for general application to other contracts administered by the Department.

Compensation for the Contractor's share of the actual net cost savings associated with a value engineering proposal will be as specified in Section 110.07.

104.05 CLEANING OF PROJECT SITE—Remove silt and other deposits from newly constructed culverts, inlet, outlet and parallel ditches, bridges, and other drainage structures, including stream channels. Clean and remove surplus and discarded material, equipment, and temporary structures from the project and adjacent properties, including waste and borrow areas. Remove debris and objectionable material from areas used or disturbed by the construction operations on, or within sight of, the highway. Remove paint marks or spills, stains, rust marks, oil, or any other unsuitable marks, as directed. Restore waste and borrow areas, as specified in Section 105.14.

Maintain the vegetation within the constructed slope limits, including waste and borrow areas, and leave the project in a presentable condition.

The project will not be considered complete until the above work has been completed.

104.06 DISPOSAL OF EXISTING HIGHWAY STRUCTURES AND MATERIAL WITHIN THE PROJECT—Satisfactorily remove and dispose of all existing highway structures and material which are not to remain in place or to be used in the new construction. Unless otherwise directed, dispose of these structures and material off the project site. However, if indicated, the Department will retain drainage pipes, drainage grates or castings, guide rail posts, guide rail, bridges not under the authority of the Department, and/or portions of Department bridges. Such structures on all other highways become the property of the local authorities having jurisdiction. If the local authorities do not want to retain any portion or portions of structures or material under their jurisdiction, then remove and dispose of them off the project site.

(a) Slurry Management. Concrete slurry is a construction and demolition waste as defined in 25 Pa Code 271. If construction and demolition waste is segregated at the generation site to be re-used, then it could be considered clean fill. As a clean fill the direct use of the segregated material would not need to be permitted as specified in 25 Pa Code 271.101(b)(3). However, any further processing (e.g. grinding, treating or mixing) of the construction and demolition waste will require a waste management permit.

The impoundment on the generation site of the concrete slurry must meet 25 Pa Code 285, 285.123 Impoundments. Do not spread, discharge, store, or treat slurry within 50 feet of storm drains, water filled ditches or surface waters. The DEP Clean Water Program will not need to be involved unless there will be an impact to the waters of the Commonwealth, such as through an overflow over a spillway.

The beneficial use on the generation site (e.g. dust control) of any decanted water (also a waste) pumped from the impoundment will need to be approved by DEP or the County Conservation District (CCD) if DEP delegated authority to the CCD, to ensure that the characteristics of the waste material when used is not harmful to the environment or public health and safety. If the waste is not approved to be beneficially used, then it must be properly disposed at a site permitted to properly treat and/or dispose of the waste.

If a DEP permit is required, after consultation with the District, prepare and submit a proposed Slurry Management Plan for approval to DEP or to the CCD if DEP has delegated authority to the CCD. Additionally, submit a copy of the Slurry Management Plan to the Department through the PPCC upon submission to DEP or CCD for information and tracking purposes. If a DEP permit is not required, prepare and submit the Slurry Management Plan to the Department through the PPCC for approval. Do not begin operations or allow the discharge of untreated slurry without an approved Slurry Management Plan. Preparation of this slurry management plan, construction and restoration of the evaporation basins and removal and disposal of slurry are incidental to the construction item creating the slurry. The Slurry Management Plan will include the following:

1. General Summary. Provide a general summary outlining the project scope including means and methods for slurry management, a site map for the project, and a list of permits required for Slurry Management Plan (e.g., NPDES, Beneficial Use Permit, Erosion and Sedimentation Control Plan approval, etc.)

2. Slurry Volume. Provide an estimate of the expected volume of slurry that will be generated from the project.

3. Slurry Hauling. Describe the method to collect and transport slurry to prevent spills.

4. Water Management. Describe management of the water. While means and methods are up to contractor, the following examples are provided: Allowing the water to evaporate, re-using the water in the grinding operation, disposing of the water via sanitary sewer (provide proper permits), hauling the water to a treatment facility (provide the name of the treating facility), approved quarry waste site, or other commercially useful application.

5. Solids Management. Describe management of the precipitated solids. While means and methods are up to contractor, the following examples are provided: evaporation basins, using solids as a component in recycled aggregate, or other commercially useful application. Evaporation basins must meet requirements specified below and any area used for an evaporation basin must be in accordance with Section 105.14.

6. Corrective Action. If any of the following conditions occur stop operations and perform the necessary corrective actions before proceeding:

- Rain during operations results in discharge of slurry into buffer areas,
- Equipment fails to contain or remove slurry,
- Defined QC requirements are not being followed,
- Slurry discharge into areas not approved in the Slurry Management Plan,
- Slurry discharge into Waters of the Commonwealth*, or
- A spill occurs*.

Note:

*Notify the Department immediately if condition occurs.

7. Evaporation Basin. When an evaporation basin is proposed, provide design detail for the evaporation basin including the following:

- Ownership and location of the temporary or permanent containment basin(s), including any required permitting.
- Designation of basins as temporary or permanent.
- Number of basins proposed.
- Basin sizing including oversizing to account for rainwater.
- Method used to line the evaporation basin including material type and thickness.
- Plan showing all dimensions of the basin and distances to environmentally sensitive areas such as Waters of the Commonwealth, including jurisdictional wetlands
- Restoration plan for the evaporation basin area. At a minimum, include fill material, topsoil, seed mixtures, temporary cover, and schedule for restoration.

104.07 MAINTENANCE OF EXISTING ROADWAY—The Department reserves the right to enter upon a project and, at its own expense, maintain the existing roadway. Notwithstanding the performance of such work by the Department, continue to comply with all the provisions specified in Sections 105.13 and 901.

104.08 UNEXPECTED HAZARDOUS WASTE—The encountering of hazardous waste will be considered a differing site condition, as specified in Section 110.02(b), unless the presence of such waste is indicated in the proposal or contract. Hazardous waste is defined as material meeting the definition of a hazardous waste or Toxic Substance Control Act, Regulated PCB Waste, as specified in 40 CFR 260 or 25 PA Code, Chapters 260 to 270, Hazardous Waste Regulations.

If unexpected hazardous waste is encountered at the site, the Representative will investigate the conditions, determine the extent of the affected area, and authorize the Contractor, in writing, to remove and dispose of the waste. Payment for such work will be made as specified in Section 110.03.

The Contractor will not be required to perform or arrange for any work relating to the removal and disposal of unexpected hazardous waste. If the Contractor elects not to perform authorized waste removal and disposal work, notify the District Executive of that decision, in writing, within 2 working days of receipt of the Representative's written authorization. Cooperate fully with the Department and any authorized remediation Contractor, as specified in Section 105.07.

104.09 UNEXPECTED RESIDUAL OR MUNICIPAL WASTE—The encountering of materials that do not meet the definition of Clean Fill under the Pennsylvania Department of Environmental Protection (DEP) "Management of Fill Policy" will be considered a differing site condition, as specified in Section 110.02(b), unless the presence of such material is indicated in the bid documents. The determination of whether waste material is Residual Waste or Municipal Waste will be made in accordance with the DEP "Management of Fill Policy", applicable DEP Regulations, and the requirements of Publication 281.

If unexpected Residual or Municipal Waste is encountered at the site, the Representative, working with the Contractor, will investigate the conditions, determine the extent of the affected area, and develop and execute a mitigation plan. If deemed necessary, the Contractor will be authorized, in writing, to dispose of the material as Residual Waste or Municipal Waste, as appropriate. Payment for such work will be made as specified in Section 110.03.

SECTION 105—CONTROL OF WORK

105.01 AUTHORITY OF THE REPRESENTATIVE—

(a) General. The work will be subject at all times to the inspection of the Representative. Do not restrict or hinder this inspection.

To prevent disputes and litigation, the Representative will:

- determine the quantity of the kinds of work and the quality of material for which payment will be made under the contract;
- determine the answer to questions in relation to the project and its construction; and
- decide differences concerning the performance of the work covered by the contract.

All such determinations, decisions, directions, and explanations necessary to complete, explain, or make definite any provisions of these Specifications and Plans will be given promptly, in writing, to the Contractor.

As a condition precedent to filing a claim directly against PennDOT submit notice of intent to claim to the Contracting Officer, in writing, within 10 days of the act or omission. For projects managed using the PennDOT Project Collaboration Center (PPCC) website, submit the notice of intent to claim to the Contracting Officer through PPCC.

The filing must include a completed CS-105 “Contractor Notice of Intent to Claim” Form, otherwise it will not be accepted or processed as such. This notice of intent will give the Department the opportunity to investigate the claim and to maintain and document information for future resolution or litigation of the claim.

File the claim in writing with the Contracting Officer within 6 months of the date it accrues and not thereafter. If the Contractor fails to file the claim or does not timely file the claim, the Contractor is deemed to have waived its right to assert the claim in any forum. Claims not filed within the specified time period will be disregarded by the Contracting Officer. The claim, when filed, must state all grounds upon which the claim is based and must include a copy of the previously submitted notice of intent to claim.

The Contracting Officer will attempt to settle and resolve the claim with the Contractor. The Contracting Officer, at his or her discretion, may conduct a claim review meeting to attempt to settle and resolve the claim with the Contractor. If a claim review meeting is held, it will be attended by representatives of the Contractor and such Department representatives as the Contracting Officer considers appropriate.

If the claim is not resolved by agreement between the Contracting Officer and the Contractor, the Contracting Officer will issue a determination in writing regarding the claim and will mail it to the Contractor by first class mail. The determination will be mailed within 120 days of the date on which the Contracting Officer received the claim, unless the 120 day period is extended by consent of the Contracting Officer and the Contractor. If the Contracting Officer fails to issue a final determination within the 120 days, unless extended by consent of the Contracting Officer and the Contractor, the claim will be deemed denied. The determination of the Contracting Officer will be the final order of the Department regarding the claim. The determination of the Contracting Officer will be conclusive and binding upon the Contractor unless the Contractor appeals the determination by filing a statement of claim with the Board of Claims within 15 days of the mailing date of the determination, or, if no extension is agreed to by the Contracting Officer and the Contractor, within 135 days of the receipt by the Contracting Officer of the claim, whichever occurs first.

(b) Authority to Suspend Work. The Representative may suspend the work, wholly or in part, for the following reasons:

- failure to carry out orders;
- failure to comply with any provisions of the contract;
- unforeseen conditions not anticipated in estimating the contract time necessary for the completion of the work;

- the District Executive determines that the work will create roadway conditions that will hinder the Department's ability to safely maintain traffic or provide necessary services such as winter maintenance operations; or
- the District Executive determines that it is in the Department's best interest to delay the work until such time that a higher quality product can be obtained.

Written notification will be given of the suspension and the reason(s) for the suspension.

(c) Review and Acceptance. Review and acceptance by the Department as specified, stated, or indicated in the contract will be made on the basis of limited, general inspections.

It is understood that, because of such limited reviews, ultimate responsibility for the satisfactory completion of the project, including but not limited to:

- the quality of all materials;
- the quality of all workmanship;
- compliance with all terms of the contract;
- sufficiency, correctness, and accuracy of all working or shop drawings; and
- sufficiency of all QC Plans,

rests solely with the Contractor. Notwithstanding review and/or acceptance, save and hold harmless the Department from the consequences of all defective work as well as all defects, errors and omissions in the working or shop drawings, QC Plans, and plans of every other kind prepared by the Contractor.

105.02 DRAWINGS—The following drawings, when applicable, are required to perform the work:

(a) Contract Drawings. These drawings will be furnished. They show roadway lines, grades, and typical cross sections; location and design of structures; related construction features and details; and construction quantities. Keep one set of the drawings available on the project.

(b) Standard Drawings. Section 101.03

(c) Working Drawings. Prepare these drawings to supplement the plans. They include falsework drawings, field sketches, erection diagrams, erection stresses and loads, and other details, as necessary to construct the project. Submit two copies of the drawings to the Representative, for review and acceptance, before beginning work on the item involved. Design Computations and all drawings for load-bearing falsework submissions are to be signed and sealed by a Professional Engineer, registered in the State.

(d) Shop Drawings. Prepare these drawings in accordance with the requirements of design drawings, Department Standards, Design Manual Part 4 Structures, and the contract special provisions unless otherwise specified. Prepare original drawings using pencil or ink, or prepare drawings electronically (CAD), using standard ANSI D size, 22 inch by 34 inch sheets with 1 1/2 inch margin on the left side and 1/2 inch margins on remaining three sides. All lines on the drawing are to be of sufficient density and width so as to have residual density when reduced by 50% or microfilmed. Use a minimum U.S. Customary LeRoy size of 120 for lettering, symbols, and characters. Make details clear and uncluttered. Show complete details, dimensions, materials, notes, camber diagrams, welding details and sequences, and any other information required to fabricate the item.

Provide a title block in the lower right-hand corner of each drawing that indicates the county, route, section number, segment and offset, station, contract number, (ECMS No.), name of Contractor, name of Fabricator, title of drawing, drawing number, structure number (S-Number), initials of the drawer, initials of the checker, and date of the drawing. Include a revision block to the left of the title block and an empty block, approximately 4 inch by 3 inch above the title block to be used by the shop drawing reviewer for the shop drawing stamp.

Submit drawings electronically through the PennDOT Project Collaboration Center (PPCC) or other electronic file sharing protocol using the following requirements:

Scan original drawings or convert electronic drawings, to produce a portable document format (PDF) file for each drawing. Include structure number (S-Number) and drawing number in the file name. It is required that the PDF files be created with the “end user commenting” and “digital signature” features enabled. These features allow electronic comments to be added directly to the PDF using only reader software and create a log of comments that cannot be changed once the digital signature is added. Submit PDF files to the District Executive or to an agent designated by the District Executive, for review and acceptance. Provide files on compact disk through the PPCC or other electronic file sharing. As an alternate, files may be sent by e-mail provided attachments total to no more than 15.0 MB per e-mail message. Provide electronic transmittal forms regardless of submittal method. PDF files will be returned with corrections noted. Modify original or electronic drawings as required, scan or convert into new PDF files, and resubmit. Continue until PDF files are accepted.

After acceptance, submit final shop drawings (electronic PDF files) and, if a hard-copy is requested, one set of full-size prints. After erection is complete (if applicable), but before project completion, submit final drawings showing as-built conditions as electronic PDF files to the District Executive.

105.03 CONFORMITY WITH DRAWINGS AND SPECIFICATIONS—

(a) General. Perform work within reasonably close conformity to the lines, grades, dimensions, and indicated details, and/or as specified.

(b) Determination by the Representative.

1. Restricted Performance Specifications. The Representative will determine acceptability of material or construction. When material or construction is not within specification limits, acceptance will be as specified within the individual specification sections, except where test result variations are so great that the material or construction is unacceptable.

2. Other Than Restricted Performance Specifications. For each individual case, the Representative will determine the limits of reasonably close conformity; the judgment given will be final and conclusive.

If it is determined that material or the finished product in which the material was used is not within reasonably close conformity, but that reasonably acceptable work has been produced, the Representative will then determine if the work will be accepted and remain in place. In this event, written documentation will be provided for acceptance by required contract modification, and/or to provide for an appropriate adjustment in the contract price for such work or material.

If it is determined that material or the finished product is not within reasonably close conformity and has resulted in an inferior or unsatisfactory product, remove or replace it.

(c) Certification of Falsework Adequacy. Have a Professional Engineer, registered in the State, certify that the falsework system has been assembled as shown on the Professional Engineer’s signed and sealed falsework drawings prepared as specified in Section 105.02(c). Submit the certification to the Representative before placing loads on the falsework.

(d) Compliance with Specified Milestone Date(s). Complete all work in a manner that ensures specified Milestone Date(s) and/or contractually specified sequences are met. Failure to meet any specified Milestone Date(s) or sequence will result in the withholding of payment for completed work until the associated activity or activities have been completed to the satisfaction of the Representative.

105.04 COORDINATION OF PLANS AND SPECIFICATIONS—Perform the work according to the intent of the Plans and Specifications. Do not take advantage of any error on/or omission in the Plans or discrepancy between the Plans and Specifications. In the event such an error, omission, or discrepancy is discovered, immediately notify the Department. Failure to notify the Department will constitute a waiver of all claims for misunderstandings, ambiguities, or any other reasons resulting from the errors, omissions, or discrepancies. If requested, corrections and

interpretations necessary for the fulfillment of the Plans and Specifications will be made. Do not use scaled measurements where dimensions on the drawings are given or can be computed.

In case of a discrepancy among the contract documents, the following order of precedence will apply:

- (1) Special Provisions
- (2) Plans (excluding cited Standard Drawings)
- (3) Specifications (other than Special Provisions)
- (4) Standard Drawings
- (5) Electronic Files

If any Special Provisions or information on the Plans conflict with these Specifications, the Special Provisions or information on the Plans will govern. If a conflict exists between any portion of the Plans designed specifically for this project and any portion of the Standard Drawings, the former will govern.

If necessary, the District Executive will determine and order, in writing, any modifications or changes in the Plans, Standard Drawings, or Specifications to update, adjust, accept, or complete the work contemplated by the contract as specified in Section 104.02. Wherever reference specifications or publications are specified, comply with the issue or edition (including interim AASHTO specifications and ASTM tentative designations) in effect on the date bids are opened, unless the date or year of the reference specification or publication is indicated or specified. If there is a conflict between a cited title and a cited section number, the title will take precedence over the section number.

105.05 RESPONSIBILITY OF CONTRACTOR—

(a) General. Keep direct control of the contract and see that the work is properly supervised and is performed satisfactorily and efficiently. Supervise the work personally or appoint a competent superintendent or representative to be on the project at all times. Give this superintendent or representative the authority to receive orders and directions; to execute orders and directions without delay; and to make arrangements for all necessary material, equipment, and labor.

Keep on the project, at all times, a copy of the plans, a copy of the specifications, and a copy of the contract, and a copy of all subcontracts.

The Department is not responsible for the Contractor's satisfactory completion of the contract work as a consequence of the presence of Department representatives or inspectors and their inspection.

Notify the Assistant District Executive for Construction in the District having responsibility for the project 3 days before the actual start of work. Keep the Assistant District Executive for Construction informed as to any changes in the scheduled date for starting work.

(b) Work By Others. For work to be done without the supervision of the Department, investigate the work and anticipate its execution and completion. The Department will not be liable for failure to anticipate the time of performance and completion of such work, except in those cases where, upon timely request, the Department has agreed to cooperate.

(c) Gratuities and Penalties. Do not give or offer, or allow agents, employees, or representatives to give or offer, either directly or indirectly, money, property, entertainment, or other valuable things, to any employee or representative of the Department for any reason, purpose, or cause, or as an inducement, bribe, or reward for doing or omitting to do any act, or for showing any favor or disfavor in relation to any matter relating to the contract. Any such action will constitute a violation of the contract. Upon satisfactory proof to the Secretary of such violation, the Department may terminate performance of the work and take steps to complete the project, as specified in Section 108.08.

105.06 UTILITY INFRASTRUCTURE AND UTILITY ADJUSTMENTS—

(a) Utility Infrastructure and Utility Adjustments Interfering with Contract Operations. Before submitting a bid for the project, examine the project site and any waste or borrow sites designated in the proposal to determine the location of all Utility Infrastructure and the need for any Utility Adjustments. The Department has indicated in the contract documents such Utility Infrastructure and Utility Adjustments as have been brought to its attention. The Department is not responsible for waste and borrow areas not designated in the contract documents. Accept the

responsibility and risk relating to the conditions to be encountered regarding Utility Infrastructure and Utility Adjustments that are indicated in the contract documents or that can be ascertained from a careful pre-bid examination of the project site for any waste or borrow sites designated in the proposal.

Notify the responsible parties of the plan for construction operations, in writing, no later than 15 calendar days after contract award. Responsible parties include all public service companies, utilities, municipal authorities, municipal utilities, individuals, and others owning or controlling any facilities or structures within the limits of the project, which may have to be relocated, adjusted, or reconstructed. Give due notice to the responsible party in sufficient time for that party to organize and perform such work in conjunction with or in advance of construction operations. Provide verification to the Department upon request that notification to responsible parties was done in accordance with the 15 calendar day contract award requirement.

- Schedule the date for the initial utility coordination meeting within 15 calendar days after contract award. This meeting may be scheduled in conjunction with or immediately following the pre-construction meeting but it must occur before the start of construction. At this meeting, be prepared to discuss:
 - The project schedule;
 - All project milestones, required completion dates, and all activities related to Utility Infrastructure and Utility Adjustments; and
 - How the project schedule differs from the utility relocation schedule prepared by the Department during project design.

Include as attendees:

- All utilities within the project limits (including the Utility's contractors and subcontractors),
- Applicable contractor team members and subcontractors,
- Department representatives, and
- All Utility Infrastructure owners.

Incorporate appropriate information from this meeting into the project schedule as specified in Section 108.03(b). Provide a record of the meeting. Minutes must be provided to the Department and Utility representatives for their review no later than 7 calendar days after the meeting. Allow 7 calendar days for Department and Utility representatives to review the minutes for acceptance or notification of needed revisions/clarifications and follow up with final minutes no later than 7 calendar days after the review period. Action items should be discussed and documented thoroughly at all meetings and monitored for completion to prevent impacts to the project schedule.

- Following the initial utility coordination meeting, notify the Department representatives of any unforeseen or potential conflicts discovered that were not discussed at the initial meeting and schedule follow up meetings to discuss these unforeseen or potential conflicts with the respective Utility representatives. Provide a record of the meeting. Minutes must be provided to the Department and Utility representatives for their review no later than 7 calendar days after the meeting.
- On projects where utility relocations and/or adjustments are a significant part of the construction operations and phasing as determined by the Department representative, bi-weekly utility meetings are to be scheduled by the contractor and attended by the Department, the contractor and the Utility representatives. Provide a record of the meeting. Minutes must be provided to the Department and Utility representatives for their review no later than 7 calendar days after the meeting.

Cooperate with the Utility Infrastructure owners and the owners of all waste and borrow areas not on the project site. Make arrangements for Utility Adjustments necessary to perform the work as indicated in the contract documents. Arrange and perform contract work in and around such Utility Infrastructure in accordance with recognized and accepted engineering and construction practices and in a manner that assists the Utility Infrastructure owners in their required Utility Adjustments.

Refer to the provisions of Act 287-1974, which specifies project responsibilities in regard to public health and safety during excavation and demolition operations in areas of underground utilities.

Failure to perform and document these actions could impact the acknowledgement or approval of any associated delays or time extension requests.

(b) Delays in the Performance of Work. No additional compensation will be paid because of an impact to the contract work from Utility Infrastructure and Utility Adjustments unless the Contractor establishes, to the satisfaction of the District Executive and the Director of Project Delivery, that the impact was unforeseen and unforeseeable by a reasonable contractor; that losses could not have been avoided by the judicious handling of forces, equipment and plants, or by reasonable revisions to the schedule of operations; and that the impact has resulted in a documented increase in the cost of performing the contract work, in which case only delay damages will be paid as specified in Section 111.

The following are conditions precedent to the right, if any, of the Contractor to an adjustment in compensation:

- Comply with the requirements specified in Section 105.06(a).
- Furnish all schedule updates specified in Section 108.03(b) to all affected Utility Infrastructure owners.
- Comply with the requirements specified in Section 111.

(c) Utility Adjustments by Others. When required, owners or lessees are to bring railway tracks to the established line and grade. Utility Adjustments are to be performed by the owners of the Utility Infrastructure, unless otherwise indicated. Check the line and grade as soon as possible after Notice to Proceed, but no later than 30 calendar days before the placement of base or pavement adjacent to or around such Utility Infrastructure.

(d) Damage to Utility Infrastructure. Compensate the owner for all cost of repairing, replacing, or resetting any Utility Infrastructure damaged or disturbed by contract construction as specified in Section 107.12.

Coordinate with the railroad company to provide accepted measures for protection of railroad tracks and ballast from debris, silt, or other foreign matter.

Provide required means of protection, maintenance, cleaning, repair, and replacement of ballast. This work will be subject to the approval of the Railroad's Chief Engineer or authorized representative.

105.07 COOPERATION BETWEEN CONTRACTORS—The Department reserves the right to contract for and perform other work on or near the work covered by the contract.

If separate contracts are awarded within the limits of, or adjacent to any one project, or utility work not included or identified in the contract becomes required, conduct the work to complete the Department's project and to avoid interfering with or hindering the progress or completion of the work being performed by other entities. Coordinate with the Department and schedule meetings among all entities performing work. Plan and coordinate all work activities with all entities involved to ensure efficient completion of work by all parties. Satisfactorily join work with and in proper sequence with the work of others.

This section does not necessarily preclude the contractor from claiming additional costs, if any, provided for under other provisions of the contract or specifications, provided all reasonable efforts are made by the contractor to mitigate its losses, including, without limitation, attempts to re-sequence work when reasonable and practical opportunities exist.

105.08 CONSTRUCTION SURVEYING—

(a) Projects that Do Not Include a Construction Surveying Pay Item. If the project plans and specifications do not indicate a separate pay item for Construction Surveying, control stakes will be furnished and placed, offset from the proposed roadway base line, and a grade sheet will be furnished showing the horizontal and vertical measurements from the stakes to the base line and grade of the roadway as planned, including adjusted alignment and grades, as directed, to meet conditions. Where the highway is to be constructed on a grade of more than 4%, an offset stake will be set on each side of each designated grade point. The stakes will be on a direct line through the grade point or base line, or otherwise, as may be required. Slope stakes will be placed adjacent to the top of cut and toe of embankment slopes where these points are more than 5 feet vertically above or below the finished grade line. Applicable base line, abutment, pier, sidewall, and wingwall stakes, together with offset, reference, and grade stakes for bridges, arches,

slab and box culverts, including metal plate and pipe culverts and other special structures, will also be placed, as required, to facilitate and control the work.

Employ a Professional Land Surveyor or Professional Engineer, registered in the State, qualified in the use of plans, cross sections, and specifications, to establish lines and grades, as may be required. Assume full responsibility for dimensions and elevations taken from the control stakes and the setting of lines and grades.

Furnish templates and other material and place additional stakes and markers necessary for control and guidance of construction operations. Also, furnish the Inspector with any assistance required for checking lines, grades, and measurements established (other than by the Department) and necessary for the performance of the work. The Department does not assume responsibility for the performance of the work as a consequence of this checking.

Preserve survey points and stakes, as placed. If any of these surveying controls are disturbed or destroyed by construction operations, the cost to the Department for replacement will be charged against and deducted from money due or to become due.

(b) Projects that Include a Construction Surveying Pay Item. If the project plans and specifications indicate a separate pay item for Construction Surveying, perform the work as specified in Section 686.

105.09 AUTHORITY AND DUTIES OF INSPECTOR-IN-CHARGE—The Inspector-in-Charge will have immediate responsibility for administering the performance of work on the project.

In case a dispute arises concerning material to be furnished or the manner of performing the work, the Inspector-in-Charge will have authority to reject material or suspend the work until the question at issue can be referred to and be decided by the Representative. A rejection of material or suspension of work will be confirmed by written notice from the Representative.

105.10 INSPECTION OF WORK—The work will be subject to the inspection of the Representative or authorized assistants. Provide them access to the work and furnish them with every reasonable facility for determining whether the work being performed or which has been completed is according to the requirements of the plans, specifications, and contract, except as otherwise provided. Provide all labor and equipment necessary for such examination.

Should the work thus exposed or examined prove satisfactory, the uncovering or removing and restoring of the uncovered or removed work will be paid for, as specified in Section 110.03, except the incidental work for testing the depth of base and surface courses and pavement will not be paid for separately. Should the work exposed or examined prove defective or unsatisfactory, promptly uncover or remove and satisfactorily restore the defective or unsatisfactory work, at no expense to the Department.

When any unit of government or political subdivision, or any public or private corporation, is to pay a portion of the cost of the work covered by the contract, the respective representatives will have the right to inspect the work. Such inspection will not make any unit of government or political subdivision, or any public or private corporation, a party to this contract and will in no way interfere with the rights of either party to this contract.

105.11 DUTIES OF THE INSPECTOR—Authorized inspectors, who perform their duties under the direction of the Representative, will be assigned to the project.

Execute work under the observation and subject to examination of an inspector(s); carry out such work during the normal working hours of the day, unless specifically directed otherwise. If work is performed during nighttime hours with permission, provide sufficient artificial lighting to assure proper inspection and workmanship.

The inspector is not authorized to do the following: revoke, alter, enlarge, relax, or release any requirements of the specifications; approve or accept any portion of the work; or issue instructions contrary to the plans and specifications.

The presence of the inspector during the performance of any work on the project will not relieve the Contractor of the responsibility for work that is later determined by the Representative to be defective.

105.12 DEFECTIVE WORK AND MATERIAL—If any work and/or material does not meet the requirements of the plans and specifications, or is not within reasonably close conformity, as determined by the Representative, such work and/or material will be declared defective.

Unless otherwise specified, repair, as directed, or remove and replace defective work and/or material at no expense to the Department.

105.13 MAINTENANCE OF PERFORMED WORK—

(a) Maintenance of Performed Work. Maintain performed and completed work, making continuous and effective efforts, with adequate equipment and forces, to keep the roadway or structures in satisfactory condition at all times during construction. Provide such maintenance, at no additional cost to the Department, until relieved of responsibility for further physical work, and maintenance as specified in Section 110.08(a).

If, at any time, performed work is not maintained, the Department reserves the right to perform such work as may be considered necessary for traffic accommodation and to deduct the cost thereof from money due or to become due the Contractor.

Provide removals, renewals, restorations, and repairs as required to remedy damage to performed work occurring before relief of Contractor responsibility as specified in Section 110.08(a). Perform such work, according to the terms and conditions of the contract, at no expense to the Department. Seek reimbursement of the costs of such work from legally responsible third parties and their liability insurers, asserting all available claims, including claims of the Department as the Department's subrogee where appropriate. If, as determined by the Representative, all such claims have been exhausted without full recovery of the costs of such work, and the damage was due to unforeseeable causes beyond the control of the Contractor and occurred despite satisfactory maintenance precautions taken, the Department will pay for the unrecovered portion of the costs of such work as specified in Section 110.03.

(b) Maintenance During Temporary Suspension of Work. If the work is temporarily suspended, wholly or in part, for a sustained or indefinite period, satisfactorily store all materials and take every precaution to prevent damage or deterioration of preformed work. Provide suitable drainage for the roadway by constructing temporary shoulders; by opening culverts, inlets, and parallel ditches; and by erecting temporary drainage structures where necessary.

During suspension, the entire project under contract, or any section, may be opened to traffic, as directed. If opened to traffic, maintain the roadway in satisfactory condition and maintain local traffic as specified in Section 902. Perform such work at no expense to the Department, except as specified in Section 902.4. During work suspension, remove all protective devices installed on the project. However, if directed, maintain protective devices in certain areas.

If work is suspended in part, the Representative will have the authority to direct that other parts or items of work be performed.

Satisfactorily protect the ends of any sections of rigid-type base course, pavement, or wearing surface opened to traffic during a temporary, partial suspension of work. Maintain this protection, remove it when no longer required, and satisfactorily dispose of protective material.

During any period of work suspension, properly and continuously maintain, in an acceptable growing condition, all living material in newly established plantings, seedings, and soddings furnished under the contract. Take adequate precautions to protect new tree growth and other desirable vegetative growth.

105.14 BORROW AREAS AND WASTE AREAS—

(a) Non-Designated Areas. Locate proposed areas for obtaining borrow material and/or areas for disposal of waste material, when required. Locate waste, borrow, or staging areas inside or outside of the right-of-way in upland areas not impacting Waters of the United States, including jurisdictional wetlands, unless already authorized by the U.S. Army Corps of Engineers and DEP. Situate areas so cross sections may be taken by the Department to measure the volume of material removed or deposited. Before cross sectioning borrow areas, remove topsoil and stockpile it for replacement when removal of borrow material has been completed.

Review proposed areas with the Representative for approval to negotiate a "Borrow and/or Waste Agreement." Waste and borrow areas that impact Waters of the United States are prohibited unless already permitted, as agreed to with the U.S. Army Corps of Engineers. Obtain waterway and/or other required permits as applicable. Prepare and submit an Erosion and Sediment Pollution Control Plan to the Conservation District for approval. Negotiate with the owner(s) of property to be obtained by using the Department's standard "Borrow and/or Waste Agreement," available from the District Executive. This standard agreement may be modified to cover unusual or special conditions, provided such conditions are acceptable to the Department. Submit one copy of the executed agreement to the Representative for review and acceptance. Do not proceed with work in the area until such review and acceptance is completed and until written notification of the acceptance is received.

Also submit one copy of applicable permits and of the approved Erosion and Sedimentation Control Plan to the Representative before starting work.

Have the agreement provide for cleaning and leaving the premises and area in a well-drained and, if required, smoothly graded condition, blending into the existing topography. Scarify, lime, fertilize, seed, and mulch any

disturbed areas with material, and formulae, at rates typical for the project. When directed, satisfactorily remove and dispose of surplus material.

Perform the clean fill determination for all borrow materials entering the construction right-of-way by completing and submitting the Environmental Due Diligence Form D-1, and, if necessary, Form D-2 to the Department for acceptance.

(b) Designated Areas. If the Department has previously selected areas from which to obtain borrow or areas in which to deposit waste, the proposal will specify the location(s).

For such designated area(s), complete the standard agreement as specified above for Non-Designated Areas. The Department will provide all applicable permits and Erosion and Sediment Pollution Control Plans.

105.15 ARCHEOLOGICAL AND HISTORICAL FINDINGS—In areas where remains of prehistoric people's dwelling sites or where artifacts of historical or archeological significance are encountered, discontinue construction operations in the general area. Contact will be made with the State Historical and Museum Commission to determine how to proceed. When directed, satisfactorily excavate the site to preserve the artifacts encountered, then remove them for delivery to the custody of the Pennsylvania Historical and Museum Commission. In the event construction operations are halted or delayed because of archeological or historic findings, appropriate adjustments will be made in the contract time as specified in Section 108.06. Such site excavation will be considered extra work as specified in Section 104.03.

105.16 COAL OR VALUABLE MINERAL FINDINGS—If coal or other valuable minerals are uncovered, during prosecution of the work, that are not addressed by contract special provisions, store and handle the coal and other valuable minerals according to the directions of the Representative.

Do not claim or assume ownership rights.

If direction is given to handle and dispose of the material in a manner other than as unsuitable material, the contract time and contract price may be adjusted as specified in Section 110.02.

105.17 ACCEPTANCE OF CONSTRUCTION LOADINGS AND MATERIAL STOCKPILING ON BRIDGES—Do not stage equipment or stockpile materials on a bridge unless a written request has been submitted and accepted by the Representative. Submissions are to be signed and sealed by a Professional Engineer, registered in the State. The Representative will review the documentation, supporting analysis, if required, and respond to the written request within:

- 10 calendar days of receipt for a load limit submission
- 21 calendar days of receipt for a review of analytical calculations for cases that exceed the specified loading limits, or for a crane placement submission.

Acceptance by the Representative will not relieve the Contractor of liability for damages resulting from the stockpiling of materials or from the operation and movement of construction equipment.

A bridge is considered completed if all the following conditions are satisfied:

- All applicable structural members are erected.
- Spans proposed for construction loading and material stockpiling are completed from expansion joint to expansion joint or from abutment to abutment excluding barriers and deck joints.
- If staged construction for maintenance-of-traffic, spans of staged width proposed for construction loading and material stockpiling are completed from expansion joint to expansion joint or from abutment to abutment excluding barriers and deck joints, and the staged width has been designed for and will be opened to all legal loads without restriction.

For construction equipment on deck slabs, the written request must describe the loading magnitude, arrangement, movement, and position of the equipment on the structure, including the mechanism of load transfer (load path) to the bridge.

(a) Loading limits. For spans over 40 feet, carrying live traffic loads (staged construction) or over live traffic, limit the stockpiling of material and staging of equipment on a non-weight posted completed bridge the following:

1. Individual material stockpile (including but not limited to pallets of products, reinforcement bar bundles, aggregate piles) - Limited to one individual stockpile with a maximum weight of 250 pounds/square foot and a maximum size of 100 square feet.
2. Multiple material stockpiles - Maximum weight of 65 pounds/square foot with a maximum total stockpile area of 1000 square feet.
3. Combinations of material stock piles, vehicles, other materials, and equipment are limited to a maximum total weight of 100,000 pounds per span in any for work zone width less than 24 feet, and a maximum total weight of 200,000 pounds per span for work zones ≥ 24 wide, provided loading limits in Sections 105.17(a)1 and 2 are not exceeded. The force effects produced by combinations of material stockpiles, vehicles and other materials and equipment are limited to the force effects produced by vehicles of legal configuration evaluated at operating rating levels as defined in Publication 238.

On a weight posted completed bridge, the above thresholds are to be reduced proportionately based on the ratio of the posted load limit(s) to the legal load limit(s).

If loads are proposed that will exceed the above loading limits or loads are proposed to be placed on an incomplete bridge, submit analytical calculations showing the flexural, shear, and axial stresses due to construction loadings do not exceed the operating stress levels as defined in Publication 238 for the main load carrying members of the structure or the deck slab.

(b) Placement of a crane. Submit a working drawing showing the location of crane, matting, and all other loads and denote their weights. Submit analytical calculations showing that flexural, shear, and axial stresses due to construction loadings do not exceed the operating stress levels as defined in Publication 238 for the main load carrying members of the structure or the deck slab. Provide matting to protect the deck slab from damage. Placement of cranes is not allowed on newly constructed bridge decks until the deck concrete has cured for a minimum of 14 calendar days and has attained a minimum compressive strength of 4,000 pounds per square inch.

SECTION 106—CONTROL OF MATERIAL

106.01 GENERAL—Use material complying with the requirements of these specifications. At the pre-construction conference, submit a list of material to be sampled and tested by the Contractor and a list of material to be sampled and tested by the Department.

Comply with the provisions of the Pennsylvania Trade Practices Act, 71 P.S. Section 773.101, et seq., concerning the purchase of aluminum and steel products produced in a foreign country. On Federal-Aid projects, also comply with the provisions specified in Section 106.10.

Comply with the provisions of the Steel Products Procurement Act, 73 P.S. Section 1881, et seq. in the performance of the contract or any subcontract.

Following contract execution, furnish to the Department a complete statement of the project construction material's origin, composition, and manufacture.

For Fabricated Structural Steel materials, as identified in Section 1105.01(a) and inspected in accordance with Section 1105.01(e), and any other fabricated aluminum, precast or prestressed concrete products inspected during manufacturing, stamped and approved for shipment by the Department's Representative, furnish Form CS-4171 to the Inspector-in-Charge. Certified mill test reports for any steel included will be reviewed by the Department's Inspector and retained by the fabricator.

For all other steel products or products containing steel that will be permanently incorporated in the project, provide the Inspector-in-Charge the following when the product is delivered to the project site:

- For any "identifiable" steel products, certification that Section 4 of the Steel Products Procurement Act, 73 P.S. Section 1884, has been complied with. Identifiable steel products are steel products which contain permanent markings which indicate the material was both melted and manufactured in the United States.
- For all other "unidentifiable" steel products, documentation such as invoices, bills of lading, and mill certification that positively identify that the steel was melted and manufactured in the United States.

The provisions of the Steel Products Procurement Act will not be waived unless the Secretary has determined, under authority granted in Section 4(b) of the act, that a certain steel product or products is not produced in the United States in sufficient quantities to meet contract requirements. Such a determination will be set forth in a proposal for the Department's review and response. Include with the proposal a comprehensive list of sources, including names and contact information, for verification. The Secretary does not have the authority to waive the provisions specified in Section 106.10.

Steel products are defined as products rolled, formed, shaped, drawn, extruded, forged, cast, fabricated, otherwise similarly processed, or processed by a combination of two or more of these operations from steel made in the United States by the open hearth, basic oxygen, electric furnace, Bessemer, or any other steel-producing process. Included are cast iron products and machinery and equipment as listed in United States Department of Commerce Standard Industrial Classification 25, 35, and 37 and made of, fabricated from, or containing steel components. If a product, as delivered to the project, contains both foreign and United States steel, such product is considered to be a United States steel product only if at least 75% of the cost of the articles, materials, and supplies have been mined, produced, or manufactured, as the case may be, in the United States. On Federal-Aid projects, comply with the provisions specified in Section 106.10.

No payment will be made on the contract if unidentified steel products are supplied, until the hereinbefore requirements are met.

Any payments made that should not have been made may be recoverable from a manufacturer or supplier as well as from a contractor or subcontractor.

Any person who willfully violates the Steel Products Procurement Act will be prohibited from submitting bids for any contract for a period of 5 years from the date of determination that a violation has occurred. If a subcontractor, manufacturer or supplier, violates the Steel Products Procurement Act, such person will be prohibited from performing any work or supplying any materials to the Department for a period of 5 years from the date of determination that a violation has occurred.

If steel products are used as a construction tool or appurtenance and will not serve a permanent functional use in the project, compliance with the Steel Products Procurement Act is not required.

When standard manufactured items are specified and these items are identified by unit mass (unit weight), section dimensions, or similar characteristics, their identification will be considered to be nominal masses (weights) or dimensions. Unless more stringently controlled by specified tolerances, industry established manufacturing tolerances

will be accepted.

106.02 MATERIAL—

(a) Preliminary Acceptance and Approval. Have each material and material source of supply listed on Form CS-200 (Source of Supply – Materials) or Form CS-201 (Source of Supply – Traffic Control Devices) and approved before delivery to project. Department Bulletin listed material and material sources are available for use by the Contractor. If non-Bulletin material or material sources are proposed for use, the requirements specified in 106.02(a)2 must be met before these materials are delivered to the project. The Department reserves the right to obtain samples of any material provided by the Contractor for laboratory testing to verify compliance with specifications.

1. Bulletin Material, Material Application, and Material Source. Defined as any of the following:

- Any material and material source listed in Bulletin 14 and used in the material application as specified in the Bulletin, Publication 408, or a Special Provision.
- Any material and material source listed in Bulletin 15 and used in the material application as specified in the Bulletin, Publication 408, or a Special Provision.
- Any asphalt material and material application specified in Publication 408 and produced at a source listed in Bulletin 41.
- Any cement concrete material and material application specified in Publication 408 and produced at a source listed in Bulletin 42.

Submit a CS-200 or CS-201 to the Representative with the following information: contract item number, item description, material description/type/class, product name, manufacturer/producer plant location, applicable Bulletin supplier code, Bulletin number, and Publication 408 or Bulletin Section.

If a previously submitted Bulletin material source no longer provides the specified material, submit a change in material to the Representative as outlined on Form CS-200 or CS-201. Once written acceptance is received, furnish material from another Bulletin material source listed in Bulletin 14, 15, 41, or 42.

2. Non-Bulletin Material, Material Application, or Material Source. Defined as any of the following:

- Any material, product, or material source not listed in Bulletin 14 or Bulletin 15.
- Any material, product, or material source listed in Bulletin 14 or Bulletin 15 being used in an application not intended or specified in the Bulletin, Publication 408, or a Special Provision.
- Any asphalt material or product not produced at a source listed in Bulletin 41.
- Any asphalt material or product not specified in Publication 408 or a Special Provision.
- Any ready-mixed, cement concrete material or product not produced at a source listed in Bulletin 42.
- Any ready-mixed, cement concrete material or product not specified in Publication 408 or a Special Provision.

2.a. Construction-Aid Material. A necessary, temporary, or ancillary material that is not specified for use as part of a contract item or extra work item, but used by the Contractor only to aid in the completion of the work. The material is typically not a permanent part of the specified work (example: wood and nails for temporary formwork). The material need not be listed on Form CS-200 and does not require any Department approval for delivery to or use on the project. The Representative reserves the right to determine whether a material is a construction-aid material. Note temporary traffic control items are not construction-aid materials and do need listed on Form CS-201 since these items must be from Bulletin 15 listed sources and are specified for use as part of contract items or extra work items.

2.b. Project-Specific, LTS Approved Material. Non-Bulletin material proposed for use on a particular project as part of a contract item or extra work item, which requires approval by the LTS. Use of material is not meant to circumvent the use of available material sources listed in Bulletin 14, 15, 41, or 42. Have each material and material source listed on Form CS-200 or Form CS-201. The material is defined as any material, product, or material source that meets one or more of the following criteria:

- Meets specified requirements in Publication 408 or Special Provision, for the material and material application.
- Meets specified requirements in AASHTO or ASTM Standard for the material and material application.
- Meets specified requirements in project Special Provision for the material and material application.

Submit material to the LTS for evaluation and testing a minimum of 90 days before planned delivery to the project. Submit the following information to the LTS, with a copy to the Representative: source, description, specified use, QC Plan, independent lab test data showing material meets all specified requirements as determined on a single lot of material, and material samples of the kind and quality specified. Do not deliver material to the project until written acceptance is received from the Representative.

2.c. Project-Specific, Locally Approved Material. Non-Bulletin material proposed for use on a particular project as part of a contract item or extra work item, which does not require LTS approval because of the low risk to constructed Project performance, but does require local approval by the Representative (i.e. at the District or project level). This category of material is not meant to circumvent the use of available material sources listed in the Bulletins, or the requirements of Project-Specific, LTS Approved Materials. These materials must meet specification requirements and will be clearly identified in the specification as only needing local approval by the Representative. Have each material and material source listed on Form CS-200 or Form CS-201. Submit for local approval by the Representative all required information for the material, as indicated in the specification.

Examples of locally approved materials are project specific items, such as Section 860 (inlet filter bags), Section 867 (compost filter socks), and Section 868 (compost blanket and compost filter berms) where the specification indicates that these materials are to be locally approved. Bulletin 15 will reference specific Publication 408 Sections that apply to Locally Approved Materials. Bulletin 15 will not list actual materials or material sources for this category of materials as they will be accepted for use on a project-specific basis by local approval.

(b) Inspection. Inspect material delivered to the project and stockpile the material passing inspection for use. Do not incorporate questionable material, until material is tested by LTS and accepted in writing by the Representative. The Department reserves the right to reject questionable material delivered to the project when the LTS test results are not according to the specifications. Furnish assistance to the Inspector, as required to obtain samples.

Allow designated Department representatives to inspect material being used, or intended to be used, at any time before, during, or after material preparation, while being used during the progress of the work, or after the work has been completed. Furnish or arrange with producers or manufacturers to provide necessary material, labor, tools, and equipment for such inspection.

Inspections and tests, if made at any point other than the point of incorporation in the work, will not guarantee acceptance of the material. Inspection and testing performed by the Department will not relieve the Contractor's responsibility for QC.

106.03 TESTS AND ACCEPTANCE OF MATERIAL—

(a) Restricted Performance Specifications.

1. Responsibility. The Department will be responsible for determining the acceptability of the material and construction. Material will be reviewed for acceptance through the Department's specified acceptance procedures. Sample locations for acceptance testing will be determined by the Department.

Perform sampling and testing for acceptance in the presence of the Inspector, unless otherwise specified. Lot size will be specified. In the event that operational conditions cause work to be interrupted before the specified lot size has been achieved, the lot may be redefined by the Inspector. It is the intent of these specifications that each lot be evaluated based on the same number of samples. Transport acceptance samples from sampling point to testing site or other designated location in the presence of the Inspector.

The Contractor is responsible for the control and quality of the material and construction.

Prepare a QC Plan as specified in Section 106.03(a)2.a and submit it to the Inspector-In-Charge for review at the start of the project. Include QC sampling and testing frequencies and action points to initiate corrective measures. Notify the Inspector before performing QC sampling and testing. Perform QC sampling and testing and report results to the Inspector.

Obtain and test samples according to the Department's PTMs. If the required test method is not specified, use methods described in the AASHTO Standard Specifications for Transportation Materials and Methods of Sampling and Testing, and Supplements, Standards and/or Tentatives of ASTM, or other testing procedures adopted by the Department.

Verification sampling and testing will be performed by the District, unless otherwise specified.

QA sampling and testing will be performed or witnessed by the BOPD.

Independent Assurance sampling and testing will be administered by the CQAS.

2. QC.

2.a Maintain a QC system that provides reasonable assurance that materials, products, and completed construction, submitted for acceptance, conform to contract requirements whether self-manufactured, processed, or procured from subcontractors or vendors. When specified, submit for review, a plan of the QC system to be used. Have performed or perform the inspections and tests required to substantiate product conformance to contract requirements. Make the inspection and test results available for review throughout the contract life. Procedures will be subject to the review of the Department before the work is started. Charts and records documenting QC inspections and tests are the property of the Department. Submit a QC Plan for use in compliance with the following guidelines, as a minimum:

2.a.1 Raw Materials. List the source of material along with methods of documentation and testing performed to assure the material quality.

2.a.2 Production Control. List lot size and samples required; include sample selection, labeling and test procedure; also include manufacturing phase.

2.a.3 Product Testing. List type and frequency of tests to be performed, along with method of documenting and reporting test results. List test equipment and calibration procedure (frequency) required. List procedure for retesting or rejecting items failing the tests. List the disposal methods and location for test samples and rejected lots.

2.a.4 Personnel. List the personnel in charge of QC and define their areas of responsibility.

2.a.5 Packaging and Shipping. List method of identifying, storing, loading, transporting, and unloading to assure safe delivery of acceptable material and products.

2.a.6 Documentation. List the procedures used for documentation and certification.
The QC Plan and process are subject to periodic review and inspection by the Department.

2.b Promptly record conforming and non-conforming inspection and test results on acceptable forms or charts. Keep these records complete and keep them available for inspection at all times during the performance of the work.

2.c Promptly correct any errors, equipment malfunctions, process changes, or other assignable causes which have resulted or could result in the submission of material, products, and completed construction not conforming to specification requirements.

2.d When required, provide or have provided and maintain measuring and testing devices necessary to ensure that material and products conform to contract requirements. In order to ensure continued accuracy, calibrate these devices at established intervals against Department standards.

2.e When required, make the measuring and testing equipment available to the Representative for use in determining conformance of material, products, or completed construction with contract requirements. In addition, make personnel available for the operation of such devices and for verification of the accuracy and condition of the devices. Have calibration results available at all times. The Department reserves the right to conduct periodic inspections of the measuring and testing devices to confirm both calibration and condition of operation.

2.f Failure to comply with the QC Plan may result in suspension of approval to provide material for Department use and/or removal from the approved list of material suppliers in the applicable bulletins.

3. Acceptance Plans.

3.a Percent Within Limits. The percentage of each lot within the specified limits will be determined by the following procedures:

3.a.1 The “n” sampling positions on the lot will be located by use of the table of random numbers found in PTM No. 1.

3.a.2 A measurement will be made at each location, or a test portion taken and the measurement made on the test portion.

3.a.3 The lot (X) measurements are averaged to find \bar{X} .

$$\bar{X} = \sum_{i=1}^n \frac{X_i}{n}$$

3.a.4 The Standard Deviation, “s,” of the lot measurements will be determined as follows:

$$s = \sqrt{\sum_{i=1}^n \frac{(X_i - \bar{X})^2}{n-1}}$$

3.a.5 The Quality Index (Q_U) is found by subtracting the average (X) of the measurements from the upper specification limit (U) and dividing the result by “s.”

$$Q_U = \frac{(u - \bar{X})}{s}$$

3.a.6 The Quality Index (Q_L) is found by subtracting the lower specification limit (L) from the average and dividing the result by “s.”

$$Q_L = \frac{(\bar{X} - L)}{s}$$

3.a.7 The percentage of material that will fall within the upper limit (U) is estimated by entering Table A or Table B with Q_U , using the column appropriate to the total number of measurements (n). Use Table A if Q_U has a negative value, or use Table B if Q_U has a positive value.

3.a.8 The percentage of material that will fall within the lower limit (L) is estimated by entering Table A or Table B with Q_L , using the column appropriate to the total number of measurements (n). Use Table A if Q_L has a negative value, or use Table B if Q_L has a positive value.

3.a.9 In cases where both upper (U) and lower (L) limits are concerned, the percentage of material that will fall within limits is found by adding the percent (P_U) within the upper limit (U) to the percent (P_L) within the lower limit (L) and subtracting 100 from the sum.

$$\text{Total percent within limits} = (P_U + P_L) - 100$$

3.a.10 When determining the percentage within limits when the calculated Quality Index (Q.I.) value is between two tabular values in Table A or Table B, the following procedure is used:

- The difference between the tabular Q.I. values on either side of the calculated value Q.I. value will be determined.

- The difference will be divided by 2 and the quotient added to the lower tabular Q.I. value, resulting in the interpolated Q.I. value.
- If the calculated Q.I. is equal to or greater than the interpolated value, the higher listed percent within limits will be used.
- If the calculated Q.I. is less than interpolated value, the lower listed percent within the limits will be used.

3.b Resampling of Lot. It is the intent of these specifications that lots will meet specification requirements at the time of submission. If permitted, nonconforming lots that can be corrected may be reworked and sampled.

3.c General Basis of Adjusted Payment. The related adjusted percentage of contract price will be determined by the method designated in the appropriate specification section.

(b) Specifications, Other than Restricted Performance.

1. Responsibility. The Department will be responsible for determining the acceptability of the material and construction. Material will be reviewed for acceptance through the Department's specified acceptance procedures. Sample locations for acceptance testing will be determined by the Department.

Perform sampling and testing for acceptance in the presence of the Inspector, unless otherwise specified. Transport acceptance samples from sampling point to testing site or other designated location in the presence of the Inspector.

The Contractor is responsible for the control and quality of the material and construction.

Prepare a QC Plan as specified in Section 106.03(a)2.a and submit it to the Inspector-In-Charge for review at the start of the project. Include QC sampling and testing frequencies and action points to initiate corrective measures. Notify the Inspector before performing QC sampling and testing. Perform QC sampling and testing and report results to the Inspector.

Do not incorporate any material into the work that is determined to be outside the specification limits.

Obtain and test samples according to the Department's PTMs. If the required test method is not specified, use methods described in the AASHTO Standard Specifications for Transportation Materials and Methods of Sampling and Testing, and Supplements, Standards and/or Tentatives of ASTM, or other testing procedures adopted by the Department.

Verification sampling and testing will be performed by the District, unless otherwise specified.

QA sampling and testing will be performed or witnessed by the BOPD.

Independent Assurance sampling and testing will be administered by the CQAS.

2. QC. Section 106.03(a)2. and as follows:

Provide a plan of the QC system to be used for all construction work requiring acceptance testing by the Department, including QC test frequencies and action points to initiate corrective measures. Submit a copy of the QC Plan to the Project Engineer, to be maintained at the Department's project field office, before the start of work. A QC Plan is not required for items specified in Section 901.

3. Compliance Certification of Bulletin Materials. The Contractor is responsible for the control and quality of all materials, both Bulletin and non-Bulletin materials, arriving at the project. Each Bulletin material must be certified to be from a Bulletin source and to be in compliance with the specification requirements for the material. A properly completed and submitted Form CS-4171, Certificate of Compliance, is the means for certification of Bulletin materials. Bulletin materials are defined in Section 106.02(a)1.

The Department reserves the right to sample and test any material for verification that specification requirements are met. Materials of questionable quality delivered to the project will be sampled, tested, and approved by LTS before incorporation in any work. Materials on a reduced certification level may be required to be sampled, tested, and approved by LTS before incorporation in any work. Random field verification samples of the material may be taken by the Representative at the material source, from delivered project material, or at the place of the last manufacturer, fabricator, or producer before delivery. Random QA samples may also be taken by the Representative from delivered project material, at the place of supply, or at the place of the last manufacturer, fabricator, or producer before delivery. The random samples will be sent to the LTS for testing.

3.a Form CS-4171 Completion. Form CS-4171 is completed by the manufacturer, fabricator, or producer (Producer) of Bulletin material provided to the project. The Producer maintains the original Form CS-4171 and provides a copy of Form CS-4171 with each direct shipment to the project.

When a Producer sells a Bulletin 15 material to a distributor/supplier (shipper), the Producer provides a copy of Form CS-4171 with each delivery to the shipper. When a shipper provides Bulletin 15 material directly to the project, the shipper completes and signs a new Form CS-4171 and provides a copy with each direct shipment to the project. The shipper will maintain the copy of the Producer's Form CS-4171 that they have received.

Form CS-4171 must be properly signed by a legally responsible company official.

3.b Form CS-4171 Submission for Project Shipments. Ensure that Form CS-4171 is received for each project shipment of Bulletin material. Submit to the Representative a properly completed and signed copy of Form CS-4171 for each project shipment. Do not incorporate any Bulletin material in the work until certification arrives on the project, unless otherwise approved by the Representative. Payment for material will be withheld until proper certification documentation is received.

Form CS-4171 may be submitted to the Department either in hard copy format or electronically. Contractors who wish to submit certification documentation to a project electronically, e.g. via e-mail, facsimile or through a PennDOT Project Collaboration Site, must notify the Department at the preconstruction meeting.

3.c Supplemental or Alternate Certification. Certain Bulletin materials require the submission of supplemental CS-4171 certification in addition to Form CS-4171, to provide traceability of materials in multi-step manufacturing processes.

- Epoxy coated or galvanized reinforcement steel requires the submission of supplemental certification Form CS-4171C (Epoxy Coating or Galvanizing Facility) and/or Form CS-4171F (Fabrication Facility).
- Structural steel, aluminum, or precast/prestressed concrete products, produced in a Bulletin 15 approved facility with an on-site Inspector or a Representative, must be stamped with an approved inspection stamp at the plant and certified with a Form CS-4171.
- Steel products containing foreign steel require the submission of supplemental Form CS-4171S.

Certain Bulletin materials require a form of certification other than the Form CS-4171, as identified in the particular material specification.

- Section 701 and Section 702 materials require a properly completed vendor bill of lading.
- Certification of daily asphalt mixtures by submission of Form CS-4171B.

- Certification of locally approved non-Bulletin materials by submission of Form CS-4171LA.

Organize and submit only Forms CS-4171 and supplemental or alternate certifications for material supplied to the project. Submissions containing irrelevant forms or documentation for materials not incorporated into the project will not be accepted.

3.d CS-4171 Record Retention. Retain Form CS-4171 and supplemental and alternate certifications as defined in Section 106.03(b)3.c, for a period of not less than 3 years from the date of the last project shipment. Make files available for inspection and verification by the Department.

Notify shippers that a certification file must be maintained for purchased Bulletin materials to provide an audit trail to the Producer. Certifications for purchased Bulletin materials must be maintained at their place of business for a period of not less than 3 years from the date of the last shipment to the project and must be available for inspection by the Department.

Notify Producers that all component certifications for purchased Bulletin materials must be maintained at their place of business for a period of not less than 3 years from the date of the last shipment to the project and must be available for inspection by the Department.

3.e Levels of Certification for Bulletin 15 Producers. The BOPD determines the Level of Certification for each Producer based on the Producer's ability to comply with the material specifications. The Levels of Certification are defined in Table C. Bulletin 15 will indicate if a Producer is at a certification level other than Level 1. Material provided by Producers listed in Bulletin 15 is approved for use only in its intended application(s).

TABLE C

Levels of Certification for Bulletin 15 Producers		Producer Material Shipment Procedure	Producer Additional Requirements
Level 1	Standard Certification	Ship on Certification with Form CS-4171*	None
Level 2	Standard Certification - Reduced	Ship on Certification with Form CS-4171*	See Section 106.03(b)3.e.2
Level 3	Lot Approval Certification	Ship only after Material Lot Approval using Modified Certification, with Form CS-4171*	See Section 106.03(b)3.e.3
Suspension or Removal	According to the State's Contractor Responsibility Program: <ul style="list-style-type: none"> • Producer may be suspended or removed from Bulletin 15 for any of the reasons stated in the Bulletin 15 Preface, regardless of Producer certification level. • Failure of Producer to advance above Certification Level 3 will result in PennDOT's initiating action for suspension or removal from Bulletin 15. 		

* Certain Bulletin materials require supplemental or alternate forms of certification, as specified in Section 106.03(b)3.c.

3.e.1 LEVEL 1 (Standard Certification).

- Initial Level of Certification typically issued to Bulletin 15 listed Producers.
- Material is produced and tested in accordance with the Producer's approved QC Plan.
- No known material performance or quality issues exist that warrant a reduced level of certification.
- Material is shipped on certification using Form CS-4171.

3.e.2 LEVEL 2 (Standard Certification - Reduced).

- Reduced Level of Certification issued to Bulletin 15 listed Producers who have exhibited minor/moderate material performance or quality issues.

- Producer is required to work with PennDOT on submission of an improvement plan that may include, but is not limited to, any or all of the following items: a revised QC Plan, a failure analysis/action plan to assess why failures are occurring and how to prevent these failures from occurring in the future, correlation testing between in-house and independent lab testing to assist with validating results.
- Material is produced and tested in accordance with the improvement plan approved by PennDOT.
- Material is shipped on certification using Form CS-4171.

3.e.3 LEVEL 3 (Lot Approval Certification).

- This Level of Certification is issued to Bulletin 15 listed Producers who have exhibited major material performance or quality issues.
- Producer is required to work with PennDOT on an improvement plan as defined in Level 2.
- Material cannot be shipped to projects using the standard CS-4171 certification process.
- Producer must arrange for independent, in-plant acceptance testing (IPAT) that will be conducted side-by-side with “in-house” Producer testing at the designated frequencies in the revised QC plan. IPAT will be at the Producer’s expense. PennDOT’s LTS must approve the Producer’s proposed IPAT provider, before it begins.
- Any material lot to be used on a project must be tested and approved by the IPAT as meeting the required PennDOT specification prior to shipment to the project.
- Each material lot meeting the specification may be shipped to a project using a modified certification process as follows: submit, to both the Project Representative and LTS, Form CS-4171 along with a signed letter from the IPAT (on their official letterhead) indicating that the material lot meets testing and specification requirements.
- Correlate results from parallel “in-house” Producer testing and IPAT testing, and submit to the LTS on a monthly basis.

106.04 USE OF MATERIALS FROM WITHIN THE PROJECT—With written permission, material found in the excavation areas and meeting the Department’s specifications may be used in the project construction. Material used will be paid for, as specified in Section 110.01. However, replace any portion removed with suitable material, if required to complete the embankments. The replaced quantity will be 110% of the volume of stone or gravel removed and 100% of the volume of sand and other material removed. Do not use reserved material, as specified in Section 104.06, or as indicated in the proposal.

106.05 STORAGE OF MATERIAL—

(a) General. Store material to assure preservation of specified quality and fitness for the work.

Stored material, even though accepted before storage, may again be inspected before use in the work. Locate stored material to facilitate prompt inspection and control.

Adhere to the restrictions below for the storage of construction materials with known physical hazards (explosive, flammable, or combustible) or storage of any motorized equipment under any structure with vertical clearance measured:

- Less than 16 feet – No storage is allowed.
- Between 16 feet and 24 feet – Short term operational storage will be allowed provided the materials are stored in an enclosure which meets all ANSI and OSHA requirements for said material(s) and a fire prevention plan has been submitted for the short term operational storage. Short term operational storage is limited to the amount of material and/or equipment required for a 24-hour period.
- Greater than 24 feet – No restriction.

Vertical clearance is measured from the lowest structure member to the ground level below that member.

Do not use private property for storage purposes without written permission of the owner or lessee. Make copies of this permission available to the Department. Restore storage sites to conditions acceptable to property owners and the Department.

(b) Storage of Aggregates. Provide a separate stockpile for each aggregate size and type at cement concrete plants. Do not use aggregates that become segregated or mixed with earth or foreign material. If divided aggregate bins are used for storage or for proportioning, take measures to prevent mixing of aggregates. Provide an area for storage of aggregates for use in Portland cement concrete and asphalt concrete. Store aggregates on one of the following constructed according to standard practice:

- Asphalt concrete base course, 4 inches minimum depth.
- Class C concrete, or better, 4 inches minimum depth.

(c) Control of Aggregates. Have aggregates available for use in cement concrete at the proportioning plant in enough time before batching to allow inspection and testing. Handle the aggregates so they may be field tested and accepted, before storing them with previously accepted aggregates. Batch fine and coarse aggregates separately. Properly control uniformity of moisture and uniformity of gradation. Provide a system of water sprays, then use when required, to maintain coarse aggregate moisture control.

During cool and cold weather concrete production, maintain aggregates required for individual concrete placements, whether stored in proportioning bins or stockpiles, at a temperature of not less than 40F before and during batching operations, for a sufficient length of time to eliminate the presence of frost in or around the aggregate particles.

(d) Storage of Reinforcement. Satisfactorily store reinforcement above ground, in a clean and dry condition on a platform, in an orderly manner, plainly marked to facilitate inspection.

106.06 HANDLING AND TRANSPORTATION OF MATERIAL—

(a) General. Carefully handle material to preserve quality and fitness for the work and to prevent loss, segregation, or inconsistency in quantities after weighing or measuring for incorporation in the work.

(b) Aggregates. In dry batching operations, measure aggregates or weigh before placing in the compartments of the vehicle, unless otherwise specified or permitted. Clean the vehicles and provide tight batch partitions at least 4 inches higher than the batched aggregate level being hauled, to prevent any spillage from one compartment to another.

(c) Bulk Cement. Bulk cement may be used, as specified in Section 701. If bulk cement is used, transport to the mixer in acceptable metal, rubber, or plastic, watertight containers or compartments.

(d) Bag Cement. If bag cement is used, dump the contents of the correct number of bags required for each batch into the mixer skip. If permitted, bag cement may be transported from storage to the mixer by placing the correct number of bags per batch on the batched aggregate in the aggregate compartments. When transported, the bag cement may be dumped on the aggregate after having been checked by the inspector, and if done not more than 100 feet from the mixer. Bag cement that is allowed to lie on the batched aggregates longer than 2 hours, or cement dumped on the batched aggregate longer than 1 hour, will be rejected.

106.07 UNACCEPTABLE MATERIAL—

(a) Restricted Performance Specifications.

1. Acceptance or Rejection. Following the application of the appropriate acceptance plan, the Representative's decision will be final as to the acceptance, rejection, or acceptance at an adjusted price of sampled lots.

2. Disposition of Lots. If permitted, lots not conforming to specifications may be reworked and resubmitted for acceptance sampling. For nonconforming lots that are not adaptable to correction by reworking, remove and replace them, have them accepted without payment, or have them accepted at an adjusted price as stated in the specifications or, if not stated, as directed.

(b) Specifications, Other than Restricted Performance. Material not conforming to the requirements of the specifications, whether in place or not, will be rejected. Remove such material promptly from the site of the work, unless otherwise directed. Do not return rejected material to the work site until defects have been corrected and the material has been accepted for use.

(c) Serviceable Precast or Prestressed Concrete, Fabricated Structural Steel and Aluminum Products. Plant produced fabricated materials or products having materials substitutions, dimensional deviations, specifications deficiencies, or damage which result in materials or products which may be serviceable but, do not meet all contract requirements will be addressed as follows:

1. Minor Deficiency or Defect. For materials or products with one or more minor deficiencies or defects, resolution of the deficiencies or defects will be made directly by the precaster or fabricator with the BDTD's Structural Materials Section. Minor defects and deficiencies are generally defined as those which will not require:

- engineering design review
- revisions to approved installation or erection plans or methods
- anticipated premature maintenance or rehabilitation

The Structural Materials Section may determine that one or more of the minor deficiencies or defects are actually significant deficiencies or non-conformances and require the precaster or fabricator to resolve the deficiency or defect as a significant deficiency or non-conformance as specified in Section 106.07(c)2.

2. Significant Deficiency or Non-Conformance. For materials or products having one or more significant deficiencies or non-conformances, which cannot be corrected to meet the contract specifications and which the Department determines may require one or more of the bulleted items listed in Section 106.07(c)1., submit documentation to support acceptance of the material or product (provided by the precaster or fabricator) and a request for Department evaluation and final disposition of the materials or products.

Where visible defects are present, or when otherwise requested, include detailed sketches, drawings, or photographs along with the supporting documentation from the precaster or fabricator to support acceptance of the material or product. Include a detailed repair procedure to correct the deficiency, if applicable.

For requests submitted for acceptance of the material or product "as is", provide supporting justification to demonstrate that the significant deficiency or non-conformance will not result in additional constructability issues during erection or construction or unanticipated premature maintenance work. Obtain approval of any revisions required to the shop drawings to reflect as built conditions prior to shipment.

Submit engineering calculations, when required or requested, to support the acceptability of the significant deficiency or non-conformance, sealed by a registered Professional Engineer that is licensed in the State. Submittals must include a statement by the Engineer that the defect will not compromise either the structural capacity or service life of the original design.

Submit the above to the District Assistant Construction Engineer with copies to the following:

- Chief Structural Materials Engineer, Bridge Design and Technology Division, Bureau of Project Delivery
- District Structural Control Engineer
- District Bridge Engineer
- Chief Bridge Engineer, Bridge Design and Technology Division, Bureau of Project Delivery (when calculations are required or requested).

Include the following minimum information on a cover page, attached to the submission:

- ECMS or other contract identification including State Route, Section and County
- Structure Number, if applicable
- Specific identification of the affected unit(s), i.e. girder-beam-culvert number, etc.
- Anticipated shipping date
- Detailed sketches, drawings or photographs of the defect, if visible or when requested.

After evaluation, the disposition of the material or product, including any conditions of acceptance, will be

provided by the Chief Structural Materials Engineer from information provided by the Engineering District. Replace materials or products which are rejected via this policy with those complying with the contract specifications and requirements.

106.08 DEPARTMENT FURNISHED MATERIAL—The Department will furnish material, if specified in the proposal, in the quantities required. Material will be delivered or made available at the point specified.

The cost of handling and placing material after delivery will be included in the contract price for the item.

After delivery and acceptance by the Contractor, the cost of replacing material due to shortages, deficiencies, or damage, including demurrage charges, will be deducted from money due or to become due.

106.09 PENNSYLVANIA TRADE PRACTICES ACT—This section does not apply to projects which are partially or totally financed with Federal funds.

(a) General. Pursuant to the PA Trade Practices Act, Act 226-1968, the Department will not specify, purchase, or permit to be furnished or used in any contract aluminum or steel products as set forth below made in the countries set forth below.

The Department may utilize the discretionary waiver provision of Act 3-1978 as to steel products. As to aluminum products, if the sole source is from a banned country relief may be permitted under the Statutory Construction Act, 1 PA C.S. 1901 et seq.

1. Brazil. Welded carbon steel pipes and tubes; carbon steel wire rod; tool steel; certain stainless steel products including hot-rolled stainless steel bar; stainless steel wire rod and cold-formed stainless steel bar; pre-stressed concrete steel wire strand; hot-rolled carbon steel plate in coil; hot-rolled carbon steel sheet; and cold-rolled carbon steel sheet.

2. Spain. Certain stainless steel products, including stainless steel wire rod, hot-rolled stainless steel bars, and cold-formed stainless steel bars; pre-stressed concrete steel wire strand; certain steel products, including hot-rolled steel plate, cold-rolled carbon steel plate, carbon steel structural shapes, galvanized carbon steel sheet, hot-rolled carbon steel bars; and cold-formed carbon steel bars.

3. South Korea. Welded carbon steel pipes and tubes; hot-rolled carbon steel plate; hot-rolled carbon steel sheet; and galvanized steel sheet.

4. Argentina. Carbon steel wire rod and cold-rolled carbon steel sheet.

106.10 BUY AMERICA PROVISIONS AND CONVICT PRODUCED MATERIALS—This section only applies to projects partially or totally financed with Federal funds.

(a) Buy America Provisions. Furnish steel or iron materials, including coating for permanently incorporated work according to 23 CFR 635.410 and as follows:

- Pig iron and processed, pelletized, and reduced iron ore manufactured outside of the United States is acceptable for use in domestic manufacturing process for steel and/or iron materials.
- All manufacturing processes of steel or iron materials in a product, including coating; and any subsequent process that alters the steel or iron material's physical form or shape, or changes its chemical composition; are to occur within the United States. This includes rolling, extruding, machining, bending, grinding, drilling, and coating. Coating includes all processes that protect or enhance the value of the material, such as epoxy coatings, galvanizing or painting.
- Provide certification to the Inspector-in-Charge, that all manufacturing processes for steel and iron materials in a product, including coating, have occurred in the United States; certify as specified in Section 106.01.

Products manufactured of foreign steel or iron materials may be used, provided the cost of such products as they are delivered to the project does not exceed 0.1% of the total contract amount, or \$2,500, whichever is greater.

(b) Convict Produced Materials. Pursuant to 23 CFR 635.417, materials produced by convict labor after July 1, 1991 may not be used for Federal-aid highway construction projects, unless produced at a prison facility which had been producing convict-made materials for Federal-Aid construction projects before July 1, 1987.

Material produced by convicts who are on parole, supervised release, or probation from a prison may be incorporated in a Federal-Aid highway construction project.

SECTION 107—LEGAL RELATIONS AND RESPONSIBILITY TO THE PUBLIC

107.01 LAWS TO BE OBSERVED—At all times, observe and comply with the following, and post as required: all Federal, State, and local laws, ordinances, and regulations that have appropriate jurisdiction over the project and affect the conduct of the work or that apply to employees on the project; and all orders or decrees that have been or may be enacted by any legal bodies or tribunals having authority or jurisdiction over the work, material, employees, or contract. Protect and indemnify the State and its representatives against any claim or liability arising from or based on the violation of any such law, ordinance, regulation, order, or decree, including violations by Contractor employees.

(a) **Bulletin Board.** On Federally Funded mobile operation projects with no field office or staging area, the contractor must display and provide all notices and posters where hiring is conducted. Each employee must be provided copies of all notices and posters and sign Form EO-107, Bulletin Board Acknowledgment Signature Sheet, acknowledging they have received and understood the content of all the notices and posters. A Contractor's Representative shall then sign Form EO-107 acknowledging that all required notices and posters are displayed at the hiring location and that all employees on the signature sheet have received copies and understand the content of these notices and posters. Maintain a copy of the form at all times on the project and submit a copy of the completed Form EO-107 in PPCC for PennDOT and FHWA review.

107.02 PERMITS, LICENSES, AND TAX RESPONSIBILITY—

(a) **Permits and Licenses.** Purchase and submit copies of permits and licenses. At the job site, post notices necessary for the proper and lawful performance of the work according to such permits and licenses. Do not start work until signing and submitting all documentation required to become a transferee/co-permittee for all applicable permits required for the project.

(b) **Tax Responsibility.** Ascertain the possible existence, scope and coverage of any local subdivision tax, sometimes called an occupation tax, wage tax, income tax, franchise tax, or excise tax on the construction operations within the limit of the political subdivision imposing such tax. Also indemnify and save harmless the State and its agents from liability for the collection and payment of any taxes assessed and levied by the constituted authority, including upon Contractor agents, employees, and/or representatives in connection with the performance of work on the project.

(c) **Vehicle Registration.** Attention is directed to 75 P.S. 1302(a) and 1303(a), (b), which requires vehicles to be registered in Pennsylvania when used on a project which is being built under traffic or where the vehicles are operated on a public highway opened to traffic.

107.03 PATENTED DEVICES, MATERIAL, AND PROCESSES—If any design, device, material, or process covered by letters of patent or copyright is used, provide for use by suitable legal agreement with the patentee or owner. Indemnify and save harmless the State or political subdivision from any claims for infringement, by reason of the use of any patented design, device, material, process, or any trademark or copyright, and indemnify the State for any costs, expenses, and damages which it may be obliged to pay by reason of any infringement, at any time during the performance or after the completion of the work. These provisions also apply to the surety.

107.04 RESTORATION OF SURFACE OPENED BY PERMIT—Do not allow any opening to be made within the right of way unless a valid permit is presented authorizing the opening. For such an opening, made before the date upon which the work provided for in the contract is finally accepted, repair at the time and in the manner directed in writing by the District Executive.

107.05 FEDERAL-AID PROVISIONS—If the Federal Government pays any portion of the project costs, observe the Federal laws pertaining to the project, as well as the rules and regulations made according to such laws. Work will be subject to the inspection of the appropriate Federal agency.

Such inspection will not make the Federal Government a party to the contract and will not interfere with the rights of either party to the contract.

107.06 SANITARY PROVISIONS—Incidental to contract items, provide and maintain, in a neat and clean condition, sanitary facilities (including toilet facilities, hand washing facilities, and drinking water) meeting the requirements of Section 609.2(a) for the exclusive use of Department personnel on the project. Clean, disinfect, and maintain to the satisfaction of the Representative any drinking water coolers or other drinking water delivery implements. Dispose of all wastes, both sewage and wastewater, in a manner approved by the DEP. As required, obtain permits from local municipalities to install temporary toilet facilities. The requirement for sanitary facilities, as described in this section, are not waived for projects that do not include a PennDOT field office.

107.08 OCCUPATIONAL SAFETY AND HEALTH—Comply at all times with applicable Federal, State, and local laws and regulations, provisions, and policies governing safety and health, including the Federal Construction Safety Act (Public Law 91-54), 29 CFR Chapter XVII, Part 1926, Occupational Safety and Health Regulations for Construction, and the Occupational Safety and Health Act (Public Law 91-596), 29 CFR Chapter XVII, Part 1910 Occupational Safety and Health Standards for General Industry, and subsequent publications updating these regulations.

Take any other needed action or proceed as directed, to protect the life, health, and general occupational welfare of personnel employed on the project. Provide confined space training on the proper use of the testing equipment and all safety procedures to ensure a safe operation to Contractor personnel and Department Representatives required to access the area for inspection purposes and provide all safety and testing equipment required by 29 CFR 1910.146, to both Department Representatives and Contractor personnel to ensure the safety of all workers and inspectors during construction operations and inspection operations of any confined spaces. Also, provide proof of training, such as a course sign-in sheet or certificate of training. Provide appropriate rescue services, personnel, and equipment as per 29 CFR 1910.146(k).

Provide appropriate exposure controls, personnel, and equipment as per 29 CFR 1926.1153 for respirable crystalline silica (RCS). For operations which require Contractor personnel for RCS mitigation to employ respiratory protection or perform work within an enclosed cab, direct inspection by the Representative will be withheld from the operation. Perform the work in such operations to allow for inspections at hold points, as determined by the Representative.

If, in the Representative's opinion, employees are exposed to extraordinary conditions which could or do constitute a hazard, modify such equipment, devices, and job procedures to ensure protection against the hazard or to reduce the risk to the employees engaged in project work. The Department does not approve of the disengagement of any safety features on contractor equipment. If the contractor, as part of its means and methods, and at the responsibility of trained and certified operators, disengages any type of equipment safety feature, it will hold the Department harmless against any liability on any claims made against the Department due to the disengagement of the feature.

Prior to or at the preconstruction conference, submit a written Project Safety Program. Include at a minimum, the following procedures and information:

- A procedure to document lost time.
- Detailed confined space mitigation procedures and safety procedures as required by 29 CFR 1910.146 including procedures for conducting air monitor calibrations as required by the equipment manufacturer's instructions and a written Confined Space Entry Permit system.
- Provide air monitoring equipment calibration documentation, for spaces that have actual or potential atmospheric hazards.
- Written verification of rescue services availability and qualifications for permit-required confined spaces.
- Written verification of annual training for internal/contractor employed rescue team if these services are provided by the contractor for permit-required confined spaces. Provide a list of employees that attended the training and the dates they attended.
- A written exposure control plan for RCS, as per 29 CFR 1926.1153(g) to also include:
 - A description of the tasks on the project that involve exposure to RCS.
 - A description of the engineering controls, work practices, and respiratory protection required to limit worker exposure to RCS for each task.
 - A description of the housekeeping measures used to limit worker exposure to RCS.

- A description of the procedures used to restrict access to work areas when necessary, to minimize the number of workers exposed to RCS and their level of exposure.
- Provide a procedure for assuring compliance by subcontractors and suppliers working within the project's limit of work.

All costs associated with the preparation and implementation and updates of Project Safety Program and complying with the requirements are considered incidental.

Give special emphasis to providing safeguards for any specially or unusually hazardous operations and health hazards. Include initial indoctrination and continuing instructions for all employees to enable them to perform work in a safe manner. Include in the instruction project safety practices, manner of reporting accidents, availability of medical facilities, and explanation of individual responsibility for accident-free operations.

Require all persons to wear high-visibility safety apparel (orange or yellow-green) that is intended to provide conspicuity during both daytime and nighttime usage, and that meets the Performance Class 2 or 3 requirements of the ANSI/ISEA 107-2004 publication entitled "American National Standard for High-Visibility Safety Apparel and Headwear" while in work zones exposed either to traffic or to construction equipment.

All areas of a project will be hard hat areas. Require all persons within the project limits to wear protective headgear, including persons in cement concrete and asphalt concrete plants operated exclusively for a project, even though the plant(s) may be remotely located.

For multi-season projects with a contract amount \geq \$5,000,000, provide and maintain one scoreboard safety sign 4 feet wide by 3 feet high to identify the number of days worked on the project without a lost time accident. Imprint on the sign, the name of the Contractor and an appropriate safety message. Prominently display the following on the sign in 4-inch letters:

- a. Contractor's name and address.
- b. "(***) Days Worked Since Last Lost-Time Injury"

NOTE: "(***)"—indicates space for three removable numbers. Number displayed to include subcontractors.

Place the sign in a prominent location at the project site. Update the sign at least bi-weekly.

Immediately take corrective action, upon notification by the Representative of any noncompliance with the provisions of this section. Upon receipt of this notice, failure or refusal to promptly comply will cause a written order to be issued, stopping all or part of the work until the corrective action has been taken. Claim for an extension of time, costs, or damages because of the time lost due to any such stop orders will not be considered.

107.09 RAILWAY-HIGHWAY PROVISIONS—Conform to regulations stipulated in the Pennsylvania Public Utility Commission's order when work is indicated to be performed within, or adjacent to, the right of way or trackage belonging to, or upon which a common carrier operates. Observe strict adherence to all requirements pertaining to the work, safety, and movement of trains; to public and personal liability insurance; and to any other related matters. If it is necessary to use crossings other than those indicated, make arrangements for the use of the crossings.

107.10 BRIDGES OVER NAVIGABLE WATERS—Conduct work on navigable waters according to the requirements of permits issued by the U.S. Army Corps of Engineers or U.S. Coast Guard, whichever is applicable.

107.12 CARE OF PUBLIC AND PRIVATE PROPERTY—Do not damage overhead and underground facilities and structures or property within or adjacent to the project. Use special care in the performance of the work in order to avoid interference or damage to operating utilities or plants; however, where there is any possibility of interference or damage, make satisfactory arrangements with responsible corporate officers of the utilities or plant, covering the necessary precautions to be used during the performance of the work. Make these arrangements, subject to review, before work is started.

Protect all land monuments and property markers which are to be affected by the construction until they have been correctly referenced by the Department. Beyond the construction area, reset monuments and markers which are disturbed by contract operations, either during the construction of the project or otherwise, when and as directed.

Promptly make restitution for or satisfactorily repair or restore damaged public or private property except in instances in which underground facilities are damaged because of a failure on the part of the owner of such facilities to accurately locate or mark the facilities.

Protect trees to be left standing. If these existing trees to be left standing are damaged, satisfactorily repair or replace them, at no expense to the Department, or compensate the Department for the damage by an equitable monetary amount as determined by, or agreed with, the Department.

107.13 PUBLIC USE LANDS—In performing work within or adjacent to public use lands, namely National or State Forests, State Gamelands, Wildlife or Waterfowl Refuges, recreation areas, parklands, and historic sites, comply with all applicable rules and regulations of the authority having jurisdiction.

Cooperate with the National or State Forest Officer or Supervisor and authorized subordinates in observing sanitary laws and in exercising every reasonable precaution to prevent and suppress forest fires and vandalism.

Do everything reasonable to prevent and suppress forest fires. Notify a forest supervisor, as soon as possible, of the location and extent of any fire observed. Before starting indicated work affecting stream channels, verify that the Department has the approval of the DEP and/or the DCNR.

107.14 RESPONSIBILITY FOR DAMAGE CLAIMS—Furnish insurance certificate(s), as specified in Section 103.05, to indemnify and save harmless the State, the Department, and all of its officers and employees from all suits, actions, or claims of any character, name, and description, brought for or on account of any injuries or damages received or sustained by any person, persons, or property during the performance of work by the Contractor, whether the same is due to the use of defective material, defective workmanship, neglect in safeguarding the work or public interests, or by or on account of any act, omission, neglect, or misconduct of the Contractor, or any Subcontractors, Fabricators, Manufacturers, or Vendors.

Also indemnify and save harmless the State, the Department, and all of its officers and employees from cases arising as specified in Sections 105.05 and 107.16, or from any claims for amounts arising or recovered under the Workers' Compensation Law, or any other law, bylaw, ordinance, order, or decree.

107.15 OPENING SECTIONS OF PROJECT TO TRAFFIC—The Representative will have the authority to order, in writing, any substantially completed section of the project opened to traffic when seasonal, local, or other conditions relating to the project or public convenience justify such action; however, such opening will not be held to be an acceptance or a waiver of any provisions of the specifications or the contract.

Furnish, place, and maintain necessary traffic control devices, as directed, at the Department's expense, as specified in Section 110.03. Conduct the remainder of construction operations so as to cause the least obstruction to traffic.

Any section of the project opened before project completion will be subject to the applicable requirements specified in Section 110.08(a).

After opening a section of the project to traffic, any damage to satisfactorily completed work items within the section which occurs due to vehicles, other than construction vehicles and equipment engaged on the project, and not to defective materials and/or workmanship, and which occurs despite satisfactory precaution taken, will be replaced or repaired, as directed, at the Department's expense, as specified in Section 110.03.

107.16 CONTRACTOR'S RESPONSIBILITY FOR WORK—

(a) Responsibility for Performed Work. The terms and conditions of the Contract will be in effect until the work is completed and accepted by the Department, as evidenced by the dated acceptance certificate issued by the Department. However, the Contractor will be relieved of responsibility for further physical work and maintenance as specified in Section 110.08(a). The issuance of the acceptance certificate does not relieve the Contractor and Surety from continuing liability for latent defects, as specified in Section 107.16(b).

(b) Responsibility for Latent Defects. The Representative will determine if a defect is a latent defect. The Contractor and the Surety continue to be liable for all latent defects; however, the Surety is liable only until the performance bond is released. Satisfactorily repair or correct latent defects at no expense to the Department. If defects cannot be satisfactorily repaired or corrected, provide reimbursement for any expenses or damages incurred by the State because of latent defects. Failure to satisfactorily correct latent defects, or to reimburse the State for expenses or

damages incurred as a result of latent defects, will be considered sufficient cause to suspend or remove prequalification, according to 67 PA Code Chapter 457, regulations governing prequalification of prospective bidders, provided that any adjudication regarding such latent defects is final.

(c) Responsibility During Temporary Suspension of Work. Should the work be temporarily suspended, wholly or in part, according to the provisions specified in Section 105.01(b), written notification will be given of the suspension and the reason(s) for the suspension.

If the work is temporarily suspended, wholly or in part, due to the fault of the Contractor, the Required Completion Date and any specified Milestone Date(s) will not be changed, unless otherwise directed by the Director of Project Delivery.

After a whole or partial suspension, upon receipt of written notice from the Representative, actively resume work according to the detailed schedule of operations.

107.17 CONTRACTOR'S RESPONSIBILITY FOR PUBLIC OR PRIVATE FACILITIES AND STRUCTURES—Cooperate with others in the performance of corrective project work, as specified in Section 105.06.

The Department will cooperate in the issue of notices and will participate in all essential field conferences relating to the facilities and structures.

107.18 FURNISHING OF RIGHT OF WAY—The Department will be responsible for securing all necessary rights of way in advance of construction. Any exceptions will be indicated in the proposal and contract.

107.19 PERSONAL LIABILITY OF PUBLIC OFFICIALS—In carrying out any of the provisions of these specifications or in exercising any power or authority granted to them by or within the scope of the contract, no liability may be placed upon the Secretary, Engineer, or their authorized representatives, either personally or as officials of the State. In such matters, they act solely as State agents and representatives.

107.20 NO WAIVER OF LEGAL RIGHTS—The Department, the Secretary, the Engineer, or the Representative will not be prevented by an erroneous

- measurement,
- computation,
- estimate, or
- certificate

made or given by them or any agent or employee of the Department, under any provision or provisions of the contract at any time, either before or after the completion and acceptance of, and payment for the roadway, from showing at any time that any

- measurement,
- computation,
- estimate, or
- certificate

is untrue or incorrectly made in any particular or that the work or material or any part does not conform to the specifications and contract.

The Department will have the right to reject the whole or any part of the work or material, should any

- measurement,
- computation,
- estimate,
- certificate, or
- payment

be discovered or be known to be inconsistent with the contract terms or otherwise improperly given. The Department will not be prevented, notwithstanding any

- measurement,
- computation,
- estimate,
- certificate, or
- payment

from demanding and recovering from the Contractor or surety, such damages as it may sustain by the failure to comply with the terms of the specifications and contract or on account of any overpayment(s) made on any estimate or certificate.

Neither the payment on any estimate or certificate signed by the Department nor any extension or remission of contract time nor any possession taken by the Department or its employees, will operate as a waiver of any portion of the Contractor of any power herein reserved by the Department or any right to damages herein provided, nor will any waiver of any breach of contract held to be a waiver of other or subsequent breach.

The terms of this contract will not be waived or modified by any verbal communication between the Contractor and Department personnel.

107.21 WORKERS' COMPENSATION INSURANCE—Carry Workers' Compensation Insurance or file a proper Certificate of Exemption as provided for by the Workers' Compensation Act and execute a valid affidavit in accepting provisions of the Workers' Compensation Act as supplied with the contract.

107.22 MINIMUM WAGE SPECIFICATIONS AND RATES—

(a) Requirements. According to the provisions of the Pennsylvania Prevailing Wage Act 43 P.S. 165-1, and the implementing Regulations of the Pennsylvania Department of Labor and Industry, comply with the prevailing minimum wage predetermination requirements, as specified in the proposal, specifications, and contract.

(b) Responsibility for Payment of Wages. Accept responsibility for all wages paid or due to any employees engaged upon the project under contract, as mandated by the Pennsylvania Prevailing Wage Act, various applicable Federal acts, and the contract. Do not attempt to pass such responsibility elsewhere. Do not require employees to refund, directly or indirectly, any part of such wage(s). Where classification, reclassification, or additional classifications of workers are made according to the Pennsylvania Prevailing Wage Act and its regulations, make no claim against the Department for additional compensation for such classification, reclassification, or additional classification.

If after a contract has been awarded, it is decided, because of unforeseen construction development, to list an additional classification and wage rate, the Department, with or without application by the Contractor, will make written request for a wage determination by the Secretary of Labor and Industry.

No person may be employed on the project under contract, except according to the classification set forth in the decision of the Secretary of Labor and Industry.

(c) Certification and Payment of Rate of Wage. According to the provisions of the Pennsylvania Prevailing Wage Act and various applicable Federal acts, including their implementing regulations, file with the Department a weekly statement and a final statement at the conclusion of project work under contract, certifying that all employees have been paid wages in conformity with the provisions of the contract, as prescribed by the regulations of the Pennsylvania Department of Labor and Industry, implementing the Pennsylvania Prevailing Wage Act. If any wages remain unpaid, list on the statement the amount of wages due to each employee. Certify that, directly or indirectly, no refunds are received from any employee of any such minimum wage(s), other than deductions authorized by the Pennsylvania Wage Payment and Collection Law, 43 P.S. 260.1. Use forms furnished by the Department and submit the forms to the District Executive within 7 days after the regular payment date of the payroll period. Payment of the current and semifinal estimates and final settlement certificate will be withheld if such certification is not submitted, using the proper form, within the prescribed time limit.

1. Furnish all payrolls via the PennDOT Project Collaboration Center (PPCC). Two submittals, in the Other Correspondence category have been created for payroll submissions: “Labor Compliance-Prime Contractor Payroll” and “Labor Compliance-Sub-Contractor Payroll”. The Title for the Prime Contractor payrolls should consist of the Prime Contractor’s name and the payroll week ending date (YYYYMMDD). The Title for the Sub-Contractor payrolls should consist of the Sub-Contractor’s name and the payroll week ending date (YYYYMMDD). Example: the title for Prime Contractor ABC for payroll weekend ending January 30, 2019 is “ABC 20190130”. The title for Sub-Contractor XYZ for the same week is “XYZ 20190130”

(d) Posting. Post a notice(s) in the manner and form prescribed by the current regulations of the State Department of Labor and Industry. This notice is to be clearly legible and to be placed in a prominent and easily accessible place at the project site under contract, as well as at places where employees are paid their wages.

(e) Records and Inspection. Keep accurate records of employment and wage payments, including all the information required by the regulations of the State Department of Labor and Industry implementing the State Prevailing Wage Act, as amended. Keep time cards of employees, as required by the cited regulations and act. In addition, keep the original signed indentures for each apprentice and the approvals of the Pennsylvania Apprenticeship and Training Council. Preserve the records for 2 years from the date of payment and keep open at all reasonable hours, for inspection by the Department and by the State Secretary of Labor and Industry. Make these records easily accessible within the State within a period of 7 days from the date on which the State Secretary of Labor and Industry requests in writing that such records be made available. For the purpose of such inspection, furnish the authorized inspectors of the Department every assistance in determining the wages paid in compliance with the regulations.

(f) Penalties. Failure to comply with the Pennsylvania Prevailing Wage Act and its regulations will result in withholding money due or to become due on the project contract. It will also result in termination of the right to proceed with the project work under contract and/or other penalties prescribed by law.

(g) Federal-Aid Projects. All Federal-Aid Projects are subject to the implementing rules and regulations of the various Federal departments. Accordingly, the contract provisions and the penalties prescribed for their violations, both of which are required to be incorporated verbatim in all contracts for such Federal-Aid Projects, will be set forth in the proposal and the contract applicable to each project.

107.23 HAULING RESTRICTIONS—

(a) General. Accept responsibility for all hauling done on the project and on adjacent highways, in connection with the contract. Hauling restrictions on highways will be according to the applicable sections of the Pennsylvania Vehicle Code, Act of 1976, No. 81.

Before submission of the bid, if truck delivery of long bridge members (in excess of 70 feet) is contemplated, obtain, in writing, a determination if a Department's hauling permit can be issued for the routing from the proposed source(s) of supply to the project.

Without written permission, do not move and/or operate heavy-duty construction grading and hauling equipment over existing or new pavements, subbase, base and surface courses, and structures which will remain in service.

No special permits will be required for the transfer of oversize or overweight equipment or vehicles from one work area to another work area within the project limits. However, correct any damage caused by the transfer of equipment or vehicles.

If, in special cases, further restrictions are necessary, such restrictions will be indicated and/or specified in the proposal.

(b) Weight Limits and Weighing.

1. Do not operate on public highways any vehicles which are in excess of the registered, gross, and/or axle weight limits established in Chapter 49 of the Vehicle Code, 75 PA C.S. Chapter 49, or as posted by the Department.

2. Submit to weighing by Department weigh teams when requested. If, as a result of such a weighing, it is determined that a vehicle owned or leased by the Contractor or any Subcontractor has been operated on public highways carrying a weight in excess of the above registered, gross or axle weight limits, the sum of \$50 for each 500 pounds or part thereof of such excess weight will be deducted as liquidated damages from money due or to become due. These liquidated damages are attributable to inherent damage to the highway which is not readily ascertainable and do not relieve the Contractor of responsibility to pay ascertainable damage as may be required in other sections of these Specifications.

3. When a weight slip shows that a vehicle delivering material to the project exceeds limits specified in Section 107.23(b), the Contractor will be assessed liquidated damages as specified in Section 107.23(b)2. Weighing by a Department Weigh Team will not be required.

107.24 ACCESSIBILITY OF FIRE HYDRANTS—Make necessary arrangements with the local authorities to provide fire protection at all times. Keep the fire hydrants adjacent to the work readily accessible to fire apparatus and do not place material or other obstructions within 15 feet of any hydrant.

107.25 DISCRIMINATION ON ACCOUNT OF RACE, COLOR, RELIGIOUS CREED, ANCESTRY, SEX, AGE, OR NATIONAL ORIGIN PROHIBITED IN CONNECTION WITH EMPLOYMENT—

(a) General. Do not discriminate against any individual, who is qualified and available to perform the work to which the employment relates, by reason of race, color, religious creed, ancestry, sex, age, or national origin.

(b) Penalties. Failure to comply with the above provisions, prescribed in greater detail in 15 P.S. 7306, and modified by Pennsylvania Human Relations Act 43 P.S. 951, may result in the deduction of money due or to become due for each violation. A second or subsequent violation will result in cancellation or termination of the contract upon which the violation occurred, and forfeiture of all money due or to become due, and other penalties prescribed by law.

(c) Federal-Aid Projects. In addition to the above, the requirements specified in Section 107.22(g) also apply.

107.26 SELECTION OF LABORERS AND MECHANICS—This Section does not apply to projects which are partially or totally financed with Federal funds.

(a) Veteran Preference. In employment on public works, provisions of 51 P.S. 492.1 require a preferential rating, similar to that given to State employees, to any soldier making application for employment and on intended discharge for reduction in force. The word “soldier,” as used in the cited act, means a person who served in the armed forces of the United States or in any official women's organization, during any war or armed conflict in which the United States was engaged, and who has an honorable discharge from such service.

107.27 WATERWAY REGULATIONS AND WATER POLLUTION CONTROL—

(a) Waterway Regulations. Conduct indicated work in waterways, flood plains or their hydrologically connected wetlands according to the requirements of permits or approvals issued by the U.S. Army Corps of Engineers, the U.S. Coast Guard, the DEP, the DCNR, and/or the Pennsylvania Fish and Boat Commission, whichever is applicable. Do not conduct work, including borrowing or wasting material other than indicated, in waterways, floodplains or their hydrologically connected wetlands before obtaining the required permits or approvals.

(b) Water Pollution Control. Comply with all applicable State and Federal laws and regulations preventing the pollution of surface water and ground water resources.

(c) Act 247. According to Act 247, enacted by the General Assembly of the Commonwealth of Pennsylvania and approved by the Governor on October 26, 1972, the statutes, rules, and regulations concerning anti-pollution measures have been enumerated in Appendix C, Designated Special Provision 9. Include in the bid price all costs of complying with the terms of the listed statutes, rules, and regulations. No separate or additional payment will be made for such compliance. In the event that the listed statutes, rules, and regulations are amended, or if new statutes, rules, or regulations become effective, perform all additional and/or extra work deemed necessary, as ordered in writing and directed by the Representative, as specified in Section 110.03.

Determine what local ordinances, if any, will affect the project work. Check for any county, city, borough, or township rules or regulations applicable to the area in which the project is being constructed, and, in addition, for any rules or regulations of other organizations having jurisdiction, such as chambers-of-commerce, planning commissions, industries, or utility companies who have jurisdiction over lands which the project occupies. Include any costs of compliance with local controls in the prices bid, even though documents of such local controlling agencies are not listed herein. No separate or additional payments will be made for complying with existing, amended or new local ordinances, directives, or controls.

107.28 EROSION AND SEDIMENT POLLUTION CONTROL PLANS AND PERMITS—Install and maintain erosion and sediment (E&S) pollution control devices as indicated or submit an alternate plan for accomplishing equal or better temporary and permanent erosion and water pollution control. If an alternate plan is submitted, do not start work until the plan is approved by the County Conservation District and the Department. If a National Pollutant Discharge Elimination System (NPDES) Permit is involved, do not start work until the plan is approved by the DEP or the authorized County Conservation District and the Department. Concrete clean out areas, either contractor designed or indicated within the contract documents, are incidental to the contract items.

When a general or individual NPDES Permit is involved:

- Do not start earth disturbance activities until written acknowledgement is received for the Transferee/Co-Permittee Application form completed as specified in Section 107.02(a).
- At the preconstruction conference, submit a Preparedness, Prevention and Contingency (PPC) Plan and identify a licensed professional (Professional Engineer, Geologist, Land Surveyor or Landscape Architect) registered in the Commonwealth and if applicable, their designee to be present onsite and responsible for implementing critical stages of the approved Post Construction Stormwater Management (PCSM) Plan.
- Prepare an as-built (record) PCSM Plan to be sealed and signed by the identified licensed professional registered in the Commonwealth. All construction survey, plan preparation, and engineering required for the as-built (record) PCSM Plan will be incidental to the contract items. The as-built (record) PCSM Plan must accurately reflect deviations from the approved PCSM Plan including, but not limited to, plan locations, dimensions, inverts/elevations, materials used and grading. Update the as-built (record) PCSM Plan as construction of the project's PCSM features progresses. Have the identified licensed professional immediately notify the Representative of all deviations from the approved PCSM Plan. Deviations to the approved PCSM Plan must be submitted for approval. Assist with the determination and documentation if the as-built deviations require a permit amendment or if the PCSM features must be removed and replaced as indicated on the PCSM Plan.

Assist the Representative in performing visual site inspections weekly and after each precipitation event greater than 0.25 inches to ensure the project's E&S Best Management Practices (BMPs) are functioning properly. Immediately initiate corrective actions, at no additional cost to the Department, upon notification by the Representative

of noncompliance with the provisions of this section that the Representative has determined requires immediate corrective action under Department policies. For all other notifications of noncompliance, initiate corrective actions within 24 hours. Failure or refusal to promptly comply with such notice upon receipt may, at the Department's sole discretion, result in: the withholding payment of estimates for work completed until the requirements of the E&S Plan are met, assessment of E&S noncompliance liquidated damages as specified in Section 108.07(d) or issuance of a written order stopping all or part of the work until the corrective action has been taken and the requirements of the E&S Plan are met. No claims for extension of time, costs, or damages arising from, related to, or based upon such notices of noncompliance or stop orders will be granted, paid, or considered.

Nothing in this Section shall be interpreted to relieve the Contractor of its obligation to fully and timely comply with all applicable laws and any permits for the project. The time periods set forth in this Section do not supersede any more stringent time periods required by applicable laws or permits for the project.

If corrective action or noncompliance with the provisions of this Section result from design errors/omissions or a precipitation event exceeding the design storm criteria as specified in applicable Department publications; the cost and/or time required for the performance of the corrective actions for noncompliance notices or stop work orders will be considered as specified in Section 110.03 and Section 108.06, as applicable.

Utilize Department, DEP, or other authorized agency's form(s) included in the contract or project permits unless directed otherwise by the Representative, DEP, the County Conservation District or other authorized regulatory agency.

For the purpose of determining compliance with the provisions of this section, "substantial completion" will be considered to have been attained when all of the following project milestones have been reached:

- Either a semi-final or final inspection has been performed, physical work is complete, and an Environmental Commitments and Mitigation Tracking System (ECMTS) Sheet has been executed if applicable to the project.
- Earth disturbance activity has been permanently stabilized and sufficient vegetative growth has been achieved to meet permit conditions (uniform 70% perennial vegetative cover).
- Installation of PCSM BMPs has occurred if applicable. Upon completion of PCSM conversions and facilities, the County Conservation District must approve the removal of all remaining E&S BMPs.

Once a project with a general or individual NPDES Permit has reached substantial completion, submit to the Representative a DEP Notice of Termination (NOT) Form ensuring Sections 3 and 5, Appendix B, and Section 4 of the NOT Completeness Review and Fieldwork Checklist are fully executed. The NOT is to be accompanied by the required as-built (record) PCSM Plan, the final certification by the licensed professional and the Contractor's executed portion of the ECMTS Construction Tracking Signature Sheet. Include a completed DEP Co-Permittee Liability Release Form with the NOT Form as well as other necessary documentation required for submission of the NOT.

107.29 THIRD-PARTY LIABILITY—Contracts covered by these specifications are not to be construed for the benefit of any person or political subdivision not a party to this contract, nor will this contract be construed to authorize any person or political subdivision not a party to this contract to maintain a lawsuit on or under this contract.

107.30 SPECIFIC EQUAL EMPLOYMENT OPPORTUNITY RESPONSIBILITIES—This Section only applies to projects which are partially or totally financed with Federal funds.

(a) General.

1. Equal employment opportunity requirements not to discriminate and to take affirmative action to assure equal employment opportunity, as required by Executive Order 11246 and Executive Order 11375, are set forth in Required Contract Provisions (Form FHWA-1273) and these requirements; imposed pursuant to 23 U.S.C. 140, as established by Section 22 of the Federal-Aid Highway Act of 1968. The Equal Opportunity Construction Contract Specifications set forth under 41 CFR 60-43 and the provisions of the Americans with Disabilities Act of 1990 (42 U.S.C. 12101 et seq.) set forth under 28 CFR 35 and 29 CFR 1630 are incorporated by reference in this contract. The requirements set

forth herein constitute the specific affirmative action requirements for project activities under this contract and supplement the equal employment opportunity requirements set forth in the Required Contract Provisions.

2. Work with the Department and the Federal Government in carrying out equal employment opportunity obligations and in their review of contract activities.

3. Comply with and have subcontractors (not including material suppliers) comply with the following minimum specific requirement activities of equal employment opportunity. The Equal Employment Opportunity Requirements of Executive Order 11246, as set forth in 23 CFR 633, are applicable to material suppliers as well as contractors and subcontractors. Include these requirements in every subcontract of \$10,000 or more with such modification of language as is necessary to make them binding on the subcontractor.

(b) Equal Employment Opportunity Policy. Accept as operating policy the following statement which is designed to further the provision of equal employment opportunity to all persons without regard to their race, color, religion, sex, or national origin, and to promote the full realization of equal employment opportunity through positive continuing programs:

It is the policy of this Company to assure that applicants are employed, and that employees are treated during employment, without regard to their race, religion, sex, color, or national origin. Such action includes: employment, upgrading, demotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation; and selection for training, including apprenticeship, pre-apprenticeship, and/or on-the-job training.

(c) Equal Employment Opportunity Officer. Designate and make known to the Department contracting officers an equal employment opportunity officer (hereinafter referred to as the EEO Officer) who has the responsibility for and is capable of effectively administering and promoting an active company program of equal employment opportunity and who has been assigned adequate authority and responsibility to do so.

(d) Dissemination of Policy.

1. Make all company staff members related to the project who are authorized to hire, supervise, promote, and discharge employees, or who recommend such action, or who are substantially involved in such action, fully cognizant of, and have them implement, the company's equal employment opportunity policy and contractual responsibilities to provide equal employment opportunity in each grade and classification of employment. To ensure that the above agreement is met, take the following actions as a minimum:

1.a Conduct periodic meetings of supervisory and personnel office employees before the start of work and then not less often than once every 6 months, at which time the contract equal employment opportunity policy and its implementation will be reviewed and explained. Have the meetings conducted by the EEO Officer or another knowledgeable company official.

1.b Give all new company supervisory or personnel office employees a thorough indoctrination by the EEO Officer or other knowledgeable company official covering all major aspects of the company's equal employment opportunity obligations within 30 days following their reporting for duty on the project.

1.c Instruct all company personnel who are engaged in direct recruitment for the project by the EEO Officer or appropriate company official in the company procedures for locating and hiring minority group employees.

2. In order to make the equal employment opportunity policy known to all company employees, prospective employees, and potential sources of employees, i.e., schools, employment agencies, labor unions (where appropriate), college placement officers, etc., take the following actions:

2.a Place notices and posters setting forth the equal employment opportunity policy in areas readily accessible to company employees, applicants for employment, and potential employees.

2.b Bring the equal employment opportunity policy and the procedures to implement such policy to the attention of company employees by means of meetings, employee handbooks, or other appropriate means.

(e) Recruitment.

1. When advertising for employees, include in all advertisements for employees the notation: "An Equal Opportunity Employer." Publish all such advertisements in newspapers or other publications having a large circulation among minority groups in areas from which the project work force would normally be derived.

2. Unless precluded by a valid bargaining agreement, conduct systematic and direct recruitment through public and private employee referral sources likely to yield qualified minority group applicants, including, but not limited to, State employment agencies, schools, colleges and minority group organizations. To meet this requirement, through the company EEO Officer, identify sources of potential minority group employees, and establish with such identified sources procedures whereby minority group applicants may be referred to for company employment consideration.

In the event a valid bargaining agreement exists providing for exclusive hiring hall referrals, observe the provisions of that agreement to the extent that the system permits compliance with equal employment opportunity contract provisions. (The U.S. Department of Labor has held that where implementation of such agreements have the effect of discriminating against minorities or women, or obligates the Contractor to do the same, such implementation violates Executive Order 11246, as amended.)

3. Encourage present company employees to refer minority group applicants for employment by posting appropriate notices or bulletins in areas accessible to all such employees. In addition, discuss information and procedures with regard to referring minority group applicants with employees.

(f) Personnel Actions. Establish and administer wages, working conditions, and employee benefits and take personnel actions of every type, including hiring, upgrading, promotion, transfer, demotion, layoff, and termination, without regard to race, color, religion, sex, or national origin. Follow the following procedures:

1. Conduct periodic inspections of the project site to insure that working conditions and employee facilities do not indicate discriminatory treatment of project site personnel.

2. Periodically evaluate the spread of wages paid within each classification to determine any evidence of discriminatory wage practices.

3. Periodically review selected personnel actions in depth to determine where there is evidence of discrimination. Where evidence is found, promptly take corrective action. If the review indicates that the discrimination may extend beyond the actions reviewed, take corrective action to include all affected persons.

4. Promptly investigate all complaints of alleged discrimination made to the company in connection with obligations under this contract, attempt to resolve such complaints, and take appropriate corrective action within a reasonable time. If the investigation indicates that the discrimination may affect persons other than the complainant, include in such corrective action such other persons. Upon completion of each investigation, inform every complainant of all of his/her avenues of appeal.

(g) Training and Promotion.

1. Assist in locating, qualifying, and increasing the skills of minority group and women employees, and applicants for employment.

2. Consistent with company work force requirements and as permissible under Federal and State regulations, make full use of training programs, i.e., apprenticeship, and on-the-job training programs for the geographical area of contract performance. Where feasible, provide 25% of apprentices or trainees in each occupation in their first year of apprenticeship or training. In the event the Special Provision for Trainees is provided under this contract, this subparagraph will be superseded.

3. Advise employees and applicants for employment of available training programs and entrance requirements for each.

4. Periodically review the training and promotion potential of minority group and women employees and encourage eligible employees to apply for such training and promotion.

(h) Unions. If reliance is made in whole or in part upon unions as a source of employees, use maximum effort to obtain the cooperation of such unions to increase opportunities for minority groups and women within the unions, and to effect referrals by such unions of minority and female employees. Actions either directly or through a contractor's association acting as agent will include the procedures set forth below:

1. Use maximum efforts to develop, in cooperation with the unions, joint training programs aimed toward qualifying more minority group members and women for membership in the unions and increasing the skills of minority group employees and women so that they may qualify for higher paying employment.
2. Use maximum efforts to incorporate an equal employment opportunity clause into each union agreement to the end that such union is contractually bound to refer applicants without regard to their race, color, religion, sex, or national origin.
3. Obtain information as to the referral practices and policies of the labor union except that to the extent such information is within the exclusive possession of the labor union and such labor union refuses to furnish such information, so certify to the Department and set forth what efforts have been made to obtain such information.
4. In the event the union is unable to provide a reasonable flow of minority and women referrals within the time limit set forth in the collective bargaining agreement, through independent recruitment efforts, fill the employment vacancies without regard to race, color, religion, sex, or national origin, making full efforts to obtain qualified and/or qualifiable minority group persons and women. (The U.S. Department of Labor has held that it is no excuse that the union with which the Contractor has a collective bargaining agreement providing for exclusive referral failed to refer minority employees.) In the event the union referral practice prevents meeting obligations pursuant to Executive Order 11246, as amended, and these requirements, immediately notify the Department.

(i) Subcontracting.

1. Use maximum efforts to solicit bids from and to utilize minority group subcontractors or subcontractors with meaningful minority group and female representation among their employees. Obtain lists of minority-owned construction firms from Department personnel.
2. Use maximum efforts to ensure subcontractor compliance with their equal employment opportunity obligations.

(j) Records and Reports.

1. Keep such records as are necessary to determine compliance with the company's equal employment opportunity obligations. Design the records kept to indicate:

1.a The number of minority and non-minority group members and women employed in each work classification on the project.

1.b The progress and efforts being made in cooperation with unions to increase employment opportunities for minorities and women (applicable only to contractors who rely in whole or in part on unions as a source of their work force).

1.c The progress and efforts being made in locating, hiring, training, qualifying, and upgrading minority and female employees.

1.d The progress and efforts being made in securing the services of minority group subcontractors or subcontractors with meaningful minority and female representation among their employees.

2. Retain all such records for a period of 3 years following completion of the contract work and make them available at reasonable times and places for inspection by authorized representatives of the Department and the FHWA.

3. Submit to the Department a report each month after construction begins for the duration of the project, indicating the work hours, number of minority, women and non-minority group employees currently engaged in each work classification required by the contract work. This information is to be reported on Form EO-400, and according to the instructions included thereon. Form PR-1391 is to be submitted annually for the month of July, reflecting personnel figures for the project work force, for the last payroll period preceding the 31st of the month. If on-the-job training is being required by Special Provision for trainees, furnish Form EO-365 for each trainee employed, on a monthly basis, and Form FHWA-1409 semi-annually.

107.31 PUBLIC WORKS EMPLOYMENT VERIFICATION ACT—

(a) General. In accordance with Act 127 of 2012, known as the Public Works Employment Verification Act (“the Act”), effective January 1, 2013, 43 P.S. §§167.1-167.11, use the Federal Government’s E-Verify system to ensure that all employees performing work on the project, including subcontractor’s employees, are authorized to work in the United States.

(b) Verification Form. Verify the employment eligibility of each new employee hired after January 1, 2013 and submit the Commonwealth Public Works Employment Verification Form (Form), located in the ECMS File Cabinet (in References Tab). If assistance with the Form is needed, contact the ECMS Help Desk at 855-783-8330 or at 717-783-8330. ECMS Help Desk assistance is available 24 hours a day, 7 days a week.

(c) Contractor. Upload the form to ECMS or Email to publicworksform@pa.gov or fax the Form to 717-265-7207, signed by an authorized representative of the Contractor, possessing sufficient knowledge to make the representations and certifications on the Form by 3:00 P.M. prevailing local time within 7 calendar days after the bid opening. When the seventh (7th) calendar day after the bid opening falls on a day that the Department offices are closed, submit the Form by 3:00 P.M. prevailing local time on the next business day. Failure or refusal to provide the Form will be considered a refusal to comply with bidding requirements, will result in rejection of the bid, and may subject the Contractor to the enforcement activities, sanctions and civil penalties specified in the Act.

(d) Subcontractor. Obtain a form signed by an authorized representative of the subcontractor performing work on the project, possessing sufficient knowledge to make the representations and certifications on the Form. Attach the Form on the Subcontractor Request Screen in ECMS before submitting the request for approval. Failure or refusal to provide the Form will be considered a refusal to comply with subcontractor approval requirements, will result in rejection of the subcontractor request, and may subject the subcontractor to the enforcement activities, sanctions and civil penalties specified in the Act. Include information about the requirements of the Act in all subcontracts.

(e) Department of General Services. The Department of General Services is the Commonwealth agency responsible for enforcement and administration of the Act. Please direct questions about the Act to:

Department of General Services Public Works
Employment Verification Compliance Office
Room 105 Tent Building
18th and Herr Streets
Harrisburg, PA 17125
Fax: 717-214-3669

107.32 USE OF UNITED STATES-FLAG VESSELS—For Federal-Aid contracts, the Contractor is referred to the requirements of Public Law 664 as further specified in Part 381, Title 46, Code of Federal Regulations.

(a) The Contractor Agrees:

1. To use privately owned United States-Flag commercial vessels to ship at least 50% of the gross tonnage involved (computed separately for dry bulk carriers, dry cargo liners, and tankers), whenever shipping any equipment, material, or commodities for this contract, to the extent such vessels are available at fair and reasonable rates for United States-Flag commercial vessels.

2. To furnish within 20 days following the date of loading for shipments originating within the United States or within 30 working days following the date of loading for shipments originating outside the United States, furnish a legible copy of a rated, "on-board" commercial ocean bill-of-lading. Furnish the bill-of-lading in English, for each shipment of cargo described above, to both the Department (through the prime Contractor in the case of subcontractor bills-of-lading) and to the Division of National Cargo, Office of Market Development, Maritime Administration, Washington, D.C. 20590.

3. To insert the substance of the provisions of this clause in all subcontracts issued pursuant to the contract.

SECTION 108—PERFORMANCE AND PROGRESS

108.01 SUBLETTING OR ASSIGNMENT OF CONTRACTS—

(a) General. Do not sublet, sell, transfer, assign, or otherwise dispose of the contract or contracts or any portion or rights, title, or interest, without the written consent of the Representative.

If consent is given, subletting a portion of the contract will be allowed; however, do not sublet a portion exceeding 50% of the original total contract price except as provided herein.

Use only prequalified subcontractors, classified for the type of work undertaken and not exceeding their assigned maximum capacity rating.

For prequalification capacity evaluation, the amount of subcontracted work will be charged solely to the subcontractor when the subcontractor and items of work to be undertaken are named in the bid and to both the prime contractor and the subcontractor when the subcontractor is named after the award of the contract.

Do not replace or cancel a subcontractor named in the bid without the approval of the Representative, which approval will not be unreasonably withheld.

Subcontracts or transfer of contract will not release Contractor liability under the contracts and bonds.

(b) Specialty Items. “Specialty Items,” as identified in the proposal, may be performed by subcontract. The cost of any specialty items performed by subcontract may be deducted from the original total contract price before computing the amount of work allowed to be performed by subcontract.

(c) Disadvantaged Business Enterprises (DBE). For Federal-Aid contracts when requirements for DBE are included in the proposal, the cost indicated on the approved Minority Participation and Commitment in ECMS for DBE's utilization may be deducted from the original total contract price before computing the amount of work allowed to be performed by subcontract, provided the request to Perform Less Than 50% of Work Items has been submitted with the Minority Participation and Commitment submission. In cases where specialty items and DBE involvement overlap, any cost deducted is restricted to a single assignment of either specialty item or DBE goal amount, but not both. The maximum amount of the DBE cost that may be deducted is equal to 40% times the difference between the original total contract price and the specialty items' cost.

(d) Diverse Businesses (DB). For contracts financed with other than Federal funds when requirements for DB are included in the proposal, the cost of the Agreement Amount indicated on the approved Minority Participation and Commitment in ECMS for DB's utilization may be deducted from the original total contract price before computing the amount of work allowed to be performed by subcontract, provided the request to Perform Less Than 50% of Work Items has been submitted with the Minority Participation Commitment submission. In cases where specialty items and DB involvement overlap, any cost deducted is restricted to a single assignment of either specialty item or DB agreement amount, but not both. The maximum amount of the DB cost that may be deducted is equal to 40% times the difference between the original total contract price and the specialty items' cost.

(e) Subcontract Approval. Do not allow any work on the project that is assigned to others (including services) to be performed until a copy of the executed subcontract (agreement or any other assignment of the contract) has been reviewed and is available on the project to Department representatives for purposes of monitoring contract compliance. The Department will verify that the subcontract is evidenced in writing and that all pertinent provisions and requirements of the prime contract are physically incorporated or included by reference. It should be noted that the allowance for pertinent provisions to be included in a subcontract by reference does not apply to the provision entitled “FAR—Required Contract Provisions Federal-Aid Construction Contracts” (Form FHWA-1273/DSP8), which must be physically incorporated into all related subcontract agreements of \$10,000 or more with the exception of material supply, engineering, or architectural service contracts. All firms listed on the approved Minority Participation and Commitment, including those business types other than subcontractor, must be submitted for subcontractor approval after the contract is executed.

108.02 NOTICE TO PROCEED—As soon as practical after approval of the contracts, bonds, and insurance certificates by the Chief Counsel, the General Counsel, or the Attorney General, or their respective designees, and subject to the provisions as specified in Section 103.07, a written Notice to Proceed will be sent, specifying the calendar date on which to begin the work.

(a) Requirements for Starting Work. Begin work on the Notice to Proceed Date specified in the Notice to Proceed and complete all physical work, including any authorized additional or extra work, on or before the Required Completion Date.

(b) Notice to Proceed Period. The Notice to Proceed will be issued on or before the Anticipated Notice to Proceed or within 30 days after the award of the contract, whichever is later. Extension(s) of the 30-day period will be made only by mutual written consent of the parties to the contract provided such written consent is given before the expiration of the 30-day period.

108.03 PERFORMANCE AND PROGRESS—

(a) Preconstruction Conference. Before the anticipated Notice to Proceed Date, a preconstruction conference will be held in the District office. The purpose of this conference will be to discuss the scope of the project work, to discuss all essential matters pertaining to the satisfactory project completion, and to resolve any questions regarding contract interpretation and/or contract time.

Submit the following to the Representative at the Preconstruction Conference:

- List containing names of the project superintendent, project engineer, foremen, surveyor and construction scheduling coordinator
- Names, titles, and contact information of the selected individuals required to complete Form CS-8 (Issue Escalation Matrix)
- Forms CS-200 (Source of Supply – Materials) and Form CS-201 (Source of Supply – Traffic Control Devices)
- Work Plan (60 Calendar Day for Critical Path Method (CPM) and 60 Calendar Day for Resource Loaded CPM contracts)

Failure to submit the above documentation may result in the actual Notice to Proceed Date being after the anticipated Notice to Proceed Date in the proposal, but will not qualify for an extension of contract time.

If a preconstruction conference is not held before the anticipated Notice to Proceed Date in the proposal, an extension of contract time may be granted, provided the requirements as specified in Section 108.06(a) have been met (i.e., the extension is supported by the Construction Schedule and it can be demonstrated that progress on one or more controlling operations has been adversely affected by the Department's failure to comply with the requirements of this section).

(b) Construction Project Scheduling. Prepare a complete Schedule that adheres to and incorporates all contract time requirements, shows work being completed on or before the Required Completion Date, meets specified Milestone Date(s), and is in compliance with all contractual requirements. For Design/Build or Partial Design/Build Projects, include design activities associated with the Design/Build elements as well as the review and approval durations as specified in the contract provisions.

The Representative may require that the Contractor attend a scheduling conference for the purpose of reviewing this specification and the applicable portions of Section 689 that pertain to the scheduling format indicated for the project (i.e., Narrative, CPM, or Resource Loaded CPM). This scheduling conference may be held in conjunction with the Preconstruction Conference. Be prepared to discuss the concepts and logic to be used in sequencing work activities for development of the construction Schedule.

Acceptance of the Contractor's Schedule or any revision(s) thereto, by the Department, will not constitute the Department's approval of or agreement with the sequence of operations, the durations of activities, the adequacy or propriety of resources, the identity of controlling operations, nor the feasibility or any other characteristics of the Schedule or its revisions.

Show the sequence and interdependence of activities for completion of all work. Consider and make appropriate scheduling and operational allowances, including but not limited to, seasonal weather conditions and ambient temperatures, permitting requirements, plant establishment periods, traffic signal testing periods, Intelligent Transportation System equipment-related testing periods, pavement marking retro-reflectivity testing, Maintenance and Protection of Traffic restriction periods, and asphalt pavement restriction periods.

Incorporate in the Schedule coordination with all entities (subcontractors, utilities, railroads, etc.) and adjacent or private contracts that could impact the Schedule. Utility coordination as specified in the contract documents must be

interdependently specified within the Construction Schedule. All Utility entities will be incorporated into the Construction Schedule to define the interdependencies with all Construction Activities. In addition to construction activities, include in the Schedule, the procurement, fabrication, and delivery of critical or special materials and equipment, and indicate relationships between activities.

Schedule updates are required at minimum on a monthly basis.

1. Construction Scheduling Coordinator. Have the individual responsible for supervising the work, as specified in Section 105.05(a), serve as the Construction Scheduling Coordinator or be responsible for and oversee all activities of the Construction Scheduling Coordinator.

2. Project Control Meetings. Project control meetings will be held on an as needed basis, as directed. During project control meetings, the Representative and the Contractor's superintendent will conduct a site visit and jointly review project progress. Submit, 2 working days before each project control meeting, a written report, in an acceptable format, that includes the following:

- Progress of project design and construction activities.
- Impacts on the current Schedule.
- Planned progress for the next 2 weeks.
- Other Schedule-related information, as required.

3. Submittals. Prioritize and schedule submissions to allow sufficient time for Department review. Make submissions at least 21 calendar days before information is needed for purchasing, fabricating material, or obtaining equipment, unless otherwise indicated or directed. The 21-calendar day review period will begin on the date the Representative receives the submission. Any delays caused by incomplete submissions, including drawings and designs, will be the responsibility of the Contractor.

4. Adjustment of Required Completion Date or Specified Milestone Date(s). If a request for a time extension is approved or a time reduction processed, the Department will use the changed Required Completion Date and/or Milestone Date(s) for the purpose of monitoring progress, assigning resources, authorizing additional and/or extra work, processing contract adjustments associated with incentive/disincentive clauses, and assessing liquidated damages. Contractor imposed dates in the Schedule; other than the Required Completion Date, specified Milestone Date(s), and/or any contractually specified sequences; will not be binding on the Department.

5. Recovery. If the latest completion time for any work on the current Schedule results in a controlling activity being delayed 14 days or more beyond the Required Completion Date or any specified Milestone Date(s), as adjusted, the Representative may require the Contractor to submit a written description of the plan to recover all lost time and maintain the Required Completion Date or specified Milestone Date(s) including affected activities (with explanations for delays or duration variance from the original accepted baseline). If required, submit the written recovery plan within 7 calendar days of notification by the Representative.

If the order of project operations is changed to the extent that the Contractor is no longer following the accepted Schedule, the Representative may require that a recovery schedule be submitted. The revision to the schedule must include the Asta Powerproject (.pp) recovery schedule, a narrative recovery plan including what has changed and an explanation as to why it has changed, and a Portable Document Format (PDF) of the recovery schedule, submitted through the PennDOT Project Collaboration Center (PPCC). If the recovery plan and/or recovery schedule is not received within 14 calendar days from the date of the request by the Representative, the District Executive may withhold current estimate payments until the required information has been submitted and accepted.

6. Updates. Submit updates to the Schedule monthly on or before the date agreed to by the Department, unless otherwise specified. If any Update is not received within 7 calendar days from the agreed upon date, the District Executive may withhold current estimate payments until all requested schedule updates are received and accepted.

(c) PennDOT Project Collaboration Center (PPCC). Submit all project-related documentation, as required or indicated, using PPCC. Coordinate with the Department to obtain access for necessary parties to PPCC. The Department's standard file format is PDF. The Department may require documentation to be submitted in other

compatible electronic file formats.

108.04 LIMITATION OF OPERATIONS—

(a) Maintenance of Traffic. Conduct the work in a manner and sequence that assures minimal interference to traffic.

(b) Completion of Sections of Project. Complete any designated section or sections of the project as indicated; as specified; or when directed, in writing, as specified in Section 107.15.

The Contractor will be relieved of responsibility for further physical work and maintenance only for work items within the section of the project which are satisfactorily completed at the time of, or subsequent to, opening of the section to traffic. The Contractor's responsibility for further physical work and maintenance remains for work items within the section of the project which are not satisfactorily completed at the time of, or subsequent to, opening of the section to traffic.

Release of Contractor responsibility is further contingent on the following:

- a final inspection of the section has been made as specified in Section 110.08(a);
- the Contractor's obligation under the contract to replace defective work or material is not relieved;
- the Contractor's responsibility for repairing any damage to satisfactorily completed work items within the section, which occurs due to construction operations, is not relieved; and
- any work done by the Department, on a designated section of the project that may have been satisfactorily completed, as provided, does not waive the rights of either party to the entire contract.

(c) Maintenance of Existing Vegetation. In order to maintain natural vegetation in all undisturbed areas, do not cross these areas with construction equipment or make any other use of these areas, except at allowed locations.

108.05 CHARACTER OF WORKERS; METHODS AND EQUIPMENT—

(a) General. Employ at all times sufficient labor and equipment for performing the work, as specified in Section 108.03.

(b) Competence of Workers. Employ only competent and efficient superintendents, forepersons, clerks, timekeepers, equipment operators, laborers, mechanics, or artisans for every kind of work. Whenever, in the Representative's opinion, any person is unfit to perform the task, does the work contrary to instructions, or exhibits improper conduct, discharge the person immediately and do not employ the person again on the project without written permission of the Representative. Failure to remove such person, as ordered, or failure to furnish suitable and sufficient personnel for the proper completion of the work, after being ordered to correct the deficiency, may result in suspension of the work, by written notice from the District Executive, until such orders are followed.

If the superintendent or representative on the project fails to cooperate with the Department's authorized representatives in any way, the District Executive will give a written order for dismissal and replacement of that superintendent or representative.

(c) Equipment. Furnish the type, condition, and quantity of equipment that meets the qualifications necessary for the proper execution of the work within the specified contract time. Maintain the equipment in good condition, subject to acceptance, before and during use in connection with the project. If special equipment, not normally used in highway construction, is required to be used, comply with Section 108.05(c)2.

1. Alternate Method and/or Equipment. If the contract specifies that construction be performed by the use of certain methods and equipment, use such methods or equipment, unless others are authorized. To use a method or type of equipment other than those specified, request authority to do so. Provide the request in writing and include a full description of the methods and equipment proposed to be used, with an explanation of the reasons for desiring to make the change. If acceptance is given, it will be on condition that construction work is performed in conformity with

contract requirements. If, after trial use of the substituted methods of equipment, it is determined that the work produced does not conform to the contract requirements, discontinue the use of the substitute method or equipment. Complete the remaining construction with the specified methods and equipment. Remove the deficient work and replace it with work of specified quality, or take such other corrective action, as directed. No change will be made in the basis of payment for the construction items involved, nor in contract time, as a result of authorizing a change in methods or equipment under these provisions.

2. Test of New Special Equipment. A vendor or manufacturer of equipment not currently used may submit the necessary technical data concerning the item to the LTS. If the item warrants further investigation, the LTS may grant permission to the vendor to contact a contractor for the experimental use of the equipment on an appropriate project under construction. The experimental operation will be observed by representatives of the LTS and the District Executive's office, to obtain data necessary to substantiate a final recommendation to the Department.

3. Roller Requirements. Provide rollers, of the type(s) specified for the various items of construction, complying with the following:

3.a Three-wheel power rollers, with an unballasted load of not less than 300 pounds per linear inch of tread of rear wheels, having a manufacturer's certified metal weight of not less than 10 tons.

3.b Tandem power-driven rollers, with a ballasted load of not less than 330 pounds per linear inch of tread of drive roll, having a manufacturer's certified metal weight of not less than 10 tons.

3.c Tandem power-driven rollers, with a load of not less than 120 pounds per linear inch of tread of drive roll, having a manufacturer's certified metal weight of either not less than 5 tons or more than 8 tons or either not less than 8 tons or more than 10 tons.

3.d Self-propelled trench-type rollers, with a minimum trench roller factor (RF_t) of 2.0 using the following equation:

$$RF_t = (F_c * (f * A)^2) / (W_d * 650)$$

where,

RF_t = Trench roller factor (dim)

F_c = Maximum centrifugal force (lb)

f = Minimum vibration frequency (Hz)

A = Maximum vibration amplitude (in)

W_d = Drum width (in)

Trench-type rollers may be hand operated or remotely controlled. Use trench rollers capable of being operated in both static and vibratory modes. Roller drums must have alternating rows of raised pads across the entire drum width and be equipped with scraper bars at each drum to assist in removal of soil from between the pads. Smooth steel drums are prohibited.

Supply manufacturer's technical data, measured data, and the serial number for the specific trench roller being used to the Representative before beginning compaction operations. Verify that the roller meets the minimum requirements. Equipment that does not meet the minimum requirements will be rejected. Operate equipment in accordance with manufacturer's recommendations and at a frequency and amplitude to provide the minimum required RF_t.

3.e Pneumatic-tire rollers, used to compact base courses, may be either single or multiple-axle type and may be equipped with pneumatic tires of equal size and diameter on any one axle. Uniformly inflate tires so that air pressure does not vary more than 5 pounds per square inch. Use rollers of sufficient weight and dimensions that, when loaded, will cause the pneumatic tire wheels to exert a ground pressure of not less than 300 pounds per inch of width of tread, as measured on a hard surface.

3.f Pneumatic-tire rollers, used to compact hot asphalt mixtures of a self-propelled type. Use rollers having not less than seven wheels mounting smooth tread pneumatic tires, not less than 7 1/2 inch by 15 inch size, each tire capable of exerting an average contact pressure through a range from 60 pounds per square inch to 95 pounds per

square inch. Use rollers with wheels equally spaced along both axles and so arranged that those on one axle track midway between those of the other, with the wheels on one or both axles arranged to oscillate in pairs or to be individually sprung.

Use rollers equipped with power steering and fluid drive or a torque converter, capable of turning or reversing on the hot material without surface scuffing or displacement, and provided with means of wetting and cleaning the tires during operation, to prevent adhesion of hot asphalt mixture to the tires.

Make provision for checking tire pressures during operation. Keep the tires uniformly inflated at the designated pressure and with the difference in pressure between any two tires not to exceed 5 pounds per square inch.

In operation, adjust the tire pressure and wheel load, as required, to provide an average contact pressure of from 60 pounds per square inch to 95 pounds per square inch over the surface, to conform to the requirements of both the particular application and the material being compacted.

Equip the roller with means of adjusting the wheel load by ballasting and provide tires with a ply-rating that supports the maximum operating wheel load, at the specified maximum contact pressure.

Furnish copies of the roller manufacturer's charts or tabulations, showing the contact areas and average contact pressures for the full range of both tire inflation pressures and tire loadings for each type and size of compactor tire furnished. Also, furnish copies of the calibration table or chart for the ballast box, showing both the volume of the box in cubic feet, for at least each 3-inch increment of depth, and the empty or tare weight of the roller.

3.g Padfoot rollers with a minimum pad contact pressure of 160 pounds per square inch, a flat pad contact surface with a minimum pad contact area of 15 square inches, and a minimum pad projection of 3.0 inches from the surface of the drum. Calculate pad contact pressure by dividing the static roller weight by the product of the maximum number of pads sighting across the roller drum and the pad contact area.

Use padfoot rollers capable of being operated in both static and vibratory modes. Roller drums must have alternating rows of raised pads across the entire drum width and be equipped with a scraper bar(s) to assist in removal of soil from between the pads.

Supply manufacturer's technical data, measured data, and the serial number for the specific padfoot roller being used to the Representative before beginning compaction operations. Verify that the roller meets the minimum requirements. Padfoot rollers that do not meet the minimum requirements will be rejected.

3.h Smooth drum tandem vibratory rollers of a self-propelled type, with the necessary frequency and amplitude to achieve required density without objectionable undulations, material pickup, or other surface defects. Use a vibrator drive that automatically stops when the roller changes direction or stops.

3.i Smooth single-drum vibratory rollers of a self-propelled type, with a minimum drum width (W_d) of 48 inches and a minimum vibratory roller factor (RF_v) of 2.0 using the following equation:

$$RF_v = (F_c * (f * A)^2) / (W_d * 1,000)$$

where,

RF_v = Vibratory roller factor (dim)

F_c = Maximum centrifugal force (lb)

f = Minimum vibration frequency (Hz)

A = Maximum vibration amplitude (in)

W_d = Drum width (in)

The vibratory rollers must be capable of achieving the required density without objectionable undulations, material pickup, or other surface defects. Use a vibrator drive that automatically stops when the roller changes direction or stops.

4. Other Compaction Equipment. Permission may be given for the use of other types of impact vibratory, and/or compaction equipment designed for, and capable of accomplishing, compaction. Specific minimum requirements for various types of lightweight and/or hand-operated compaction equipment are provided below.

Supply manufacturer's technical data, measured data, and the serial number for the specific compactor being used to the Representative before beginning compaction operations. Verify that the compaction equipment meets the minimum requirements. Equipment that does not meet the minimum requirements will be rejected.

4.a Hand operated impact rammer (jumping jack) with a minimum required impact rammer factor (RF_i) of

2.0 using the following equation:

$$RF_i = (w_o * (f * A)^2) / (W_p * L_p * 400)$$

where,

RF_i = Impact rammer factor (dim)

w_o = Operating weight (lb)

f = Percussion rate or frequency (Hz)

A = Rammer stroke or amplitude (in)

W_p = Rammer plate width (in)

L_p = Rammer plate length (in)

The rammer plate length and width must be reported as the actual dimensions of the plate. Verify that the plate dimensions reported on the manufacturer's technical data sheet are correct for the actual impact rammer being used. Use rammer plates constructed of steel. Plastic, rubber, or wood rammer plates are prohibited. Operate equipment in accordance with manufacturer's recommendations and at a percussion rate and stroke to provide the minimum required RF_i .

4.b Hand operated vibratory plate compactor with a minimum required plate factor (PF_v) of 2.0 using the following equation:

$$PF_v = (F_c * (f * A)^2) / (A_p * 100)$$

where,

PF_v = Vibratory plate factor (dim)

F_c = Maximum centrifugal force (lb)

f = Minimum vibration frequency (Hz)

A = Maximum vibration amplitude (in)

A_p = Effective plate area (in²)

The effective plate area must be reported as the actual area of the bottom surface of the plate in contact with the ground when placed on a firm surface. Verify the effective plate area in the presence of the Representative. Use vibratory plates constructed of steel. Plastic, rubber, or wood plates are prohibited. Operate equipment in accordance with manufacturer's recommendations and at a frequency and amplitude to provide the minimum required RF_v .

5. Material Transfer Vehicle (MTV). For RPS pavements or when specified in a special provision, provide a Material Transfer Vehicle (MTV) to be used as an intermediate and separate motorized, self-propelled unit between the haul vehicle and the asphalt paver as follows:

- Provide adequate covers of sufficient size to protect the material in the MTV, under all conditions.
- Capable of transferring the material from the haul vehicle to the paver hopper at a uniform and continuous rate to allow the continuous movement of the paver.
- Equipped with remixing augers for remixing the asphalt material before transferring to the paver hopper.
- Free of petroleum oils, solvents, or other material, which adversely affect asphalt concrete.

In addition, equip the asphalt paver with a manufactured hopper insert to provide a mass flow of material directly to the slat conveyors of the paver. Deliver mixture through the MTV at the correct laying temperature as specified in Section 413.2(e) Table A or Section 413.2(e) Table A, and free from lumps of chilled material.

6. Cranes. Crane operators must hold a valid Crane Operator's license for the Commonwealth for the size and type of crane to be used. Before performing work with a crane, submit a copy of the operator's license to the Representative. In addition, one on-site meeting must be held with the crane operator(s) to discuss safety and crane type(s), size(s), location(s) and movements. For projects that require an erection plan or pre-erection meeting or both,

ensure that the crane operators are in attendance at the meeting and invite the Structure Control Engineer to the meeting. If the crane operator cannot attend the meeting, a representative from the crane company must be in attendance. Remediate possible mat shifts and correct possible conflicts observed with the operation.

108.06 TIME EXTENSIONS AND REDUCTIONS—

(a) Time Extensions. An extension of the Required Completion Date and/or a specified Milestone Date(s) may be granted by the Department as a result of any of the events or occurrences identified herein. If an event or occurrence qualifies for an extension of contract time, and the extension is supported by the Construction Schedule after the impact of the event or occurrence is incorporated, submit an official time extension request to the Representative early enough so that it can be evaluated and decided upon by the Department in time to avoid any constructive acceleration of the work, but no later than 30 calendar days after the “termination” of the event or occurrence, as specified herein. Submit time extension requests electronically, using ECMS. Include a combined PDF of the Supporting Schedules with each request, at no additional cost to the Department. The Supporting Schedules are to include: a pre-impact schedule, which is the accepted schedule in place prior to the impact, and a post-impact schedule, which shows the impact of the specific event or occurrence on the Required Completion Date and/or specified Milestone Date(s) on the accepted schedule in place at the time of the event or occurrence. Along with submitting the combined PDF of the Supporting Schedules in ECMS, the electronic Asta Powerproject (.pp) files are to be submitted to the Representative outside of ECMS (via the PPCC). The Representative will respond to all time extension requests within 14 calendar days of receipt. Time extension requests that are not submitted within the specified time and/or do not include all of the required supporting information, including Supporting Schedules, will not be approved. If, after reviewing the Contractor’s initial time extension request, the Representative determines that the supporting information provided is incomplete or inadequate, notification of the deficiency will be sent to the Contractor. Complete or revise the time extension request, as indicated, and resubmit within 10 calendar days of receipt of the Representative’s notification. Revised time extension requests that are not resubmitted within the specified time will not be approved. If a time extension request is disapproved by the Department, liquidated damages may be chargeable.

The following events or occurrences may qualify for an extension of the Required Completion Date and/or a specified Milestone Date(s):

- A Notice to Proceed is issued indicating that the actual Notice to Proceed Date will be after the anticipated Notice to Proceed Date in the proposal, through no fault of the Contractor. A time extension will only be granted for such an occurrence if it is requested by the Contractor within 30 calendar days after the date of Department acceptance of the initial Construction Schedule.
- Progress on one or more controlling operations is adversely affected by impacts from Utility Infrastructure and Utility Adjustments as specified in Section 105.06. Submit a time extension request within 30 calendar days after the date all utility infrastructure and utility adjustments impacting the Contractor’s operations are completed.
- Satisfactory project completion requires work in greater quantities than those indicated in the contract, and progress on one or more controlling operations is adversely affected by the item plan quantity overruns. Submit a time extension request within 30 calendar days after the date the overrun quantity of work under the applicable item(s) is completed.
- The District Executive, in writing, authorizes the elimination of an item(s) of work or a reduction in quantity for an item(s) of work, and progress on one or more controlling operations is adversely affected by the elimination(s)/reductions(s). Submit a time extension request within 30 calendar days after the date of receipt of the District Executive’s initial, itemized, written authorization for the work item elimination(s)/quantity reduction(s).
- The District Executive, in writing, authorizes additional and/or extra work, which affects progress on one or more controlling operations. Submit a time extension request within 30 calendar days after the date the prices to be paid for all authorized additional work and/or extra work at a negotiated price are agreed upon and, when applicable, accepted by the Department, or, if authorized extra work is to be paid on a force account basis, within 30 calendar days after the date the force account work is completed.

- A strike or labor dispute that causes, despite all reasonable efforts by the Contractor to avoid it, a shutdown of the entire project or of one or more controlling operations, as specified in Section 108.10. Submit a time extension request within 30 calendar days after the date the strike or labor dispute ends.
- Progress on one or more controlling operations is adversely affected by the delayed action or failure to act of an agency other than the Department that is not the fault of the Contractor, all of which will be determined by the Representative. Submit a time extension request within 30 calendar days after the date all issues involving the agency's delay or failure are resolved.
- Progress on one or more controlling operations is adversely affected by an act or omission of the Department that is not the fault of the Contractor, all of which will be determined by the Representative. Submit a time extension request within 30 calendar days after the date all issues involving the Department's act or omission are resolved.

Events or occurrences that do not qualify for an extension of the Required Completion Date and/or a specified Milestone Date(s) include, but are not limited to, weather delays, the removal and replacement of defective work, and the reseeded of areas where specified growth coverage and/or germination time requirements have not been met.

Weather-related events warranting an emergency declaration by the Federal Government or by the Government of the Commonwealth of Pennsylvania may qualify for an extension of contract time provided it can be clearly established that the delay to the project for which a time extension is sought is not, in fact, the responsibility of the Contractor, and that the Contractor has taken all necessary precautions to protect the project from damage, as required. Furthermore, the Secretary of Transportation, or an authorized delegate, must determine, following an emergency declaration, that the emergency conditions had a direct adverse impact on one or more active construction projects. Finally, for a given project to qualify, the accepted Schedule in place at the time of the weather-related event giving rise to the emergency declaration must show work on one or more controlling operations occurring during the period in which the weather-related event took place.

1. Dispute Resolution. If a request for an extension of the Required Completion Date and/or a specified Milestone Date(s), supported by documentation prepared using the appropriate scheduling tool, is not approved by the Department or is approved for a number of days that is less than the number of days originally requested, and the Contractor wishes to dispute the Department's decision, submit a written request for a re-evaluation of the time extension request, to the District Executive, within 7 calendar days after the date the Department takes action on the request within ECMS. Notification of the District Executive's final determination regarding the time extension request will be provided within 7 calendar days of receipt of the Contractor's written, re-evaluation request.

(b) Time Reductions. A reduction of contract time affecting the Required Completion Date and/or a specified Milestone Date(s) may be processed by the Department as a result of any of the events or occurrences identified herein. On a case-by-case basis, before any reduction of contract time is processed in response to a qualifying event or occurrence, the Department, in consultation with the Contractor, will assess whether such an action is warranted (i.e. necessary for proper and equitable administration of the contract and supported by the Construction Schedule after the impact of the event or occurrence is incorporated). If a qualified event or occurrence is found to warrant a reduction of contract time, an official time reduction will be prepared, by the Representative, within 30 calendar days after the "termination" of the event or occurrence, as specified herein. Reductions of contract time will be processed electronically, using ECMS, and a combined PDF of the Supporting Schedules will be included as a support for the number of reduction days. The Supporting Schedules will be prepared by the Contractor, at no additional cost to the Department, and include: the accepted schedule in place at the time of the impact, and impact of the specific event or occurrence on the Required Completion Date and/or specified Milestone Date(s) using the accepted Schedule in place at the time of the event or occurrence. Notification of the Representative's processing of a time reduction will be sent to the Contractor. Within 10 calendar days of receipt of this notification, use ECMS to provide the requested disposition information (i.e. indicate agreement or disagreement with the Department's decision to reduce contract time and comment on the action). However, failure to provide the requested information within the specified time will not prevent the Representative from completing the contract time reduction. Along with submitting the combined PDF of the Supporting Schedules in ECMS, the electronic Asta Powerproject (.pp) files should also be submitted to the Representative outside of ECMS (via PPCC).

The following events or occurrences qualify for and may warrant a reduction in contract time affecting the Required Completion Date and/or a specified Milestone Date(s):

- A Notice to Proceed is issued indicating that the actual Notice to Proceed Date will be before the anticipated Notice to Proceed Date in the proposal. A time reduction, if warranted, will be processed within 30 calendar days after the date of Department acceptance of the initial Construction Schedule.
- Satisfactory project completion requires work in lesser quantities than those indicated in the contract, and progress on one or more controlling operations is favorably affected by the item plan quantity underruns. A time reduction, if warranted, will be processed within 30 calendar days after the date all work under the applicable contract item(s) is completed.
- The District Executive, in writing, authorizes the elimination of an item(s) of work or a reduction in quantity for an item(s) of work, and progress on one or more controlling operations is favorably affected by the elimination(s)/reduction(s). A time reduction, if warranted, will be processed within 30 calendar days after the date of submission of the District Executive's initial, itemized, written authorization for the work item elimination(s) / quantity reduction(s).
- The Contractor submits an initial Construction Schedule that shows the Required Completion Date and/or a specified Milestone Date(s) will be earlier than the date(s) indicated in the contract. A time reduction will be processed within 30 calendar days after the date of the Department acceptance of the initial Construction Schedule.
- Progress on one or more controlling operations is favorably affected by an act of the Department. A time reduction, if warranted, will be processed within 30 calendar days after the date notification of the Department's act is submitted to the Contractor.

1. Dispute Resolution. If a reduction of contract time affecting the Required Completion Date and/or a specified Milestone Date(s), supported by documentation prepared using the appropriate scheduling tool, is processed by the Department despite the Contractor's objections or is processed for a number of days that is more than the number of days originally indicated, and the Contractor wishes to dispute the Department's action, submit a written request for a re-evaluation of the reduction of contract time, to the District Executive, within 7 calendar days after the date the District Executive, or a delegate, approved the time reduction within ECMS. Notification of the District Executive's final determination will be provided within 7 calendar days of receipt of the Contractor's written, re-evaluation request.

108.07 LIQUIDATED DAMAGES—

(a) Construction Engineering Liquidated Damages. For each day that any physical work remains uncompleted after the Required Completion Date, the sum per day specified in the following schedule, unless otherwise stated in the proposal, will be deducted from money due or to become due. This deduction will not be as a penalty, but as Construction Engineering Liquidated Damages.

Original Contract Amount		Schedule of Daily Charges For Construction Engineering Liquidated Damages
From More Than	To and Including	Per Calendar Day
\$ 0	\$ 400,000	\$ 885
400,000	1,000,000	1,675
1,000,000	5,000,000	2,440
5,000,000	10,000,000	3,755
10,000,000	15,000,000	5,240
15,000,000		6,220

In the event the Contractor is declared in default, as specified in Section 108.08, Construction Engineering Liquidated Damages will be charged as provided by this section. If the total amount chargeable as Construction

Engineering Liquidated Damages exceeds the amount payable to the Contractor or the surety, the excess is to be paid to the State by the Contractor or the surety.

(b) Road Users Liquidated Damages. When indicated in the proposal, Road Users Liquidated Damages will be charged for each day that the roadway is not opened to unrestricted traffic after the specified Milestone Date. The sum per day will be deducted from money due or to become due. This deduction will not be as a penalty, but as Road Users Liquidated Damages.

In the event the contractor is declared in default, as specified in Section 108.08, Road Users Liquidated Damages will be charged in the amount indicated. If the total amount chargeable as Road Users Liquidated Damages exceeds the amount payable to the Contractor or the surety, the excess is to be paid to the State by the Contractor or the surety.

(c) Work Zone Liquidated Damages. A sum of no less than \$1,000 per 24 hour period will be charged as work zone liquidated damages for failure to comply with Maintenance and Protection of Traffic requirements and drawings or other contract traffic control requirements. This deduction will not be as a penalty, but as work zone liquidated damages.

(d) Erosion and Sedimentation Control (E&S) Noncompliance Liquidated Damages. Begin work to correct any noncompliance with Section 107.28 (Erosion and Sediment Pollution Control Plans and Permits) within 24 hours of notification by the Representative of the noncompliance. At the time of notification, the Representative will provide the Contractor with a copy of the visual site-inspection report or the report from DEP or their designee or other regulatory agency that identifies the noncompliance.

A sum of \$1,500 per 24-hour period will be charged as E&S noncompliance liquidated damages for failure to begin work within 24 hours of notification of noncompliance and for each subsequent 24-hour period until E&S compliance is attained. This deduction will not be as a penalty, but as E&S noncompliance liquidated damages.

The liquidated damages specified in this section are in addition to, and not in derogation of, the contractor's obligation set forth in Section 107.01 to indemnify the State and its representatives against any claim or liability arising from or based on the violation of any law, ordinance, regulation, order, or decree, including violations by Contractor employees, as well as any other obligation that the contractor may have to indemnify or hold the State and its representative harmless.

108.08 DEFAULT AND TERMINATION OF CONTRACT—in the following paragraphs, the word “Contractor” also means the surety, in case of default, and completion of the contract by the surety.

(a) Delay, Neglect, or Default. The Contractor may be declared in default for the following reasons:

- failure to begin work within the time specified in the Notice to Proceed;
- failure to perform the work with sufficient labor, equipment, or material to ensure the completion of the specified work according to the contract terms;
- unsatisfactory performance of the work;
- failure or refusal to remove material, or to repair or remove and replace any work, rejected as defective or unsatisfactory;
- discontinuing work without approval;
- failure to resume work, which has been discontinued, within a reasonable time after notice to do so;
- insolvency or bankruptcy;
- commission of any act of bankruptcy or insolvency;
- making assignment for the benefit of creditors;

- failure or refusal within 10 days after written notice by the Secretary, to make payment or show cause why payment should not be made, of any amounts due for material furnished, labor supplied or performed, for equipment rentals, or for utility services rendered, as covered by the Payment Bond;
- failure to protect, to repair, or to make good any damage or injury to property, as specified in Section 107.12; and
- not performing work in an acceptable manner for any cause.

The Secretary, upon written notice from the District Executive or upon other proof satisfactory to the Secretary, and after having given written notice to the Contractor and the surety of such delay, neglect, or default on the part of the Contractor, will have power and authority, without violating the contract to:

- declare the Contractor in default;
- take the completion of the work out of the hands of the Contractor;
- appropriate or use any or all material and equipment of the Contractor assembled for the project;
- enter into a contract or contracts for the completion of the work, according to the contract; or
- use such other methods that will be expedient for the completion of the contract in a satisfactory manner.

(b) Completion by Surety. The Secretary may elect to take the performance of the work from the Contractor. The Secretary may at that time notify and require the surety to complete the contract according to its terms. Also, require the surety to render within 3 months from the completion certificate date, but before payment on the final certificate, a detailed statement of the costs of the completion of the work, including receipts and disbursements of all funds received and paid on account. However, the responsibility of the surety extends only to the limit of the bond amount.

(c) Completion by Department Forces. The Secretary may elect to take the performance of the work from the Contractor and fulfill the contract with Department forces. At that time and in the State's name, the Secretary may take all right, title and interest in and to the equipment and material owned by the Contractor and assembled for use in the execution of the contract, and may use them for completion.

(d) Settlement of Contract. If the contract completion by any of the methods specified results in financial loss to the State, the Secretary may dispose of any of the remaining equipment and material taken over as specified in Section 108.08(a) or (c), without further legal process and in the manner that may be considered in the State's best interests. Any equipment or material not required for completion or recoupment of loss, or for legal charges against the contract, or any balance remaining from the disposition of material and equipment after deducting losses by the State, or any legal charges against the contract, will be turned over to the party legally or equitably entitled to them.

In the event the contract is completed by Department forces, all proper costs and legal charges incurred by the Department in connection with the contract will be deducted from money due or to become due to the Contractor. The Department will credit the Contractor with the amount realized from the disposal of equipment or material.

If legal charges against the contract and the expense incurred by the Department in connection with contract completion by any of the methods specified, less the credits herein provided for, exceed the sum which would have been payable under the contract for the completed work, the Contractor or the surety are liable to the State for the excess amount.

If such legal charges and expenses are less than the contract value of the completed work, the difference will be paid to the Contractor or such difference may be paid to the surety, in an amount not exceeding the total amount which has been paid by the surety on its obligations under the Performance Bond and the Payment Bond. In this event, the surety is required to furnish evidence satisfactory to the Secretary that such payments have been made and that any balance remaining after payment to the surety will be paid to the Contractor.

(e) Termination Clause. The State may, by written notice, with the approval of the FHWA where applicable, terminate the contract or any portion because of any of the following conditions:

- the Contractor is prevented from proceeding with the construction contract as a direct result of a President's Executive Order with respect to the occurrence of war or in the interest of national defense;
- the State or the Contractor is prevented from proceeding with the construction contract as direct result of an Order of a Court of competent jurisdiction;
- funds necessary for the project completion become unavailable;
- for the Department's convenience, the Department has determined that such termination will be in the State's best interest; or
- all of the work of any controlling operation is delayed for more than 90 consecutive calendar days, for any cause beyond the responsibility of the Contractor. The Secretary may enter into an Agreement with the Contractor or may terminate the contract by written notice to the Contractor. If an agreement is entered into, it will be executed by the Contractor and the Secretary, approved by the Surety and the Chief Counsel, the General Counsel or the Attorney General, or their designees.

When the contract, or any portion is terminated before completion of all items of contract work, payment will be made for each unit of work fully completed at the contract unit price and payment for each partially completed unit of work will be as mutually agreed or at the percentage of the contract unit price that the cost of the partially completed unit is of a fully completed unit with a maximum allowable of 100%. No claim for lost profits or damages of any kind will be allowed for the termination.

Acceptable material, obtained by the Contractor for the work, will be purchased from the Contractor at actual cost, as shown by receipted bills and actual cost records, at such points of delivery as may be designated.

Termination of any portion of the contract does not relieve the Contractor of responsibilities for the completed work, nor will it relieve the surety of its obligation for any claim arising out of the performance of the work.

108.09 NONCOMPLIANCE BY THE CONTRACTOR—In addition to the elective measures the Secretary may take for violation of the contract, as specified in Section 108.08, the Secretary will also have the discretionary right to take any or all of the following actions if the Contractor fails, neglects, or refuses to comply with the requirements specified in Sections 105.03, 107.12, 107.16(c), 110.03(d), or 901:

- The Secretary may shut down the work until the requirements of the violated section are met. In this event, no remission will be made in contract time for the period for which the work is shut down.
- The Secretary may withhold payment of estimates for work completed until the requirements of the violated section are met.
- The Secretary may enter upon the project and perform all work necessary to conform to the requirements of the section violated, then deduct the cost from money due or to become due to the Contractor or the surety. If the Contractor fails to comply with the requirements specified in Sections 107.12 and 107.16(c), the Secretary will not proceed until 48 hours after written notice to the Contractor and the surety that the Secretary will take such action.
- The Secretary has the right to enter upon the project and repair or replace public or private property which has been damaged in violation of Section 107.12, to estimate the amount of such damage, and to deduct the amount from money due or to become due to the Contractor or the surety. When money is deducted as provided, the Secretary will settle with the property owner and secure a written statement, releasing the State and the Contractor from further responsibility for such damage.

108.10 STRIKES OR LABOR DISPUTES—Time extensions will be considered appropriate in the event of a strike or labor dispute which causes, despite all reasonable efforts of the contractor to avoid it, a shutdown of the entire project or of one or more controlling operations, whether the strike or labor dispute involves a union bargaining with the Contractor, a subcontractor, the Department, or third parties. In no event, however, will the Contractor be entitled

to any delay costs for labor, material, equipment, or related expenses such as overhead or administrative costs, profit, etc., resulting from the strike or labor dispute, regardless of whether the strike or labor dispute involves a union bargaining with the Contractor, a subcontractor, the Department, or third parties affecting a controlling operation.

SECTION 109—MEASUREMENT OF QUANTITIES

109.01 MEASUREMENT—

(a) **Units of Measure.** Work performed under this contract will be measured in the following units shown in the Measurement and Payment sections of the Specifications and in the Design Items in the proposal, unless otherwise specified:

- **Lump Sum.** Not measured. Indicates complete construction of the item of work, as specified.
- **Each.** Measured by the number of individual items of work completed.
- **Linear Foot.** Measured parallel to the longitudinal base or foundation upon which items are placed, or along the longitudinal surface of the item.
- **(M. Linear Feet.** 1,000 Linear Feet, to the nearest 0.01 M. feet.)
- **Vertical Foot.** Measured vertically to the nearest 0.1 foot, with a minimum vertical measurement of 1 foot, at each unit.
- **Square Foot, Square Yard.** Measured by a two-dimensional area method on the surface of the item.
- **Cubic Yard.** Measured by a three-dimensional volume method.
- **Acre.** Measured by a two-dimensional area method on the surface to the nearest 0.1 acre.
- **Pound.** Measured by actual item net weight (avoirdupois).
- **Ton.** Measured by actual item net weight in short tons consisting of 2,000 pounds, avoirdupois.
- **Gallon.** Measured by actual item liquid volume.
- **M. Gallon.** Measured by actual item liquid volume consisting of 1,000 gallons, to the nearest 0.1 M. gallon.
- **(Foot Board Measure.** Measurement by a three-dimensional method of the actual item lumber board foot.)
- **(M. Feet Board Measure.** 1,000 feet board, to the nearest 0.01 M. feet board.)
- **Set.** Measured as an item unit set, consisting of two or more parts together, as specified.
- **Bag.** Measured as an item unit bag.
- **(Bushel.** Measured by actual item dry measure consisting of 32 quarts.)

(b) **General.** Measurement will be according to the system of weights and measures recognized by the United States Bureau of Standards. Method of measurement and computation of quantities will conform to generally recognized engineering and construction practice. Computer generated or electronic digital measuring and computing devices are acceptable methods.

A station, when used as a definition or term of measurement, will be 100 linear feet, horizontal measurement.

When required, weigh material on accurate, acceptable scales, using competent, qualified personnel at locations designated. When material is shipped by rail, the car weight may be accepted, if only the actual weight of material is measured. However, car weights will not be acceptable, for material passed through mixing plants. Weigh empty trucks used to haul material measured by weight daily, as directed. Mark each truck with a distinct, legible identification. Trucks may be selected at random and weighed, as directed, to verify the weight of material by weighing the truck empty and loaded on other acceptable scales.

Use acceptable vehicles to haul material to be measured by volume at the delivery point. Use acceptable vehicles of any size or type, provided the actual body contents can be readily and accurately determined. Load vehicles to at least their water level capacity. Level the loads at the delivery point.

If requested, material measured by the cubic yard may be weighed and converted to tons, if approved in writing by the District Executive. Factors to be used for conversion from weight measurement to volume measurement or weight measurement to area measurement will be determined by the Representative and agreed to by the Contractor before using this method of measurement.

Measure asphalt material by the gallon or ton, as indicated. Measure volumes at 60F or correct to volume at 60F, using ASTM D 1250 for asphalts or ASTM D 633 for tars. Net certified scale weights, or weights based on certified volumes for rail shipments, will be used as a measurement basis. Weights will be subject to correction when asphalt material has been lost from the car or by the distributor, wasted, or otherwise not incorporated in the work. If asphalt materials are shipped by truck, the net certified weight or volume, subject to correction for loss or foaming, may be used for computing quantities.

SECTION 110—PAYMENT

110.01 GENERAL—Payment for items of work performed under this contract will be made at the contract price per unit of measure, as specified in Section 109.01 for the item complete in place, or portions thereof. Unless otherwise specified, the contract unit price will cover all costs for materials, labor, and equipment:

- specified, described, or identified in each section of the specifications (including the special provisions and plans);
- identified in each section of the specifications (including the special provisions and plans) as “as required” or “as directed;” or
- allowed under the specifications (including the special provisions and plans) and for which payment is not expressly provided.

In addition to the above, the contract price includes all other costs incurred in performing work on the project (e.g., home office overhead) and all profit. The contract price is accepted as payment in full for all risk, loss, damage, or expense of every kind arising out of the nature of the work or the performance as specified in Section 107.20.

Work specified as “incidental” in the Measurement and Payment section of the specification for a contract item is to be considered as an additional obligation to the other work required for the item(s). This incidental work is not payable directly, but is to be considered included in the contract price for the item(s) of work specified.

Removal and replacement of defective work, as specified in Section 105.12, will not be paid by the Department.

No payment will be made for work in excess of that indicated, shown, or specified, unless otherwise accepted in writing by the Secretary.

Removal of material found in excavation areas and accepted for use, as specified in Section 106.04, will be paid for at the contract unit price for the class of excavation in which it is found. Payment will also be made for the contract bid item in which the excavated material is used.

Work, material, or labor specified for an item will not be measured or paid for again under any other indicated pay items.

110.02 DIFFERING SITE CONDITIONS, SUSPENSIONS OF WORK, AND SIGNIFICANT CHANGES IN THE CHARACTER OF WORK—

(a) General. If differing site conditions, changes in quantities, or alterations of the construction drawings will significantly increase or decrease the cost of performing the work directly affected, perform such work only when authorized in writing, as specified in Section 110.03(a). Payment for such work will be made as specified in Section 110.03.

(b) Differing Site Conditions. During the progress of the work, if subsurface or latent physical conditions, differing materially from those indicated, are encountered at the site, or if unknown physical conditions of an unusual nature, differing materially from those ordinarily encountered and generally recognized as inherent in the work, are encountered at the site, the party discovering such conditions is responsible for promptly notifying the other party, in writing, of the specific differing conditions, before the site is disturbed and before the affected work is performed.

Upon written notification, the Representative will investigate the conditions, and if it is determined that the conditions materially differ and cause an increase or decrease in the cost or time required for the performance of any work under the contract, an adjustment, excluding loss of anticipated profits, will be made as specified in Section 110.02(a). The Representative will notify the Contractor of the determination whether or not an adjustment of the contract is warranted.

No contract adjustment that results in a benefit to the Contractor will be allowed unless the Contractor has provided the required written notice.

No contract adjustment will be allowed under this section for any effects caused on unchanged work.

(c) Suspensions of Work Ordered by the Representative. If the performance of all or any portion of the work is suspended or delayed by the Representative in writing, as specified in Section 107.16(c), for an unreasonable period of time (not originally anticipated, customary, or inherent to the construction industry) and the Contractor believes

that additional compensation and/or contract time is due as a result of such suspension or delay, submit to the Representative, in writing, a request for adjustment within 7 calendar days of receipt of the notice to resume work. Set forth the reasons, and support for such adjustment, in the request.

Upon receipt, the Representative will evaluate the Contractor's request. If the Representative agrees that the cost and/or time required for the performance of the contract has increased as a result of such suspension and the suspension was caused by conditions beyond the control of and not the fault of the Contractor, its suppliers, or subcontractors, and not caused by weather, the Representative will make an adjustment, excluding profit, as specified in Section 110.03 and Section 108.06, as applicable. The Representative will notify the Contractor of the determination whether or not an adjustment of the contract is warranted.

No contract adjustment will be allowed unless the Contractor has submitted the request for adjustment within the time prescribed.

No contract adjustment will be allowed under this clause to the extent that performance would have been suspended or delayed by any other cause, or for which an adjustment is provided for or excluded as specified in Section 107.16(c).

(d) Required Changes in the Scope of Work. The Department reserves the right to make, in writing, at any time, such changes in quantities and such alterations in the work as are necessary to satisfactorily complete the project. Such changes in quantities and alterations in the work will neither invalidate the contract or release the surety, and the Contractor agrees to perform the work as changed or altered.

If alterations in the work or changes in quantities do not significantly change the character of the work to be performed under the contract, the work will be paid for at the original contract unit price.

If alterations in the work or changes in quantities significantly change the character of the work under the contract, whether such alterations or changes are in themselves significant changes to the character of the work or by affecting other work cause such other work to become significantly different in character, an adjustment, excluding loss of anticipated profits, will be made as specified in Section 110.03. The basis for the adjustment will be agreed upon before the performance of the work. If a basis cannot be agreed upon, the work will be paid for as extra work as specified in Section 110.03.

The term "significant change in character" applies only to the following circumstances:

- If the work as altered differs materially in kind or nature from that involved or included in the original proposed construction, or
- If any major item of work as defined in Section 101 is increased to in excess of 125% or decreased to below 75% of the original contract quantity. Any allowance for an increase in quantity applies only to that portion in excess of 125% of the original contract item quantity or, in case of a decrease below 75%, to the actual quantity of work performed.

When a contract item experiences a significant change in character as a result of a decrease to below 75% of the original contract quantity, the actual quantity of work performed may be paid at an adjusted price, as agreed upon with the Contractor and as approved; however, total compensation will not exceed the contract item's original value. Item value is defined as the original contract quantity multiplied by the contract unit price.

(e) Adjustment of Lump Sum Items. The original contract price for a lump sum item, where quantities and unit prices for component items are designated on a component item schedule submitted as specified in Section 103.01(a), will be adjusted only if differing site conditions, as specified in Section 110.02(b), or changes directed by the Representative will significantly increase or decrease the cost of performing the work. If the Representative determines that conditions materially differ and cause an increase or decrease in the cost or time for performance of the work, or if increases or decreases in quantities are required due to a change directed by the Representative, adjusted payment will be made as specified in Section 110.03.

110.03 ADDITIONAL WORK, EXTRA WORK, AND EXTRA WORK ON A FORCE ACCOUNT BASIS—

(a) General. Work as specified in Sections 104.02 and 104.03 will be paid, if authorized in writing by the District Executive, as additional work, extra work, or extra work on a force account basis. Compensation will be limited to the work authorized in writing and actually performed. Work performed before written authorization will be at the Contractor's risk.

A work order identifying the work to be done and the price to be paid therefore will be processed before or during

the performance of the work. To avoid interrupting the project, written authorization to perform work under this section will be in the form of a letter or other writing from the District Executive, or the Inspector-in-Charge, in writing to the Contractor when confirming an oral authorization of the District Executive, issued within a reasonable length of time.

If the work is to be paid as additional work, the District Executive's writing will refer to the contract price for that work.

If the work is to be paid as extra work and:

- is such that a reasonable price therefore can be negotiated, and
- is such that force account records, if necessary, can be kept by the Department,

the District Executive's writing will authorize commencement of work as extra work. Within 10 calendar days of such authorization, submit a price for the extra work with back-up data to the District Executive for transmittal to the Representative. Pending approval of the price, force account records will be kept as stated below. If the price is accepted, the work will be paid only at the negotiated price, which will not be renegotiated once submitted for acceptance.

If the work is to be paid as extra work and:

- the Contractor and District Executive cannot agree on a tentative price, therefore, and
- the work is such that force account records cannot be kept by the Department,

the District Executive's writing will contain a firm, binding price determined by the District Executive to be fair and equitable for the work to be performed.

If the District Executive and Contractor cannot agree on a tentative price for the extra work and if the work is such that force account records can be kept by the Department, the District Executive's writing will state that such work is to be paid on a force account basis. Force account records will be kept as stated below.

Payment for additional work, extra work, and extra work on a force account basis is accepted as payment in full for all profit and for all equipment, labor, material, field overhead, home office and general administrative expenses, and every other expense incurred as a result of the additional or extra work. No claims for additional compensation of any kind arising out of or relating to such work can be asserted against the Department with the Board of Claims.

(b) Additional Work. This includes only the following:

- work of the type already provided by the contract, and
- work for which there is a contract price.

Perform all such work only when authorized in writing by the District Executive, as stated in Section 110.03(a).

All additional work will be paid at the contract price and in the same manner as if it had been included in the original contract.

(c) Extra Work. This includes only the following:

- work arising from changes specified in Section 110.02 that result in a significant increase or decrease in the cost of performing that work, or
- work, having no quantity and/or price included in the contract, which is determined by the District Executive to be necessary or desirable to complete the project.

Perform all such work only when authorized in writing by the District Executive, as stated in Section 110.03(a). All extra work will be paid only as stated in Section 110.03(a).

(d) Force Account Work. Perform extra work on a force account basis only when directed in writing by the District Executive, as stated in Section 110.03(a).

Upon receipt of written authorization to perform force account work, schedule a meeting with the Representative to discuss any concerns regarding the work itself, as well as expectations regarding reimbursement for the associated costs. Topics of discussion at this meeting should include, but are not limited to, the availability of needed materials or equipment; expectations regarding reimbursement for off-site labor, “show up” time, travel time, and/or paid non-working holidays; payment of standby time for owned equipment; the need to rent equipment; the need for consumables and whether they will be purchased or taken from stock; and the availability of needed subcontractors and the incurring of costs for overnight travel.

The Department will keep records of extra work done on a force account basis. Compare force account records with those kept by the Department, at the end of each day or as directed, to ensure accuracy and obtain concurrence. Report any unresolved disagreements with such records to the Representative. Failure to review the Department’s records or to report disagreements with such records will create a presumption that the Department’s records are complete and accurate.

Payment for extra work performed on a force account basis will be made, as specified herein, upon completion of the work. Progress payments will be made only when an itemized estimated force account of cost is provided, in writing, within 10 working days after receipt of the Department’s written authorization to perform the extra work on a force account basis.

1. Labor. Wages of forepersons; equipment operators; and skilled, semiskilled, and common laborers directly assigned to the specific operation or directly involved in the off-site handling, loading, and transportation of material, equipment, and/or purchased consumables needed specifically for the force account work will be reimbursed, as direct labor, at the actual wage rate and fringe benefit rate paid, for each hour that such employees are engaged in the performance of authorized work and, if directed, overtime as provided for in existing laws, regulations collective bargaining agreements, or other employment contracts generally applicable to the classes of labor employed in the work. The workforce utilized and hours paid for off-site handling, loading, and transportation must be mutually agreed upon as being fair and reasonable given the nature and scope of the force account work.

Additionally, if a labor crew assigned to the force account operation arrives on the job site and is not permitted to perform work of any kind (i.e. contract work, Additional Work, or Extra Work) due to circumstances beyond its control, payment of “show up” time as provided for in an existing collective bargaining agreement or employment contract will be reimbursed as direct labor at the actual wage rate and fringe benefit rate paid. Reimbursement for the payment of reasonable travel time from a central meeting location to the site of the force account work and/or for non-working paid holidays may be made at the actual wage rate and fringe benefit rate paid if it is mutually agreed that such costs are unavoidable and being incurred for the convenience of the Department. Additionally, with regard to reimbursement for non-working paid holidays, the Contractor must show that the payment is required by existing laws, regulations, collective bargaining agreements or other employment contracts, or being made in accordance with an established, written company policy, and that any prerequisite or post requisite work hours were earned completely in the performance of the force account work.

Finally, if a worker in a given labor classification is engaged in the performance of work not of the type typically performed by individuals in that classification, and there is an OSHA requirement for specific Personal Protective Equipment (PPE) to be used by individuals performing such work, the cost of the required PPE will be reimbursed as purchased consumables as specified in Section 110.03(d)5.a.

Indirect labor costs will be paid, without markup, as a percentage of the total base labor cost, as supported by certified payroll records and, when required, a fringe benefit letter. The total base labor cost will be the total amount paid directly to the force account workforce based on the actual wage rate paid each individual worker, which is to include that portion of the worker’s fringe benefit rate also paid directly, if any. Any amount paid on behalf of the members of the force account workforce as tax exempt fringe benefits will not be included in the indirect labor cost computation. Allowable indirect labor costs include the following:

- Social Security Tax at the percentage legally required;
- Medicare Tax at the percentage legally required;
- Unemployment Taxes at the estimated effective rate computed as specified below;
- Workers’ Compensation Insurance at the rate computed as specified below; and
- Liability Insurance at the current, policy period rate used to account for the cost of applicable Liability Insurance provided as specified in Sections 103.05 and 107.14. Update the liability rate annually in

ECMS prior to the start of each new policy period. The Liability Insurance rate entered into ECMS is to be accompanied by a certification attesting to the fact that the rate being charged for Liability Insurance for force account work does not exceed the applicable, current policy period rate used when determining unit prices for bidding purposes during the policy period. Maintain appropriate records needed to verify the certification for audit purposes, including bid documents, records of all payments, rate computations, and policy statements, in accordance with the provisions of Section 112.C

Contractors and subcontractors are to compute their company's estimated effective rate for unemployment taxes for the current calendar year by dividing total, company-wide, Pennsylvania and Federal Unemployment Tax payments for the prior calendar year by the total wages and salaries reported for applicable employees for the same period. The tax payment, wage, and salary amounts used to compute the estimated effective rate are to be consistent with the information reported on Pennsylvania Unemployment Compensation tax forms filed with the Department of Labor and Industry and on Federal Unemployment Tax returns filed with the Internal Revenue Service. Each employer reports its state and federal unemployment tax payments under a unique account or identification number representing the company and all employees for whom unemployment taxes must be paid. The gross wages and unemployment tax contribution reported on PA Form UC-2 under the employer's PA UC account number, along with the total payments to all employees and FUTA tax liability reported on Form 940 under the company's Employer Identification Number (EIN), are considered company-wide amounts representing all applicable employees for the purpose of computing the company's estimated effective rate for unemployment taxes. A company's estimated effective rate for unemployment taxes is to be updated after April 15 of each calendar year based on the prior calendar year's reported total wages and salaries and total tax payments.

Contractors and subcontractors are to compute their company's Workers' Compensation Insurance rate based on an average of applicable policy premium costs; amounts paid or credited for deductibles, loss claims, and retrospective adjustments; and actual payroll basis over the last five, consecutive, complete policy periods. The average of the policy premium amount established by the insurance carrier during its end-of-policy period, premium adjustment audit for each of the last five, consecutive, complete policy periods is to be added to the average of the total amount paid during the last five, consecutive, complete policy periods for deductibles and/or to settle loss claims, and the average of the total amount paid to or credited by an insurance carrier (current or prior) during the last five, consecutive, complete policy periods as retrospective adjustments to policies in effect during prior policy periods, dividing by the average of the applicable Payroll Basis for the last five, consecutive, complete policy periods, and multiplying the result by 100. The term "policy periods" as used herein is defined as the period of time covered by the last five, consecutive Workers' Compensation Insurance policies for which an end-of-policy period, premium adjustment audit was completed. When determining the policy premium amount for each year and its associated Payroll Basis, only the portion of each that is attributable to the company's field or project-based workforce need be included. The portion of each that is attributable to the company's clerical or sales workforce may be excluded. Additionally, any premium amount and associated Payroll Basis that is attributable to a company workforce employed in a state other than PA may be excluded. As support for the Worker's Compensation Insurance rate being charged, provide a copy of the last five, consecutive, end-of-policy period Audit Adjustment statements prepared by the insurance carrier and ensure each statement indicates the Payroll Basis upon which the adjusted premium was based. Additionally, provide a schedule (i.e. spreadsheet) of applicable deductible and claim payments made during the last five, consecutive, complete policy periods and include, at a minimum, the amount, payment date, and invoice number for each payment. Finally, provide a schedule of applicable payments made and credits received during the last five, consecutive, complete policy periods as retrospective adjustments and include, at a minimum, the amount, the payment/credit date, and the policy period to which each adjustment is applicable. If a company involved in the performance of force account work has not been in business long enough to compute its Workers' Compensation Insurance rate based on an average of five, consecutive, complete policy periods of cost data, compute the company's Workers' Compensation Insurance rate based on average cost data from all available, consecutive, complete policy periods.

Contractors and subcontractors will be required to enter their company's estimated effective rate for unemployment taxes into ECMS after April 15th of each calendar year. The rate will be effective for a one year period ending on April 15th of the subsequent calendar year. Additionally, Contractors and subcontractors will be required to enter and their computed Workers' Compensation Insurance and Liability Insurance rates into ECMS, along with the applicable expiration date for each type of coverage, prior to the start of each new insurance policy period. Supporting documentation demonstrating that the Workers' Compensation Insurance rate entered into ECMS was computed as specified above will be required, as will the required Liability Insurance rate certification. The coverage expiration date information will be tracked by ECMS and used to prompt the Contractor or subcontractor to update its rate information as existing policy periods expire.

2. Material. An item or product purchased specifically for the force account work that becomes a permanent part of the completed work will be considered a material for reimbursement purposes. The cost of material used will be reimbursable, including applicable sales tax and transportation costs charged by the material supplier.

3. Equipment. Reasonable rental rates for equipment, including trucks and machinery, mutually considered necessary, will be allowed, computed as follows:

3.a Owned Equipment. The term “owned equipment”, as used herein, applies to equipment (including trucks and machinery) that the Contractor is required to provide for the proper execution of the original contract work, as specified in Section 108.05(c), whether such equipment is actually owned by the Contractor, is leased (rented), or has been obtained in some other manner.

For any owned equipment used in the performance of force account work, a rental rate will be determined using data obtained from the Rental Rate Blue Book (aka. EquipmentWatch Cost Recovery), which is published by EquipmentWatch, a division of Penton, Inc. Blue Book published data considered “current” as of the first day that work is performed on a specific force account is the data that will remain applicable throughout the performance of such work even if Blue Book data for an applicable piece of owned equipment is updated during that time. Outdated Blue Book data will be voided by the Department annually, as of a specific date, and no longer accepted thereafter.

The Department utilizes ECMS to keep electronic records of force account work. To enable the Department to electronically account for owned equipment utilized by Contractors and subcontractors in the performance of force account work within ECMS, the following actions must be taken:

- Purchase a subscription to all necessary volumes of the Blue Book, in electronic format, based on the various ages of the pieces in the Contractor’s equipment inventory for Department projects,
- Utilize the All Saved Models tool available to subscribers to create a Department project equipment inventory,
- From the equipment included in the All Saved Models inventory, create an equipment Group,
- Use the Group Manager tool to select the applicable equipment Group and generate a Basic Fleet Report (i.e. the report that lists the ID, subtype, manufacturer, model, year, serial number, and configuration, as applicable, for each piece of equipment in the Group),
- Using the available “CSV” button, export the Basic Fleet Report to a spreadsheet and save the spreadsheet in a .csv (Comma Separated Values) file format. Note: Do not use the available “PDF” button to export the Basic Fleet Report as ECMS will not allow a spreadsheet saved in .pdf format to be imported.
- At this point, if the Contractor or subcontractor’s owned equipment inventory includes any pieces that are not listed in the Blue Book, such equipment must be added to the spreadsheet. When adding equipment with no Blue Book listing to the spreadsheet, care should be taken to ensure that applicable information relating to ID, subtype, manufacturer, model, year, serial number, and configuration, as it is entered, is consistent with the existing column headings.
- Log in to ECMS and import the .csv file using the “Import Equipment” hyperlink found on the “Contractor Portal” screen.

At a minimum, the equipment Group imported to ECMS must include all of the owned equipment that will be used to perform the authorized force account work on a given project. However, to avoid having to repeat the above import procedure for future force account work on the same project or for force account work on other projects, the Contractor may elect to import a spreadsheet file that lists all of the equipment assigned to a given project or its entire Department project, owned equipment inventory. The ECMS equipment Group import procedure may be repeated at any time (e.g. to import new pieces added to the inventory or to import a piece that was missed in a prior import).

An hourly rental rate for owned equipment will be computed by dividing the Blue Book monthly rate by 176. To this rate, the Blue Book area adjustment percentage for Pennsylvania and the age adjustment percentage for the

model year of the piece of equipment will be applied. Blue Book city-level regional adjustment factors will not be used in computing an hourly rental rate for owned equipment.

An allowance will be made for operating costs by adding, to the above adjusted hourly rate, the Blue Book estimated operating cost per hour, for each hour that the owned equipment is actually in operation on the force account work.

If a piece of owned equipment is required at the work site on a standby basis, but is not operating, compensation, if any, will be at 50% of the adjusted hourly rate, exclusive of operating costs.

Payment for standby time will not be made on any day a piece of owned equipment is operated the entire work day. For a standard 8-hour work day, when equipment operates less than 8 hours, payment for standby time will be limited to the number of hours that, when added to the operating time for that day, equals 8 hours. For work days that exceed 8 hours, when equipment operates less than 10 hours, payment for standby time will be limited to the number of hours that, when added to the operating time for that day, equals 10. When force account work extends into one or more full weeks, in any 1-week period payment for standby time will be limited to the number of hours that, when added to the operating time for that week, equals 40 hours, regardless of the number of hours per day or days per week the Contractor works (i.e. overtime, multiple shifts, etc.). Payment for standby time will not be made on days the Contractor elects not to work or days not normally a work day. Standby time will not be paid if equipment is awaiting repair, while repairs are being made, or for maintenance or servicing of equipment. Standby time will not be paid for equipment not on the job site (i.e. while equipment is awaiting transport or being transported to the job site).

With the exception of owned equipment used for maintenance and protection of traffic, owned equipment used on a 24-hour basis will be reimbursed at a daily rental rate, which will be determined by dividing the Blue Book monthly rate by 22. Owned equipment used for maintenance and protection of traffic on a 24-hour basis will be reimbursed at the Blue Book daily rate. Applicable adjustment percentages from the Blue Book will be applied.

Where owned equipment utilized in the performance of force account work is not listed in the Blue Book, a rental rate will be determined based on the sale price for such equipment at the time of purchase, if the equipment is actually owned, or the applicable lease agreement. In these cases, for equipment that is actually owned, the monthly rate will be computed as 6% of the sale price, and the total hourly rate determined by dividing the monthly rate by 160, when the equipment is operating, and by 352, when the equipment is required at the work site on a standby basis, but not operating, with no adjustment percentages applied. For equipment that is leased, an hourly rental rate will be determined by prorating the lease cost. Additionally, if not included in the lease cost, an allowance will be made for operating costs by adding, to the hourly rental rate, the Blue Book estimated operating cost per hour for an equivalent piece of equipment for each hour the equipment is actually in operation on the force account work. The equivalence of the piece of equipment in the Blue Book listing to the piece of equipment actually used must be mutually agreed upon.

With the exception of owned equipment used for maintenance and protection of traffic, owned equipment used on a 24-hour basis, with no listing in the Blue Book will be reimbursed at a daily rental rate, which will be computed as 6% of the sale price for the equipment at the time of purchase divided by 22, with no adjustment percentages applied. Owned equipment used for maintenance and protection of traffic on a 24-hour basis with no listing in the Blue Book will be reimbursed at a daily rental rate, which will be computed as 15% of the sale price for the equipment at the time of purchase divided by 22, with no adjustment percentages applied. If, instead of being purchased, the equipment was actually fabricated by the owner, the "sale price" used to determine the daily rental rate will be the owner's total, documented, fabrication cost. If equipment used on a 24-hour basis with no listing in the Blue Book is leased, whether or not the equipment is used for maintenance and protection of traffic, the daily rental rate will be determined by prorating the lease cost.

The rates established above include the cost of fuel; oil; lubrication; supplies; necessary attachments; repairs; overhaul and maintenance of any kind; storage; all costs of moving equipment on to and away from the work site, except as specified below; and all incidentals.

If a piece of owned equipment, not already on or near the project site, is needed specifically for the force account work, the cost of moving the equipment on to and away from the work site will be reimbursed, provided the equipment will not be used immediately thereafter in the performance of original contract work.

The Department will not approve any Contractor requests for reimbursement of owned equipment costs incurred in the performance of force account work in excess of those outlined above unless such costs were mutually agreed upon, in writing, based on an acceptable cost breakdown prepared by the Contractor.

3.b Rented Equipment. If a piece of equipment needed for the force account work is not of the type required to be provided by the Contractor for the proper execution of the original contract work, or if the piece of equipment needed is "owned" but not currently available, and the equipment can be obtained by rental, discuss the need to rent the equipment with the Representative and obtain approval of the rental source and the rate to be paid before renting

the equipment for the force account work. The Department will not provide reimbursement for equipment rented without the prior knowledge and approval of the Representative.

The Contractor will be reimbursed the actual invoiced cost for rented equipment, plus the cost of transporting the equipment to and from the work site, provided transportation is not included in the rental cost and the rented equipment will not be used immediately thereafter in the performance of original contract work. An allowance will be made for operating costs by adding, to the rental cost, the Blue Book estimated operating cost per hour for each hour the rented equipment is actually in operation on the force account work. If the rented equipment has no listing in the Blue Book, the Blue Book estimated operating cost per hour for an equivalent piece of equipment will be allowed, as mutually agreed upon.

Transportation charges for each piece of rented equipment, to and from the site of the force account work, will be paid provided:

- Return charges do not exceed the delivery charges,
- Haul rates do not exceed the established rates of licensed haulers, and
- Charges are restricted to those units of equipment not readily available and not on or near the project.

Equipment that is rented or leased from an entity that is a division, affiliate, or subsidiary of, or that is in any other way related to, the Contractor or its parent company will be considered owned equipment for reimbursement purposes and subject to the provisions of Section 110.03(d)3.a.

4. Services by Others. Specialized construction analyses, engineering services, and work not considered subcontract work requiring prequalification will be considered services by others for reimbursement purposes. Additionally, when required exclusively for the force account work, as directed, the securing of permits, bonds, and specialized insurance coverage, of a type not already required by the contract, will be considered a service by others. The Contractor will be reimbursed the actual invoiced cost of each service by others; including allowable permit fees, bond premiums, and insurance premiums; plus 5% to cover administration and all other costs. The markup on service by others costs will be limited to 5% only, regardless of whether the service was arranged by the Contractor or a subcontractor performing any or all of the force account work. The overhead and profit allowances specified in Section 110.03(d)7 are not applicable to service by others costs.

5. Consumables. An item needed specifically for the force account work that does not become a permanent part of the completed work, the useful life of which is either fully or partially expended in the performance of the work, will be considered a consumable for reimbursement purposes. Reimbursement for consumable items will be determined as follows:

5.a Purchased Consumables. If a consumable item needed for the force account work is purchased (new), as evidenced by a supporting invoice, and the item's useful life is completely expended in the performance of the work, as mutually agreed upon by the Representative and the Contractor, the full cost of the item will be reimbursed, including applicable sales tax and transportation costs. Otherwise, that portion of the item's useful life expended in the performance of the force account work will be determined, as mutually agreed upon by the Representative and the Contractor, and reimbursement made at a prorated cost. In such cases, the purchase price of the item plus applicable sales tax will be prorated, with applicable transportation costs being reimbursed in full.

5.b Consumables Taken From Stock. If one or more of the items shown in Table A is needed for the force account work and is not purchased (new) but rather obtained from the Contractor's existing inventory of used consumables, the item will be considered as being taken from stock. Given the fact that the usage history of these items cannot always be accurately assessed by the Department, reimbursement will be made based on the percentage of value and payment frequency specified in Table A. When utilizing Table A to compute reimbursement for a consumable taken from stock, item value will be established based on a supporting invoice. The supporting invoice must show the purchase of the item (new or used), from a vendor regularly engaged in the sale of such items. Reimbursement based on the percentage of value in Table A includes the cost of off-site handling and loading the consumable (e.g. at the Contractor's yard). Applicable transportation costs to the project site (i.e. labor and equipment costs) will be reimbursed separately. All consumables taken from stock remain the Contractor's property upon completion of the force account work. No additional payment will be made for a consumable taken from stock if the

Contractor elects to leave the item in place for its own convenience. No payment will be made for a consumable taken from stock if the Contractor is unable to furnish a supporting invoice meeting the above requirements.

TABLE A

Consumable Item	Unit of Measure	% of Value Reimbursed	Payment Frequency
Structural Steel – Plate	LB	1%	Monthly*
Metal Bridge Overhang Brackets	Each	1%	Monthly*
Temporary Concrete Barrier	LF	1%	Monthly*
Steel Sheet Piling	LB	1%	Monthly*
Structural Steel – Falsework	LB	1%	Monthly*
Wood – Structural Timber	Board Foot	33%	One Time
Wood – Dimensional Lumber	Board Foot		
Plywood	Sheet		
Concrete Forms – Metal	SF	1%	Monthly*
Concrete Forms – Laminated			
Concrete Curing Blankets	Each	25%	One Time

*For each 1-month period or portion thereof.

6. Subcontracting. If any or all of the force account work is to be performed by an approved subcontractor, the work must be considered subcontract work requiring prequalification and the Contractor's need to subcontract the work must be approved. Payment for work performed by a subcontractor, will be determined based on a complete statement of applicable material, labor, and equipment costs, computed as specified herein, plus applicable markups for overhead and profit.

If a subcontractor's workforce must be in overnight travel status while performing force account work, any costs incurred for hotel rooms, per diem, subsistence, travel allowance, or any other similar expense may be reimbursed, provided it is mutually agreed that such costs are unavoidable and being incurred for the convenience of the Department. Overnight travel costs, when agreed to, will be reimbursed as service by others, as specified in Section 110.03(d)4.

7. Overhead and Profit. Except for work considered to be service by others, as specified in Section 110.03(d)4, to cover all administration, general and project superintendence, other overhead, bonds, insurance, anticipated profit, and use of small tools and equipment for which no rental is allowed (i.e. tools and/or equipment having a sale price at the time of purchase of \$1,000 or less), 15% will be added to the total material cost, 30% will be added to the total direct labor cost, and 5% will be added to the total cost of equipment rented as specified in Section 110.03(d)3.b, and the total cost of consumables provided as specified in Section 110.03(d)5. If applicable, in addition to the above markups, 5% will be added to the total cost of any force account work performed as approved subcontract work as specified in Section 110.03(d)6.

8. Statements. Upon completion of force account work, prepare an itemized statement of the cost of the work, in the form of a properly completed ECMS Actual Force Account record, detailed as follows:

- Name, classification, work dates, daily hours, total hours, base pay rate, fringe benefit rate, total pay rate and extension for each foreperson; equipment operator; and skilled, semi-skilled, and common laborer;
- Description (year, make, model, axel configuration, capacity, horsepower, etc.), Blue Book edition reference, use dates, daily hours, total hours, rental rates (operating and standby) and extension for each piece of owned equipment and/or description, rental cost, transportation costs (if separate), and extension for each piece of rented equipment;

- Description, quantity, unit of measure, unit price and extension for all materials, applicable sales tax, and transportation costs charged by the material supplier;
- Name, description, quantity, unit price, and extension for all consumables;
- Name, description, and amount for all services by others; and
- Rates paid for liability insurance, workers' compensation insurance, and unemployment taxes.

Statements of labor costs are to be supported by certified payroll records. If certified payroll records do not indicate the fringe benefit rate being paid, furnish a notarized statement, on company letterhead paper, listing the total fringe benefit rate for each applicable labor classification, showing how the total rate is proportioned and distributed, and identifying the portion of the rate, if any, that is being paid directly to individual workers, which would be subject to payroll taxes and therefore considered part of the base labor cost. If a salaried working foreman is involved in the force account work and the Contractor elects not to include that individual on certified payroll records, furnish an affidavit certifying that the individual's combined salary and benefit package is equivalent to or exceeds the wage and fringe benefit rates being charged.

Statements of material costs (including sales tax and transportation costs), rented equipment costs, consumables costs, and service by others costs are to be supported and accompanied by invoices, receipts, or canceled checks.

If materials used in the force account work are not specifically purchased for the work but are taken from the Contractor's stock or provided by entities that are divisions, affiliates, subsidiaries or in any other way related to the Contractor or its parent company, and a supporting invoice, receipt, or canceled check cannot be provided, furnish an affidavit certifying that the materials were obtained as described above, that the quantity claimed was actually used, and that the price and transportation costs claimed were actually incurred.

If the Contractor fails to furnish the required itemized statement of the cost of force account work, detailed as specified, within 90 calendar days after completion of the force account work, final payment for the work will be made based on the daily force account records kept by the Department. In such cases, since the Department will be unable to verify the prices paid for materials, rented equipment, consumables, and services by others due to the Contractor's failure to provide supporting invoices, receipts, or canceled checks, the total cost of unsupported material, rented equipment, consumables, and/or services by others will be fully discounted and not included in the final payment amount.

When the required itemized statement of the cost of the force account work, detailed as specified, is furnished within 90 calendar days after completion of the force account work, the Department will review the submission and notify the Contractor, in writing, within 14 calendar days, regarding all corrections that must be made and all outstanding support documentation that must be provided. Make all necessary corrections, obtain all missing support documentation, and resubmit the itemized statement within 14 calendar days of the date of the Department's written notification. If the Contractor fails to furnish a properly completed and fully supported statement of the cost of force account work within the 14-calendar day period, final payment for the work will be made based on the Contractor's original submission and the daily force account records kept by the Department. In such cases, the total cost of any material, rented equipment, consumables, and/or services by others for which a supporting invoice, receipt, or canceled check has not been furnished will be fully discounted and not included in the final payment amount.

Extension(s) of either of the above 14-calendar day periods will be made only by mutual written consent of the parties to the contract provided such written consent is given before the expiration of the applicable 14-day period.

If the amount already paid to the Contractor via progress payments exceeds the final payment amount computed after discounting unsupported material, rented equipment, consumables, and/or service by others costs, the overpayment amount will be recouped through the processing of a negative Force Account Adjustment.

The Contractor's failure to submit all required supporting invoices, receipts, or canceled checks, releases and forever discharges the Department from any claims relating to the act of discounting the cost of unsupported material, rented equipment, and/or services by others before making final payment for force account work.

(e) Disputes. Notwithstanding the provisions specified in Section 105.01, in the event of a disagreement with the District Executive as to whether work is:

- original contract work or additional work,
- original contract work or extra work, or

- additional work or extra work,

notify the Inspector-in-Charge immediately of such disagreement and confirm the disagreement in writing to the District Executive within 10 calendar days. Upon notification to the Inspector-in-Charge of such disagreement, records will be kept daily of all labor, equipment, and materials used from that day forward in the disputed work. Keep and maintain such daily records in the field. Claim no extra costs of any kind for work performed before notifying the Inspector-in-Charge of disagreements with the District Executive's decision. On each Monday, compare records of the previous week's work with those kept by the Department and review for accuracy. Report to the District Executive within 10 calendar days of each review all disagreements with such records or to report disagreements with such records. Refusal or repeated failure to meet to review the Department's records or to report disagreements with such records will create an irrebuttable presumption in favor of the Department that its records are accurate.

Disputes concerning all such work will be resolved by the District Executive and payment will be made on the basis determined by him.

In the event of a disagreement with the decision of the District Executive, comply with provisions specified in Section 105.01 concerning due notice in writing of an intent to file a claim and send a copy of the written notice to the District Executive within the time frame allowed by that section. If written notice is not submitted to the District Executive within 10 calendar days of receipt of the District Executive's decision, daily records of labor, equipment and materials will no longer be kept by the Department and no claim for additional compensation of any kind arising from or relating to the disputed work or the decision of the District Executive can be filed with the Board of Claims.

If due notice in writing is submitted to the District Executive and Deputy Secretary for Highway Administration within the 10 calendar-day period, continue to keep and review daily records, as provided above, until completion of the disputed work.

With the exception of those specific daily records or portions thereof on which written disagreements were filed with District Executive as provided above, any claim for damages filed with the Board of Claims arising out of or relating to the disputed work or the decision of the Secretary can be measured at the hearing solely by the aforementioned daily records kept by the Department.

110.04 PRICE ADJUSTMENT OF ASPHALT MATERIALS—These requirements provide for a price adjustment, in the form of a payment to the Contractor or a rebate to the Department, for fluctuations in the cost of asphalt cement used in the asphalt materials placed as part of the construction work specified in the following Sections:

313	360 ^b	420	471	489 ^e	656 ^d
316	410	450	480 ^c	496	657 ^d
341 ^a	412	460	481	651 ^d	
342 ^a	413	461	482	653 ^d	
344 ^b	419	470 ^c	483	654 ^d	

Publication 447 – Approved products for Lower Volume Local Roads

MS-0310-0011 ^b	MS-0310-0032 ^{b,c}	MS-0350-0018 ^a
MS-0310-0021 ^b	MS-0310-0051 ^b	MS-0360-0019 ^b
MS-0310-0022 ^b	MS-0311-0001 ^b	MS-0370-0040 ^a
MS-0310-0031 ^{b,c}	MS-0340-0005 ^a	

Applicable contract items include any modified standard or nonstandard item where the character of the work to be performed is considered placement of one or more of the asphalt materials specified in these Sections.

^a Price adjustments, when applicable, will be computed based on the Asphalt Material item quantity (gallon) only, as paid on current estimates.

^b When measured and paid for on a square yard basis, the tonnage of material placed will be determined from delivery tickets and the asphalt tonnage computed as specified in Section 110.04(b)4.a. The tonnage of material wasted, if any, will be agreed upon with the Contractor and deducted.

^c When measured and paid for on a Material Used Basis, price adjustments, when applicable, will be computed based on the Asphalt Material item quantity (gallon) only, as paid on current estimates.

^d Price adjustments, when applicable, will be computed as specified for the type of asphalt material used in the type of paved shoulder placed. Excludes shoulder backfill items.

^e Price adjustments, when applicable, will be computed based on the tonnage of asphalt cement used in the ultra-thin bonded wearing course only (i.e., excluding the asphalt cement used in the emulsified asphalt membrane).

(a) General. These price adjustment provisions apply only to projects where more than 100 tons of asphalt cement, including asphalt cement residue contained in emulsions or cut backs, will be used in the asphalt materials specified or indicated for placement.

The Department posts monthly index prices for asphalt cement (PG 64S-22) using price data obtained, on the last Wednesday of the preceding month, from a survey of producers who do business in Pennsylvania. Data provided by producers serving the eastern portion of the state is averaged to compute the index price for Zone 1 (Districts 3-0, 4-0, 5-0, 6-0, and 8-0). Data provided by producers serving the western portion of the state is averaged to compute the index price for Zone 3 (Districts 1-0, 10-0, 11-0, and 12-0). The index price for Zone 2 (Districts 2-0 and 9-0) is computed as the average of the index prices for Zone 1 and Zone 3.

The price index IB, will be the index price posted by the Department, determined as specified above, for the month in which the project is advertised.

The price index at the time of placement, IP, will be the index price posted by the Department, determined as specified above, for the month during which the applicable material is placed.

(b) Price Adjustment Criteria and Conditions. The following criteria and conditions will be considered in determining a price adjustment for asphalt materials:

1. No Price Adjustment. When the ratio IP/IB falls within the range of 0.90 to 1.10, no price adjustment will be made for any asphalt material placed during the relevant month.

2. Price Rebate. When the ratio IP/IB is calculated to be less than 0.90, the Department will receive an automatic price rebate determined according to the following formula:

$$P.R. = (0.90 - IP/IB) (Q) (IB)$$

where:

P.R. = Price Rebate
 IP = Price Index for the last Wednesday of the month preceding the month in which the material is placed (One-Month Price Adjustment Period)
 IB = Price Index
 Q = Quantity tons of Asphalt in Mixture placed

3. Price Increase. When the ratio IP/IB is calculated to be greater than 1.10, the Contractor will receive a price increase determined according to the following formula:

$$P.I. = (IP/IB - 1.10) (Q) (IB)$$

where:

P.I. = Price Increase
 IP = Price Index for the last Wednesday of the month preceding the month in which the material is placed (One-Month Price Adjustment Period)
 IB = Price Index
 Q = Quantity tons of Asphalt in Mixture Placed

4. Equivalent Tonnage.

4.a Ton Basis. For asphalt mixtures containing performance-graded (PG) asphalt binder or emulsified asphalt, which are measured and paid for on a ton basis; including Superpave HMA base, binder, and wearing courses; flexible

base replacements, asphalt treated permeable base courses; stone matrix HMA wearing courses; asphalt wearing courses, FJ-1, FJ-1C, FB-2, and FB-1; asphalt binder courses, FB-2 and FB-1; manual asphalt patching; and polymer-modified emulsified asphalt paving systems (micro-surfacing), type RF; the equivalent tonnage is computed as follows:

$$\frac{\text{Asphalt Tonnage in Asphalt Mixture}}{1} = \left[\frac{\text{Asphalt Mixture Tonnage Placed}}{1} \right] \times \left[\frac{\text{Percent Asphalt by Weight}^*}{1} \right]$$

* If the asphalt mixture contains performance-graded (PG) asphalt binder, the Percent Asphalt will be obtained from the approved JMF (Form TR-448A, Job Mix Formula Report) for the asphalt mixture placed. The Percent Asphalt will be the “Virgin AC%” listed on the applicable JMF. If the asphalt mixture contains emulsified asphalt, the Percent Asphalt will be computed using the approved mix design for the type of asphalt mixture placed and Bulletin 25. The Percent Asphalt will be the percent emulsion in the asphalt mixture, as listed on the applicable mix design, multiplied by the minimum asphalt percent by weight for the class of emulsified asphalt used, as specified in Bulletin 25.

4.b Square Yard Basis. For asphalt mixtures containing performance-graded (PG) asphalt binder only (i.e. not including emulsified asphalt or cut-back asphalt), which are measured and paid for on a square yard basis; including Superpave WMA base, binder, and wearing courses; flexible base replacements, aggregate- asphalt base courses; stone matrix WMA wearing courses; asphalt wearing courses, FJ-1, FJ-1C, FB-2, and FB-1; asphalt binder courses, FB-2 and FB-1; and paved shoulders, types 1-F, 1-SP, 6-F, 6-SP, and 7; the equivalent tonnage is computed as follows:

$$\text{Asphalt Mixture Tonnage Placed} = (0.000375) (A) (D) (d)$$

where:

- A = Surface Area (square yards)
- D = Design Depth (inches)
- d = Design Density* (pounds per cubic feet)

$$\left[\frac{\text{Asphalt Tonnage in Asphalt Mixture}}{1} \right] = \left[\frac{\text{Asphalt Mixture Tonnage Placed}}{1} \right] \times \left[\frac{\text{Percent Asphalt by Weight}^{**}}{1} \right]$$

* The Design Density will be obtained from the approved JMF (Form TR-448A, Job Mix Formula Report) for the asphalt mixture placed. The Design Density will be the “N_{des} Density” listed on the applicable JMF. If necessary, the Design Density (i.e. N_{des} Density) obtained from Form TR-448A will be converted to the proper units by multiplying by the density of water, 62.4 pounds per cubic foot.

** The Percent Asphalt will be obtained from the approved JMF (Form TR-448A, Job Mix Formula Report) for the asphalt mixture placed. The Percent Asphalt will be the “Virgin AC%” listed on the applicable JMF.

4.c Gallons per Square Yard Basis. For asphalt coatings or mixtures measured and paid for on a square yard basis, where asphalt material (i.e. performance-graded asphalt binder, emulsified asphalt, or cut-back asphalt) is used or applied on a gallons per square yard basis; including asphalt tack coats, asphalt prime coats, asphalt seal coats, asphalt surface treatments, slurry seals, and polymer-modified emulsified asphalt paving systems (micro surfacing); the equivalent tonnage is computed as follows:

$$\text{Asphalt Tonnage} = (0.004164) (A) (a) (g)$$

where:

- A = Surface Area (square yards)
- a = Actual Residue Application Rate* (gallons per square yard)
- g = Specific Gravity of Asphalt Material**

* For asphalt tack coats, asphalt prime coats, asphalt seal coats, and asphalt surface treatments, the Actual Residue Application Rate will be the rate of application of the emulsified asphalt, cut-back asphalt, or performance-graded (PG) asphalt binder, as applicable, in gallons per square yard, as determined in the field according to PTM No. 747; multiplied by 100% if PG asphalt binder is used, or by the minimum asphalt percent by weight for the class of emulsified asphalt or cut-back asphalt used, as specified in Bulletin 25. For asphalt seal coats and asphalt surface treatments using pre-coated aggregate, the Actual Residue Application Rate for the asphalt precoating material will be the design rate of application of the coarse aggregate, in pounds per square yard; multiplied by the average of the minimum and maximum residual asphalt binder percent by weight for the type of asphalt precoating material used, as specified in Section 471.2(d); multiplied by 100% if PG asphalt binder is used, or by the minimum asphalt percent by weight for the class of emulsified asphalt or cut-back asphalt used, as specified in Bulletin 25; divided by the weight of water, 8.328 pounds per gallon. For slurry seals, the Actual Residue Application Rate will be the average of the minimum and maximum rate of application for the type of slurry seal constructed, in pounds per square yard, as specified in Section 482.2(e); multiplied by the percent emulsion in the asphalt mixture, as listed on the applicable mix design; multiplied by the minimum asphalt percent by weight for the class of emulsified asphalt used, as specified in Bulletin 25; divided by the weight of water, 8.328 pounds per gallon. For polymer-modified emulsified asphalt paving systems (micro-surfacing), the Actual Residue Application Rate will be the average of the yield value for the asphalt mixture calculated at the end of each day's application, in pounds per square yard; multiplied by the percent emulsion in the asphalt mixture, as listed on the applicable mix design; multiplied by the minimum asphalt percent by weight for the emulsified asphalt, as specified in Bulletin 25; divided by the weight of water, 8.328 pounds per gallon.

** The Specific Gravity of Asphalt Material will be obtained from the bill of lading provided with each shipment of asphalt material delivered to the project. If asphalt material from multiple shipments is placed or applied during the same one-month period, and the specific gravity reported on the bills of lading varies from one shipment to another, the Specific Gravity of Asphalt Material will be the average of the specific gravities reported on each applicable bill of lading.

4.d Gallon Basis. For asphalt coatings or mixtures where the asphalt material (i.e. performance graded asphalt binder, emulsified asphalt, or cut-back asphalt) used or applied is measured and paid for on a gallon basis; including asphalt tack coats, asphalt prime coats, and asphalt material for cold recycled asphalt base courses, asphalt wearing courses FB-1, asphalt binder courses FB-1, asphalt seal coats and asphalt surface treatments; the equivalent tonnage is computed as follows:

$$\text{Asphalt Tonnage} = (0.004164) (V) (g) (p)$$

where:

$$\begin{aligned} V &= \text{Volume of Asphalt Material (gallons)} \\ g &= \text{Specific Gravity of Asphalt Material*} \\ p &= \% \text{ Asphalt**} \end{aligned}$$

* The Specific Gravity of Asphalt Material will be obtained from the bill of lading provided with each shipment of asphalt material delivered to the project. If asphalt material from multiple shipments is used, placed or applied during the same one-month period, and the specific gravity reported on the bills of lading varies from one shipment to another, the Specific Gravity of Asphalt Material will be the average of the specific gravities reported on each applicable bill of lading.

** For other than performance-graded (PG) asphalt binder (% Asphalt = 100%), the % Asphalt will be the minimum asphalt percent by weight for the class of emulsified asphalt or cut-back asphalt used, as specified in Bulletin 25.

5. Expiration of Contract Time. If asphalt materials or mixtures are placed after expiration of contract time and liquidated damages are chargeable, the value for IP used to compute the price adjustment will be either the price index at the time of actual placement or the price index at the time contract time expired, whichever is less.

6. Approval. Should the price index at time of placement, IP, indicate an increase of 50% or more over the price index, IB, do not furnish asphalt material for the project without prior written approval.

7. Payment/Rebate. The price adjustment will be paid, or rebated, upon approval of a work order to be prepared after completion of all work. Cumulative price adjustments amounting to less than \$500 will be disregarded. Upon written request by the Contractor, partial payments may be made, before total completion, when the unpaid accrued price increase exceeds \$10,000 or once every 12 months.

8. Inspection of Records. The Department, through the Office of Inspector General, reserves the right to inspect the records of the prime contractor and its subcontractors and material suppliers to ascertain actual pricing and cost information for the asphalt cement used in the asphalt materials incorporated in the work.

9. Extra Work. If applicable items of work, as specified herein, are added to the contract as extra work, as specified in Section 110.03, no price adjustment will be made for fluctuations in the cost of asphalt cement used in any asphalt materials placed in the performance of the extra work, unless otherwise approved. The current price for asphalt cement is to be used when preparing required backup data for extra work to be performed at a negotiated price. For extra work performed on a force account basis, reimbursement for material costs along with the specified overhead and profit markup will be considered to include full compensation for the current cost of asphalt cement.

110.05 CURRENT ESTIMATE PAYMENTS—Current estimate payments will be processed based upon assessments made by the Department as work is satisfactorily completed. Processing of estimate payments will begin on the first estimate date established following the Notice to Proceed Date or indicated in the special provisions. No estimate payments will be processed before the Notice to Proceed Date. Current estimate payments exceeding \$1,000 will be processed by the Department at semimonthly intervals, or more frequently, as work progresses. Current estimate payments amounting to less than \$1,000 may be processed monthly. Final payments amounting to between - \$10 and +\$10 will be disregarded. Partial payments do not bind the Department to the acceptance of any material furnished or work performed.

Within 7 calendar days of the receipt of current estimate and final payments from the Department, pay all subcontractors their earned share of the payments, including all retainage, provided the terms and conditions of the applicable subcontract or purchase agreement have been reasonably met.

110.06 MATERIAL STORED OR ON HAND—

(a) Stored Material. The Representative may authorize payment for certain material, using form CS-110, before its incorporation into the work. Upon the Contractor's written request and the Representative's written approval, the Contractor may be paid 100% of the cost of the material, less the pro-rata share of the retainage, if any; provided the quantity of stored material does not exceed the total estimated quantity required to complete the project, the cost is at least \$1,000 but does not exceed 90% of the contract price of the applicable contract item or component item, and the accumulative costs do not exceed 25% of the current contract amount. The cost of the material is that amount to be paid by the Contractor as evidenced by invoices. Fabricated structural steel that is to receive a protective coating may be approved for prepayment at 75% of the contract price of the applicable contract item or component item, before application of the coating, provided the structure has been fully fabricated and preassembly of field connections has been made.

Payment for stored material will not be authorized until the material has been delivered to the project site or an approved location in the vicinity of the project, is inspected by the Representative to ensure the material is in a satisfactory condition and of sufficient quantity, is stored in an approved manner, and conforms to the requirements specified in this Section and Section 106.03. Identify stored material by project designation and set apart from other materials. Material to be stored less than 30 days is not eligible for prepayment. In determining eligibility for prepayment, the beginning date for evaluating whether the required 30-day minimum storage period will be met will be the date the material is delivered to the project or approved storage location, or the date the invoice is submitted to the Department, whichever is the latter. Material originally determined to be ineligible for prepayment due to the minimum storage period requirement, that is then stored for more than 30 days, is eligible for prepayment on the next estimate, provided the invoice has been submitted to the Department. If the Representative determines, because of required fabrication at an off-site location, that it is not feasible or practicable to store material in the vicinity of the project, the material may be stored at an approved location, which is not in the vicinity of the project, at the Contractor's expense.

With the exception of structural steel to be incorporated into fabricated structural steel components for main bridge members, as specified in Section 110.06(a)1., only end product manufactured material or fully fabricated products

that are awaiting installation and/or incorporation into the finished work are eligible for prepayment. Ingredients of a finished product are not eligible for prepayment. Aggregates, cements, and other bulk material are not eligible for prepayment. Beams containing precast components or secondary precast elements detailed on the structure component item schedule or both are eligible for prepayment. Living or perishable plant materials are not eligible for prepayment before planting.

Assume full control and responsibility for the protection of the stored material from the elements and against loss or damage by any cause. In the event any stored material becomes lost, stolen, impaired, or damaged while stored, the monetary value of the lost, stolen, impaired, or damaged material as may have been paid for in a current estimate will be deducted from a subsequent estimate. Retain the title to the prepaid material until issuance of the acceptance certificate.

Payment for acceptable stored material will be made on current estimates against the applicable contract item. The amount paid will be proportionately recouped as the material is incorporated into the work. The cost of surplus stored material previously paid on a current estimate but not ultimately incorporated in the final measured work will not be included in the final payment. Surplus stored material is the property of the Contractor. Remove surplus material from the project and dispose of in a satisfactory manner.

Pay the material provider the amount due, as shown on the invoices within 7 calendar days of receipt of payment from the Department. Provide evidence of payment upon request. Failure to make invoice payments as specified will cause the appropriate monies to be deducted from future estimates and will cause the disapproval of further prepayment requests.

1. Prepayment for Structural Steel. Structural steel to be incorporated into fabricated structural steel components for main bridge members may be approved for payment up to 60% of the contract price of the applicable contract item or component item; provided the quantity, cost, delivery, inspection, and storage requirements of Section 110.06(a) are met. The cost of the structural steel is that amount to be paid by the Fabricator as evidenced by invoices. Invoices for approved structural steel are to include the material quantity and Department project identification (i.e. ECMS number, SR & Section, and county), and must be accompanied by certification, as specified in Section 106.03(b)3., and proof of payment (e.g. a copy of a canceled check or receipt, or a certified letter from the structural steel supplier acknowledging receipt of payment).

Payment for approved structural steel will be made on current estimates against the applicable contract item. The amount paid will be proportionately recouped as the fabricated structural steel components are incorporated into the work. Pay the Fabricator the amount due, as shown on the invoices, within 7 calendar days of receipt of payment from the Department. When payment is made, the structural steel becomes the property of the Department. Have the Fabricator furnish a transfer of ownership document within 7 calendar days of receipt of payment and promptly submit the documentation to the Department.

Only approved structural steel to be incorporated into fabricated structural steel components for main bridge members is eligible for prepayment. Handling, transportation, and storage of structural steel materials including, but not limited to, any storage site rental, security, and weather protection, are to be borne by the Contractor and included in the contract price for the applicable contract item.

(b) Erected Steel. Partial payment for structural steel required for bridge construction will include not over 97% of the total estimated weight of structural steel in a span erected and completely and permanently bolted, riveted, or welded. The total estimated weight of structural steel will be included in partial payments after painting has been satisfactorily completed.

110.07 VALUE ENGINEERING—Upon acceptance of a detailed value engineering proposal, as specified in Section 104.04, a two-part, lump sum value engineering payment will be made in an amount equal to one-half of the actual net cost savings associated with the proposal. Actual net cost savings is defined as the cost difference between the original contract work and the actual cost of the new work.

Compensation will be made only for proposals pertaining to contracts in effect with the submitting Contractor at the time of submission.

An initial contract adjustment will be processed within 14 days of the detailed value engineering proposal acceptance providing payment for one-quarter of the estimated net cost savings as identified in the approved value engineering proposal.

An authorization for contract work and work order will be processed with estimated quantities of work based on the value engineering proposal. These items will have the prices justified using the accepted value engineering proposal.

Upon completion of all items of work included as part of the value engineering proposal along with the submission and acceptance of all required documentation, a final, lump sum payment will be made by processing a follow-up contract adjustment. The final, lump sum payment amount will be determined by computing the actual net cost savings associated with the value engineering proposal, based on actual item quantities, taking one-half of the actual net cost savings, and deducting the amount paid under the initial contract adjustment.

110.08 FINAL INSPECTION, ACCEPTANCE, AND FINAL PAYMENT—

(a) Final Inspection. When the project is substantially complete, make arrangements for a mutual final inspection. Substantial completion is the date when at least 90% of the contract work has been completed and the project can be used, occupied, or operated for its intended use.

At the time of final inspection, the Representative, along with the Contractor, will establish the following:

- The date of final inspection;
- The list of all physical work items, by stations and in detail, requiring completion and/or correction; and
- A list of all certificates or documents requiring submission, completion, and/or correction.

As established during the final inspection, perform work as necessary for required correction or completion of all physical work items, and complete, correct, and submit all outstanding certificates and documents.

The Contractor will be relieved of responsibility for further physical work and maintenance only for work items which are satisfactorily completed at the time of, or subsequent to, the final inspection. The Contractor's responsibility for further physical work, maintenance, and third-party liability remains for work items, which are not satisfactorily completed at the time of, or subsequent to, the final inspection. When all physical work has been satisfactorily completed according to the requirements of the contract, the Representative will establish the Date of Physical Work Completion.

Upon receipt and verification, the Representative will establish the date that all required certificates and/or documents are satisfactorily furnished.

When all physical work has been satisfactorily completed and all contractually required certificates and documents have been properly furnished, the date of project acceptance will be established.

If any substantial project section has been completed in advance of the whole, a final inspection will be made of that section and the Contractor will be relieved of responsibility for further physical work and maintenance on the section of the project as specified in Section 108.04(b). The final inspection will be conducted as specified for the entire project; except, the date of project acceptance will not be established nor will an acceptance certificate be issued.

(b) Acceptance Certificate. Upon completion of the requirements as specified in Section 110.08(a), an acceptance certificate will be issued, establishing the date on which the project has been satisfactorily completed and certifying that the project is accepted as of that date.

(c) Final Settlement Certificate Computations. The Representative will compute the entire amount of each contract work item performed and its contract value. The Representative will notify the Contractor of the amount for each item, including additions to and deductions from the contract quantity for each item of work, all other legal and equitable additions and deductions to be made, amounts previously paid, and the net amount of the final settlement certificate computations. The Representative will request written acceptance of, or exception to, these final settlement certificate computations within 10 days of the notification. Failure to follow the following procedures will waive the right to file a claim.

1. Within 10 days from the date the final settlement certificate computations or revised computations are submitted, notify the Representative, in writing, of acceptance or exceptions.

1.a If accepted, or upon failure to accept or take exception within the specified time, the Director, BOPD will certify to the Secretary, in the final settlement certificate, the entire amount of each work item performed, its contract value, all legal and equitable additions and deductions, and the amounts previously paid. The Secretary will certify to the State Treasurer the amount due in final payment and contract settlement. Under these circumstances, all claims are considered waived by the Contractor.

The Department will forward a copy of the final settlement certificate, setting forth the final settlement date. Copies will also be forwarded to the surety and other appropriate interested agencies. The date the Secretary notifies the Contractor of the final settlement certificate computations, or revised computations, will be the date of contract completion.

1.b If not acceptable, notify the District Executive, in writing, of all exceptions. The District Executive will give notification of the acceptance or rejection of the exceptions. The Contractor or surety has the right to appeal, within 10 days of the rejection, to the Chief, HDD. Notification will then be sent, in writing, from the Chief, HDD stating that the claim has been approved or rejected. Where the claim does not involve any disputes specified in Section 105.01, the “date that the claim accrued,” for purposes of filing claims before the Board of Claims, will be the date notification in writing is sent from the District Executive, of the rejection of the claim. In the event of an appeal within 10 days, as provided, the date will be the first notification following the claim rejection by the Chief, HDD.

2. During final settlement certificate computations, if the Department determines that the net total amount to be received is actually a negative amount, then prompt reimbursement to the Department for the total amount overpaid is required. In the event of failure to reimburse the Department, the Secretary will take legal measures to secure the amount due. The Department may, in addition, remove the Contractor from its list of approved pre-qualified contractors, according to regulations.

(d) Final Settlement of Contract. Final contract settlement will occur when the Secretary certifies to the State Treasurer the amount due in final payment and contract settlement, after making all legal and equitable additions and deductions, including amounts previously paid, according to the contract terms, the terms of written or approved work orders, and the terms of an award, if any, of the Board of Claims. The Department will forward a copy of the final settlement certificate, setting forth the final settlement date. Copies will also be forwarded to the surety and other appropriate interested agencies.

(e) Final Settlement Certificate on Related Contracts. Where work has been done for a political subdivision of the State or other agency, by means of approved related contract or contracts under the specifications and Department supervision, the Secretary will forward a copy of the acceptance certificate to the proper authorities. The final settlement certificate in such cases will be certified to the proper authorities for payment, after approval by the Secretary or authorized representative, instead of to the State Treasurer, as provided for work done for the State.

110.09 RELEASE OF FINAL PAYMENTS—The Secretary will authorize interest payments on the final payment due, at the rate of 6% per annum, beginning 30 calendar days after the date of physical work completion and running until the date when payment is made. If payment for an item or items is withheld due to a lack of required information from the Contractor, interest charges for the item or items will not begin to accrue until 30 days after the date the Representative receives the information required for payment. For projects financed with bonds, interest will be payable at the rate of interest of the bond issue or at the rate of 10% per annum, whichever is less.

Foreign corporations and their sureties will not be discharged from liability on the bond, nor the bond surrendered, until the corporation files the following with the Department:

- a certificate, from the Department of Revenue, proving the payment in full of all bonus taxes, penalties, and interest; and
- a certificate, from the Bureau of Employment and Unemployment Compensation of the Department of Labor and Industry, as required by the Act of June 10, 1947, P.L. 493 (8 P.S. 23).

110.10 EVALUATION, DISPOSITION, AND ADJUSTED PAYMENT OF LOW STRENGTH CEMENT CONCRETE—The following outlines procedures for the evaluation, disposition, and adjusted payment of low strength cement concrete. Use the Concrete Specification Flowchart, Section 110.10(e), as a visual guide to these procedures.

(a) General. Low strength, cast-in-place cement concrete will be evaluated using the compressive strength of concrete cylinder or concrete core test specimens. The requirements of this specification do not apply to concrete construction performed as specified in Section 506.

(b) Definitions.

- **F'(28-day).** 28-day minimum mix design concrete compressive strength (pounds per square inch), as specified in Section 704, Table A.
- **F'(c).** 28-day structural design concrete compressive strength (pounds per square inch), as specified in Section 704, Table A.
- **F'(28-cyl).** 28-day concrete compressive strength (pounds per square inch) of acceptance cylinders representing a specific concrete lot. Determined as the average of the compressive strength testing of two cylinders molded from the same sample.
- **F'(56-cyl).** When specified for bridge decks only, 56-day concrete compressive strength (pounds per square inch) of acceptance cylinders and QC cylinders representing a specific concrete lot. Determined as the average of each set of compressive strength testing of two cylinders molded from the same sample. The lower of the two averages will be used in the calculation of payment.
- **F'(cores).** 28-day concrete compressive strength (pounds per square inch) of concrete test cores representing a specific concrete non-bridge deck lot. Determined as the average of the compressive strength tests of the cores and calculated according to PTM No. 606.
- **F'(cs).** Minimum acceptable concrete compressive strength (pounds per square inch), as specified in Section 110.10, Table B.
- **CUP.** Contract Unit Price of in-place concrete as shown in the Bid Items or, for lump sum structure items, the Component Item Schedule. This value represents the cost of the in-place concrete only and does not include the cost of reinforcing steel. The cost of stay-in-place formwork and other incidental items is to be included in the contract unit price.
- **LOT.** Lot size (cubic yards).

TABLE B
Minimum Concrete Compressive Strength Requirements

Class of Concrete	Use	Minimum F'(cs) (psi)
AAAP	Bridge Deck	3,500
AAA	Other	3,500
AA	Paving	3,000
H.E.S.	Paving	3,000
AA	Structures and Misc.	3,000
A		2,500
C		2,000
H.E.S.		3,000

(c) Evaluation, Disposition, and Payment of Low Strength Cement Concrete Using Acceptance Cylinders. If F'(28-cyl), representing a specific concrete lot, fails to meet the F'(28-day) for the specified class of concrete, the concrete may be considered deficient. Disposition of the low strength concrete will be determined as follows:

1. $F'(28-cyl) \geq F'(c)$. If F'(28-cyl) is greater than or equal to F'(c), and the corresponding QC test result is greater than or equal to F'(c), the concrete lot may be accepted at an adjusted payment. The adjusted payment will be calculated as specified in Section 110.10(d)2 with $F'(cores)=F'(28-cyl)$.

As an alternative, within 2 working days of notification of deficient F'(28-cyl), request permission of the

Representative, in writing, to extract concrete cores from the deficient lot of concrete. If this alternative is permitted, the procedures specified in Section 110.10(d) for extracting and evaluating the core specimens will be followed. When coring is approved, final disposition of the low strength cement concrete will be determined based solely on the compressive strength of core specimens, $F'(\text{cores})$. The acceptance cylinder strength will no longer be used.

2. $F'(\text{cyl}) < F'(c)$.

2.a Non-Bridge Deck Lots. Extract core specimens from the deficient lot of concrete. Notification to core will be given by the Representative within 2 working days after receiving acceptance cylinder test results. Use the procedures specified in Section 110.10(d) for extracting and evaluating the core specimens.

2.b Bridge Deck Lots. Conduct compressive strength testing at 56-days. If $F'(56\text{-cyl}) > F'(c)$ the lot will be accepted at full payment. If $F'(56\text{-cyl}) < F'(c)$, the adjusted payment will be calculated as specified in Section 110.10(d)2. using $F'(56\text{-cyl})$ for $F'(\text{cores})$.

(d) Evaluation, Disposition, and Payment of Low Strength Cement Concrete Using Concrete Core Specimens. Core locations will be randomly selected within the deficient lot of concrete according to PTM No. 1. Obtain cores, under the direction and supervision of the Representative, within 1 week of notification, at no additional cost to the Department.

Obtain five cores from the deficient lot of concrete.

Obtain cores according to PTM No. 606, except as follows:

Obtain 4-inch diameter cores, which are free of reinforcing steel. A pachometer will be used to locate the reinforcing steel. If 4-inch diameter cores free of reinforcing steel cannot be obtained, smaller diameter cores may be allowed provided the core diameter is at least three times the nominal maximum size of the coarse aggregate used in the concrete mix, but not less than 2 inches.

Deliver cores immediately to the Representative. Cores will be delivered to the LTS within 3 working days. Cores will be prepared for testing according to PTM No. 606 and compressive strength testing will be conducted according to PTM No. 604.

The compressive strength test results of the core specimens will be evaluated to determine material acceptance and adjusted payment. Disposition of the low strength concrete will be determined as follows:

1. Acceptance. Material acceptance for the lot of low strength cement concrete will be determined using the minimum $F'(cs)$ value for the specified class of concrete, as specified in Section 110.10(b), Table B and the average of the compressive strength test results of the core specimens, $F'(\text{cores})$ or $F'(56\text{-cyl})$ when applicable.

- If $F'(\text{cores})$ meet the minimum compressive strength listed in Table C, the lot of low strength cement concrete will be considered acceptable. Adjusted payment will be computed as specified in Section 110.10(d)2.
- If $F'(\text{cores})$ does not meet the minimum compressive strength listed in Table C, the lot of low strength cement concrete will be considered deficient. Remove and replace deficient lot of concrete, at no additional cost to the Department, unless otherwise directed, in writing, by the District Executive. Remove and replace reinforcement steel damaged as a result of the concrete removal process, and not conforming to requirements specified in Sections 709 and 1002, at no additional cost to the Department.

Under certain specific circumstances, the District Executive may approve allowing deficient concrete to remain in place. This approval may be granted only if all of the following conditions are met:

- The Contractor must request, in writing, that the lot of deficient concrete remain in place.
- An engineering analysis of the deficient concrete is performed at no expense to the Department.
- Adjusted Payment for the lot of deficient concrete left in place will be exactly 50% of the contract unit price (CUP) of the contract item.
- The Contractor provides a signed document waiving the right to pursue a claim as a result of the

reduced payment for the lot of concrete.

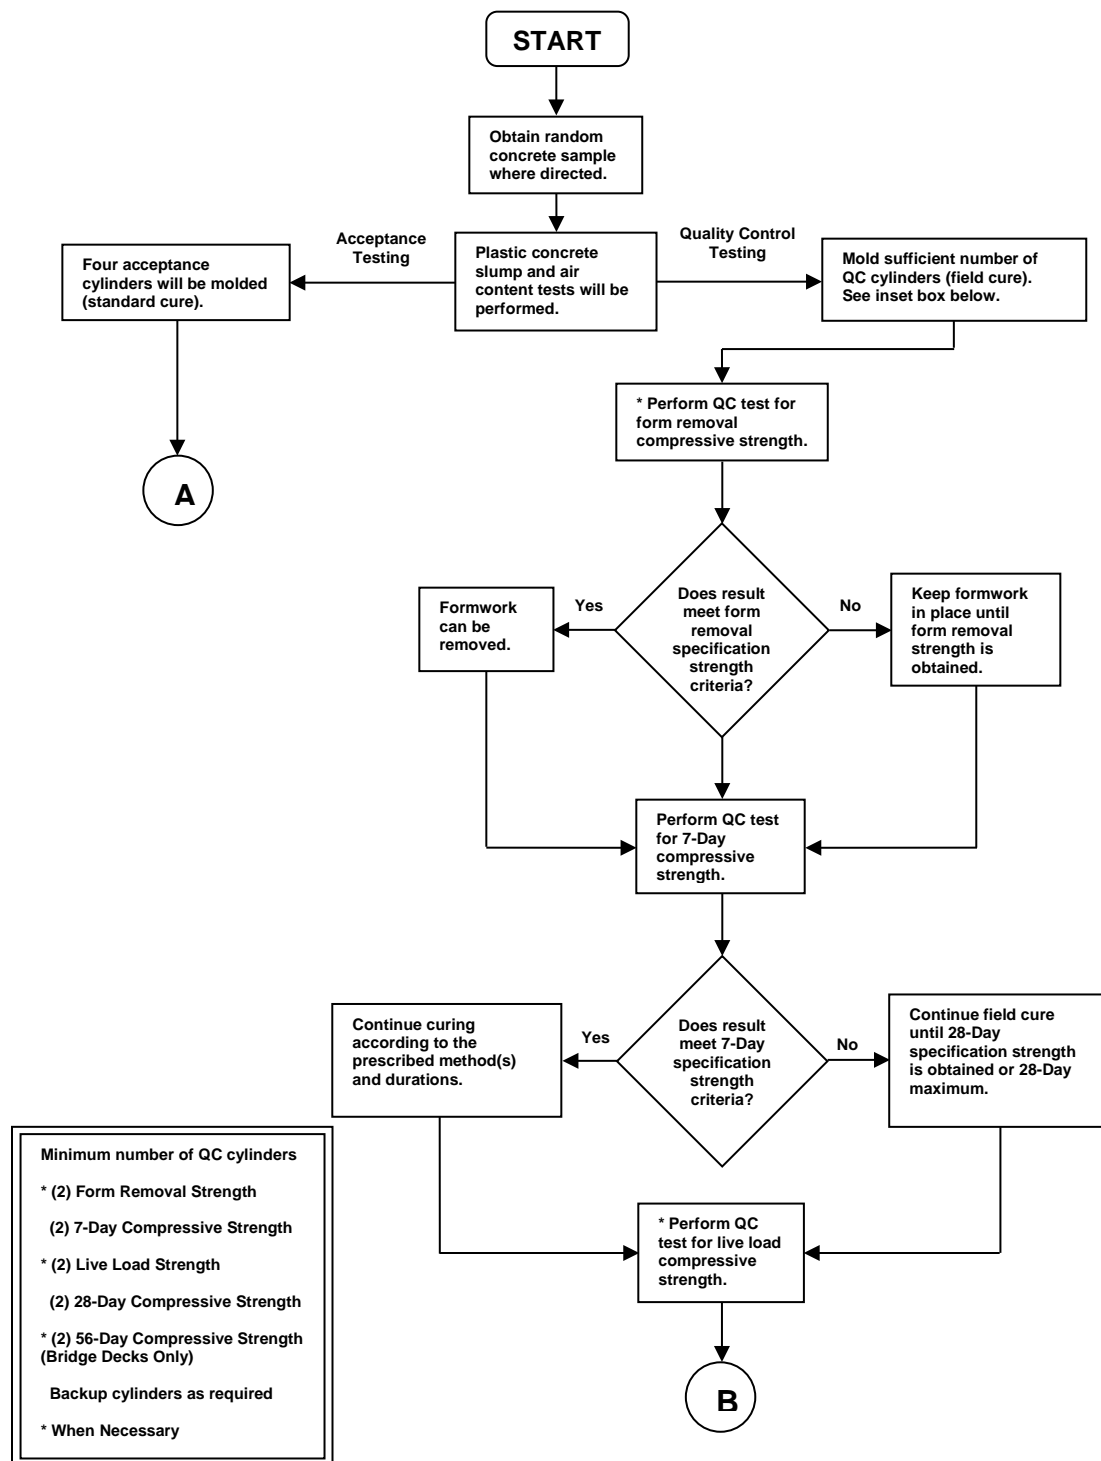

2. Payment. Adjusted payment for lot of low strength cement concrete will be computed using the Payment Factors specified in Table C. The applicable Payment Factor will be determined using the $F'(c)$ value for the specified class of concrete, as specified in Section 704, Table A; the Minimum $F'(cs)$ value of the specified class of concrete, as specified in Section 110.10(b), Table B including a 100 pounds per square inch, and the average of the compressive strength test results of the core specimens, $F'(cores)$.

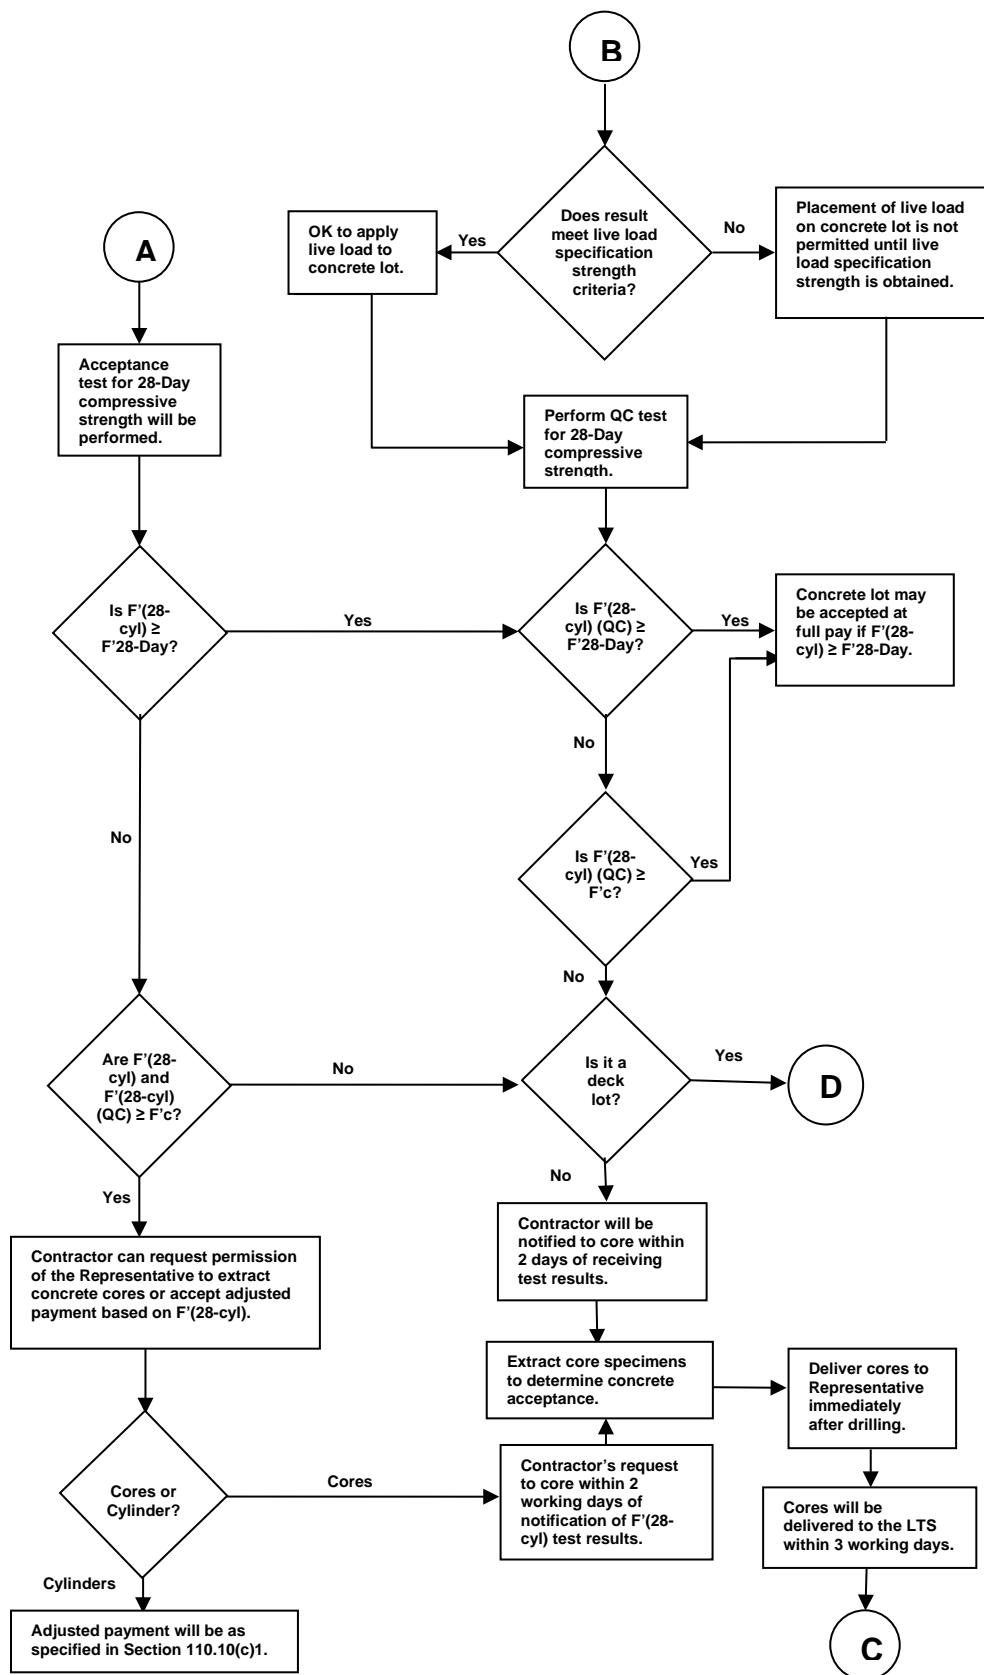

$$\text{Adjusted Payment} = A \times \text{CUP} \times \text{LOT}$$

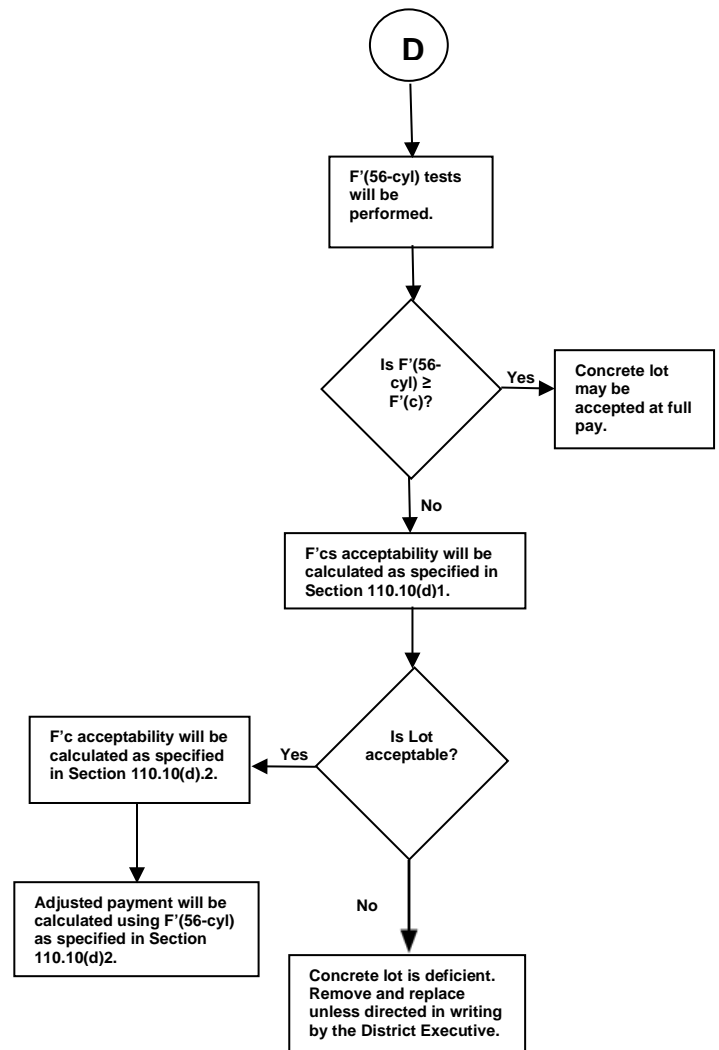

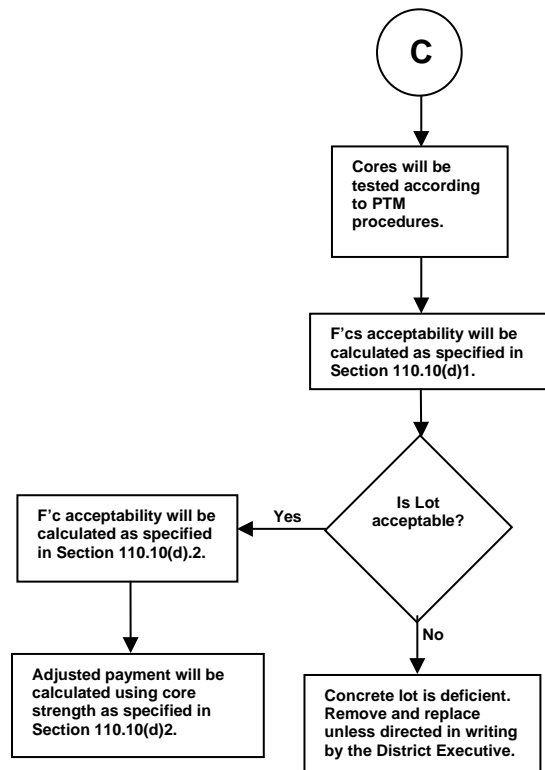

TABLE C
Low Strength Concrete Payment Factors, A

Average of Compressive Strength Test Results of Core Specimens, $F'(cores)^*$	Payment Factor, A
$\geq F'c$	1.00
$\geq F'(cs) + 400$	0.99
$\geq F'(cs) + 300$	0.98
$\geq F'(cs) + 200$	0.96
$\geq F'(cs) + 100$	0.92

(e) Concrete Specification Flowchart.

110.11 EVALUATION, DISPOSITION, AND ADJUSTED PAYMENT OF PRESTRESSED CONCRETE BEAMS—

(a) **General.** Low strength concrete prestress beams will be evaluated using the compressive strength of concrete cylinder or concrete core test specimens.

(b) **Definitions.**

- **F'(28-day).** 28-day minimum concrete compressive strength (pounds per square inch), as specified on the approved shop drawings.
- **F'(cyl).** 28-day concrete compressive strength (pounds per square inch), of acceptance cylinders representing a beam. Determined as the average of the compressive strength of two or more cylinders.
- **F'(r).** Minimum concrete compressive strength (pounds per square inch), for transfer of prestress as indicated.
- **F'(cores).** Concrete compressive strength (pounds per square inch) of acceptance cores extracted from a beam. Determined as the average compressive strength of the cores as determined by PTM No. 606.
- **FBP.** Fabricated beam price.

(c) **Evaluation, Disposition, and Payment of Low Strength Prestressed Concrete Beams Using Acceptance Cylinders.** If $F'(cyl)$, representing a specific beam, fails to meet the $F'(28\text{-day})$ for the specified design, the beam will be considered deficient. If $F'(cyl) < F'(r)$, the beam will be rejected. If $F'(cyl) \geq F'(r)$, perform structural calculation based on $F'(cyl)$ for the prestressed beam. Calculations must include all the original design considerations and be performed by a Professional Engineer registered in the State. Submit calculations to the BDTD's Structural Materials Section for review by the appropriate Engineering District. These calculations must be submitted within 2 weeks of notification that $F'(cyl)$ was deficient. If the structural calculations show that the beam is not acceptable to the Department, the beam will be rejected. If the structural calculations show that the beam is serviceable in accordance with Section 106.07(c) the beam will be accepted and the adjusted payment will be computed as follows:

$$\text{Adjusted Payment} = [(A/B \times 0.50) + 0.50] \times \text{FBP}$$

where:

$$\begin{aligned} A &= F'(cyl) - F'(r) \\ B &= F'(28\text{-day}) - F'(r) \end{aligned}$$

As an alternative, within 2 working days of notification of deficient $F'(cyl)$, request permission of the Chief Structural Materials Engineer, in writing, to extract five concrete cores from the deficient beam. If this alternate is permitted, the procedures specified in Section 110.11(d) for extracting and evaluating the core specimens will be followed. When coring is approved, final disposition of the low strength beam will be determined based solely on the compressive strength of core specimens. The acceptance cylinder strength will no longer be used.

(d) **Evaluation, Disposition, and Payment of Low Strength Prestressed Concrete Beams Using Cores.** When coring is approved by the Chief Structural Materials Engineer, obtain cores, under the direction and supervision of the Representative or his or her designate, within 1 week of notification, at no additional cost to the Department.

Obtain five cores, one from each fifth of the deficient strength beam, according to PTM No. 606. Obtain cores from the portion of the beam that does not contain prestressing strands. Use a pachometer if necessary to avoid damage to the stirrups or strands. Patch holes left after coring using an approved patching material from a manufacturer listed in Bulletin 15 or the approved concrete mix design.

Deliver the cores to the Representative immediately upon drilling. Cores will be delivered to the LTS within 3 working days of obtaining them. No cores will be tested at an age of greater than 50 days. Cores will be prepared for testing according to PTM No. 606 and compressive strength testing will be conducted according to PTM No. 604.

The $[F'(core)]$ and standard deviation(s) of three cores will be determined and the results sent to the supplier of the prestress beam. If $F'(core) \geq F'(28\text{-day})$, the beam will be accepted at full payment; no structural analysis is required.

If $F'(\text{core})$ falls below $F'(r)$, the beam will be rejected. If $s \geq 1,000$ pounds per square inch and $[F'(\text{core}) - s] < F'(r)$, the beam will also be rejected. If $s < 71,000$ pounds per square inch or $[F'(\text{core}) - s] \geq F'(r)$, perform structural calculations based on $F'(\text{core})$ and submit these to the Structural Materials Section as specified in Section 110.11(c). If the structural calculations show that the beam is not acceptable to the Department, the beam will be rejected. If the structural calculations show that the beam is serviceable in accordance with Section 106.07(c) the beam will be accepted at an adjusted payment. The adjusted payment will be calculated using the equation specified in Section 110.11(c), except that $F'(\text{core})$ will be used in place of $F'(\text{cyl})$.

110.12 PRICE ADJUSTMENT FOR DIESEL FUEL COST FLUCTUATIONS

(a) **General.** These requirements provide for a price adjustment in the form of a payment to the Contractor or a rebate to the Department for fluctuations in the cost of diesel fuel consumed in the performance of applicable construction work. These requirements apply to contract items as grouped by category. Category descriptions and the fuel usage factors which are applicable to each are as follows:

1. Categories.

1.a Category A-Earthwork. Contract items performed under Sections 203*, 204*, and 205, including any modified standard or nonstandard item where the character of the work to be performed is considered earthwork. The sum of the plan quantity for each applicable item in the category must exceed 50,000 cubic yards.

If the sum of the plan quantity for each applicable item in the category exceeds 50,000 cubic yards but is less than or equal to 1,000,000 cubic yards, the earthwork will be considered Small Excavation for adjustment purposes. If the total of the plan quantity for each applicable item in the category exceeds 1,000,000 cubic yards, the earthwork will be considered Large Excavation for adjustment purposes.

*Excluding presplit blasting and cleaning existing ditches.

1.b Category B-Subbase and Aggregate Base Courses. Contract items constructed under Sections 303, 341*, 342*, 344*, 350, 360, and Publication 447 items MS-0370-0005, MS-0370-0020, MS-0370-0030, MS-0370-0035, MS-0370-0040*, and MS-0450-0004 including any modified standard or nonstandard item where the character of the work to be performed is considered construction of a subbase or aggregate base course. The sum of the plan quantity for each applicable item in the category must exceed 5,000 tons.

*When the coarse aggregate and asphalt material are measured and paid for under separate contract items, price adjustments, when applicable, will be computed based on the coarse aggregate item quantity (ton) only, as paid on current estimates.

1.c Category C-Flexible Bases, Pavements, Pavement Patching, and Shoulders. Contract items constructed under Sections 313 316, 410, 412, 413, 419, 420, 450, 470*, 471*, 480*, 481*, 496, 651, 653, 654**, 656**, 657, and Publication 447 items MS-0310-0011, MS-0310-0021, MS-0310-0022, MS-0310-0031, MS-0310-0032, MS-0310-0051, MS-0311-0001, MS-0340-0005, MS-0350-0018, and MS-0360-0019, including any modified standard or nonstandard item where the character of the work to be performed is considered construction of a flexible base, pavement, pavement patch, or shoulder. The sum of the plan quantity for each applicable item in the category must exceed 5,000 tons.

*When measured and paid for on a Material Used Basis, price adjustments, when applicable, will be computed based on the coarse aggregate item quantity (square yards) only, as paid on current estimates. For seal coats / surface treatments paid on an Area Basis, a depth equal to the maximum allowable size of the type of aggregate used, as specified in Section 703.2, Table C, will be assumed.

**Excluding shoulder backfill.

1.d Category D-Rigid Bases, Pavements, Pavement Patching, and Shoulders. Contract items constructed under Sections 323, 501, 502, 505, 506, 516*, 518*, 519, 520, 529, 530, 540**, 545**, and 658, including any modified standard or nonstandard item where the character of the work to be performed is considered construction of a rigid base, pavement, pavement patch, or shoulder. The sum of the plan quantity for each applicable item in the

category must exceed 10,000 square yards.

*Excluding patching joint, new pavement joint, and subbase material for concrete pavement patching.

**Excluding concrete overlay transition, concrete pavement cores, cement concrete, and surface preparation for concrete overlay.

1.e Category E- Structures. Structure work (i.e. new construction or structure rehabilitation) tabulated on an S-drawing or BPAA-drawing; whether the work is measured and paid for under a lump sum contract item (8xxx-xxxx series) plus one or more associated contract items or under one or more separate contract items; excluding any component item(s) or associated contract item(s) for fabricated structural steel, prestressed concrete bridge beams, bearings, bearing pads, and/or any design-related work such as might be included in a design-build project or when an alternate design structure is bid.

Any contract item tabulated on an S-drawing or BPAA-drawing as being a “Roadway Item” is to be included, as are the following contract items, whether or not tabulated on an S-drawing or BPAA-drawing:

- Removal of Existing Bridge / Culvert / Superstructure;
- Removal of Portion of Existing Bridge / Culvert;
- Painting of Existing Structural Steel (i.e. contract items performed under Sections 1070 and 1071, including any modified standard or nonstandard item where the character of the work to be performed is considered painting of existing structural steel;
- Containment (i.e. contract items within the 9075-xxxx series); and
- Causeway Construction and Removal (i.e. any contract item where the item description includes the word “causeway”).

The value of all structure work on the project (i.e. the sum of the value of each applicable component item or contract item in the category) must exceed \$1,000,000. Item value is defined as the contract item or component item quantity; as indicated on the S-drawing, BPAA-drawing, or Roadway drawing; multiplied by the contract unit price or component item unit price, as applicable.

1.f Category F-Milling. Contract items constructed under Sections 491 and 492, including any modified standard or nonstandard item where the character of the work to be performed is considered milling. The sum of the plan quantity for each applicable item in the category must exceed 10,000 cubic yards.

2. Diesel Fuel Usage Factors -

<u>Category</u>	<u>Factor</u>	<u>Units</u>
A - Earthwork		
• Small Excavation	0.34	Gallons per cubic yard
• Large Excavation	0.25	Gallons per cubic yard
B - Subbase and Aggregate Base Courses	0.71	Gallons per ton
C- Flexible Bases and Pavements	2.00	Gallons per ton
D-Rigid Bases and Pavements	1.77	Gallons per cubic yard
E - Structures	4.00	Gallons per \$ 1,000 of work performed
F - Milling	1.15	Gallons per cubic yard

3. Quantity Conversion Factors -

<u>Category</u>	<u>Conversion</u>	<u>Factor</u>
B	square yard to ton	90 lbs/inch of depth/square yard
		110 – 27
		Change No. 2

B	cubic yard to ton	3,240 lbs/cubic yard
C	square yard to ton	110 lbs/inch of depth/square yard
D	square yard to cubic yard	inches of depth/36
F*	square yard to cubic yard	inches of depth/36

*For variable depth milling, an average milling depth of 2 inches will be assumed. For profile milling, an average milling depth of 1 inch will be assumed.

(b) Index Prices. The Department posts a monthly index price for Ultra Low Sulfur (ULS), No. 2 Diesel Fuel using price data obtained, on the last Wednesday of the preceding month, from the Oil Price Information Service (OPIS), which publishes a weekly report on gasoline and distillate reseller prices for cities in the Eastern U.S. Price data reported for Harrisburg, Philadelphia, and Pittsburgh are averaged together to determine the statewide index price.

The price index, FB, will be the index price posted by the Department, determined as specified above, for the month in which the project is advertised.

The price index at the time of performance, FP, will be the index price posted by the Department, determined as specified above, for the month during which applicable contract work is performed.

(c) Price Adjustment Criteria and Conditions. The following criteria and conditions will be considered in determining a price adjustment for diesel fuel cost fluctuations.

1. No Price Adjustment. When the ratio FP/FB falls within the range of 0.95 to 1.05, no price adjustment will be made for any diesel fuel consumed in construction work performed during the relevant month.

2. Price Rebate. When the ratio FP/FB is calculated to be less than 0.95, the Department will receive an automatic price rebate determined in accordance with the following formula:

$$P.R. = (0.95 - FP/FB)(Q)(FB)(F)$$

where:

P.R. = Price Rebate

FP = Price Index for the month during which the diesel fuel is consumed in the performance of applicable construction work.

FB = Price Index

Q = Quantity of eligible Category items as reported on current Estimates. Item quantities will be converted, as necessary, to agree with the units associated with the applicable Diesel Fuel Usage Factor.

F = Diesel Fuel Usage Factor

3. Price Increase. When the ratio FP/FB is calculated to be greater than 1.05, the Contractor will receive a price increase to be determined in accordance with the following formula:

$$P.I. = (FP/FB - 1.05)(Q)(FB)(F)$$

where:

P.I. = Price Increase

FP = Price Index for month during which the diesel fuel is consumed in the performance of applicable construction work.

FB = Price Index

Q = Quantity of eligible Category items as reported on current Estimates. Item quantities will be converted, as necessary, to agree with the units associated with the applicable Diesel Fuel Usage Factor

F = Diesel Fuel Usage Factor

4. Payment/Rebate. The price adjustment will be paid, or rebated, upon approval of a contract adjustment to be prepared on a quarterly basis. Quarterly price adjustments amounting to less than \$1,000 will be disregarded.

5. Expiration of Contract Time. When eligible items of work are performed after expiration of contract time and liquidated damages are chargeable the value of FP used to compute the price adjustment will be either the Price Index at the time of actual performance or the Price Index at the time contract time expired, whichever is less.

6. Final Quantities. Upon completion of the work and determination of final pay quantities, a final contract adjustment may be prepared to reconcile any difference between estimated quantities previously paid and the final pay quantities. In this situation, the value for FP used in the price adjustment formula will be the average of all FP's previously used for computing price adjustments.

7. Inspection of Records. The Department, through the Office of Inspector General, reserves the right to inspect the records of the prime contractor and its subcontractors and material suppliers to ascertain actual pricing and cost information for the diesel fuel used in the performance of applicable items of work.

8. Extra Work. When applicable items of work, as specified herein, are added to the contract as Extra Work, as specified in Section 110.03, no price adjustment will be made for fluctuations in the cost of diesel fuel consumed in the performance of the extra work, unless otherwise approved by the Representative at the time written authorization to perform the extra work is submitted. The current price for diesel fuel is to be used when preparing required backup data for extra work to be performed at a negotiated price. For extra work performed on force account basis, reimbursement for material, equipment, and service by others costs along with specified overhead and profit markups will be considered to include full compensation for the current cost of diesel fuel.

110.13 EVALUATION, DISPOSITION, AND PRICE ADJUSTMENT OF LOW STRENGTH PRECAST CONCRETE PRODUCTS

(a) General. Low strength precast concrete products will be evaluated using the compressive strength of concrete core test specimens. This policy applies to non prestressed precast concrete products where the minimum structural design strength is equal to the 28-day minimum concrete compressive strength. Where precast concrete products are designed with a minimum structural concrete strength less than the 28-day minimum compressive strength, evaluation and disposition will be in accordance with Section 110.10.

(b) Definitions.

- **F'(28-day).** 28-day minimum concrete compressive strength (pounds per square inch), as specified on the Standard Drawings or on the approved shop drawings.
- **F'(cyl).** 28-day concrete compressive strength (pounds per square inch) of acceptance cylinders representing the lot of precast concrete products. Determined as the average of the compressive strength of two or more cylinders.
- **F'(cores).** Concrete compressive strength (pounds per square inch) of acceptance cores extracted from the precast concrete products. Determined as the average compressive strength of all cores from the lot as determined according to PTM No. 606.
- **Lot.** One shifts production and produced from a single mix design at the same water/cement ratio.

(c) Evaluation and Disposition of Low Strength Precast Concrete Products Using Cores. If F'(cyl), representing a specific lot of precast concrete products, fails to meet the F'(28-day) for the specific product, the lot of precast concrete products will be considered deficient.

Request permission from the Chief Structural Materials Engineer, in writing, to extract cores from the deficient lot within 2 working days following testing and determination that $F'(cyl) < F'(28\text{-day})$. Obtain cores under the direction and supervision of the Representative or his or her designate within 2 working days following authorization for coring.

and evaluation, at no additional cost to the Department. The Representative will affix their inspection stamp using indelible ink on each core to provide verification and traceability. Deliver cores to the LTS within 3 working days from the date coring and evaluation was approved. Use a pachometer to avoid damage to the reinforcing steel. Patch holes left after coring using the approved concrete mix design or an approved concrete repair material a manufacturer listed in Bulletin 15 that will achieve the minimum concrete design strength. For products with architectural finishes, obtain advance approval for the repair methods and materials from the Department.

Determine the total number of cores required for evaluation of the lot from the cube root of the number of precast concrete products produced for that lot rounded to the nearest whole number. A minimum of five cores are required, regardless of the lot size.

Cores will be obtained and compressive strength testing conducted according to PTM No. 606.

If $F'(\text{cores}) > F'(28\text{-day})$, the lot of precast concrete products is considered serviceable in accordance with Section 106.07(c) and will be accepted. If $F'(\text{cores}) < F'(28\text{-day})$, the lot is considered deficient and will be rejected.

(d) Price Adjustment and Payment for Low Strength Concrete Acceptance Testing Using Concrete Core Specimens. If a specific lot of precast concrete products is determined to be deficient by failing to meet $F'(\text{cyl}) > F'(28\text{-day})$ but is considered serviceable by meeting $F'(\text{cores}) > F'(28\text{-day})$, the lot will be accepted and the contract unit price (CUP) will be reduced by 5% for the lot.

110.14 PRICE ADJUSTMENT FOR STEEL COST FLUCTUATIONS

These requirements provide for a price adjustment, in the form of a payment to the Contractor or a rebate to the Department, for fluctuations in the cost of the steel used in the applicable materials placed as part of the construction work specified in Sections 620, 621, 948, 1002, 1005, 1050, 1056, 1080, and 1085.

(a) General. These price adjustment provisions apply to items in the contract Schedule of Prices, as specified above, including any modified standard or non-standard item where the work to be performed includes incorporation of one or more of the applicable steel materials specified in the above Sections and addressed herein. Additionally, items in the Component Item Schedule (CIS) for an "as-designed" or alternate design structure, as well as work performed under a design-build contract, will be included when applying the specified price adjustment requirements, provided the work to be performed includes incorporation of one or more of the applicable steel materials specified in the above Sections and addressed herein. Terminal sections, end treatments, transitions, and transition treatments associated with guide rail and metal median barrier work; as well as mechanical splice systems, pile tip reinforcement, high load multi-rotational bearings, shear connectors, and scuppers; will not be subject to the price adjustment criteria and conditions specified herein.

To elect to have these price adjustment provisions apply to one or more of the steel product categories identified herein, when planned for incorporation into a specific project, advance notification must be submitted to the Department. The apparent low bidder is required to submit the Steel Escalation Option form attached to the proposal, via email to steeloptions@pa.gov or fax to 717-265-7208 by 3:00 pm prevailing local time within 7 calendar days after the bid opening. When the seventh calendar day after the bid opening falls on a day PENNDOT offices are closed, submit the Steel Escalation Option form by 3:00 pm prevailing local time on the next business day. If a properly completed Steel Escalation Option form is not provided by the apparent low bidder within the time specified, the Department will consider the option to apply these price adjustment provisions to the project to be declined. Furthermore, if a Steel Escalation Option form, when provided within the specified time, has been completed such that the Department is unable to ascertain the bidder's intention with regard to the inclusion of any one of the applicable steel product categories, the Department will consider the option to apply these price adjustment provisions to that product category to be declined. No further opportunity to elect steel escalation for the project or an individual steel product category will be made available. In the event the apparent low bid is rejected, the next lowest bidder will be notified to submit the Steel Escalation Option form by 3:00 pm prevailing local time within 7 calendar days after notification.

The Department posts a monthly index price for steel (\$ per ton) based on data obtained from the U.S. Department of Labor (USDOL), Bureau of Labor Statistics, which publishes monthly Producer Price Index (PPI) values for various commodities. The statewide index price for steel will be based on the PPI value posted by USDOL for "Semi-finished

Steel Mill Products" (Series ID: WPU101702). The Department will post its monthly index price for steel after the USDOL lists the PPI value on which it is based as final.

The "base / benchmark" index price, SB, will be the steel index price posted by the Department, determined as specified above, for the month in which project letting occurred.

The "invoice" index price, SI, will be the steel index price posted by the Department, determined as specified above, for the month in which applicable steel material is invoiced.

Steel material will be considered invoiced as of the date when an invoice from the steel mill providing the necessary raw material is sent to the Contractor or to a subcontractor, fabricator, manufacturer, or supplier. The steel price adjustment provisions specified herein are not applicable to raw steel material having a mill invoice date that precedes the project letting date. On a quarterly basis, provide documentation of the invoice date for applicable steel material incorporated into the work during the prior 3-month period. Documentation is to be in the form of a tabulation that lists all material invoiced during the period, in chronological order by invoice date; the quantity invoiced; and the applicable contract item(s) and corresponding project location(s) where the invoiced quantity or portion thereof was incorporated, along with copies of supporting invoices. Have a representative of the Contractor, authorized to make such statements, certify that the information provided in the tabulation is complete and accurate and may be relied upon by the Department.

Failure to provide the required tabulation within 10 calendar days of the end of each, applicable 3-month period will result in the Department computing a price adjustment (rebate or increase) using a value for SI that results in the greatest possible price rebate or least possible price increase based on the monthly index prices posted by the Department, to date, since work on the project began.

(b) Price Adjustment Criteria and Conditions. The following criteria and conditions will be considered in determining a price adjustment for steel cost fluctuations.

1. No Price Adjustment. When the ratio SI/SB falls within the range of 0.95 to 1.05, no price adjustment will be made for applicable steel material having an invoice date that falls within the month for which the SI index price was posted.

2. Price Rebate. When the ratio SI/SB is calculated to be less than 0.95, the Department will receive an automatic price rebate, for applicable steel material having an invoice date that falls within the month for which the SI index price was posted, to be determined in accordance with the following formula:

$$\text{P.R.} = (0.95 - \text{SI} / \text{SB}) (\text{SB}) (\text{ST})$$

where:

P.R. = Price Rebate

SI = Index price for the month in which applicable steel material is invoiced.

SB = Index price for the month in which project letting occurred.

ST = Quantity (tons) of applicable steel material incorporated into the work during the applicable 3-month period.*

*Computed based on the quantity paid, under applicable contract items, on current estimates processed during the 3-month period addressed in the tabulation provided by the Contractor. Not to exceed the total tonnage of applicable steel material invoiced during the month for which the SI index price was posted, as shown on the Contractor's tabulation.

3. Price Increase. When the ratio SI/SB is calculated to be greater than 1.05, the Contractor will receive a price increase, for applicable steel material having an invoice date that falls within the month for which the SI index price was posted, to be determined in accordance with the following formula:

$$P.I. = (SI / SB - 1.05) (SB) (ST)$$

where:

P.I. = Price Increase

SI = Index price for the month in which applicable steel material is invoiced.

SB = Index price for the month in which project letting occurred.

ST = Quantity (tons) of applicable steel material incorporated into the work during the applicable 3-month period.*

* Computed based on the quantity paid, under applicable contract items, on current estimates processed during the 3-month period addressed in the tabulation provided by the Contractor. Not to exceed the total tonnage of applicable steel material invoiced during the month for which the SI index price was posted, as shown on the Contractor's tabulation.

4. Equivalent Tonnage. For applicable steel material furnished under a separate contract item, under a design-bid-build contract, or under a design-build contract the equivalent steel tonnage will be computed as indicate in the following sections.

For design-build contracts, provide an itemized breakdown of the applicable steel materials addressed herein incorporated into the work and indicate the quantity of each actually installed. Indicated quantities should be based on field measurements or take-offs from the approved plans or shop drawings and be equivalent to those used to compute payments made against the Lump Sum construction item on current estimates.

4.a Guide Rail and Metal Median Barrier. For applicable guide rail and metal median barrier components (i.e. rail elements, posts, and rubbing rail) furnished under separate contract items or as part of a single contract item for guide rail / metal median barrier complete in place, the equivalent steel tonnage is computed as follows:

4.a.1 Guide Rail or Median Barrier Rail Element (Weak Post or Strong Post).

$$\text{Steel Tonnage (ST)} = 7.84 (Q) / 2000$$

where:

Q = Quantity (linear feet) of weak post or strong post guide rail element paid on current estimates processed during the applicable 3-month period

4.a.2. Type 2W Posts.

$$\text{Steel Tonnage (ST)} = 8.67 (L) (Q) / 2000$$

where:

L = Length of each post (feet) as required by the Standard Drawings or as specified

Q = Quantity (each) of Type 2W posts paid on current estimates processed during the applicable 3-month period.

4.a.3 Type 2S Posts.

$$\text{Steel Tonnage (ST)} = 9.17 (L) (Q) / 2000$$

where:

L = Length of each post (feet) as required by the Standard Drawings or as specified

Q = Quantity (each) of Type 2S posts paid on current estimates processed during the applicable 3-month period

4.a.4 Rubbing Rail.

$$\text{Steel Tonnage (ST)} = 8.56 (Q) / 2000$$

where:

Q = Quantity (linear feet) of rubbing rail paid on current estimates processed during the applicable 3-month period

4.b Reinforcement Bars. For applicable reinforcement bars furnished under a separate contract item, as a component item associated with an alternate design structure, or as a component item associated with a design-build contract, the equivalent steel tonnage is computed as follows:

$$\text{Steel Tonnage (ST)} = (Q) / 2000$$

where:

Q = Quantity (pounds) of reinforcement bars paid on current estimates processed during the applicable 3-month period.

4.c Piles. For applicable steel beam bearing piles, cast-in-place concrete bearing piles, cast-in-place concrete piles, and steel pipe piles, furnished under a separate contract item, as a component item associated with an alternate design structure, or as a component item associated with a design-build contract, the equivalent tonnage is computed as follows:

4.c.1 Steel H-Piles.

$$\text{Steel Tonnage (ST)} = (UW) (Q) / 2000$$

where:

UW= Unit Weight of the Steel Beam* (pounds per foot)

Q = Quantity (linear feet) of steel piles paid on current estimates processed during the applicable 3-month period.

* The unit weight of steel will be the second of the two numbers associated with the size designation for the beam as cited in the item description (i.e. If the item description is "Steel Beam Bearing Piles, HP12x74", the unit weight of the steel is 74 pounds per foot).

4.c.2 Cast-in-Place Concrete Piles.

$$\text{Steel Tonnage (ST)} = 2.80 (D) (Q) / 2000$$

where:

D = Diameter of the steel shell (inches)*

Q = Quantity (linear feet) of cast-in-place concrete piles paid on current estimates processed during the applicable 3-month period.

* From the approved structure Plans or field measurements. For cylindrical shells of varying diameter, a weighted average diameter will be used, computed based on the number of shells of each diameter actually installed. For tapered shells, an average diameter will be used, computed as the average of the shell diameters at the butt end and at the tip.

4.c.3 Pipe Piles.

Steel Tonnage (ST) = $6.70 (D) (Q) / 2000$

where:

D = Diameter of the steel pipe (inches)*

Q = Quantity (linear feet) of pipe piles paid on current estimates processed during the applicable 3-month period.

* From the approved structure Plans or field measurements.

4.d Steel Sign Structure. For applicable steel sign structures constructed under a separate contract item, the equivalent tonnage is computed as follows:

Steel Tonnage (ST) = $(Q) / 2000$

where:

Q = Quantity (pounds) of steel in each sign structure, or portion thereof, paid on current estimates processed during the applicable 3-month period.*

*Not to exceed the estimated weight of each sign structure as indicated on the structure Plans.

4.e Fabricated Structural Steel. For applicable fabricated structural steel; furnished under a separate contract item, as a component item associated with an "as-designed" or alternate design structure, or as a component item associated with a design-build contract; the equivalent tonnage is computed as follows:

Steel Tonnage (ST) = $(Q) / 2000$

where:

Q = Quantity (pounds) of fabricated structural steel girders, rolled beams, angle, and plate paid on current estimates processed during the applicable 3-month period.

4.f Precast Reinforced Concrete Box Culverts and Prestressed Concrete Bridge Beams. For applicable precast reinforced concrete box culvert segments and prestressed concrete bridge beams; furnished under a separate contract item, as a component item associated with an "as-designed" or alternate design structure, or as a component item associated with a design-build contract; the equivalent tonnage is computed as follows:

Steel Tonnage (ST) = $(UW)(Q)/2000$

where:

UW= Unit Weight (pounds per foot) of reinforcing steel in a box culvert segment or of reinforcing steel and prestressing strands in a prestressed bridge beam.*

Q = Quantity (linear feet) of precast reinforced concrete box culvert segments and prestressed concrete bridge beams paid on current estimates processed during the applicable 3-month period.

* Submit documentation indicating the weight (pounds) of reinforcing steel included in and the length (feet) of each box culvert segment, and the weight (pounds) of mild reinforcing steel and prestressing strands included in and the length (feet) of each prestressed bridge beam. UW will be computed as the average of the unit weight of steel (i.e. weight of steel divided by length) in each box culvert segment, or as the average of the unit weight of steel (i.e. weight of steel divided by length) in each prestressed bridge beam. Documentation must be submitted at the time required shop drawings are submitted for approval.

5. Payment/Rebate. The price adjustment will be paid, or rebated, upon approval of a contract adjustment to be prepared on a quarterly basis as applicable work is completed. Cumulative quarterly price adjustments amounting to less than \$1,000 will be disregarded.

6. Expiration of Contract Time. When eligible materials are purchased after expiration of contract time and liquidated damages are chargeable, the value for SI used to compute the price adjustment will be either the index price for the month in which applicable steel material is invoiced or the index price at the time contract time expired, whichever is less.

7. Final Quantities. Upon completion of the work and determination of final pay quantities, a final contract adjustment may be prepared to reconcile any difference between estimated quantities previously paid and the final quantities. In this situation, the value for SI used in the price adjustment formula will be the average of all SI values previously used for computing price adjustments.

8. Inspection of Records. The Department, through the Office of Inspector General, reserves the right to inspect the records of the prime contractor and its subcontractors and material fabricators and suppliers to ascertain actual invoicing dates and quantity information for the steel material used in the performance of applicable items of work.

9. Extra Work. When applicable items of work, as specified herein, are added to the contract as Extra Work, as specified in Section 110.03, no price adjustment will be made for fluctuations in the cost of the steel used in manufacturing the materials placed during performance of the extra work. The current price for steel is to be used when preparing required backup data for extra work to be performed at a negotiated price. For extra work performed on a force account basis, reimbursement of actual material costs, along with the specified overhead and profit markup, will be considered to include full compensation for the current cost of steel.

SECTION 111—DELAY CLAIMS

111.01 COMPENSABLE DELAYS—The Department is responsible for delay damages arising only from delays created by its negligent acts or omissions and from Utility Infrastructure and Utility Adjustment delays as specified in Section 105.06. Unless otherwise specified, assume the risk of damages from all other causes of delay.

111.02 GENERAL CONDITIONS CONCERNING DELAY CLAIMS—Because of the nature and extent of damages arising out of work that has been delayed; of the need for the Department to be made aware of potential delay claims promptly after the cause or causes of delay have arisen so that record-keeping can begin; and of the parties' intent to have all such claims as fully documented as possible, strict adherence to the provisions of this section is an essential condition precedent to filing a delay claim with the Board of Claims. The following items of damage cannot be included in any delay claim against the Department:

- profit;
- loss of profit;
- labor inefficiencies;
- home office overhead, including but not limited to costs of any kind for home office personnel; and
- consequential damages, including but not limited to loss of bonding capacity, loss of bidding opportunities, and insolvency.

111.03 NOTIFICATION OF DELAY CLAIM—Notwithstanding the provisions specified in Section 105.01, within 10 calendar days of any negligent act or omission of the Department or of any Utility Infrastructure or Utility Adjustment delay as specified in Section 105.06, notify the Inspector-in-Charge that operations have been or will be delayed and that a claim for delay damages either is going to or might be filed with the Board of Claims. Confirm such notification in writing to the District Executive within 10 calendar days of such notification to the Inspector-in-Charge.

111.04 PROCEDURES—Upon notifying the Inspector-in-Charge as provided above, keep records, on a daily basis, of all labor, material, equipment, and site overhead expenses for all operations that are affected by the delay. Identify in such daily records each operation and the station or stations thereof affected by the delay. The Department's forces will also keep daily records of all labor, equipment, material, and site overhead expenses for all operations affected by the delay. On each Monday, compare the previous week's daily records with those kept by the Department and review for accuracy. Report to the District Executive, within 10 calendar days of each such review, all disagreements with such records. Refusal or failure to meet to review the Department's records or to report disagreements with such records will create an irrebuttable presumption in favor of the Department that its records are accurate. Make no claim for delay costs of any kind allegedly incurred, before notifying the Inspector-in-Charge that operations have been delayed.

On a weekly basis, prepare and submit to the Inspector-in-Charge written reports containing the following information:

(a) The number of days behind schedule.

(b) An identification of all operations that have been, or are to be delayed.

(c) An explanation of how the Department's negligent act or omission or the Utility Infrastructure or Utility Adjustment as specified in Section 105.06 delayed each operation, and an estimation of how much time is required to complete the project.

(d) An itemization of all extra costs being incurred, including:

- An explanation as to how those extra costs, including site overhead costs, relate to the delay and how they are being calculated and measured;
- An identification of all project employees for whom costs are being compiled; and
- An identification of the manufacturer's numbers for all items of equipment for which costs are being compiled.

Upon completion of the project, submit to the Inspector-in-Charge and the District Executive copies of a report containing the following information:

- An itemization and explanation of the measurement and basis of all extra costs being sought, including all reports certified by an accountant;
- A description of the operations that were delayed, including all reports by scheduling experts or other consultants, if any;
- All actions taken by the Contractor to minimize the delay and to minimize the delay costs incurred;
- An as-built chart, CPM scheme, or other diagram, depicting in graphic form how the operations were adversely affected; and,
- For delays related to Utility Infrastructure and Utility Adjustments, an explanation of why the delay was unforeseen based on the contract documents and a careful pre-bid examination of the project site, or of any waste or borrow sites designated in the proposal.

The District Executive will review the submission and any reports prepared by the Inspector-in-Charge. If, in the opinion of the District Executive, the Department is not liable for any delay, a written decision will be issued. Comply with the provisions of Section 105.01 if the District Executive's decision is disputed.

If the District Executive determines that the Department delayed operations, a review of the damages claimed will be made and a written decision will be issued. Comply with the provisions of Section 105.01 if the District Executive's decision is disputed. For operation delayed by a Utility Infrastructure or Utility Adjustment as specified in Section 105.06, concurrence of the district Executive's decision by the Director of Project Delivery is also required.

Only expenses for extra labor, material, equipment, and site overhead will be considered by the Department. Ten percent will be added to these costs to cover allocable home office overhead. Likewise, in the event a delay claim is filed with the Board of Claims, only the foregoing expenses may be claimed.

When computing additional equipment expenses, do not use, in any way, the Rental Rate Blue Book for Construction Equipment or any other rental rate book. For equipment that is owned, use actual records kept in the usual course of business, and compute increased ownership expenses pursuant to Generally Accepted Accounting Principles (GAAP). For equipment that is rented or leased, use the rental agreement or actual invoices to compute increased rental expenses. Equipment that is rented or leased from an entity that is a division, affiliate, or subsidiary of, or that is in any other way related to, the Contractor or its parent company, will be considered owned equipment.

SECTION 112—PROJECT RECORDS

112.01 SCOPE—This section pertains to all project records that were used to prepare and compute the bid; to prepare all schedules used on the project; to record the progress of work on the project; and to record, compute and/or analyze all costs incurred on the project, including those used in the preparation or presentation of claims to the Department or the Board of Claims.

112.02 DEFINITION—Charts, graphs, cross-sections, plans, photographs, schedules, reports, accounting statements, accounting ledgers, balance sheets, bid sheets, take-off sheets, cost estimates, cost records, payroll records, financial documents, notes, memoranda, correspondence, and all other records, whether typewritten, handwritten, computerized, microfilmed, photographed, or recorded, that were prepared by or received by the Contractor.

112.03 RETENTION PERIOD—Retain the aforementioned project records for a period of 3 years from the date of receipt of final payment with the following exception:

- If any litigation, claim, or audit is started before the expiration of the 3-year period, retain the records until all litigations, claims, or audit findings involving the records have been resolved.

112.04 INSPECTION—Upon written notice by the Representative or an authorized agent acting on behalf of the Department, make available all requested project records for inspection and copying by Department personnel or those authorized to act on its behalf. Make such records available at a reasonable time and place.

Refusal or repeated failure to present requested project records for inspection or copying may be considered grounds for declaring the Contractor in default and may be considered against prequalification for work on future projects.

Exempt from this section are all project records, which under the Pennsylvania Rules of Civil Procedure, are deemed confidential and, therefore, exempt from discovery.

112.05 RELEASE OF ELECTRONIC VERSION OF PROJECT PLAN FILES--After executing the Contract the Department may, if requested in writing, provide the existing available electronic version of the project plan files (the Commonwealth of Pennsylvania's (Commonwealth's) Intellectual Property) to the Contractor subject to the terms and conditions of this specification.

The Department's Project Manager will determine the content of the electronic files to be released.

The Department does not warrant or guarantee the information and data in the electronic version of the project plan files as a substitute for the sound engineering judgment of the Contractor.

Do not assume any proprietary rights to or interest in the Commonwealth's Intellectual Property. Hold, maintain, and protect the Commonwealth's Intellectual Property in the strictest confidence. Do not transfer any translated or converted form of the information or data in any manner without written permission of the Department.

Do not copy, distribute, sell, rent, sub-license, or lease the Commonwealth's Intellectual Property to any third parties or use the files or any translated or converted form of the files to produce, market, or support Contractor owned products. The provisions set forth in this paragraph are not intended to supplant a Contractor's right to allow access to its sub-contractors.

After payment of the final invoice for work and services provided by the Contractor as part of the Contract, one electronic copy of the information and data contained in the Commonwealth's Intellectual Property or any translated or converted form of its Intellectual Property may be retained for archival purposes only. However, all rights in the Intellectual Property including documents, sketches, drawings, designs, papers, reports, computer programs, data, computer documentation, and other tangible materials authored, prepared and transmitted by the Department constitute and remain the Intellectual Property of the Commonwealth.

The electronic version of the project plan files are provided by the Department, "AS IS," without any covenant, representation or warranty of any kind or nature whatsoever, express or implied. Indemnify and hold harmless the Department, its officials and employees for any injury to the person or property of third parties arising out of the use of or any defect in the Commonwealth's Intellectual Property or any translated or converted form of these files or any

accompanying documentation. All copies of the Commonwealth's Intellectual Property remain the property of the Commonwealth, acting through Department, and any rights involving the copyright law, patent law, trademark law, and trade secret law remain with the Commonwealth. All goodwill remains with the Commonwealth.

SECTION 200 EARTHWORK

SECTION 201—CLEARING AND GRUBBING

201.1 DESCRIPTION—This work is:

- Removal of the first 8 inches of topsoil and organic material.
- Removal of topsoil and organic matter such as trees, stumps, brush, roots, and other vegetation within the limits of grading, including ditches and channels. When indicated, perform tree trimming and selective tree removal outside of the limits of grading as specified in Section 810.
- Removal of objectionable material, rubbish, and junk within the project limits.
- Removal of buildings and structures, fences, walls, guide rail posts, guide rails, signs, direction markers, and other obstructions interfering with the work.
- Disposal of removed material.
- Salvaging, temporarily storing, and delivering of material.
- Obtaining of waste areas for disposal of material as specified in Section 105.14.
- Stockpiling of topsoil mixture as specified in Section 801.
- Chipping and stockpiling wood waste material, if specified in the Special Provisions.

201.3 CONSTRUCTION—Clear and grub before the start of grading operations in an area. The Contractor may remove stumps within excavation areas during grading. Replace suitable material and topsoil that is required on the project and was wasted during clearing and grubbing operations, at no additional cost to the Department.

Do not damage trees or other vegetation beyond the grading limits. Install protective fencing as indicated, as specified in Section 811, before clearing and grubbing operations.

Clear the ground of organic matter within excavation areas. Remove stumps and roots to a depth of at least 2 feet below subgrade or slope surfaces.

Remove organic matter and topsoil within embankment areas to a depth of 8 inches below the existing ground to 20 feet beyond the pavement edges. Beyond 20 feet of the pavement edges and within the embankment area, cut trees and stumps flush with the ground surface. Remove remaining topsoil over 8 inches in depth, when directed, as specified in Section 203. Stockpile removed topsoil as specified in Section 801.

Trees and shrubs along a highway previously opened to traffic belong to the property owner. Surrender all material from the removal of trees and shrubs to the owner of the abutting property. Dispose of the trees and shrubs if the owner refuses to accept the wood.

Transport wood chips to approved stockpile areas that will not interfere with construction operations, obstruct drainage, or cause water pollution.

Dispose of material in an approved waste area, unless otherwise specified in the Special Provisions. Review and comply with all Federal, State and Local regulations governing burning. If burning is allowed, obtain permits and burn in accordance with regulations. Comply with the requirements of the Air Pollution Control Act (Act 245-1972, or as amended), the Solid Waste Management Act (Act 97-1980, or as amended), and the permits specified in Section 107.27(a), whichever are applicable. Do not burn within 40 feet of remaining vegetation. Recondition the sites of fires as specified in Section 105.14.

When an enclosure fence is partly or wholly within the right of way, notify the property owner 30 days in advance of clearing and grubbing operations to allow the owner to make necessary arrangements to restore the enclosure. Upon failure of the property owner to proceed with work required to enclose the property, carefully remove the fence within the right of way and neatly pile material on the owner's property adjacent to the right of way.

201.4 MEASUREMENT AND PAYMENT—Lump Sum

If no item of work is provided in the contract, this work is incidental to the other contract items.

SECTION 202—TOTAL DEMOLITION OR PARTIAL DEMOLITION OF BUILDINGS AND OTHER STRUCTURES

202.1 DESCRIPTION—This work is total or partial demolition of buildings and other structures, as indicated. The following definitions apply:

(a) Total Demolition. This work is the removal of indicated buildings and other structures located wholly within the right of way.

(b) Partial Demolition. This work is the removal of indicated buildings and other structures located partly within the right of way. Demolish and remove only the portion within the right of way, unless the owner of the remaining portion requests and authorizes total demolition in writing.

(c) Refinishing Party Walls. Refinishing of the exposed portion of the party wall, including the party wall foundation.

202.2 MATERIAL—

(a) Cement, Type IS, IP, or II. Section 701

(b) Fine Aggregate, Type A. Section 703.1

(c) Lime. Section 723

(d) Water. Section 720.1

(e) Emulsified Asphalt, Class E-1 or E-2. Section 702

(f) Caulking Compound. Section 705.7

(g) Other Material. Certify as specified in Section 106.03(b)3.

- Metal Mesh Lath, 3.4 pounds per square yard—FSS QQ-L-101a
- Roofing Material, 65 pounds per roll—ASTM D 224
- Insulating Board—ASTM C 578, Types I and II, Grades 2 and 3
- Asphalt Mastic—FSS SS-C-153

202.3 CONSTRUCTION—

(a) General. Confine movements and operations to the existing right-of-way limits. Do not deposit construction material, junk, debris, or rubbish on private property. Do not enter private property without first obtaining the written consent of the property owner or owners and filing a copy of the consent with the Department.

The Department will obtain the vacation of all buildings or structures to be demolished as expeditiously as possible. The Department does not guarantee that all facilities will be vacated and available in sufficient time to allow systematic operations.

The Department does not assume responsibility for the condition of the various buildings or loss of fixtures, equipment, material, or other objects between submittal of the proposal and actual possession of the buildings.

Remove and dispose of material taken from within the project limits as well as debris and rubbish, except items of personal property belonging to owners or tenants and material required for backfilling. Remove material from the project limits as it accumulates, or as directed. Conduct no sale of material while within the project limits.

Comply with the requirements, outlined in Pennsylvania's Asbestos Occupations Accreditation and Certification Act of 1990 (Acts 194 and 161) as well as Federal National Emission Standard for Hazardous Air Pollutants (NESHAP) regulations, for providing notification to all State and County agencies having regulatory enforcement responsibility for demolition and asbestos abatement projects prior to the start of any such work. Such notification should be made using the "Asbestos Abatement and Demolition/Renovation Notification Form," which may be obtained by contacting the DEP Asbestos Office at (717) 787-9257, or the nearest DEP regional office. The form may also be obtained here.

(b) Safety Regulations. Furnish, erect, and maintain barricades, steady burn lights, flashing warning lights, and warning and "Keep Out" signs where the placing of such protective devices is warranted, or as directed.

Provide, erect, light, and maintain suitable footway shelter platforms, as required by law or as directed.

Control dust resulting from demolition.

Comply with the National Emission Standard for Asbestos, as contained in the Federal Register, Vol. 55, No. 224.

(c) Utility Disconnections. Before starting work, make arrangements with the proper utilities for turning off and disconnecting utilities in connection with demolition operations. Perform the work according to local requirements.

When only a portion of an occupied building is to be demolished, conduct demolition and related operations without interrupting utility service to the remaining portion of the building.

Make permanent reconnections where it is necessary to reconnect facilities to the un-demolished portion of the building.

(d) Demolition. Submit a demolition plan to the Representative at least 2 weeks before beginning demolition. Provide a rodent control plan if directed. Before beginning demolition, pump out and clean wells, cesspools, and outbuildings, within the areas to be cleared, in a sanitary manner. Disinfect all such structures as required by the appropriate health authorities, then backfill to the adjacent ground level.

Do not interfere with functioning wells, cisterns, cesspools, or other ground openings outside the condemned area. Securely and permanently cap well casings. Cut off and cap pipes leading into or out of abandoned wells or wells to be demolished.

Where the uncondemned portion of a property has been abandoned, cover, backfill, or treat wells and other openings that constitute a hazard or dangerous condition. Before proceeding with this work, obtain the consent of the owner or owners in writing.

Leave contiguous buildings in a safe condition. Do not deface, mar, or jeopardize them. Repair damage and restore them as directed.

Remove existing fences and guide rail posts, unless otherwise directed. Do not disturb existing curbs, sidewalks, and street paving unless directed.

Do not use a swinging ball immediately adjacent to any public thoroughfare or in any area where its use may create a public hazard.

Do not set fire to any structure. Burn debris only with written permission of local police or fire authorities and if the burning conforms to State Air Pollution Control Commission regulations. Do not begin burning debris until the Department receives a copy of the written permission.

Ensure that the demolition work is strictly confined within the limits of the indicated temporary construction area without hazard to adjacent properties or to the public.

Do not demolish chimneys common to adjacent properties. Do not disturb these chimneys other than to give them support as necessary for continued stability. Repoint and cap as directed.

Restrict partial demolition to horizontal operations, one floor of each structure at a time. Progressively demolish a structure(s), except for the stripping of fixtures, from top to bottom, one floor at a time. The Contractor may perform bay or sectional-type demolition provided a detailed plan, including the building's structural framework, is submitted and accepted before beginning the work. Progressively demolish bay or sectional-type structures from top to bottom as well. Completely demolish each bay or section before starting operations on any adjacent bay or section. Remove each bay or section in a manner that maintains the integrity and proper support of adjacent bays or sections.

If only a portion of a building is to be demolished, adequately shore, brace, and support the remaining part to maintain the integrity of remaining walls, floors, and roofs and their supporting members. Construct shoring, bracing, and supports to be outside the right of way. Tightly board up and seal the remaining portion of a partially demolished building along the right-of-way line. Construct the new closure and connections to the remaining portion of the building in a satisfactory manner and make them weatherproof. Provide a closure of adequately braced lumber studding placed not more than 16 inches apart, with plywood or equal facing, without holes, tightly and securely nailed to the studding. Cover the plywood facing with two layers of smooth finished roofing material. Overlap the roofing material by not less than 4 inches.

Where demolition involves severance through a cellar or other subsurface opening, immediately erect a 18-inch thick cement masonry wall adjacent to and wholly outside the right of way. Provide a wall extending from 18 inches below the existing cellar floor to the elevation of the top of adjacent cellar walls. Integrally connect the new wall to the existing adjacent walls.

Demolish wall portions above the first floor that are located immediately adjacent to and parallel to any street. Remove walls and foundations, except required party walls as indicated, to an elevation 4 feet below the adjacent sidewalk elevation. Clear partition walls and columns of any nature, in cellars or in other subsurface openings, to their floor elevations.

Fill in and repair holes, breaks, or depressions in remaining walls with brick and cement mortar.

Rough cast repaired areas with cement mortar so that they are left in a safe and weatherproof condition.

Remove floor construction above cellars. Remove basement partitions, furnaces, heating apparatus, piping, fuel tanks, miscellaneous fixtures, and stairways from the demolition area.

Store material suitable for backfill that may be encountered in the demolition, until the walls are down.

(e) Refinishing Party Walls. Where indicated or directed, cap party walls and restore by insulating and plastering to an acceptable finish. Before work, thoroughly clean the party wall of old plaster, sand, and dirt. Rake pit joints in the brickwork to a minimum depth of 1/4 inch, as directed. Water joints and repoint while damp.

1. Insulating Coating. If the wall has an average thickness of less than 6 inches, apply an insulating coating as follows:

- Evenly spread a heavy coating of cold asphalt mastic over the entire wall surface.
- Fit, press in place, and securely bond insulating boards (1-inch by 2-foot by 8-foot stock) to the asphalt mastic.
- Caulk joints between the insulating boards with emulsified asphalt or caulking compound to obtain a uniform and finished appearance.

2. Cement Plaster Coating.

2.a Metal Mesh Lath. Place metal mesh lath against the insulating coating, and securely attach with acceptable devices.

If an insulating coating is not required, securely attach the metal mesh lath directly to the wall, using acceptable devices penetrating the mortar and not the brick. Repair damage to the mortar bond or interior of the wall to the satisfaction of the Representative.

2.b Cement Plaster. Do not plaster until the preceding operations have been inspected and accepted. Do not plaster when the outside air temperature is below 45F. Extend the plaster from the roofline or wall top to the established ground line, or as directed. Provide a total thickness of finished plaster not less than 7/8 inch.

Mix plaster in a suitable mixer with water to obtain a plastic composition. Proportion the mix as follows:

**Cement Plaster
Scratch and Brown Coats**

Cement—1 bag (94 pounds)
Lime—1 bag (50 pounds)
Natural Sand—5 cubic feet

**Cement Plaster
Finish Coat**

Cement—1 bag (94 pounds)
Lime—1 bag (50 pounds)
Natural Sand—6 cubic feet

Immediately before scratch coat application, evenly wet the wall surface but do not saturate. Apply a 3/8-inch scratch coat, heavily cross-hatched to integrate with the metal mesh lath.

After the scratch coat dries thoroughly, again, evenly wet the wall surface but do not saturate. Apply a 3/8-inch brown coat.

After the brown coat dries thoroughly, again, evenly wet the wall surface but do not saturate. Apply a 1/8-inch finish coat. Provide color and finish type as directed.

Protect each coat of plaster from sun and wind to prevent rapid drying. Keep each coat moist by sprinkling for at least 3 days after application or as directed. Allow each coat to dry thoroughly before placing the succeeding coat.

Upon completion of the plastering, install suitable matching wood trim along the border of the roof. Paint new wood trim to conform to the trim color of the remainder of the structure or as directed.

(f) Backfilling. Backfill subsurface areas as specified in Section 206.3 and as follows:

Before starting backfilling operations, submit the method of backfill and compaction for review and acceptance.

Furnish additional embankment material for backfilling subsurface areas. Have the quality, nature, and source of any additional embankment material accepted before use. Do not use unsuitable or unstable material in the backfill.

Break-up existing cellar floors and other surface areas to ensure adequate subsurface drainage. Backfill cellars and other subsurface spaces, and grade to the adjacent ground level or as directed.

Clean party wall foundations against which backfill material is to be placed, point brick or block walls with mortar, and waterproof with two coats of emulsified asphalt.

(g) Treatment of Disturbed Areas. Treat disturbed areas resulting from demolition with seeding and soil supplements as specified in Section 804. Use a seeding type as indicated or directed. When directed, mulch as specified in Section 805.

202.4 MEASUREMENT AND PAYMENT—

(a) Demolition. Lump Sum

(b) Refinishing Party Walls. Square Foot

(c) Utility Disconnections/Reconnections. Dollar

If indicated, the Contractor shall pay all expenses resulting from utility disconnections/reconnections, including fees to utility companies or other agencies. The Contractor shall be paid for all fees and work performed as specified in Section 110.03(d)4.

(d) Treatment of Disturbed Areas. Treatment of disturbed areas is incidental to this work.

SECTION 203—CLASS 1, CLASS 1A, CLASS 1B, AND CLASS 1C EXCAVATION

203.1 DESCRIPTION—This work is excavation for roadways, roadway appurtenances, and structures. The four classes of excavation include the following:

(a) Class 1 Excavation.

- Excavation as shown on the Standard Drawings, for roadways, shoulders, ditches, drainage structures, stream channels, grade separation structures, retaining walls, and wingwalls.
- Excavation, as indicated or directed, for benches and for the removal of existing pavements not being rehabilitated.
- Excavation, as indicated or directed, for the removal of unsuitable material having a bottom width of 8 feet or more.
- Excavation, as indicated or directed, to allow for the placement of topsoil.
- Excavation and stockpiling, as indicated or directed, for the removal of topsoil other than the first 8 inches, which are incidental to the clearing and grubbing operations specified in Section 201.
- Removal of unforeseen slides and rock ledges.
- Removal of stone fences, piles of dirt or stones, individual boulders, and any portions of structures above the natural ground, when in excess of 1/2 cubic yard volume.
- Full depth saw cutting of existing pavement to neat lines as indicated.

(b) Class 1A Excavation. Excavation for the removal of unsuitable material below subgrade having a bottom width of less than 8 feet, as indicated or directed. Includes sawcutting of existing pavement as indicated. Includes backfilling as specified in Section 206.

(c) Class 1B Excavation. Excavation for roadway rehabilitation and removal of existing pavement to neat lines. Includes full depth saw cutting or milling of the pavement to neat lines as directed.

(d) Class 1C Excavation. Excavation for the removal and undercutting of unsuitable material below existing subgrade having a bottom width of 8 feet or more. Includes backfilling as indicated or as specified in Section 206.

203.3 CONSTRUCTION—

(a) General. During construction, keep the excavation graded to drain, and seal with smooth-wheeled compaction equipment to prevent subgrade from becoming saturated. Seal the surface at the end of the workday in order to prevent conditions from deteriorating before work can proceed. Temporary drainage structures or channels may be required.

(b) Blasting. Drill and blast rock, not removable by other excavating methods, in a manner that completes the excavation to the lines indicated, with the least disturbance to adjacent material, as specified in Section 207.

(c) Removal of Existing Pavements.

1. Under Embankments. Remove existing pavements within 3 feet of the finished grade, scarify the underlying base to a depth of 6 inches and recompact.

2. Outside Embankment Limits. Remove existing pavements outside the limit of embankments as indicated to neat lines. Backfill with suitable material compacted as specified in Section 206.3(b). If specified, use Type C or

better, No. 2A or OGS as specified in Section 703.2.

3. Roadway Rehabilitation. Outline area, cut, and remove existing pavement structure as indicated or directed.

(d) Slopes. Vary the slopes, if directed, depending on the type of material encountered, to obtain satisfactory stability. Remove the material by a method that allows the revised slope lines to be neatly and acceptably trimmed to meet existing conditions.

If a slide occurs, notify the Inspector-in-Charge immediately and cease operations in the slide area until directed to resume.

Remove slide material and bench or flatten slopes, as directed, to obtain the planned width of roadway.

(e) Excavation Beyond Established Slope Lines. Do not remove or excavate any material beyond the slope lines indicated, without written authorization.

(f) Stream Channels. Do not excavate stream channels until directed.

(g) Topsoil. Stockpile topsoil removed from within the excavation or under embankment areas as specified in Section 801, unless otherwise directed. Replace topsoil that is required on the project and wasted during clearing and grubbing operations at no additional cost to the Department.

(h) Bracing and Shoring. Brace and shore sides of the excavation, as necessary. Remove bracing and shoring when no longer required, unless otherwise indicated or directed.

(i) Cofferdams. Drive timber or metal sheeting to form a cofferdam. Brace the sheeting in all directions. Pump or bail to remove water as necessary. Remove sheeting or bracing when no longer required, unless otherwise indicated or directed.

(j) Suitable Material Required for Embankment and Backfill. Haul suitable excavated material for placement in embankment and for backfill. Replace suitable material (Section 206.2(a)2) that is required on the project and wasted during clearing and grubbing operations at no additional cost to the Department.

(k) Unsuitable and Surplus Material. Dispose of unsuitable and surplus material in suitable waste areas obtained as specified in Section 105.14.

(l) Stockpile of Material. Remove and stock pile excavated material in approved areas.

(k) Removal of Temporary Roadway. Deliver the items including rock and stream crossing pipe to a County Maintenance Facility or location approved by the Representative. If delivered to a Department Facility, notify and coordinate with the County Manager for delivery. Materials not claimed by the Department are the Contractor's responsibility for disposal.

203.4 MEASUREMENT AND PAYMENT—Cubic Yard

For the class of excavation indicated and as follows:

(a) Excavation Within Established Slope Lines. Excavation quantities will be determined for payment using the following methods:

1. Plan Quantities. Indicated quantities may be used if the Representative agrees, in writing, that the project has been constructed as indicated and that the indicated quantities may only be used if the borrow section can be isolated.

2. Measured Quantities. If the plans have been altered by construction changes, or if the project involves Borrow Excavation that cannot be isolated, excavation will be measured. Measurement may also be requested, or the Representative may require measurement, if there is disagreement as to the accuracy of the indicated quantities. Cross-sectional measurements will be obtained by field survey or by photogrammetric methods. The original cross-sections will be used as the base cross-sections and the final cross-sections plotted thereon. Additional cross-sections may be

interpolated at intermediate points, where necessary to more accurately determine the quantities. The average end-area method, based on horizontal measurement, will be used to compute quantities. If the Representative or Contractor determines this method produces a considerable error, the Representative will use any other three-dimensional method that will keep the error to a minimum.

Stone fences, piles of stone, and individual surface boulders, in excess of 1/2 cubic yard and not shown on the cross-sections, will be measured by a three-dimensional volume method.

Measure the excavation by acceptable methods involving three-dimensional measurements where it is otherwise impractical to measure material by the cross-sectional method due to the erratic type or location of work.

(b) Excavation Beyond Established Slope Lines. The Department will make payment as specified in Section 205.4(a) when widened excavation is used in place of borrow excavation, as shown on the Standard Drawings and accepted in writing. Excavating offsets for the convenience of drilling is incidental to the Class 1 Excavation.

(c) Stream Channels. Request an inspection of the excavation when excavation of a channel is completed as indicated. Cross-sections will be obtained, and the quantities computed, using the method specified in Section 203.4(a)2 when the excavation is satisfactory. These quantities will be used as the basis for current and final payments.

Clearing and grubbing required to make such measurements is incidental to stream channel excavation.

(d) Slope Changes. The Department will pay for work required to change slopes from the indicated template, when directed, as specified in Section 110.03.

(e) Saw Cutting. Linear Foot.

Saw cutting will be paid, when directed or indicated by the Linear Foot. Removal of pavements to neat lines by a milling method when directed or indicated, will be incidental to the class of excavation.

SECTION 204—CLASS 2, CLASS 3, CLASS 4, AND EXISTING DITCH CLEANING EXCAVATION

204.1 DESCRIPTION—This work is the cleaning of existing ditches and the excavation for ditches, stream channels, culverts, drains, utilities, and structures. The four classes of excavation include the following, as shown on the Standard Drawings or as indicated.

(a) **Class 2 Excavation.** Excavation for inlet, outlet, and parallel ditches; stream channels; structures removed below the ground surface and not replaced with new structures; spillways; and half-circle pipe.

(b) **Class 3 Excavation.** Excavation for new grade separation and drainage structures, new retaining walls, abutments, piers, and wingwalls.

(c) **Class 4 Excavation.** Excavation for pipe culverts; pipe-arches; metal plate pipe; metal plate pipe-arches; standard endwalls for pipe culverts and pipe-arches; utilities; and excavation in excess of the standard depth for pavement base drains, pipe underdrains, subsurface drain outlets, and subgrade drains.

(d) **Cleaning Existing Ditches Excavation.** Removal and disposal of all soil and organic material in existing ditches.

204.3 CONSTRUCTION—

(a) **Foundations.** Notify the Representative 2 weeks in advance of excavation for structures so that cross-sections may be obtained. Excavate to a depth that provides a satisfactory foundation, as directed. Do not disturb the foundation area to the extent that it requires removal of additional material to provide a satisfactory bearing. Compact direct load bearing foundation to the original bearing capacity as specified in Section 206.3(b). Do not place concrete or masonry until the foundation area has been accepted.

(b) **Drilling and Blasting.** Drill and blast to complete the excavation to the required lines, with the least disturbance to remaining material. Do not blast within 5 feet of the foundation bearing elevation. Remove remaining rock to bearing elevation using mechanical means.

(c) **Bracing and Shoring.** Section 203.3(h)

(d) **Cofferdams.** Drive timber or metal sheeting to a depth below the bottom of foundation, substantially braced in all directions to form a cofferdam, when required, allowing the foundation area to be pumped reasonably free of water while concrete or masonry is being placed. The Representative may require the cofferdam to be sealed below the foundation with sufficient concrete so that it may be pumped reasonably dry where the foundation area is of sandy or other porous materials. Remove sheeting and bracing when no longer required, unless otherwise indicated or directed.

(e) **Backfilling.** Backfill spaces excavated for, but not occupied by, structures with acceptable material as specified in Section 206.3(b).

(f) **Ditch and Stream Channel Slopes.** Trim slopes neatly to the lines indicated. Do not remove or excavate any material beyond lines indicated, without written authorization from the Representative.

(g) **Topsoil.** Dispose of or utilize topsoil removed in Class 2 Excavation as specified in Section 203.3(g)

(h) **Suitable Material Required for Embankment and Backfill.** Section 203.3(j)

(i) **Unsuitable and Surplus Material.** Section 203.3(k)

(j) Cleaning Existing Ditches Excavation. Remove and satisfactorily dispose of all soil and organic matter from within the limits of the existing ditch and side slopes as indicated or directed and as specified in Section 204.3(f).

(k) Excavation for Utility Construction. Excavate trench sufficiently true in alignment to allow the utility facility to be laid in the approximate center of the trench. Excavate unsuitable material to width and depth as directed. Excavate rock six inches below bottom of trench.

204.4 MEASUREMENT AND PAYMENT—

(a) Class 2, Class 3, and Class 4 Excavation. Cubic Yard

Measured, using the methods specified in Section 203.4(a)2, for the class of excavation indicated.

When directed to perform excavation below the indicated structure foundation elevation, the Department will pay for excavation as additional work, as specified in Section 110.03(b), to a maximum depth of 2 feet, and as extra work, as specified in Section 110.03(c), beyond a depth of 2 feet.

When directed to perform excavation in rock below utility trench design elevations, the Department will pay for the excavation and backfill as specified in Section 110.03(c), to a maximum depth of 6 inches. When directed to perform utility trench excavation of unsuitable material, the Department will pay for the excavation as specified in Section 110.03(b).

The Department will not pay for material removed or excavated in advance of obtaining cross-sections, unless written authorization by the Representative is first obtained.

(b) Cleaning Existing Ditches Excavation. Linear Foot

SECTION 205—BORROW EXCAVATION

205.1 DESCRIPTION—This work is the excavation or obtaining embankment material from borrow areas acquired as specified in Section 105.14, or from other sources for construction of embankments or backfills.

Borrow excavation includes Common Borrow Excavation, Foreign Borrow Excavation, Selected Borrow Excavation, and Selected Borrow Excavation for Structure Backfill described as follows:

(a) **Common Borrow Excavation.** Excavation of suitable material as specified in Section 206.2 from borrow areas that can be measured before and after excavation. Common Borrow Excavation also includes the removal of topsoil from borrow areas and stockpiling as specified in Section 801.

(b) **Foreign Borrow Excavation.** Excavation of or obtaining satisfactory material as specified in Section 206.2 from sources outside the limits of the project that cannot be measured before and after excavation.

(c) **Selected Borrow Excavation.** Excavation of or obtaining material used in specific items of work and designated by quality, size, and/or gradation, and if indicated as specified in Section 206.2(a).1.d, Section 703.1, Section 703.2 or Section 850.2(a) from sources outside the limits of the project that cannot be measured before and after excavation.

(d) **Selected Borrow Excavation for Structure Backfill.** Excavation or obtaining material used for structure backfill as specified in Section 205.2, as shown on the Standard drawings, and as indicated.

205.2 MATERIAL—Supply materials only of the following types for Selected Borrow Excavation for Structure Backfill as indicated:

(a) AASHTO No. 1, No. 2A, No. 3, No. 5 or No. 57 Coarse Aggregate, meeting at least Type C quality requirements and as specified in Section 703.2, Table B and 703.2(c) Table C; R-3 Rock Lining, as specified in Section 850.2(a).

205.3 CONSTRUCTION—

(a) **General.** If project excavation is insufficient to complete the embankments or backfills, or does not meet the physical requirements, obtain material to complete the work.

Do not use material from borrow excavation until all suitable and available project excavation is used, unless otherwise directed.

If suitable material is available on the project, the Representative may, upon request, authorize in writing the widening of areas adjacent to slopes to obtain a portion or all of the excavation in place of borrow excavation, as shown on the Standard Drawings.

The Contractor may waste suitable material and replace it with common borrow after obtaining written authorization from the District Executive and making satisfactory arrangements for obtaining cross-sections of borrow and waste areas and the satisfactory disposal of the waste material.

Haul material from borrow excavation of other sources for placement in embankment or for backfill.

Restore borrow areas as specified in Section 105.14.

(b) **Common Borrow Areas.** When common borrow areas are required, obtain from areas as specified in Section 105.14. Clear and grub the borrow site as specified in Section 201, and remove topsoil. Notify the Representative at least 2 weeks before removing any suitable material, to sample, test, and take cross-sections.

(c) **Foreign and/or Selected Borrow Excavation.** When foreign or selected borrow excavation is required, do not begin operations until the material and placement sequence is accepted in writing and an Erosion and Sediment Pollution Control Plan is accepted by the County Conservation District and/or the DEP and by the Representative, as applicable.

(d) Selected Borrow Excavation for Structure Backfill. Construct structure backfill behind bridge abutments and adjacent to structures with Selected Borrow Excavation, as shown on the Standard Drawings and as specified in Sections 1001.3(q)2.b. Material requirements for structure backfill are shown on the Standard Drawings. Compact with equipment for the material classification and placement condition as specified in Section 206.3(b) and as shown on the Standard Drawings. Do not place rock where deep foundations are to be installed.

205.4 MEASUREMENT AND PAYMENT—

(a) Common Borrow Excavation. Cubic Yard

Measured as specified in Section 203.4(a)2 based on cross-sections of the borrow area. The Department will not pay for material removed before measurements are taken.

Additional material obtained within project limits as specified in Section 205.3(a), used in place of borrow excavation will be measured and paid for as specified in the preceding paragraph. However, the Department will make payment at the lower contract unit price for either Class 1 Excavation or Borrow Excavation of the type indicated.

The Department will not pay for common borrow required to replace suitable excavated material wasted for contractor convenience, error, or oversight.

(b) Foreign Borrow Excavation. Cubic Yard

Measured as compacted material in completed embankments.

(c) Selected Borrow Excavation. For the type indicated, and as follows:

1. Volume Basis. Cubic Yard

Measured in place as compacted material, using the average end-area method.

2. Weight Basis. Ton

(d) Selected Borrow Excavation for Structure Backfill. Cubic Yard.

Measured as compacted material in the completed embankments.

SECTION 206—PLACEMENT AND COMPACTION OF EMBANKMENT AND FILL

206.1 DESCRIPTION—This work is the construction of embankments, fills, and backfills.

206.2 MATERIAL—

(a) **Embankment Material.** Obtain material for embankment, fill, or backfill construction from the various classes of excavation on the project, including Common Borrow Excavation, Foreign Borrow Excavation, and Selected Borrow Excavation.

1. General. Provide material meeting one of the following material classification requirements. Material of maximum size that can be placed within, and does not interfere with the proper compaction of, compacted 6-inch layers, except as specified and classified as follows:

1.a Soil. Material consisting of earth having 20% or more of the material passing the No. 200 sieve and having a minimum dry density of 95 pounds per cubic foot oven-dried mass determined according to PTM No. 106. Material must have a maximum liquid limit of 65, determined according to AASHTO T 89, and a plasticity index of not less than the liquid limit minus 30, determined according to AASHTO T 90 for soils with liquid limits of 41 to 65.

1.b Granular Material, Type 1. Material consisting of natural or synthetic mineral aggregates having greater than 70% of the material passing the 3/8-inch sieve (less than 30% retained on the 3/8-inch sieve) and less than 20% passing the No. 200 sieve, except for AASHTO No. 8 coarse aggregate and select granular material (2RC).

1.c Granular Material, Type 2. Material consisting of natural or synthetic mineral aggregates having less than or equal to 70% of the material passing the 3/8-inch sieve (greater than or equal 30% retained on the 3/8-inch sieve) and less than 20% passing the No. 200 sieve. Also includes AASHTO Nos. 8 or 57 coarse aggregate, or PennDOT Nos. 2A or OGS coarse aggregate meeting the requirements specified in Section 703.2, select granular material (2RC) meeting the requirements specified in Section 703.3, and structure backfill.

1.d Rock. Includes natural material that cannot be excavated without blasting or using rippers; also boulders, detached stones, and concrete and masonry units of a size that cannot be readily incorporated into compacted 6-inch layers and having insufficient soil to fill the voids in each layer.

1.e Shale. Includes rock-like material formed by natural consolidation of mud, clay, silt, and fine sand; usually thinly laminated, comparatively soft, and easily split.

1.f Random Material. Includes Type 1 or Type 2 granular material combined with shale, concrete, brick, stone, or masonry units that can readily be incorporated into compacted 6-inch layers.

2. Suitable Material. Provide material meeting the requirements of any of the materials specified in Section 206.2(a)1 and reasonably free of organic matter, coal, carbonaceous materials, or other objectionable matter. Wet, dry, or frozen material may be suitable when dried, wetted, or thawed, respectively.

The Contractor may waste suitable material, including wet or frozen material, after obtaining written authorization. This suitable material is subject to replacement in equivalent volume.

(b) **Geotextile.** Section 735, Class 4, Type A

206.3 CONSTRUCTION—

(a) **General.**

1. Prepare the embankment foundation area as specified in Section 201.

Backfill existing depressions in embankment or fill areas, such as gullies, old stream channels, stump holes, and areas of undercutting and topsoil or pavement removal, to the adjacent ground elevation. Backfill with material

indicated. If no specific materials are indicated, backfill with suitable material, unless directed otherwise.

Where undercutting is not directed, proof roll entire embankment or fill foundation with a loaded triaxle dump truck (72,000 pounds GVW). Maintain uniform inflation pressures for all tires on the loaded triaxle between 100 and 110 pounds per square inch. When conducting proof rolling, do not exceed a speed of 1.5 feet per second (1 mile per hour). Any areas displaying permanent deformation (rutting) greater than 1/2 inch are considered unstable. Treat unstable areas by excavating material in the area to a depth of 1 foot. Dry the material and recompact or replace with compacted suitable material of the same type or other material, including Soil, Type 1 granular material, and Type 2 granular material, except having particles no greater than 2 inches in size, as approved by the Representative or as indicated. Perform proof rolling only in the presence of the Representative who will assess and approve or disapprove the stability of the area being investigated. In wet areas or unstable areas, the Representative may waive this requirement if other stabilization or treatment measures are indicated and/or required. The Representative may also waive this requirement in confined areas or in areas too small to be effectively proof rolled with the loaded triaxle dump truck. Proof roll the foundations of small or confined areas using the equipment that will be used to compact the fill in these areas. Treat areas identified by the Representative as unstable as specified above.

Proof rolling of constructed embankments or fills may be required by the Representative at any time during the construction when the constructed embankment or fill appears to be visually unstable. Perform proof rolling and mitigation of unstable areas as described above and at no additional cost to the Department.

Break existing pavements, more than 3 feet below the finished grade, as follows:

- break asphalt pavements to a maximum size of 1 square foot and recompact;
- break concrete pavements to a maximum size of 1 square yard; and
- scarify asphalt, surface-treated roadways to a depth of 6 inches and recompact.

Remove existing pavements, less than or equal to 3 feet below finished subgrade, in their entirety unless specified otherwise.

When constructing embankment or fill on an existing or excavated slope, bench the slope to the width and depth indicated, or as directed.

Where required for installation of transverse drainage, construct embankment as shown on the Standard Drawings.

2. QC Plan. When placing and compacting materials as specified in Sections 206.3(b)1.a and 1.b, prepare a compaction control QC Plan as outlined on Form CS-206 and submit for the Representative's review. A QC Plan is not required when placing and compacting materials as specified in Sections 206.3(b)1.c, 1.d, 1.e, and 1.f, where the compaction criteria is non-movement. QC test methods must be as specified in Section 206.3(a)3. The frequency of the QC testing may be determined by the Contractor, however, at a minimum, the frequency must meet the requirements as indicated in Table A. Use start-up criteria at the commencement of operations until proper control of operations has been demonstrated by passing and repeatable QC test results, as determined by the Representative. A minimum of one start-up frequency cycle must be completed before moving to production QC test frequencies. QC tests cannot be performed at the same location as an acceptance test and cannot be replaced by an acceptance test. Submit the compaction control QC Plan at the Pre-construction conference or at least 14 calendar days before placement and compaction is scheduled to commence. If any changes are needed to the QC Plan throughout the life of the project, submit an addendum to the Representative for review before implementation.

Table A Minimum QC Test Frequency			
Material	Embankment or Fill	Subgrade*	Pipe Backfill
Start-up Frequency	One QC test per lift for each 500 square yards placed; minimum six tests per lift per day. In limited or restricted areas the test rate should not exceed the rate for pipe backfill.	One QC test per lift for each 400 square yards placed; minimum eight tests per lift per day.	For every pipe run conduct one QC test for every 50 cubic yards of pipe backfill; minimum two tests per lift per day.
Production Frequency	One QC test per lift for each - 3,000 square yards placed; minimum three tests per lift per	One QC test per lift for each 1,600 square yards	For every pipe run conduct one QC test for every 200 cubic yards of pipe backfill;

	day. In limited or restricted areas the test rate should not exceed the rate for pipe backfill.	placed; minimum three tests per lift per day.	minimum two tests per lift per day.
--	---	---	-------------------------------------

*Subgrade consists of the top 3 feet of the material immediately below the pavement section subbase.

3. Moisture, Density, and Acceptance Testing. For materials placed and compacted as specified in Sections 206.3(b)1.a and 1.b, determine the in-place moisture and density in accordance with PTM No. 402 using the direct transmission method. All other materials will be accepted based on a condition of non-movement, as determined by the Representative. Provide a Nuclear Density/Moisture Gauge calibrated according to AASHTO T 310. PTM No. 418 may be used if the gauge is manufactured by Troxler (Note: PTM No. 418 is written for Troxler manufactured gauges while AASHTO T 310 is generic to any nuclear density gauge). Gauges must be calibrated every 12 months. A sheet with the current annual calibration providing the projected monthly decay standard with upper and lower limits must be kept with every gauge. Use Form TR-4276A located in PTM No. 402 for recording daily gauge standardization and for recording the results of all nuclear gauge moisture and density test results.

At locations directed by the Representative, conduct acceptance testing for moisture and density at the frequencies specified in Table B. If the required density of the compacted material is not obtained, promptly rework, reshape, and recompact or remove and replace damaged or unsatisfactory areas and perform an acceptance retests before placement or testing of another area. The extent of the unsatisfactory area is defined by the Representative using one of the following: visual inspection of the site, behavior of the material under the compaction equipment originally used to compact the material, delineation using the acceptance moisture-density gauge, or any combination of the above methods.

When an acceptance retest fails to meet the specified requirements, check standard count of the acceptance test gauge on the reference standard block in accordance with PTM No. 418 or AASHTO T310, as appropriate. If the standard count does not meet requirements established for the gauge from the last annual calibration, or is inconsistent with the daily gauge standardization count, the gauge must be diagnosed and repaired or replaced, as necessary, before work may proceed.

If the acceptance test gauge is determined to be functioning properly, and if the required density of the compacted material, within the specified moisture limits, cannot be obtained, conduct a new moisture-density test on the material, according to PTM No. 106, to determine if the moisture-density relationship of the material has changed. If the moisture-density relationship of the material has changed, the corresponding new target values for moisture and density must be established and used for QC acceptance and verification testing. If moisture-density testing indicates that the original target moisture and density are valid, the Contractor must review their operations, make adjustments within specification requirements, and amend the QC Plan to obtain acceptable results.

Table B Acceptance Test Frequency			
Material	Embankment or Fill	Subgrade*	Pipe Backfill
Frequency	One acceptance test per lift for each 4,000 square yards placed; minimum one test per lift per day. In limited or restricted areas the test rate should not exceed the rate for pipe backfill.	One acceptance test per lift for each 3,000 square yards placed; minimum one test per lift per day.	For every pipe run conduct one acceptance test for every 500 cubic yards of pipe backfill; minimum one test per lift per day.

*Subgrade consists of the top 3 feet of the material immediately below the pavement section subbase.

4. Verification Testing. The Representative will perform verification testing, using an Independent Nuclear Density/Moisture Gauge, on one of the first three acceptance tests and a minimum of one verification test for every 10 acceptance tests performed thereafter. Verification testing will consist of testing for moisture and density as specified in Section 206.3(a)3. The verification testing will take place immediately after the Contractor's Nuclear Density/Moisture Gauge has obtained a passing acceptance test result as specified in Sections 206.3(b)1.a and 1.b. Verification tests will be run at the same location and in the same test hole as the acceptance test. Maintain a distance of at least 30 feet between gauges and from any other radioactive source when performing acceptance and verification testing. Perform testing in an area where influences affecting the gauge performance are minimized, whenever practical. In some instances, the Representative may direct an additional acceptance test based upon availability of verification testing equipment and personnel.

Verification test results will be compared to the associated acceptance test results and will not be used to determine acceptance of the in-place moisture and density. A verification test is considered acceptable if the Independent

Nuclear Density/Moisture Gauge readings are within ± 2.0 pounds per cubic foot for wet density (not the dry density) and within $\pm 0.1w$ for moisture, where w is the moisture content in percent, when compared to the readings obtained by the Contractor's Nuclear Density/Moisture Gauge.

When verification test results do not conform as specified, check the standard count of both the acceptance test gauge and the verification test gauge on their respective reference standard blocks in accordance with PTM No. 418 or AASHTO T 310, as appropriate, before placement and testing of another area. If the standard count for either gauge does not meet requirements established for the gauge from the last annual calibration, or is inconsistent with the daily gauge standardization count, the gauge must be diagnosed and repaired or replaced, as necessary, before work may proceed. AASHTO T 2147 or AASHTO T 265 may be used to help resolve questions concerning proper functioning of gauges when determining moisture.

If both gauges are determined to be functioning properly, the Representative will immediately contact the DME/DMM or District Compaction Supervisor for guidance before the continuation of work. The Representative will record the acceptance test results, the verification test results, and applicable corrective measures on Form TR-4276A.

5. Compaction Control Technician. Provide and assign to the work, during placement and compaction of material, a properly trained and experienced Nuclear Equipment Operator to perform the required QC and acceptance testing. The technician must carry a valid nuclear gauge operator certification during placement and compaction of material.

(b) Placement and Compaction.

1. General. Provide uniform material from the same borrow source for the entire lift being placed, unless otherwise indicated or directed by the Representative. Compact material using the specified equipment appropriate for the material classification and placement condition. Do not operate compaction equipment at a speed exceeding 1.5 feet per second (1 mile per hour) when compacting materials. For compaction equipment other than rollers, as specified in Section 108.05(c)4, operate the equipment over the material to be compacted for a minimum duration of 6 seconds. Use the appropriate target moisture and density for the material being placed for QC, acceptance, and verification testing. Shape layers of the compacted embankment or fill to drain during construction. Fine grade to remove low areas and seal the embankment or fill surface at the end of each work day by rolling with a smooth drum roller to promote continuous positive drainage and reduce water infiltration. No furrows at the edges of embankments or fills that prohibit the free drainage of surface water are allowed.

1.a Soil. Place soil for the full width of the embankment or fill in uniform horizontal layers to achieve a compacted 6-inch depth. Determine the optimum moisture content and maximum dry density according to PTM No. 106. Compact soil with a padfoot roller meeting the requirements specified in Section 108.05(c)3.g. Run all compaction equipment in static mode. Do not use vibratory compaction on soil. A single pass of a smooth drum roller in static mode may be used on soil before compaction with the padfoot roller. Maximum roller speed as specified in Section 206.3(b)1 must not be exceeded. During compaction with a padfoot roller, keep the roller drum clean and free of any soil buildup on the drum surface and between pads. When constructing embankments or fills to top of subgrade elevation with soil, overbuild in elevation and mechanically cut the embankment to final grade. Fine grade the surface to fill any depressions left by the roller pads and to establish the final surface elevation. Compact the subgrade surface with a smooth drum roller in static mode. Finish subgrade as specified in Section 210.

In pipe trenches, locations adjacent to structures, and locations where standard, full scale compaction equipment is prohibited, may cause damage, or is not practical due to space or other constraints, compact soil using equipment as specified in Sections 108.05(c)3.d or 108.05(c)4, as directed by the Representative. Reduce lift thickness to 4-inch compacted depth or as directed by the Representative to achieve the equivalent level of compaction as the full scale compaction equipment. Operate in a manner as to provide the required level of compaction, while producing a dense, stable soil mass that does not rut, push, or shove.

Except for the top 3 feet, compact soil for the full width of embankments or fills to not less than 97% of the maximum dry density. Compact the top 3 feet of soil for the full width of embankments or fills to 100% of the maximum dry density. Determine the in-place dry density of soil according to PTM No. 402, using the direct transmission method. Maintain soil within -3% of optimum and optimum moisture content at the time of compaction. Determine the moisture content according to PTM No. 402. Compact soil to a stable condition so there is no rutting, displacement, or shear wave under compaction equipment. A shear wave is bulging of the soil surface in front of and behind the roller.

1.b Granular Material, Type 1. Place Type 1 granular material for the full width of the embankment or fill in uniform horizontal layers of not more than a compacted 6-inch depth. Compact material adjacent to structures as indicated on the Standard Drawings. Determine the optimum moisture content and maximum dry density according to PTM No. 106. Except for pipe trenches, locations adjacent to structures, and locations where standard, full scale compaction equipment is prohibited, may cause damage, or is not practical due to space or other constraints, compact Type 1 granular material using a smooth drum vibratory roller as specified in Section 108.05(c)3.i. For all other areas except for pipe trenches, use dynamic and/or vibratory equipment as specified in Sections 108.05(c)3.d or 108.05(c)4, as directed by the Representative. Reduce lift thickness to 4-inch compacted depth or as directed by the Representative to achieve the equivalent level of compaction as the full scale compaction equipment.

Except for the top 3 feet, compact Type 1 granular material for the full width of embankments or fills to 97% of the maximum dry density. Compact the top 3 feet of Type 1 granular material for the full width of embankments or fills to 100% of the maximum dry density. As directed by the Representative, determine the in-place dry density of Type 1 granular material according to PTM No. 402 using the direct transmission method. The Representative may allow the back scatter method to be used if the material is too coarse for the direct transmission method to be conducted effectively. Conditions when the backscatter method would be appropriate include when the drive rod cannot be readily driven to the required depth to create the hole necessary to insert the nuclear gauge source rod due to coarse particles impeding or deflecting the drive rod, or when the material is too coarse to create a smooth sided, stable, open hole using the drive rod. Compact Type 1 granular material to a stable condition so there is no rutting, displacement, or shear wave under compaction equipment. A shear wave is bulging of the material surface in front of and behind the compaction equipment.

Maintain Type 1 granular material within $\pm 2\%$ of the optimum moisture content at the time of compaction. Determine moisture content in accordance with PTM No. 402.

1.c Granular Material, Type 2. Place Type 2 granular material for the full width of the embankment or fill in uniform horizontal layers of not more than a compacted 8-inch depth. Compact material adjacent to structures as indicated on the Standard Drawings. Except for pipe trenches, locations adjacent to structures, and locations where standard, full scale compaction equipment is prohibited, may cause damage, or is not practical due to space or other constraints, compact Type 2 granular material using a smooth drum vibratory roller as specified in Section 108.05(c)3.i. For all other areas except pipe trenches, use dynamic and/or vibratory equipment as specified in Sections 108.05(c)3.d or 108.05(c)4. Reduce lift thickness to 4-inch compacted depth or as directed by the Representative to achieve the equivalent level of compaction as the full scale compaction equipment.

Compact Type 2 granular material for the full width of embankments or fills to a condition of non-movement under the compaction equipment. Compaction acceptance will be determined by the Representative. Non-movement under compaction equipment is defined as creating a stable condition of the compacted material. A stable condition occurs when there is no rutting, displacement, or shear wave under compaction equipment. A shear wave is bulging of the material surface in front of and behind the compaction equipment.

Maintain Type 2 granular material in a surface damp condition, but not wet (no excess moisture) at the time of compaction.

1.d Rock. Do not place rock in embankments or fills without acceptance of the planned excavation and embankment or fill operations.

When used to form the base of an embankment or fill, place rock the full cross-section width. Place rock on embankment side slopes, where indicated.

Before placing rock on other types of compacted material, slope the top of the embankment or fill from centerline to the sides, at a rate of approximately 1 inch per foot, and compact the surface.

Place rock in uniform loose layers to a depth not exceeding the approximate average size of the larger rock, but limited to a maximum depth of 36 inches. Remove oversize rock or reduce in size until it can be readily incorporated in a maximum 36-inch layer. Do not dump rock in final position, unless specified, but distribute by blading or dozing; keep voids, pockets, and bridging to a minimum. Place rock so larger pieces are evenly distributed and voids are filled as completely as possible. Compact with a smooth drum vibratory roller as specified in Section 108.05(c)3.i. Compact rock to a condition of non-movement under the compaction equipment. Compaction acceptance will be determined by the Representative.

When rock and finer material are placed adjacent to each other at the same time, place the finer material sufficiently above rock layers to allow for proper compaction of the finer material.

When the embankment or fill is to be constructed with rock, choke the surface of the rock with select granular material (2RC) of sufficient thickness to completely fill all voids in the rock and cover with a Class 4, Type A

geotextile. Place an additional layer of select granular material (2RC) to reach the finished subgrade elevation and to allow fine grading as specified in Section 210.

When transitioning from rock to other types of materials, choke the rock surface with select granular material (2RC) of sufficient thickness to completely fill all voids in the rock. Place a second lift of select granular material (2RC) to a compacted thickness of 6 inches. Only one transition from rock to another type of material is allowed in an embankment or fill section.

1.e Shale. Place shale in maximum 6-inch compacted lifts so larger pieces are evenly distributed and voids are filled as completely as possible. Remove oversize shale or reduce in size until it can be readily incorporated in a maximum 6-inch compacted layer. Compact as specified in Section 206.3(b)1.c.

1.f Random Material. Place and compact random material as specified in Section 206.3(b)1.e.

2. Wet and/or Unstable Foundation Areas. Where the embankment or fill foundation is in water or swamp areas or is saturated or unstable, construct embankment or fill with rock to the indicated elevation or as directed.

3. Existing Embankment or Fill. Existing embankment or fill is defined as material placed and compacted during prior construction not associated with the current project, or material placed and compacted as part of the current project during a prior construction season and has been in place at least one winter season. When an existing embankment or fill requires additional material to bring it to the required elevation, proof roll the entire existing surface as specified in Section 206.3(a), before placement of material.

4. Confined Areas. Do not use rock, shale, random material, or any other material having a maximum size greater than 2 inches or otherwise preventing the material from being placed in a compacted 4-inch layer in confined areas. Place material in uniform horizontal layers of not more than 4 inches in compacted depth in areas where small or hand operated compaction equipment, as specified in Sections 108.05(c)3.d and 108.05(c)4, is required for compaction. Compact material to the density and at the moisture content based on the material type as specified in Sections 206.3(b)1.a, 1.b, and 1.c. Determine the in-place dry density and moisture content based on the material type as specified in Sections 206.3(b)1.a, 1.b, and 1.c.

5. Frozen Material. Do not place or compact frozen material. Do not place embankment or fill material on any material that is frozen. Remove frozen material, if the embankment or fill top freezes, before placing additional material.

6. Wet Material. Before compacting, dry material to within -3% of optimum and the optimum moisture content for soil, $\pm 2\%$ of optimum moisture content for Type 1 granular material, and surface damp for Type 2 granular material. Do not place material on embankment or fill that has become unstable from excessive moisture.

7. Dry Material. Before compacting, moisten material to within -3% of optimum and the optimum moisture content for soil, $\pm 2\%$ of optimum moisture content for Type 1 granular material, and surface damp for Type 2 granular material.

(c) Stability. Assume responsibility for the stability of embankments and fills. Replace material that, in the Representative's judgment, has been damaged or displaced due to the following: carelessness or negligence, natural causes such as storms and floods, shrinkage of material, and all other reasons not attributable to other than movement of the natural ground upon which the material is placed.

Dry, reshape, recompact, and test material for moisture and density requirements if construction equipment causes movement, rutting, or displacement of the material.

206.4 MEASUREMENT AND PAYMENT—

(a) Embankment. When measurement is required, embankment will be measured in its final position as specified in Section 203.4(a)2 by the cubic yard.

Embankment construction is incidental to excavation or borrow excavation except for AASHTO Nos. 8 or 57, or PennDOT Nos. 2A or OGS meeting the requirements specified in Section 703.2 and select granular material (2RC) meeting the requirements specified in Section 703.3.

(b) **Select Granular Material (2RC).** Ton

(c) **Granular Material, Type 2, Aggregates.** For fills and backfills incorporating AASHTO Nos. 8 or 57, or PennDOT Nos. 2A or OGS meeting the requirements specified in Section 703.2 or structure backfill, measurement and payment are made according to the work specified.

(d) **Geotextile, Class 4, Type A.** Section 212.4(c)

SECTION 207—BLASTING FOR ROCK CUT SLOPE EXCAVATION

207.1 DESCRIPTION—This work is excavation of rock using controlled blasting and production blasting to achieve a uniform face in the rock along the plane of the specified excavation back slope. Blasting required for rock cut slopes must be conducted in a safe manner to the line and grade as indicated.

(a) **Controlled Blasting.** Blasting that use explosives and proper blasting equipment placed in carefully spaced and aligned blastholes to produce a uniform surface in the rock along a specified excavation back slope. Controlled blasting methods include:

1. Presplit Blasting. A controlled blasting method in which the row of blastholes are drilled along the plane of the specified final excavation back slope. Presplitting uses reduced blasthole spacing, diameter, and explosive charges. The initiation of blasting in the presplit blastholes precedes the initiation of the adjacent production blasthole explosives by a delay. The delay decouples the final excavated rock face from the excavation and prevents energy from production blasts from propagating to, and damaging, the final cut face.

2. Trim Blasting. A controlled blasting method that cleanly shears a rock face when there is insufficient burden for production blasting. It is essentially identical to presplit blasting, but without production blast holes.

(b) **Production Blasting.** Rock fragmentation blasting that typically has more widely spaced blastholes than controlled blastholes. Production blastholes are drilled in a pattern throughout the main excavation area adjacent to the controlled blast row. Production blastholes are detonated in a controlled delay sequence toward an open face or relief produced by blastholes firing on an earlier delay. Production blasting fragments the rock in the area to be excavated, to the size required for removal and placement.

207.2 MATERIALS—

(a) **General.** Provide non-electric detonators and initiating devices that are not damaged or deteriorated and have not been exposed to weather. Non-electric detonators and initiating devices include, but are not limited to, all explosive materials, initiators, blasting caps, detonating cord, delays and timing devices, and all other materials and devices necessary to perform the work. While electric detonators are not allowed, electronic programmable detonators are permissible for use. Submit copies of the technical data sheets and safety data sheets for all materials to the Representative with the Blasting Plan. All blasting caps for any individual shot must come from one manufacturer.

1. Stemming. Coarse Aggregate, Type A, AASHTO No. 8. Section 703.2.

207.3 CONSTRUCTION—

(a) **General.** Use controlled and production blasting for excavations in rock when mechanical excavations methods cannot produce a uniform excavated surface at the specified slope angle. Conduct all blasting, explosive handling, and monitoring operations according to the latest OSHA standards, 29 CFR Parts 1926.900 through 1926.914 and Pennsylvania Code, Title 25 Environmental Resources, Article IV – Chapter 77, Chapter 210, Chapter 211, and all local requirements. Maintain a copy of all standards on site including health and safety requirements and make available upon request.

1. Perform blasting operations by a blaster licensed in the Commonwealth of Pennsylvania meeting the following qualifications: The blaster must submit to the Representative a list containing at least five successfully completed similar projects that, together, demonstrate a minimum of 3 years of experience in surface rock blasting including controlled blasting. Include a brief description of each project, and the name and telephone number of the owner's representative knowledgeable in each project listed. The Department will review and approve the blaster. Receipt of written approval must be obtained before any blasting operations including drilling of blastholes are initiated. Allow at least 21 calendar days for approval.

2. When blasting is used to excavate rock, use controlled blasting techniques for all portions of any rock cut slope exceeding a vertical height of 10 feet and a slope equal to or steeper than 0.5(H):1(V). The Department may require controlled blasting to form the faces of more gradual slopes or excavations, even if the slopes could be formed by non-blasting methods. Conduct presplit test sections to determine the presplit blast pattern and design necessary to achieve the required results. The conditions of each presplit section will be evaluated by the Representative. Revisions to the presplit blast design must be made by the blaster, as necessary, to achieve the required results before drilling can proceed in adjacent presplit sections.

3. Design production blasting to control flyrock, minimize ground vibrations and noise, and result in fragmented, in-situ rock that can be removed, processed, or placed as required. Locate and drill the production blasthole as specified in Section 207.3(g). Prepare the production Blasting Plan so as not to affect the controlled blastholes. Where blasting is adjacent to highways with lane closure restrictions, the volume of rock cannot exceed the Contractor's ability to remove the blasted material from the highway within the established maximum allowable closure time.

The sequence of blasting at any blast is as follows:

- Conduct and submit the Pre-Blast Survey.
- Submit and obtain acceptance of the Blasting Plan.
- Submit and obtain acceptance of the Blasting Safety Plan.
- Before blasting operations, conduct and submit the Water Supply Monitoring Report.
- Notify appropriate entities of blasting schedule (property owners, utilities, traffic, flagging, and police).
- Schedule and conduct the Pre-Blast meeting.
- Obtain Department approval and selection of the test section.
- Drill and conduct test section blasting before the start of any full-scale blasting operations.
- Proceed with full-scale drilling and blasting.
- Submit required Blasting Report including Vibration and Airblast Monitoring Reports.
- Remove rock and scale if required.
- Inspect and evaluate rock face/excavation results (including any required modifications).
- If applicable, submit a modified Blasting Plan for adjacent blasts in that project work area.
- Conduct and submit the Post-Blast Survey.
- Post blasting operations, conduct and submit the Water Supply Monitoring Report.

(b) Pre-Blast Survey. Conduct an Exterior and Interior Pre-Blast Survey on all structures, buildings or utilities within 300 feet of the blasting site, and within 1,000 feet of the blasting site if the blast is designed for a peak particle velocity (PPV) exceeding 0.5 inches per second (confirm by vibration monitoring). If no structure or building is located within these limits, complete a survey on the closest structure or building within 1 mile of the blasting operations. At a minimum, complete one survey as directed on the closest structure or building within 1 mile. The Pre-Blast Survey will serve as proof of the condition of the existing residential and commercial structures prior to blasting. Begin the Pre-Blast Survey no sooner than 6 weeks before the beginning of blasting operations. Submit the completed Pre-Blast Survey at least 1 week before the Pre-Blast meeting.

Complete the Exterior and Interior Pre-Blast Survey using Form TR-42. Alternative forms/reports are acceptable for use if they contain the information required on Form TR-42. Include structural observations and descriptions, locating any existing cracks, including length and size. Where significant cracks, structural defects, or damage exists, collect digital images to supplement the written description. Provide a scale and a date stamp on each digital image taken. Capture digital images at a minimum 8-megapixel resolution and submit electronically with the Pre-Blast Survey.

Request, in writing, property access from each property owner where a Pre-Blast Survey is necessary. If the property owner does not allow access to the property for the Pre-Blast Survey, notify the Representative. If the property owner declines the Pre-Blast Survey, submit a notification letter and Form TR-43 that is signed by the property owner to the Representative. If the property owner refuses to sign, the qualified independent blasting consultant must indicate this and sign the waiver. Keep a copy of the letter and waiver on file as part of the Pre-Blast Survey Records. Do not enter any private property without written permission. The Pre-Blast Survey must be conducted by a qualified independent blasting consultant in the presence of the property owner. At the end of the

Pre-Blast Survey, ensure the property owner signs both Exterior and Interior Pre-Blast Survey Forms and provide them a copy. Submit the Exterior and Interior Pre-Blast Survey Forms, including diagrams and digital images, at least 1 week before the Pre-Blast meeting. Notify the respective utility company within a minimum of 7 days before blasting of any utility within 300 feet of the blasting site and within 1,000 feet of the blasting site if the blast is designed for a PPV exceeding 0.5 inches per second. Provide notice in writing at 2 weeks and again 48 hours before blasting begins to all property owners where a Pre-Blast Survey was performed. Inform the residents that blasting signals will be issued according to Title 25 Pa. Code § 211.155 to warn of imminent blasting. The Contractor is solely responsible for any damage resulting from blasting.

(c) Blasting Plan. Provide the Representative a Blasting Plan at least 1 week before the Pre-Blast Meeting and before the start of drilling for blasting for each proposed rock cut excavation that requires blasting, and at any time the drilling and blasting operations change. The Blasting Plan will be reviewed by the Department and any concerns will be discussed with the Contractor before acceptance of the Blasting Plan. Do not drill any blast holes until the Blasting Plan is accepted by the Department.

Schedule and attend a pre-blast meeting at least 1 week before any explosives being brought onto the project site to review the following: the Blasting Safety Plan including requirements concerning explosives being brought onto the project site, the restrictions and requirements during the loading of explosives; the sequence of operations before, during, and after each blast; all required traffic control; all inspection procedures of blast zones for misfires, stability, blast material debris clean up; and any other relevant issues. At a minimum, the following must attend the pre-blast meeting: The Representative, the blaster, the Contractor, the qualified independent blasting consultant(s), and other personnel designated necessary by the Representative.

Submittal of the Blasting Plan is for quality control, conformance, and record keeping purposes. Review and acceptance of any Blasting Plan by the Department does not relieve the Contractor of full responsibility for the accuracy of the plans, safety of operations, quality of work, or conformance to specification performance requirements, when implemented in the field.

Complete the Blasting Plan using Form TR-40 and include in the submittal of the Blasting Plan along with any necessary documentation. Alternative forms/reports are acceptable for use if they contain the information required on Form TR-40. Submit information and documentation with the Blasting Plan that includes, but is not limited to, the following:

- A completed Blasting Activity Permit approved by the DEP Bureau of Mining and Reclamation. Include any other necessary permits required to complete blasting activities according to current applicable federal, state, and local requirements.
- Station limits of the proposed shots, critical distances and directions to structures, buildings, or utilities, and pre-blast survey limits detailed on the plan view sheets. Also, include scaled distance and estimated PPV.
- One plan and section view for each rock cut excavation showing the proposed drill pattern for any blastholes, including blasthole spacing, blasthole diameters, blasthole angles, lift height, drill depth, buffer rows, and burden. Accurately show to scale each cut area to be blasted.
- Loading diagram(s) detailing the type, amount, and specific gravity of explosives, primers, and initiators. Also include the location and depth of stemming.
- Initiation sequence(s) of any blastholes including delay times and delay system(s).
- Schedule and timeframes for notification of the blasting sequence.
- Manufacturer's product data sheets for all explosives, primers, and initiators to be used in the work.
- A Maintenance and Protection of Traffic Plan which details how traffic will be protected and managed during blasting.
- Methods to control site security, vibration, flyrock, and airblast levels.
- Method and quality control of the depth, direction, and alignment of the drilled blastholes for blasting.
- Licensing information, experience, and qualifications of the blaster who will be directly responsible for the loading and firing of each shot.
- The name and qualifications of the licensed blaster in the State of Pennsylvania responsible for designing and directing the blasting operation.
- The qualified independent blasting consultant(s) proposed to conduct and complete the Pre- and Post- Blast Surveys, and the Airblast, Vibration, and Water Supply Monitoring Reports.

(d) Blasting Safety Plan. Provide the Representative a detailed description of transportation, pick-up and delivery locations, blasting procedures, and the use of explosives at the project work area at least 3 weeks before the start of drilling for blasting. The Blasting Safety Plan must include, but is not limited to, the following:

- Details about hazard communication programs for employees.
- Equipment that will be used to monitor the approach of lightning storms, and evacuation and site security plans in the event of a storm.
- Methods for preventing spills or losses of explosives, drilling fluids, oil, or any other pollutants into the ground during all handling and blasthole loading operations. Include details of all containment and contingency plans for quickly and effectively cleaning up any spilled materials.
- A safe and approved disposal method of all explosive packaging materials.
- Detailed contingency plan(s) for handling misfires of explosives resulting from cutoffs or other causes.
- Fire prevention plan details, including smoking policies, procedures and limitations for work involving any open flames or sparks, and description and location of all firefighting equipment and evacuation plans.
- One hard or electronic copy of the blaster's valid Pennsylvania blasting license and the Contractor's ATF blasting license.
- Other required county or state permits required for explosive use and storage.
- An explanation of how the explosive transport vehicles will meet all applicable ATF, OSHA, federal, state, county, and local regulations.
- If applicable or if underground mining is identified during design, provide air quality monitoring plans for local buildings.

Post and maintain in a visible area all current licenses required for blasting and explosive handling. Provide a certificate of insurance to the Representative showing that the Contractor retain the required insurance to the applicable limits to meet all local, state, and federal regulations. Store explosives on and off the project site according to OSHA standard, 29 CFR Part 1926.904, Title 27 CFR 181, Part 55, Subpart K, and in compliance with local requirements. The explosive transporters' valid commercial driver's license(s) with HazMat endorsements must be available and provided upon request. Maintain enough magazine records for stored explosives. Do not store bulk blasting agents such as Ammonium Nitrate and Fuel Oil (ANFO) on-site. Remain on-site once the blastholes are loaded with explosives until any misfires are resolved or remediated and the blast is completed. Do not leave explosives, blasting agents, detonators, or loaded blastholes unguarded or unattended at any time.

(e) Blasting Requirements for all blasting operations:

- Remove all overburden soil and loose rock along the top of the proposed cut and lay back to a stable condition before drilling and blasting.
- Drill blastholes one pattern at a time. When conditions justify simultaneous drilling and loading of blastholes, separate the two operations as widely as practical and not less than 50 feet apart.
- Check, measure, and record the depth of all blastholes when the drill is retracted from the blasthole. If any blasthole is found not to be open to the drilled depth, re-drill the short blastholes to the proper depth at no additional cost. If any blastholes are too deep, fill with stemming as specified in Section 207.2(a)1.
- Do not allow horizontal blastholes.
- Complete and submit with the Blasting Report, the Blasthole Drill Log, using Form TR-39. Alternative forms/reports are acceptable for use if they contain the information as required on Form TR-39. Keep accurate drilling logs on each blasthole to show the depth of the geological features such as zones of soft or weathered rock, mud or clay seams, voids, and color of drill cuttings. Also include the drilling rate (drill footage per work shift).
- If necessary, revise the Blasting Plan to address concerns during drilling. Obtain Department acceptance of the revised Blasting Plan before proceeding.
- Before loading of blastholes, post warning signs at points of access to the blasting site.

- Cover and design blastholes to keep material from falling into the blastholes after drilling. Place reusable plastic hole markers in each blasthole to identify all blasthole locations.
- Measure blastholes before loading any explosives into the blastholes to ensure each blasthole is open to the original drilled depth and free of obstructions before placing a charge. Use precaution to prohibit caving of material from borehole sidewalls during placement of the charges.
- While loading the explosives into the drilled blastholes, allow only the blaster and those persons necessary for the loading process within 50 feet of ablast area.
- Stem all unloaded portions of the blastholes between 0.7 and 1.3 times the burden distance. The actual ratio may need to be refined after the initial blast (i.e., test blast section or production blast). Stemming material must be as specified in Section 207.2(a)1.
- Employ appropriate explosives and accessories for the various conditions to achieve the specified cut slope design.
- If blasting is allowed on structure foundations, repair any over break beyond the desired Bottom of Footing Elevation (BOFE) by excavating broken materials and leveling off to the BOFE with Class C concrete, or as required.
- Furnish and use approved blasting mats when necessary to hold and suppress flyrock and prevent subsequent damage to property and roadway.
- Repair roadway, structures, utilities, and any property damage as a result of blasting at no additional cost.
- The Contractor is liable for all injuries or deaths of persons and/or farm/domestic animals, and any damage to property caused by blasting.

(f) Controlled Blasting.

1. Test Section. Conduct test blast sections before the start of full-scale blasting operations as specified in Section 207.3(e), and with the following.

- Conduct initial test blast section as one presplit blast pattern using variable spacing of 18 inches over 18 feet, 24 inches over 24 feet, 30 inches over 30 feet, and 36 inches over 36 feet using a maximum lift of 30 feet.
- Maintain hole to hole spacing requirements for 18 inch and 24 inch presplit patterns within 75 to 125 percent of the intended spacing. For 30 inch and 36 inch presplit patterns, hole to hole spacing must be within 6 inches of the intended spacing. Maintain hole to hole spacing throughout presplitting. If the deviation of presplit blastholes exceeds the allowable tolerance, provide the Representative alternative drilling methods in a revised Blasting Plan to reduce deviation within the above specified tolerances. Alternative drilling methods may include, but are not limited to, revised procedures, drill tooling, cutting bits, or other equipment that provides specified spacing tolerances. Obtain Department acceptance of the revised Blasting Plan before proceeding. Do not exceed 110 feet for test sections.
- Ensure the test section demonstrates the suitability of the proposed blast plan relative to fragmentation requirements, over break control, flyrock control, adequacy of stemming, and other appropriate or necessary factors.
- When results of the drill logs are unusual (i.e., encountering zones of soft or weathered rock, mud or clay pockets, voids; rate of penetration; and the color and character of drill cuttings), revise the Blasting Plan as necessary and obtain Department acceptance of the revised Blasting Plan before proceeding.
- When rock of different characteristics is encountered, perform a blasting test section.
- Excavate the blasted test section to fully expose the presplit face and provide the means to access the face so that the Representative can examine and evaluate the results of the blasted test sections. The Representative will examine the completed test section and select the blasthole spacing that demonstrates the best presplit face quality. If no acceptable conditions are found by the Representative upon examination of the test section, revise and submit to the Representative a new Blasting Plan for review and acceptance. Suspend drilling and blasting until the Blasting Plan is accepted. At no additional cost, conduct additional test sections at the same blasthole diameter and spacing used for the previous test section and adjust the explosive load until

desired/acceptable results are obtained without exceeding the established PPV as specified in Section 207.3(j). Unsatisfactory results include, but are not limited to, excessive fragmentation beyond the indicated lines and grade, excessive flyrock, and poor timing delays. Upon completion of test blasting, obtain written approval from the Department to proceed with full scale blasting operations.

- If repeated test blasts are conducted using different drilling techniques, the height of the lift in an attempt to meet the borehole deviation limits has been reduced, evidence is provided that the magnitude and direction of deviation between each blasthole has remained constant, and if it is determined that due to geologic conditions deviation tolerances are not achievable, the Department may review the findings and make an informed decision of any acceptable borehole deviations.
- The Department's approval of the test blasting program and the techniques and procedures associated with test blasting does not relieve the Contractor of any responsibilities to employ appropriate safety measures and exercise proper supervision of blasting operations.

2. Presplit Blasting. Complete all presplitting, including test section blasting, as specified in Section 207.3(e), and as follows:

- Employ a surveyor licensed in the Commonwealth of Pennsylvania to locate and mark each presplit blasthole shown on the Blasting Plan to produce an excavated slope to the lines and grade as indicated. Drill presplit blastholes within 3 inches of the staked location. Blastholes drilled beyond this limit will be rejected.
- Control the angle and bearing at which the drill steel enters the rock with an electro-mechanical or electronic device (smart level meeting accuracy conditions of plus or minus 0.2 degree) by attaching to or resting on the drilling equipment. Blasthole drilling will not be allowed if this device is missing or inoperative.
- Complete a borehole deviation survey of each presplit blasthole before loading the blastholes using an electronic, borehole deviation measuring system with a probe resolution of 0.2-degree accuracy. Provide a report of each blasthole deviation survey to the Representative including blasthole alignment and graphical output data. Also, the report must show that the alignment will produce the excavated face as indicated-Plans. Terrestrial Surveying may be employed as necessary to produce this report. The output software must be capable of plotting vertical profiles parallel and perpendicular to the slope. No blasthole must deviate by more than 6 inches parallel and perpendicular from the planned slope. Maintain hole to hole spacing throughout presplitting as specified in Section 207.3(f)1.
- Drill a replacement presplit blasthole if the blasthole is 12 or more inches from the intended spacing at no additional cost. Abandon presplit blastholes not meeting the accuracy requirements using stemming as specified in Section 207.2(a)1 at no additional cost.
- Drill presplit blastholes between 2.5 and 3 inches in diameter. If drilling accuracy requirements cannot be achieved during test blast sections, blastholes with a diameter not exceeding 4 inches may be drilled.
- Do not exceed a length of 30 feet in blastholes for any lift. The Department maintains the right to decrease the length of the presplit blastholes at any time due to poor performance.
- Drill presplit blastholes a minimum of 30 feet longitudinally beyond the limits of the production blastholes to be detonated or to the end of the cut.
- If the cut height requires more than one lift, offset a maximum of 24 inches between lifts for drill equipment clearance. Begin the presplit blasthole drilling at a point that allows for the necessary offsets and adjust to compensate for any drift that may occur in the upper lifts.
- Use only explosives manufactured specifically for presplitting in presplit blastholes. Bulk ANFO is prohibited in presplit blastholes. The maximum diameter of the explosives must not exceed one half the diameter of the presplit blasthole.
- Detonation of explosives in each blasthole in a presplit shot may be simultaneous or delayed due to noise or vibration concerns provided the hole to hole delay does not exceed 25 milliseconds.
- Initiate the blasting in the presplit blastholes before initiating the production blasthole explosives by a minimum of 25 milliseconds.

3. Trim Blasting. If the horizontal distance between the existing rock face and the design cut face is less than 15 feet, the Contractor may use trim blasting. Perform trim blasting as specified in Section 207.3(f)1 and 2, except there are no production blastholes.

(g) Production Blasting. Complete all production blasting as specified in Section 207.3(e), and as follows:

- Do not exceed 6.25 inches in diameter for the production blastholes.
- Drill the production blastholes in the patterns and to the depths established in the Blasting Plan. Do not drill blastholes to a depth that exceeds 30 feet.
- Drill the row of production blastholes adjacent to presplit blastholes. Drill the row of production blastholes on a plane parallel to the presplit blastholes. The distance between production blastholes and presplit blastholes will be based on a distance of 1 foot per inch in diameter of production blasthole.
- Drill the bottom of the production blastholes at an equal depth/elevation to the bottom of the controlled blastholes, except for the bottom lift for sub drilling.
- Do not blast within 5 feet above of an at-grade separation to minimize disturbance. Remove remaining rock above the top of the at grade separation by mechanical methods.
- Drill a line of buffer holes on a parallel plane adjacent to the presplit blastholes. Buffer hole spacing can range from one half the production blasthole spacing to two times the presplit blasthole spacing. Drill buffer holes between 2.5 and 3 inches in diameter, and 3 feet from the presplit line. Do not load the buffer holes with more than 50 percent of the full explosive load that could be placed in a 3 inch production blasthole.
- Maintain a burden distance that is not more than one half the bench height to control blasting effects. Determine the required burden distance so as not to over or under confine the blast and to prevent flyrock and backbreak of the presplit face.
- Drill the production blastholes within two blasthole diameters from the staked drill collar location. Survey the elevation at the collar of each drilled production blasthole to foundation grade and verify the production blastholes are not sub-drilled below final foundation grade. Blastholes drilled outside either tolerance must be backfilled with stemming and re-drilled at the proper location and grade as directed by the Representative and at no additional cost.
- Detonate production blastholes on a delay sequence toward the free face as specified in the Blasting Plan. Delay the detonation sequence from hole to hole within a row by a minimum of 2 milliseconds per foot of hole spacing. A delay of less than 2 milliseconds is acceptable if vibration, pre-spilt performance, and flyrock can be controlled. Delay the detonation sequence from row to row by a minimum of 2.5 times the hole to hole delay.
- Take all necessary precautions to minimize blast damage to the rock backslope during production blasting.
- Remove or stabilize rock along the cut face that is loose, hanging, or creates a potentially dangerous condition during or on completion of the excavation in each lift. Do not drill the next lift until this work is performed.

(h) Blasting Report. Complete, sign, and submit the Blasting Report using Form TR-41 within 48 hours after making any blast and obtain acceptance before drilling of the next blast section is initiated. Alternative forms/reports are acceptable for use if they contain the information required on Form TR-41. Only the blaster who was reviewed and approved by the Department may perform blasting operations including the drilling of blastholes. At a minimum, the Blasting Report must include the following:

- Drill logs, drilling remarks, and loading and timing delays used in each blasthole of the blast.
- All blast monitoring documentation, which includes vibration and airblast monitoring data.
- Contractor's evaluation of the blast performance.
- Two High-definition (minimum 1080p resolution and 60p frame rate) digital video recordings submitted in MPEG-4 file format (or acceptable variant as determined by the Representative) on a CD, DVD, or flash drive of any test, controlled, and/or production blasting. The two videos must be recorded at opposite angles of the blast and, if feasible, from an elevated angle and a ground angle.

- All damage incurred and details of complaints or comments.
- Blast area description, weather, Contractor/crew, and layout and timing diagram.

(i) Maintenance and Protection of Traffic (MPT) during Blasting Operations. Coordinate MPT activities with the Department for any portion(s) of roadway that must have temporary closures or lane restrictions during blasts. The MPT Plan for any partial or full roadway closures and detours must be approved by the District Traffic Engineer (DTE). At a minimum, all traffic must be stopped during blasting operations on roadways where the Contractor or the Representative has determined that road users may be impacted by blasting operations. Traffic may be halted for periods not to exceed 15 minutes, or unless otherwise approved. Traffic may not resume after a blast until the area is clear of any debris, the excavated slope face is free of any loose material, and the blasted material is stockpiled into a stable mass until it can be removed from the site. Place enough of a barrier to temporarily separate blasted material between active roadway lanes and blasted material. Time between traffic stoppages will be determined by the Department. Blasting operations will not be allowed during peak traffic hours as determined by the Department's DTE. Roadway closures are allowed Monday through Friday, 9:00 A.M. to 3:00 P.M. or as determined acceptable by the DTE. No blasting is allowed during holiday periods or local events as determined by the Department's DTE.

Notify the Department RTMC and State/local Police two times before each blasting event. The initial notification must be made 24 hours in advance of the expected blast time. A second notification must be made 15 minutes before stopping traffic for the blast work. Provide enough flaggers to control traffic on all impacted roadways. When traffic is stopped for blasting, monitor the traffic queue. Provide a shadow vehicle on each affected approach, one in each direction, at least 300 feet in advance of the last vehicle in the traffic queue. This vehicle must remain at least 300 feet in advance of the last vehicle as the length of the queue increases. It may be necessary to provide two of these vehicles with drivers working as a team if enough shoulder or roadside is not available for a single vehicle to safely drive in reverse along the roadway.

Furnish, erect, and maintain on all affected roadways, appropriate standard signing according to the MUTCD, Part 6 Figure 6H-2 Blasting Zone (TA-2). These signs are in addition to any temporary traffic control devices as indicated or according to Publication 213.

Provide patrol vehicles, one in each direction, to drive through the blast area, to determine the site has been completely cleared before the blast is detonated. Employ suitable precautionary measures and devices to prevent roadway damage (including pavement, drainage features, signing, traffic barrier and/or guide rail, lighting, traffic control devices, and any other roadway element). Precautionary measures and devices may include barriers, blasting mats, and other protective and control measures and devices. As soon as the blasting has been completed, inspect the work area for any unsafe conditions. An inspection of the roadway by one patrol vehicle in each direction must be completed before traffic is released. Provide excavation equipment on standby to clear any rock debris from the roadway immediately following inspection.

(j) Vibration Monitoring. Complete vibration monitoring by a qualified independent blasting consultant. Use a minimum of five portable seismographs for each blast according to the International Society of Explosives Engineers Performance Specifications for Blasting Seismographs. Use seismographs capable of measuring particle velocities for three perpendicular components of vibration within a frequency response range from 2 to 250 Hz. Use seismographs that have received a factory calibration within the 12-month period preceding the blast recorded and according to the following:

- Complete the Vibration Monitoring Report using Form TR-44. Alternative forms/reports are acceptable for use if they contain the required information required on Form TR-44.
- Place four of the seismographs north, south, east, and west of the blast at the approved locations. Place the remaining seismograph at the nearest critical structure subject to blast induced damage.
- Monitor and record PPV and frequency for each blast.
- Provide the data recorded for each shot to the Representative before the next blast.
- Do not blast within 10 feet of the closest structure.
- Do not blast within 250 feet of less than 3-day old concrete.
- Do not blast within 30 feet of newly placed concrete until it has reached 28-day strength unless approved by the Department. For blasting greater than 30 feet away from new concrete, the ground vibration limits apply according to Table A.

Table A

Age of Concrete	Maximum PPV
Less than 3 days	No blasting
After 3 days	1.0 in/sec
After 28 days	2.0 in/sec

- Before test blasting, calculate the value of maximum powder charge per delay permissible using an initial conservative scaled distance of 50 for the distance between the critical structure and shot. The scaled distance is calculated by dividing the true distance (feet) from the blast to a point of concern by the square root of the maximum charge weight in pounds per delay.
- Plot the PPV measured from each seismograph versus the scaled distance between the blast and seismograph location on a logarithmic-logarithmic graph. From this plot determine the site-specific working scaled distance factor for a maximum particle velocity of 1.6 inches per second.
- The Representative and the qualified independent blasting consultant will confirm that the PPV of each component does not exceed the safe limits of the nearest structure subject to vibration damage. The limits for any of the three mutually perpendicular components of PPV must be determined using Figure 1 of Title 25 Pa. Code § 211.151.
- For all subsequent blasts, the qualified independent blasting consultant will evaluate the resulting PPV measured by the seismographs by plotting the recorded PPV versus the scaled distance on a logarithmic-logarithmic graph and submit it for approval. If at any time a maximum particle velocity of 2.0 inches per second is exceeded a modification to the initially established working scaled distance is required.
- Stop all blasting operations if the vibration limits are exceeded until the Contractor reports to the Representative that no damage has occurred to structures covered in the Pre-Blast Survey and that corrective measures are in place to lower vibrations to required limits to minimize the potential for any damage from future blasting.

(k) Airblast Monitoring. Monitor airblast between the main blasting area and the nearest structure subject to blast damage or annoyance. Monitor airblast at a second location as determined by the Representative and according to the following requirements:

- Use airblast monitoring equipment of the type specifically manufactured for airblast measurements.
- Maintain a peak overpressure below 128 dB (0.007 pounds per square inch) for residential structures. Provide a dated record of the peak overpressure measurements to the Representative immediately after each shot or use the same reporting procedures and time intervals designated for vibration monitoring.
- Stop blasting operations if the established overpressure limits are exceeded until the airblast monitoring specialist reports to the Representative that no damage has occurred or will occur, and that corrective action has been taken to lower the peak airblast.

(l) Water Supply Monitoring. Monitor water supply and submit Water Supply Monitoring Reports to the Representative before and after blasting operations, and when issues arise during blasting operations. The water supplies must include all wells, springs, or other ground water supplies used for human consumption.

Retain a qualified independent blasting consultant to oversee and complete the water supply monitoring program. Complete the Water Supply Monitoring Report using Form TR-45. Alternative forms/reports are acceptable for use if they contain the required information on Form TR-45. The following information is required for the completion of the water supply monitoring program:

- Determine the quantity and quality of water by identifying and monitoring water supplies within 1,000 feet of the blasting location(s). If geologic conditions warrant, water supplies beyond 1,000 feet may be included if there are concerns for potential impact, or if deemed appropriate for risk management.
- Two weeks before the start of blasting operations and between 6 and 8 weeks after blasting operations conclude, where allowed by the owners, for all water supplies identified, measure and record water levels, well depths, existing flow rates, well yield, and any other pertinent information.

- Two weeks before the start of blasting operations and between 6 and 8 weeks after blasting operations conclude, complete field and laboratory analyses for the following field water quality data parameters (and any other requested parameters) from all identified water supplies: pH, Temperature, Specific Conductance, Turbidity, Total Coliforms, Fecal Coliforms/E. Coli, Nitrate, Nitrite, Chloride, Hardness, Iron, and Sulfates.
- Collect water samples using sample collection and preservation techniques specified by the testing laboratory.
- Complete water analyses by a DEP certified laboratory.

Within 10 weeks after completion of blasting operations provide the Representative a final report of the conclusions and results of the water supply monitoring program and, if applicable, indicate any impacts to local water supplies from blasting activities. The Department will investigate indicated impacts to determine the cause of a water supply loss. The Contractor is not responsible for damages to the water supplies provided the excavation was done as indicated and the blasting is conducted according to this specification and the Blasting Plan.

(m) Post-Blast Survey. Conduct an Exterior and Interior Post-Blast Survey within 4 weeks after completion of all blasting and rock excavation of all utilities, buildings, or structures for which a Pre-Blast Survey was performed unless a waiver was/is obtained from the property owner. Complete the Exterior and Interior Post-Blast Survey using Form TR-42. Alternative forms/reports are acceptable for use if they contain the required information on Form TR-42. Follow the procedures as specified in Section 207.3(b), to obtain arrangements for property access and submittal procedures to the Representative. The Post-Blast Survey must be completed by a qualified independent blasting consultant in the presence of the property owner. At the end of the Post-Blast Survey, the property owner must sign both Exterior and Interior Post-Blast Survey Forms and be provided a copy. Submit the duly witnessed and signed Exterior and Interior Post-Blast Survey Forms to the Representative. Include in the report any diagrams and 8-megapixel resolution minimum digital images of structures indicating size and location of cracks, separations or damage in foundations, walls, ceilings, floors, or other structural components. Also, include documentation of any reported damage to water supplies including wells and springs and any differences from the Exterior and Interior Pre-Blast Survey Forms.

The Department will in no way relieve the Contractor of the responsibility for damage resulting from vibration or noise above the established allowable limits, and any other damages, including damages from flyrock, inadequate control or retention of blasted materials, improper or poor blast area security, or other damages resulting from improper or careless blasting practices or construction techniques.

207.4 MEASUREMENT AND PAYMENT— Blasting for Rock Cut Slope Excavation is incidental to excavation or borrow excavation. All material, explosives, labor, tools, and equipment needed for blasting operations including monitoring and survey activities will be considered incidental to the class of excavation specified and will not be paid for separately except as specified in Section 207.4(a).

(a) Controlled Blasting. Linear Foot

Measured on linear foot of acceptable presplit or trim blasthole depth for blastholes drilled within the tolerance as specified in Section 207.3(f).

SECTION 208—SPECIAL ROLLING

208.1 DESCRIPTION—This work is the special rolling of existing embankments; structure foundations on soil; existing subgrades; and the excavation and backfilling of the unstable areas, as indicated or as directed.

208.2 MATERIAL

- (a) Selected Borrow Excavation, Section 206.2(a)1.d Rock
- (b) Selected Borrow Excavation, Coarse Aggregate, No. 1 (AASHTO No. 1) - Section 703.2(c)
- (c) Selected Borrow Excavation, Coarse Aggregate, No. 2A-Section 703.2(c)
- (d) Geotextile, Class 4, Type A - Section 735-Table A
- (e) Geotextile, Class 4, Type C - Section 735-Table A

208.3 CONSTRUCTION—Perform special rolling in the presence of the Representative who will approve or disapprove the stability of the embankment and recommend corrective measures.

(a) **Equipment.** Use a roller type meeting one of the following requirements:

1. Pneumatic Tire Roller. Pneumatic-tire roller capable of varying the load from 26 tons to 28 tons.

Use a 2-axle pneumatic roller that will transmit the load through a minimum of four wheels on each axle. The wheels must be equally spaced over the roller width, be equally inflated, and have independent suspension, so that the wheels will carry approximately equal loads when operated over an uneven surface. Use a pneumatic-roller with tires capable of operating at inflation pressures ranging from 100 pounds per square inch to 105 pounds per square inch, the minimum wheel path overlap is 0.5 feet. All tires are to be smooth or have a low void ratio tread. The pneumatic roller should be not more than 10 feet wide overall.

2. Sheepsfoot or Pad Foot Roller. Use a sheepsfoot or pad roller for special rolling of fine grained and cohesive materials. The sheepsfoot or pad roller is to have a minimum foot or pad contact pressure of 160 pounds per square in.

3. Smooth Steel Drum Vibratory Roller. Use smooth steel vibratory drum roller for special rolling with a minimum dynamic force at the drum of 50,000 pounds.

4. Loaded Triaxle Dump Truck. 72,000 pounds Gross Vehicle Weight

(b) **Rolling.** Perform special rolling on existing subgrades or subgrades in cuts. Do not perform special rolling on newly constructed subgrades. Perform special rolling on embankment foundations, existing embankments where the grade is being raised, and structure foundations with spread footings bearing on soil.

- Before special rolling, compact the area as specified in Section 206.3(b). For areas of subgrade construction, prepare as specified in Section 210.
- For soils as specified in Section 206.2(a).1. a, use either a sheepsfoot, pad foot, or pneumatic tired roller. Do not use vibratory compaction, run all equipment in static mode. Operate roller at a maximum speed of 2 miles per hour. Observe that the sheepsfoot or pad foot roller "walks-out" of the soil. Alternatively, run a pneumatic roller and observe behavior of the roller and material.

- For granular materials as specified in Section 206.2(a)1.b and Section 206.2(a)1.c, compact the area as specified in Section 206.3(b)1.b or Section 206.3(b)1.c. Operate the smooth steel drum vibratory roller at a speed not exceeding 2 miles per hour. Do not use a smooth drum roller with vibratory drum on fine grained soils such as silt and fine sands.
- Compact material to 97% of maximum dry density for embankment foundations or for existing embankments greater than 3 feet below the proposed subgrade elevation. Compact material to 100% of maximum dry density for structure foundations, subgrades, or for material within 3 feet of proposed subgrade elevation. Compact material at a moisture content between minus 3% of optimum moisture content and optimum moisture content. Material that is above the optimum moisture content, shall be dried by disking, scarifying, or other means, until the material meets the moisture content requirements before compaction.
- When moisture-density test data is not available, compact with the proposed equipment using a test strip approach. After each pass of the compaction equipment, check the in-place moisture and density at several pre-determined random locations according to AASHTO T191 or AASHTO 310. When the measured moisture density does not increase by more than 1% over three consecutive passes of the compaction equipment, and the material appears stable, then proceed to special rolling. If the material cannot be compacted to a stable mass, the material is too wet and must be dried and recompacted, as above, to a stable mass before proceeding to special rolling.
- When special rolling using a loaded triaxle dump truck (72,000 pounds, gross vehicle weight), perform special rolling only in the presence of the Representative who will assess, and approve or disapprove the stability of the area being investigated. Run the loaded triaxle dump truck in a systematic manner to investigate the stability of the entire area indicated, or as directed. Additional passes of special rolling equipment may be ordered by the Representative in order to assess the soils. The Representative may waive special rolling requirements in wet or unstable areas if other stabilization or treatment measures are specified or required.
- Do not substitute special rolling for compaction procedures. Protect structures such as bridges, box and pipe culverts, from damage by special rolling equipment. Do not perform special rolling within 10 feet of bridge abutments or approach slabs.

(c) Stability. When the Representative determines the stability of the subgrade is unsatisfactory, stabilize the subgrade by providing compaction or by undercutting/excavating and replacing the unsuitable subgrade material. Unsatisfactory stability due to special rolling is defined as one of the following:

- For existing subgrade, subgrade in cut, spread footing on soil, when the permanent deflection or rutting is greater than 1/2 inch.
- For embankment foundations, including existing embankment when the grade is being raised, if the permanent deflection or rutting is greater than 1 inch of permanent deflection.

(d) Stabilization. When removing and replacing areas of unsatisfactory stability, the length and width of excavation is as directed and as follows:

1. Transition at the beginning and end of undercut shall be constructed with a slope ratio no steeper than 8H:1V. Compact the bottom of the undercut.

1.a. 1 Foot Depth Subgrade Undercut. For subgrade areas with greater than 0.5 inch and less than or equal to 3 inches of permanent deflection when performing Special Rolling, excavate the failed subgrade area to a depth of 1 foot as directed. Place Geotextile Class 4, Type C, as directed at the bottom of the undercut as specified in Section 212.3(e). If directed, drain the undercut by excavating a drainage path and backfilling it with No. 57 aggregate. Place Selected Borrow Excavation or other material as specified in Section 205. Compact aggregate as specified in Section 206.3 and Section 210.3. A minimum of 8 inches of approved material is to be in place on the geotextile before compaction.

2.a. 3 Foot Maximum Depth Subgrade Undercut. For subgrade areas with greater than 3 inches of permanent deflection when performing Special Rolling, excavate the failed subgrade area to a maximum depth of 3 feet as directed. Place Geotextile, Class 4, Type C at the bottom of undercut as specified in Section 212.3(e). If directed, drain the undercut by excavating a drainage path and backfilling it with No. 57 aggregate. Place Selected Borrow Excavation or other material as specified in Section 205. Compact aggregate as specified in Section 206.3 and Section 210.3. A minimum of 8 inches of approved material is to be in place on the geotextile before compaction.

Place a layer of Geotextile, Class 4, Type A as specified in Section 212.3(d) on Selected Borrow Excavation used to backfill the undercut prior to placing subbase on the undercut area. A minimum of 6 inches of subbase is to be placed on the geotextile before compaction.

Protect existing underground utilities during undercut operations.

208.4 MEASUREMENT AND PAYMENT—

(a) Special Rolling. Hour

Special rolling is paid by the hour, measured to the nearest 0.25 hour, in which special rolling is being performed in the presence of the Representative.

Payment will not be made to correct damage caused by the Contractor to the subgrade.

No measurement and payment will be made for idle equipment time for testing of materials, repairs or servicing equipment, loading or unloading ballast, increasing or decreasing tire pressure, inclement weather, or for any other similar reason under the control of the Contractor.

(b) Excavation/Backfill/Compaction. Cubic Yard. Measured in place as compacted material using the average end area method. All labor, materials and equipment required to excavate, drain and backfill areas are included in the cubic yard item.

(c) Geotextiles, Class 4. Square Yard
For the type indicated or specified.

SECTION 210—SUBGRADE

210.1 DESCRIPTION—This work is preparation of the roadbed to establish the top of subgrade elevation for both fills and excavations.

210.3 CONSTRUCTION—

(a) **General.** Form roadbed to the established top of subgrade elevation and compact as specified in Section 206.3(b).

(b) **Preparation and Proof Rolling.** Place and compact fill materials to top of subgrade elevation as specified in Section 206.3(b) for the type of material placed. For newly placed fills, maintain materials as specified in Section 206.3(b).

Where undercutting is not directed, compact and proof roll existing subgrades or subgrades in cut areas as specified in Section 206.3(a)1. Seal all subgrade surfaces that have been constructed or disturbed at the end of each workday with a smooth-drum steel wheel roller in the static mode to promote continuous positive drainage and to minimize infiltration of surface water.

Maintain and protect completed subgrade. When the completed subgrade has been in place for more than 60 days or at least one winter season, compact and proof roll the entire subgrade surface as specified in Section 206.3(a)1 before placing the Class 4, Type A geotextile separator and subbase. Promptly reshape and recompact, or remove and replace, damaged or unsatisfactory areas before placement of the geotextile.

After acceptance of the subgrade, place a Class 4, Type A geotextile over the completed subgrade for the entire lane width 8 feet or greater before placing the subbase. Place the geotextile as specified in Section 212.3(d)1. Install the geotextile continuously in a longitudinal direction, with the transverse limits extending to within a minimum of 6 inches and a maximum of 12 inches from the interior edge of the pavement base drain. Do not disturb or damage the geotextile during the installation of the pavement base drain. Repair damaged geotextile at no additional cost to the Department.

(c) **Subgrade Requirements.** Install reference grade lines with ample supports, or grade stakes, offset along each side of the subgrade, to control the elevation. Maintain reference grade lines until after completing the surface and correcting deficiencies.

Check subgrade for grade and slope. Test the finished surface for irregularities by using a string line stretched tautly, transversely across the subgrade area, between the reference grade lines. Measure the vertical distance from the string line to the finished grade, at various points along the string line, from one side of the surface to the other. Test for surface irregularities at longitudinal intervals of not more than 25 feet.

As an alternative or whenever the Representative suspects an area is deficient or irregular, check the finished surface with a template and 10-foot straightedge. Test the finished surface for irregularities by using a template cut to the required cross-section of the surface. Equip the template with metal or other vertical extensions attached to the top of each end to support a leveling device for checking the cross slope. The bottom of the template is to be at the elevation of the top of the subgrade. Use a 10-foot straightedge to test for longitudinal irregularities in the surface. Hold the straightedge parallel to the road centerline in contact with the surface. Move the straightedge from one side of the surface to the other. Advance along the surface in 5-foot increments.

Where subgrade is constructed using an automatic grading machine that cuts the subgrade and is controlled by a reference line or lines, the longitudinal interval for checking the surface cross-section may be increased to not more than 50 feet.

Where subgrade is constructed using grading equipment controlled by Survey Grade Global Positioning System (GPS), laser technology, and/or combination thereof, the longitudinal interval for checking the surface cross-section may be increased to not more than 500 feet provided the requirements specified in Section 210.3(d) are met.

Correct surface irregularities exceeding 1/2 inch by loosening the surface and removing or adding material as required. Compact the corrected area and surrounding surface by rolling. Recheck the corrected subgrade area for grade and slope.

(d) **GPS or Laser-Controlled Equipment.** At least 1 week before the preconstruction conference, submit a machine control grading QC Plan to the Department as specified in Section 106.03(b). At a minimum, the QC Plan

must demonstrate that the grading control equipment meets the performance requirements within acceptable tolerances.

At a minimum, set construction stakes at right angles to the centerline on tangents and radial offsets on curves at 500 foot intervals the entire length of mainline. In addition, set a minimum of two construction stakes on each ramp, on each intersecting roadway, and on projects less than 1000 feet in length. Tabulate offsets and elevations of all stakes using Form D-413 (Grade Sheet) located in Publication 122M, Appendix C, and provide to the Representative. Rough grade and fine grade stakes will be accompanied by a guard stake for easy identification.

Provide control points and conventional grade stakes at critical locations such as, PC's, PT's, superelevation points, and other critical points required for the construction of drainage and roadway structures.

Provide other points of reference necessary to establish quality control or for verification of accuracy by the Department.

Provide the same Survey Grade GPS network to the Department as that used during construction. The Department will review the network and monitor the project.

Check and recalibrate, if necessary, the GPS or laser machine control system at the start of each work day.

Test the finished surface at all hinge points and/or centerline, edge of lane, and edge of shoulders on the cross-section at all critical locations and as established in the QC Plan.

Correct surface irregularities exceeding 1/2 inch by loosening the surface and removing or adding material as required. Compact the corrected area and surrounding surface by rolling. Recheck the corrected subgrade area for grade and shape.

Upon successful quality control testing, notify the Representative the subgrade is ready for acceptance. At a minimum, the Representative will test the finished surface at all hinge points and/or centerline, edge of lane, and edge of shoulders on the cross-section at a random locations every 500 feet for acceptance. Correct all areas exceeding 1/2 inch. If more than 10% of all acceptance tests are determined to exceed 1/2 inch in any phase of the project, the Representative may require stakes and stringline be established as specified in Section 210.3(c).

Provide all electronic data files used for the construction of the fine-grade of the roadway to the Representative.

210.4 MEASUREMENT AND PAYMENT—

(a) Subgrade. Subgrade is incidental to the immediate overlying pavement structure. If required for shaping and finishing unpaved classes of work, subgrade is incidental to those items of work.

(b) Geotextile, Class 4, Type A. Section 212.4(c)

SECTION 212—GEOTEXTILES

212.1 DESCRIPTION—This work is furnishing and installing geotextiles for the class specified.

212.2 MATERIAL—Use geotextiles as specified in Section 735 for the specified class and type.

(a) **Bedding.** Section 703.2, No. 57 Coarse Aggregate Type C or better.

(b) **Securing Pins.** Use steel securing pins minimum 8 inches long by minimum 1/4 inch in diameter and with a 1 1/2-inch washer head. If allowed, alternate securing devices that provide equivalent or greater anchorage may be used.

(c) **Cover Material.** Use cover material as specified or indicated.

212.3 CONSTRUCTION—As shown on the Standard Drawings, and as follows:

(a) **General.** Remove and replace fabric areas damaged during construction. Lap replaced fabric as specified for the class of fabric used. Do not allow traffic or construction equipment directly on the fabric.

(b) **Class 1—Subsurface Drainage.** Provide smooth side and bottom trench surfaces so the fabric does not bridge depressions in the soil and is not damaged by rock projections. Lay the fabric flat in the prepared trench without stretching. Lay the top of the fabric back on the sides to allow for the placement of the aggregate backfill and pipe. Place and compact the aggregate backfill up to the pipe invert level and install pipe. Continue filling the remainder of the trench with compacted aggregate backfill, as indicated. Backfill aggregate and install pipe in a manner to prevent damage to the fabric. Lap out or overlap the geotextile as shown on the Standard Drawings for the specific type of subsurface drain being constructed. Use fabric of a width to allow a minimum trench-width overlap across the backfill at the trench top where required. Overlap adjacent ends of rolls an amount equal to the trench width. Do not allow the fabric to be exposed for more than 2 weeks without covering with aggregate.

(c) **Class 3—Sedimentation Control.** Use Type A or B fabric as indicated or specified. Install as specified in Section 865.3 or Section 866.3.

(d) **Class 4—Layer Separation and Erosion Control (Type A).**

1. Layer Separation. Prepare the surface and remove any object that may puncture the geotextile. Roll out the geotextile over the prepared surface. Place fabric in a loose and unstretched condition, but without folds or wrinkles. Do not drag the geotextile on the ground during placement and handling. Overlap fabric roll-ends and edges a minimum of 6 inches with adjacent material. Place cover material by back dumping then spread the cover material ahead of all equipment. Do not make abrupt turns with tracked equipment that would result in pulling, folding, or tensioning of the fabric. Steel pins, as specified in Section 212.2, may be used to secure the fabric before placement of the cover material to prevent lifting of the fabric by wind. Do not allow the fabric to be exposed for more than 2 weeks before covering with subbase or other required cover material. Compact the cover material as specified in Section 206.3.

2. Erosion Control. Remove vegetation, large stones, and other debris from the area to be protected and grade the surface to a relatively smooth condition. Undercut areas of soft material and replace with acceptable compacted material, as directed.

Lay the fabric on the prepared area in a loose and unstretched condition. Overlap all adjacent edges a minimum of 1.5 feet. For underwater placement, overlap a minimum of 3 feet. Offset adjacent roll ends a minimum of 10 feet.

Anchor the fabric in place by securing pins or other acceptable methods, along overlaps, at the spacing shown in Table A. Overlap the fabric so the upslope fabric is overtop the downslope fabric and the upstream fabric is overtop the downstream fabric. Place securing pins on a maximum 6 foot spacing on the unlapped portions of the fabric, such as perimeters.

Securing pins may be eliminated for slopes flatter than 6:1, provided that aggregate, rock, or other acceptable

means are used to secure the fabric.

TABLE A
Securing Pin Spacing

<u>Slope</u>	<u>Steeper Than</u> <u>3:1</u>	<u>3:1 to 4:1</u>	<u>Flatter Than</u> <u>4:1</u>
Pin Spacing along Overlaps	2 feet	3 feet	5 feet

Cover the fabric with the covering material as soon as possible. Do not expose the fabric for more than 2 weeks. Place cover material in a manner that slippage of the cover material over the fabric does not occur.

Do not drop rocks directly on the fabric from a height greater than 1 foot. Do not allow the rock placement procedure to puncture or damage the fabric. When placing rock greater than 1 foot in size, use a minimum 6-inch layer of bedding on top of the geotextile to prevent damage to the fabric.

(e) Class 4—Stabilization and GRS Abutment Reinforcement (Type C).

1. Stabilization. Fine grade the subgrade as specified in Section 210.3(c), as indicated, and in compliance with the cross sections. Remove any object that may puncture the geotextile. Roll out the geotextile over the prepared subgrade. Place the geotextile free of wrinkles. Do not drag the geotextile on the ground during placement or handling. Overlap adjacent rolls in a minimum of 2 feet. Do not allow any equipment directly on the geotextile until it is covered to full depth of subbase. Place subbase material by back dumping then spread the subbase ahead of all equipment at full plan depth. Place subbase material so that equipment is never in direct contact with the fabric. Do not make abrupt turns with tracked equipment that would result in deformation of the fabric. Maintain positive slope for drainage. Steel pins, as specified in Section 212.2, may be used to secure the fabric before placement of the subbase to prevent lifting of the fabric by wind. Compact the subbase material as specified in Section 350.3. Fill any wheel ruts that form during construction with additional subbase to maintain plan profile. Do not remove the wheel ruts by blading the wheel ruts level.

2. GRS Abutment Reinforcement. Install as shown on the Standard Drawings.

212.4 MEASUREMENT AND PAYMENT—

(a) Geotextiles, Class 1. Linear Foot
Measured by the length of trench.

(b) Geotextiles, Class 3. Square Yard
For the type indicated or specified, except when used as silt barrier fence paid for under Section 865 or Section 866.

(c) Geotextiles, Class 4. Square Yard
For the type indicated or specified.

SECTION 213—TEMPORARY PROJECT AIR POLLUTION CONTROL

213.1 DESCRIPTION—This work is disposal of burnable spoils by the use of an open-pit incinerator, by removal, or by other acceptable disposal methods.

213.3 CONSTRUCTION—Do not perform this work without before obtaining written authorization from the Deputy Secretary for Highway Administration or authorized designee and, if applicable, FHWA.

(a) **General.** Use temporary air pollution control measures whenever burning is prohibited because it violates the Air Pollution Control Act (Act 245), as approved October 26, 1972, or as amended.

(b) **Open Pit Incinerators.** For a project where open or free standing burning is not permitted, the DEP will allow the operation of an air curtain destructor (open pit incinerator), as defined in Title 25, Section 129.14, of the Rules and Regulations of the DEP. Use the destructor for destroying wood waste generated by clearing and grubbing operations, provided that the incinerators are properly designed, located, and operated. Permission may be granted for both units within and outside the air basin areas defined in Title 25, Section 121.1 of Chapter 121 of the Rules and Regulations of the DEP, but each proposal is required to be reviewed on an individual basis by the appropriate Regional Air Pollution Control Engineer.

If operating this unit creates an air pollution problem, the DEP will take enforcement action.

213.4 MEASUREMENT AND PAYMENT—Dollar

The proposal will include an item and a predetermined amount of money for Temporary Project Air Pollution Control. The contract item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the contingent or unpredictable nature of the work being performed, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for, under the Temporary Project Air Pollution Control item as follows:

(a) **Negotiated Price.** At a price agreed upon with the Department, before performing the work. If applicable, agreement is also required with FHWA.

(b) **Force Account Basis.** Section 110.03(d)

SECTION 214—SEALING ABANDONED WATER WELLS AND SPRINGS

214.1 DESCRIPTION—This work is the sealing of water wells or springs.

214.2 MATERIAL—

- Class C Cement Concrete—Section 704, except with a slump of 5 inches to 6 inches
- Spring Box—Section 605
- Spring Box Outlet Pipe—Section 615

214.3 CONSTRUCTION—

(a) Drilled or Driven Wells. Completely seal the well with concrete.

Remove standing water in the well, if possible, before placing the concrete plug.

Do not pull metal casings of wells. If directed, where multiple ground-water aquifers exist, evidenced by a well-casing length longer than normal, pull the casing. To prevent losing the hole when the casing is pulled, proceed as follows:

1. Fill the lower uncased well portion with concrete before pulling casing.
2. As each section is pulled, fill that portion of uncased hole with concrete before removing the next casing section.
3. Continue until all of the casing is removed and the well is completely filled with concrete.
Excavate material around the casing top, at the finished elevation, 1 foot deep and 1 foot in width around the casing. Fill the excavated area with concrete placed monolithically with the top of the well plug.
Seal wells before demolition operations to prevent contamination.

(b) Dug Wells. Completely fill abandoned dug wells with concrete and finish flush with the surface.

(c) Springs. Enclose springs with satisfactory spring boxes and with suitable overflow pipes to collect and direct the flow to inlets or parallel ditches.

214.4 MEASUREMENT AND PAYMENT—

(a) Sealed Drilled or Driven Wells. Each

(b) Sealed Dug Wells. Each

(c) Sealed Springs. Each

SECTION 219—GEOFOAM LIGHTWEIGHT FILL

219.1 DESCRIPTION—This work is furnishing, transporting, and placing geofoam lightweight fill for construction of embankments and for backfilling behind structures.

219.2 MATERIAL—

(a) **Expanded Polystyrene (EPS) Geofoam Blocks.** Provide blocks from a manufacturer listed in Bulletin 15 and conforming to the following requirements:

TABLE A
EPS Geofoam Block Physical Requirements⁽¹⁾

Property	Test Method	Type 1	Type 2
Designation	ASTM D 6817	EPS22	EPS39
Density (pcf)	ASTM D 1622	1.35 ±5%	2.40 ±5%
Compressive Strength at 1% Deformation (psi)	ASTM D 1621	7.3	15.0
Compressive Strength at 5% Deformation (psi)	ASTM D 1621	16.7	35.0
Compressive Strength at 10% Deformation (psi)	ASTM D 1621	19.6	40.0
Flexural Strength (psi)	ASTM C 203	35.0	60.0
Oxygen Index (Volume %)	ASTM D 2863	24.0	24.0
Water Absorption (Volume %)	ASTM C 272	3 (max.)	2 (max.)
Dimensions (inch)	-	24 by 48 by 96 (H by W by L)	12 by 48 by 96 (H by W by L)

(1) All values minimum unless indicated otherwise.

- Provide blocks having the same dimensions as all other blocks, except where necessary for project specific fill geometries. Blocks smaller than the dimensions indicated in Table A can be provided where necessary to meet project specific geometries. Provide manufactured blocks that do not deviate from required or specified dimension of the blocks by more than 0.5 percent.
- Provide blocks having perpendicular faces, except as required for project specific geometries. Do not deviate faces from perpendicular planes more than a 1/16 inch over a length of 12 inches.
- Provide blocks with planar faces (i.e., not warped or uneven) that do not deviate from planarity by more than 3/16 inch over a length of 96 inches.
- Provide blocks manufactured using only virgin polystyrene resin. Do not use blocks manufactured with regrind or recycled material.
- Provide blocks manufactured with sufficient flame retardants to meet the minimum Oxygen Index indicated in Table A.
- Unless blocks are fully encapsulated with a geomembrane, provide blocks manufactured with an insecticide to prevent termite and other insect attack.
- Provide blocks that have been seasoned for a minimum of 72 hours after manufacture and prior to shipment. While seasoning, protect blocks from moisture and ultraviolet (UV) radiation, at a temperature of 68F ±2F. Prior to placement store blocks in a well-ventilated facility. Allow the Representative to inspect the storage facility upon request.

- Provide blocks labeled with manufacturer's name, ASTM EPS designation as specified in Table A, the date the block was molded, the weight (in pounds), and density (in pounds per cubic foot) as measured after the required seasoning period.

(b) Hydrocarbon Resistant Geomembrane. Provide a geomembrane from a manufacturer listed in Bulletin 15 and conforming to the following requirements:

- Provide a geomembrane manufactured from a tri-polymer consisting of polyvinyl chloride, ethylene interpolymers, and polyurethane or a comparable polymer combination meeting the physical and chemical requirements specified in Table B.

TABLE B
Hydrocarbon Resistant Geomembrane Physical Requirements⁽¹⁾

Property	Test Method	Value
Thickness (mils)	ASTM D 751	30
Unleaded Gasoline Vapor Transmission Rate (ounces/feet ² /day)	ASTM D 814	0.40 (max.)
Grab Tensile Strength ⁽²⁾ (pounds)	ASTM D 751	550
Elongation at Break (percent)	ASTM D 751	20
Toughness ⁽³⁾ (pounds)	-	11,000
Puncture Resistant (ball tip) (pounds)	ASTM D 751	750
Shear ⁽⁴⁾ (pounds)	ASTM D 751	320
Factory Seams Bonded Width (Each Seam) (inches)	-	2
Pass Cold Crack (1-inch mandrel, 4 hours) (F)	ASTM D 2136	-30 (pass/fail)

- (1) All values minimum unless indicated otherwise.
 (2) Both machine and cross-machine direction (1-inch grip, 4-inch by 8-inch sample)
 (3) A calculated value (grab tensile strength multiplied by percent elongation)
 (4) Modified per National Sanitation Foundation. Std. No. 54

- Provide a flexible geomembrane that covers and conforms to 90 degree edges and corners of blocks at ambient temperatures above 45F without additional heating of the geomembrane.

(c) Geotextile, Class 4, Type A. Section 735.

(d) Fine Sand. Section 703.1(c), Type B, No. 1 Asphalt Concrete Sand or sand with 100% passing the No. 16 sieve and a maximum of 10% passing the No. 100 sieve.

(e) Bedding Material. Section 703.2, AASHTO No. 10 Coarse Aggregate, Section 703.1(c), Type A Cement Concrete Sand, or Section 703.1(c), Type C Mortar Sand.

(f) Capping Material. Includes one of the following:

- Material meeting the requirements of Section 206.2(a)1.a, except 100% of the material passing the 3/4 inch sieve.
- Section 219.2(e).

(g) **Embankment.** Section 206.2(a)1.a.

219.3 CONSTRUCTION

(a) **Delivery, Storage, and Handling.** Deliver, store, and handle materials in accordance with manufacturer's recommendations.

During all stages of manufacture, shipment, storage, and construction, protect and handle blocks in a manner to prevent physical damage. Do not use any method of lifting or transporting blocks that create dents or holes in block surfaces or that cause losses of portions of block.

If blocks are to be stockpiled at the project site before placement, designate a secure storage area that is located away from any heat source or construction activity that produces heat or flame. Personal tobacco smoking or flames of any kind are not allowed in the storage area. Store blocks off of the ground and out of standing water. Protect blocks from direct sunlight and UV rays. Do not place a cover directly over blocks that might allow the buildup of heat beneath the cover. Do not traverse blocks with vehicles or equipment, and foot traffic by persons must be kept to a minimum. If blocks are exposed to wind, secure with sandbags or other similar "soft" weights that do not dent or otherwise damage blocks.

Protect blocks from contact with and exposure to vapors from organic solvents, including but not limited to acetone, benzene and mineral spirits, and petroleum based solvents, including but not limited to gasoline, kerosene, and diesel fuel.

(b) **On-site Scale.** Provide a scale on-site that is capable of weighing the blocks to verify block density. Provide a scale with a rated capacity of no more than two and one half times the weight of the heaviest block delivered to the site and accurate to a tenth of a pound. Provide documentation that the scale has been calibrated after being set up at the site. Verify block density by selecting a random block from each truck load of blocks delivered to the project. If the random block is not within density requirements, the entire truck load will be rejected. Individual blocks from a rejected truck load may be accepted if confirmed to be within density requirements. Record the following information: date and time of measurement, ASTM EPS designation as specified in Table A, dimensions and weight of the block, and the calculated density (i.e., block weight divided by block volume). Provide this information to the Representative upon request.

(c) **Block Layout Submittal.** Before placing blocks submit shop drawings to the Representative for review and acceptance. Indicate on the shop drawings the proposed location and layout of all blocks; location and thickness of bedding material, capping material, embankment material, and pavement section; and the location of the geotextile and geomembrane. The proposed layout must meet the following requirements:

- Place Type 1 blocks for the main body of the fill.
- Cap the top of the Type 1 blocks with a minimum 12 inch thick layer of Type 2 blocks. Type 2 blocks are not required to be used on the side slopes of the block fill.
- Use the maximum amount of full size blocks of minimum dimensions indicated in Table A that the placement geometry allows.
- Place blocks with smallest dimension oriented vertically.
- A minimum of two layers of blocks must be used (i.e., one layer of Type 1 and one layer of Type 2, except on sideslopes).
- The plane on which any given layer of blocks is placed must be parallel to the longitudinal profile of the roadway.
- Within a given layer of blocks, the longitudinal axes of all blocks must be parallel to each other.

- Within a given layer of blocks, vertical joints between adjacent longitudinal rows of blocks must be offset a minimum of 2 feet.
- The longitudinal axes of blocks for layers above and below a given layer must be perpendicular to the longitudinal axes of blocks within that given layer.
- The longitudinal axes of the uppermost layer of blocks must be perpendicular to the longitudinal profile of the roadway.
- Cover blocks with a minimum of 4 feet of material but not to exceed 6 feet. Total cover thickness includes the pavement section, soil embankment and capping material.
- If blocks are placed adjacent to a river, stream, creek, etc., place the bottom layer of blocks a minimum of 3 feet above the 100-year storm elevation, and a minimum of 1 foot above the 500-year storm elevation.

(d) Damage.

1. Blocks. Do not use blocks damaged during manufacturing, shipping, storage, or construction that adversely affects their qualities. Replace damaged blocks at no expense to the Department. Damaged blocks that cannot be used are defined by any of the following:

- Volumetric damage of more than 0.5% of the volume of the single block
- Surface damage of more than 5% of the load bearing area of the single block
- Surface damage of more than 5% of the total block surface area
- Continuous damage of more than 20% of the length of any side of a single block.

Fill acceptable damaged areas on horizontal bearing surfaces with dry, fine sand, meeting the requirements of Section 219.2(d).

2. Geomembrane. Repair any damaged geomembrane by welding patches according to manufacturer's requirements and as approved by the Representative. Extend patches a minimum of 6 inches beyond the limits of the damaged areas in all directions. Protect the blocks from damage during welding.

3. Geotextile. Remove and replace geotextile damaged during construction. Lap fabric over damaged areas and extend a minimum of 12 inches in all directions. Secure fabric lap with a geotextile seaming spray adhesive recommended by the manufacturer. Apply the adhesive to a minimum of 6 inches of the fabric lap. Do not bond the geotextile to the geomembrane during application of the adhesive.

(e) Placement. Place blocks as indicated in the accepted Block Layout Shop Drawing, or as directed by the Representative. Before placement, and for any period deemed necessary by the Representative, a representative from the manufacturer of the blocks must be on site to answer any questions regarding placement of the blocks.

Before placement of blocks at or below original ground, prepare the embankment foundation area in accordance with Section 206.3(a). Before placement of the first layer of blocks, place a leveling course consisting of a 6-inch loose layer of Bedding Material meeting the requirements of Section 219.2(e). Grade the leveling course parallel to the longitudinal profile of the roadway. The leveling course surface must be free of debris and water before placement of blocks.

Place geotextile, geomembrane, and blocks as indicated in the accepted Block Layout Shop Drawing. Where possible, place blocks with the factory skin (i.e., molded, uncut surface) as the outer layer. If blocks are warped/crowned but within the acceptable tolerance, place blocks with crown upward at all times to prevent the ponding of water. Place blocks by hand. Do not use wheeled, tracked, or other equipment on the surface of blocks, geomembrane, or geotextile at any time. Equipment may be used to transport or lift blocks, as long as its use does not damage the blocks.

Where custom shapes and smaller sizes than indicated in Table A are needed and are not provided from the factory, field cut these custom shapes and smaller sizes from full size blocks using a hot wire cutter. Do not use a chain saw, hand saw, or other mechanical shearing or cutting device to cut or shape blocks. Field cut blocks to within 0.5 inch of required or specified dimensions.

During placement of blocks, secure the blocks with sandbags or other similar “soft” weights that do not dent or otherwise damage blocks until the soil cover is placed. Alternatively, mechanical connectors or EPS compatible adhesive approved by the block manufacturer may be used to secure blocks.

Provide full contact between blocks. Do not leave standing water, accumulated snow or ice, or debris of any kind on previously placed blocks prior to placement of subsequent blocks. Do not use de-icing salts, sodium chloride or other products on the blocks that can cause degradation. Place blocks so that all vertical and horizontal joints between blocks are tight. Allow no gaps greater than 0.1 foot on vertical joints. Do not fill vertical joints with sand.

Construct the top finished surface of the blocks to within a tolerance of 1/2 inch over a 10 foot interval of the design longitudinal profile of the blocks and design transverse slope of the blocks. Additionally, construct the finished surface of the blocks beneath pavement sections to within 0.1 foot of the top of block design grade. Construct the finished surface of the blocks on side slopes to within 0.2 foot of the top of block design grade. Any adjustments for grade can be made using either Type 1 or Type 2 block, so long as the Type 2 blocks have a minimum thickness of 12 inches.

(f) Encapsulating Blocks with Geomembrane and Geotextile. After placement of blocks, continue bringing up the hydrocarbon resistant geomembrane to fully encapsulate all blocks in one continuous layer of geomembrane as indicated in the accepted Block Layout Shop Drawing. Field weld all geomembrane seams using a hot wedge welding machine. Do not use hot air or solvents to weld seams. Do not melt or otherwise damage the blocks during welding. Overlap seams according to manufacturer’s requirements, but no less than 3 inches. Protect the blocks as needed during field welding of the geomembrane. Replace blocks damaged from welding of the geomembrane, and repair the geomembrane at no expense to the Department.

Immediately after placement of the geomembrane, continue bringing up the Class 4, Type A geotextile to fully cover the geomembrane. Overlap adjacent layers of geotextile a minimum of 12 inches. Secure all overlaps of geotextile with a geotextile seaming spray adhesive recommended by the manufacturer. Apply the adhesive to a minimum of 6 inches of the overlap. Do not bond the geotextile to the geomembrane during application of the adhesive.

Prevent overspray of the adhesive onto the geomembrane. If overspray occurs, insert an additional piece of geomembrane that extends a minimum of 6 inches beyond the limits of the overspray, to act as a bond breaker between the geomembrane and geotextile.

(g) Capping Material Placement. A 6-inch minimum compacted lift of capping material meeting the requirements of 219.2(f) must be placed on top of the geotextile, including on the horizontal surfaces of the side slopes, before placement of embankment material. Place and compact capping material within 2 weeks after placement of the geotextile as specified in Section 206.3 except as follows:

Place the capping material over top of the fully encapsulated blocks by end dumping material just off the blocks, and blading an 8-inch thick loose lift of material across the blocks with pneumatic tire equipment. Do not end dump capping material directly on the blocks. Do not stockpile capping material on previously placed capping material. A single triaxle truck load of capping material may be dumped onto previously placed and compacted capping material. Spread capping material as quickly as practically possible. Do not drive directly on the blocks with any equipment, do not use tracked equipment, and do not make sharp, sudden turns with pneumatic tired equipment that may damage the geotextile and/or geomembrane. Repair any damage to the blocks, geomembrane or geotextile that occurs before or during fill placement.

Compact capping material using a smooth drum roller in static (non-vibratory) mode.

(h) Embankment Placement. Once a 6-inch minimum compacted lift of capping material is in place over top of the geotextile, place and compact soil embankment meeting the requirements of Section 206.2(a)1.a as specified in Section 206.3 and as indicated in the accepted Block Layout Shop Drawing. Place soil embankment to pavement subgrade elevation. Do not stockpile embankment material on previously placed capping or embankment material. A single triaxle truck load of embankment material may be dumped onto previously placed and compacted capping or embankment material. Spread embankment material as quickly as practically possible.

Place embankment over the side slopes of the block fill starting at the bottom of the slope in such a manner as to prevent damage to the blocks, geomembrane, and geotextile. Provide a minimum of 4 feet of embankment material cover vertically and horizontally over the blocks as measured from any exterior face of the block.

219.4 MEASUREMENT AND PAYMENT**(a) Expanded Polystyrene (EPS) Geofoam Blocks.** Cubic Yard.

Measure blocks in their final position. Payment will not be made for wasted material. Payment includes furnishing, storing and placing Type 1 and Type 2 geofoam blocks, bedding material, fine sand, capping material, and any incidental materials such as mechanical connectors and adhesives.

(b) Hydrocarbon Resistant Geomembrane. Square Yard.

Payment includes welding seams.

(c) Geotextile, Class 4, Type A. Section 212.4(c).

SECTION 220—FLOWABLE BACKFILL

220.1 DESCRIPTION—This work is furnishing, transporting, and placing flowable backfill. Flowable backfill may be a mixture of coarse aggregate, fine aggregate, water and air entraining agents, either cement or supplementary cementitious material, or a combination of both, and may or may not include bottom ash, or other admixtures. The three types of flowable backfill are as follows:

(a) Flowable Backfill, Type B. Future excavation of the backfill may be necessary such as at utility trenches, pipe trenches, bridge abutments, and around box or arch culverts.

(b) Flowable Backfill, Type C. Excavation of backfills not anticipated, including replacing unsuitable soils below structure foundations, filling abandoned conduits, tunnels and mines, and backfilling around pipe culverts where extra strength is required.

(c) Flowable Backfill, Type D. Construction in areas requiring low-density backfill material as in abutments over highly deformable soils, backfilling retaining walls, filling vaults, and backfilling on top of buried structures.

220.2 MATERIAL—

(a) Cement. Type I, IP, IS, or II, Section 701. If using Type IP cement, adjust the quantity of flyash in the design as necessary. If using Type IS cement, adjust the quantity of slag cement in the design as necessary. From a source listed in Bulletin 15.

(b) Flyash. Type F or C flyash, Section 724 except as follows:

- Flyash—conforming to AASHTO M 295 (or ASTM C 618) Table 1 requirements except maximum loss on ignition is 16%, and excluding the requirements of Table 1A, 2, or 2A.

From a source listed in Bulletin 15 or tested and approved before incorporating into the flowable backfill mix.

(c) Slag Cement. Section 724.3. From a source listed in Bulletin 15.

(d) Fine Aggregate. Type A, B, or C; Section 703.1; except, having a maximum loss of 20% in the Soundness Test, PTM No. 510. The fine aggregate may be natural sand, manufactured sand, or foundry sand meeting Section 703.1. From a source listed in Bulletin 14.

(e) Coarse Aggregate. Type A, B, or C, AASHTO 10, Section 703.2. Except 10% maximum for material finer than the No. 200 sieve. From a source listed in Bulletin 14.

(f) Bottom Ash. From a source listed in Bulletin 14. Coal ash having a maximum loss of 20% in the Soundness Test, PTM No. 510, and conforming to the following dry sieve gradation requirements:

Sieve Size	% Passing
1/2-inch	100
No. 200	0-10

(g) Water. Section 720.1

(h) Admixtures. Section 711.3.

(i) Air Entraining Admixtures. From a manufacturer listed in Bulletin 15, specifically for flowable backfill.

(j) Geotextile, Class 4, Type A. Section 735

(k) Mix Design. Submit a mix design and test results (density, strength, and air content if applicable) to the Representative, at least 3 weeks before construction. Alkali-Silica remediation is not required regardless of the expansion value of the aggregates used in the mix design. Use Table A as a guideline for the mix design or submit an alternate design based on density guidelines and conforming to the strength requirements of Table A. Base the submitted mix design on an absolute volume of 1 cubic yard.

TABLE A
Mix Design

Properties & Criteria	Type B	Type C	Type D
Mix Design (/CY)			
Cement (lbs)*	50	150-200	300-700
Supplementary Cementitious Material (lbs)*	300	300	100-400
Bottom ash (lbs)* or Coarse Aggregate or Fine Aggregate Air Generating Admixture*	2600	2600	**
Slump (inches) AASHTO T 119, ASTM C 136	7 min ****	7 min ****	7 min ****
Density (pcf) AASHTO T 121, ASTM C 136	N/A	N/A	30-70 or as specified ***
Water Absorption of Aggregate AASHTO T 85	--	--	20% max
Compressive Strength (psi) PTM No. 604 28 Days	125 max	800 min	90-400

*Quantities may be varied or alternate designs submitted to adapt mix to conform to density and strength requirements or to adapt to specific site conditions.

**Requires using a suitable lightweight aggregate or air entraining admixture. Provide a mix design that achieves the specified strength and density requirements.

***Approximate Value. Use of air entraining agent may reduce these values.

****Some applications may require containing flowable backfill by constructing dikes from the mix by using less water to produce a 3-inch minimum slump, if approved by the Representative. Thickening of the mix in other areas is allowed if approved by the Representative.

Provide mix designs that conform to specific density requirements, if specified. If source of material is changed, submit a revised mix design before using material. Conduct design mix testing at the highest flowability or slump being used for the project.

If applications involve exposed metal or metal coated with a layer of thin concrete (< 1/2 inch), test the design mixes for corrosion resistance as follows:

Resistivity, AASHTO T 288, 60 day cure	> 2000 ohm-centimeters
pH of pulverized flowable backfill	5.0 to 9.5
Chlorides of pulverized backfill after cure	< 200 ppm
Sulfates of pulverized backfill after cure	< 1000 ppm
Sulfides of pulverized backfill after cure	< 200 ppm

(l) Certification. Certify the properties of flowable backfill as specified in Section 106.03(b)3.

(m) Forms. Section 1001.2(h)1

220.3 CONSTRUCTION—

(a) General. Furnish indicated type of flowable backfill conforming to Table A. Do not allow the flowable backfill to contact aluminized materials or compounds.

Produce and transport as specified in Section 704, excluding maximum temperature range of 90F, or by other approved methods from a facility accepted by the Department. The Contractor may adjust the mix in the field provided it achieves the criteria specified in Table A.

(b) Placement. Submit the sequence of operations at least 4 weeks before starting the work. If required, design the forms to sustain lateral fluid pressure equal to total weight of unhardened flowable backfill with a minimum 1.3 factor of safety. Construct formwork as specified in Section 1001.3(a).

Do not place flowable backfill through flowing water. Remove and replace flowable backfill damaged by rain or flowing water. If excavation cannot be dewatered, place flowable backfill by a tremie procedure approved by the Representative.

Break up lumps by remixing or other approved methods.

Ensure that base drain outlets do not intersect areas where placing flowable backfill. Furnish solid base drain outlet pipes in areas intersecting the flowable backfill.

Do not place flowable backfill at a material temperature below 50F or if the temperature of either the air or the surface that the flowable backfill is placed on is 40F or lower. Maintain the temperature of the in-place flowable backfill at no less than 50F for a minimum of 24 hours or until the next lift is placed.

Do not place additional lifts until surface bleed water dissipates or the preceding lift hardens sufficiently to support foot traffic or both.

Protect finished surface from frost, erosion, and damage with suitable covers of soil, aggregate, concrete, pavement, or other material approved by the Representative.

If required, contain flowable backfill by constructing dikes from the mix. For the mix for dikes use less water to produce a 3-inch minimum slump, as directed by the Representative. Dikes will remain an integral part of completed flowable backfill. The Contractor may thicken the mix in other areas if allowed by the Representative.

1. Structure Backfill. When backfilling, place flowable backfill in lifts to prevent lateral pressures from exceeding resisting capacity of structure. Do not place lifts that exceed 4-foot, unless approved by the Representative. Protect structure foundation drains from intrusion and contamination of flowable backfill by using a separation membrane of Class 4, Type A geotextile. During placement of flowable backfill, protect existing structures, drainage facilities, utilities, etc., that are to remain within the fill area from movement or floating, damage, or misalignment. Repair or replace any damaged items, as directed by the Representative, at no additional cost to the Department. Provide preformed drain, no more than 2 inches thick, between the wall and the flowable fill and provide outlets at not more than 15 feet through the wall, or as directed by the Representative.

2. Pipe Bedding and Backfill. Backfill the trench as shown on the Flowable Backfill Detail in the Standard Drawings. Place adequate support to provide the minimum required bedding from trench bottom to bottom of pipe, and protect pipe from damage, movement, floating and improper alignment. Protect pipe from intrusion of flowable backfill. If shown, place Class 4, Type A geotextile membrane around pipe.

Prevent floating of pipe by placing flowable backfill in lifts or use sandbags or other weights to ballast pipe until lift is set. Place the backfill evenly on both sides of the trench to avoid overstressing the pipe. Monitor pipe alignment according to Section 601.3(c).

3. Utility Trench Backfill. Provide adequate tie-downs or weights, if required, for utility conduits to prevent floating. Protect utilities from damage and movement. Maintain proper alignment of conduits during placement of flowable backfill. Perform all utility work according to the permit requirements.

(c) Testing and Acceptance. Section 704.1(d)1, Section 704.1(d)2, Section 704.1(d)4, and as follows:

Test flowable backfill slump, according to AASHTO T 119, test air content according to AASHTO T 152 (do not apply an aggregate correction factor) or T 196, and for yield, according to AASHTO T 121, ASTM C 136, as part of the QC Plan.

Test flowable backfill for proper flowability using the slump cone. Conduct slump tests as often as necessary (at least once daily or every 200 cubic yard) to maintain the correct flowability at placement and if requested by the Representative. The Contractor may add water on-site to maintain flowability as needed. Test flowable backfill for

yield at least once daily, or one test for every 200 cubic yard of material. Record all test results and submit to the Representative.

Mold 4-inch by 8-inch cylinders according to PTM No. 611, except specimens will remain in the mold until just before testing. Mold cylinders from the sample obtained for testing material flowability. Test for compressive strength according to PTM No. 604, except use neoprene caps.

Ensure the Inspector witnesses compressive strength tests. Remove material that does not conform to Table A strength requirements. The Representative may allow the material to remain in place with liquidated damages assessed at \$25/cubic yard per lot of deficient flowable fill.

(d) Opening to Traffic. For flowable backfill Type B and Type C material, do not open to traffic until 1 hour after the surface bleed water has dissipated and as allowed by the Representative. Open flowable backfill Type D to traffic when directed by the Representative.

220.4 MEASUREMENT AND PAYMENT—

(a) Flowable Backfill. Cubic Yard. For the type indicated.

(b) Class 4 Geotextile, Type A. Section 212.4(c)

If using flowable backfill in place of a material incidental to another item of work, then the flowable backfill is also incidental.

SECTION 221—EXTENSIBLE REINFORCEMENT FOR MSE WALLS

221.1 DESCRIPTION—This work is furnishing and installing geogrids for the class specified.

221.2 MATERIAL—

(a) **Geogrid.** Section 738 for the class indicated.

(b) **Backfill.** Provide backfill consisting of natural materials, free of organic matter and other deleterious substances.

1. Backfill for Class 1 Geogrids.

1.a Mechanically Stabilized Earth (MSE) Walls. Provide backfill for MSE walls consisting of AASHTO No. 8 coarse aggregate, Section 703.2, in areas that require free draining material or in areas that are at or below the 100 year flood elevation. For all other areas of MSE walls provide backfill meeting the following requirements:

<u>Sieve Size</u>	<u>Percent Passing</u>
1/2 inch	100
No. 40	0-60
No. 200	0-10*

*Determination of the fines content (minus No. 200 sieve material) for MSE wall backfill must be determined by wash test according to PTM No. 100. This is in addition to PTM No. 616.

Provide backfill meeting the quality requirements of Type C coarse aggregate or better as specified in Section 703.2(a), Table B, except provide materials free of clay lumps, friable particles, coal and coke. Do not use metallurgical slag or cinders.

Provide backfill with a maximum plasticity index (PI) of 3 as determined according to AASHTO T 89 and T 90. Provide backfill materials with a pH between 5.0 and 9.0, determined according to AASHTO T 289.

Provide backfill with an angle of internal friction of not less than 34 degrees as determined according to AASHTO T 236 on the backfill sample portion that is finer than the No. 8 sieve. Coarse aggregate as specified in Section 703.2 does not require testing for angle of internal friction. Prepare the shear strength test sample by substituting material coarser than the No. 8 sieve with material that passes the No. 8 sieve but is retained on the No. 10 sieve. The percentage of material finer than the No. 10 sieve must remain as proportioned in the original sample before substitution. Shear testing may be performed on samples containing material larger than the No. 8 sieve if the shear device according to AASHTO T 236, Sections 5.4 and 5.5.

2. Backfill for Class 2 and Class 3 Geogrids. AASHTO No. 8 coarse aggregate, AASHTO No. 57 coarse aggregate, or PennDOT No. 2A coarse aggregate, Section 703.2, and as specified or indicated.

(c) **Class 4, Type A Geotextile.** Section 735.

221.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated or specified, and as follows:

(a) **General.** Prepare surface as indicated or required. Place geogrid to the vertical spacing, lengths and areas indicated. Provide overlaps as specified. Place geogrids flat and free of wrinkles, stretching and anchoring as necessary. Do not allow traffic or equipment on the geogrid until it has been covered with one lift (8 inch loose layer) of backfill. Dump backfill of the type specified on top of the geogrid and then blade material across the grid to the required lift thickness. Maximum backfill drop height is 3 feet. If using tracked equipment to spread backfill, do not cross track or make sudden turns that result in deforming or damaging the geogrid. Compact backfill as specified in Section 206.3 or as specified. Reject all geogrids with defects, tears, punctures, flaws, deterioration, or damage

incurred during manufacture, transportation, storage, or installation as determined. Replace damaged geogrid at no additional cost to the Department.

(b) Handling and Storage. According to ASTM D 4873 for identification, storage, and handling of geogrid. Provide clear identification to every roll of geogrid that provides identification of product designation, the manufacturer's name, lot number, material quantity, and clearly differentiates between rolls of similar geogrid. Protect all geogrid from direct sunlight, ultra-violet rays, temperatures greater than 140F, mud, dirt, dust, and debris.

(c) Class 1 – Uniaxial Geogrid Reinforcement. Place all uniaxial geogrid in the direction of primary reinforcement (machine or roll direction). The maximum allowable vertical spacing of geogrid is 2 feet for MSE wall applications and any other reinforcement applications. Overlap adjacent layers of geogrid as indicated or required, but in no case less than 3 inches. For concave wall or slope faces maintain the minimum overlap for 75% of the length of the geogrid from the wall or slope face edge of the geogrid. Do not splice or overlap geogrids in the primary reinforcement (machine or roll) direction.

(d) Class 2 and Class 3 – Biaxial Geogrids. Prepare subgrade or foundation surface flat, smooth and level, free of any sharp protrusion or debris. Place a layer of Class 4, Type A geotextile on top of the prepared subgrade before placement of geogrid. Overlap edges of geotextile and geogrid (both machine/roll and cross machine/cross roll directions) a minimum of 1 foot. Maximum vertical spacing of geogrid is 12 inches.

221.4 MEASUREMENT AND PAYMENT—

(a) Geogrid. Square Yard.

For the class indicated or specified. Any required or incidental overlaps of geogrid are not included in measurement and payment. Only the indicated plan view reinforced area per geogrid layer is included in payment.

Backfill used in the installation of geogrid is included in the payment.

(b) Class 4, Type A Geotextile. Section 212.4(c).

SECTION 222—GEOCELL LOAD DISTRIBUTION MAT

222.1 DESCRIPTION—This work is the construction of a geocell load distribution mat over soft or unstable subgrades.

222.2 MATERIAL—

(a) **Geocell.** Section 737 of the depth and type indicated.

(b) **Anchors.** Section 709.1(a), Grade 40. Used to hold expanded geocell sections in a fully and uniformly extended position until backfilling of geocell is complete. Provide anchors in accordance with the manufacturer's recommendations and as indicated, except having a minimum bar diameter of 0.375 inches and a minimum length of 12 inches plus the geocell depth.

(c) **Mechanical Fasteners.** Used to fasten adjacent sections of geocell. Provide mechanical fasteners in accordance with the manufacturer's recommendations and capable of holding adjacent geocell panels in direct contact until pavement or other type of final surface is placed.

(d) **Coarse Aggregate.** Section 703.2, No. 2A.

(e) **Geotextile.** Section 735.1, Class 4, Type A.

222.3 CONSTRUCTION—Install the geocell according to manufacturer's instructions and as follows:

(a) **Subgrade Preparation.** Prepare compacted subgrade to a uniform surface and to the lines and grade indicated.

(b) **Geotextile.** Install geotextile on prepared subgrade. Provide a minimum 12 inch overlap between adjacent layers and extend a minimum of 6 inches beyond the indicated perimeter of the installed geocell.

(c) **Geocell.** Store and transport geocell sections in an unexpanded configuration until ready to install.

Position collapsed geocell sections in place and drive in the anchors starting at the outer edge cells. Drive anchors as required by the manufacturer or as required to fully expand a geocell panel to the required cell dimensions and to hold it in place until filling with subbase is complete. Drive anchors so that the anchor extends at least 12 inches below the bottom of the geocell. Allow enough anchor length above the top of the geocell for the anchor to be removed. Remove anchors after filling the cells with subbase and before compaction when used for subgrade support and pavement applications. In situations where it is not practical to use anchors (i.e. over soft soil containing obstructions to driving anchors, existing shallow utilities, etc.) an installation frame may be needed to allow for the expansion of the geocells without anchoring in place. The installation frame must be capable of fully expanding the geocells and holding them in place until the subbase is placed in the cells.

Align adjoining geocell sections and overlap abutting perimeter cell welded ends. Keep top of geocell sections flush before fastening. Connect adjacent geocell sections with mechanical fasteners, in accordance with the manufacturer's recommendations. Mechanical fasteners must be capable of holding adjacent geocell panels in direct contact until pavement is placed. Fasten all adjoining cells of adjacent geocell sections and all overlapped abutting perimeter cell welded ends.

Place subbase in cells of expanded geocell sections. Overfill cells sufficiently to ensure the top of the compacted subbase is at least 1 inch above the top of the geocell to allow fine grading as necessary or required and to protect the geocell from construction traffic and heat during paving operations. Limit the drop height of the subbase to a

maximum of 3 feet to prevent damaging or displacing the cell wall. Do not operate equipment on unfilled geocell sections until cells have been overfilled with loose subbase.

Compact subbase as specified in Section 350, except when cells greater than 6 inches in height are used. When cell height exceeds 6 inches, compact as specified Section 350, except allow compacted lift thickness 1 to 2 inches greater than the cell height.

222.4 MEASUREMENT AND PAYMENT—

(a) **Geocell.** Square yard.

Includes mechanical fasteners and anchors.

(b) **Geotextile.** Section 212.4

(c) **Subbase.** Section 350.4(a)1

SECTION 223-GEOSYNTHETIC REINFORCED SOIL SLOPE(GRS)

223.1 DESCRIPTION—This work is furnishing the required materials and construction of Geosynthetic Reinforced Soil (GRS) slopes, to the lines and grades indicated, and as directed. Any slopes constructed must be designed according to Publication 293-Geotechnical Engineering Manual, Chapter 11 and Chapter 14.

223.2 MATERIAL—

(a) Primary Geosynthetic - Reinforcement. Geogrid, Class 1, Type A or B, as specified in Sections 738.1 and 738.2 and as follows:

Provide primary geosynthetic reinforcement materials of the lengths as indicated and meeting the following minimum tensile strength at 10% elongation (T10), according to the geogrid reinforcement Class and Type used:

The minimum primary geosynthetic tensile strengths at 10% elongation (T10) are:

T10 = XXX pounds per foot (Class 1, Type A Geogrid, PET polymer)
 T10 = XXX pounds per foot (Class 1, Type B Geogrid, HDPE polymer)
 (XXX see Contract Project Specific Details for parameters)

Each roll of geosynthetic must be clearly identified by the manufacturer with the product model designation, manufacturing plant, and lot number. When multiple primary geosynthetic product models are required, provide a visible marking on each entire roll, identifying the product model. This may be accomplished by color coding the roll ends with spray paint, or other means deemed suitable by the Representative.

(b) Secondary Geosynthetic – Compaction Aid and Face Drain. Section 735, Class 4, Type A.

(c) Geosynthetic Face Wrap. Section 735, Class 4, Type A.

(d) Geotextile Backing. Section 735, Class 4, Type A.

(e) Turf Reinforcement Mat (TRM). Section 806.2(b).

(f) Wire Mesh Forms. Consisting of galvanized welded wire mesh and galvanized wire support struts.

1. Wire Mesh Units – galvanized welded wire mesh as specified in Section 709.3, and as follows:

- Formed to a 90-degree “L” shape with equal 18 inch sides
- Minimum length = 10 feet
- Maximum mesh opening = 4 inch by 4 inch
- Minimum wire size number = W4.0
- Minimum coating thickness = Grade 65

2. Support Struts – galvanized wire formed to interlock with mesh longitudinal wires, meeting the same material requirements as the wire mesh units.

(g) Gabions. Corrosion resistant, Type-B (hand-placed rock only) gabion units as specified in Section 626.2, and having the following nominal dimensions:

- Height = 18 inches
- Width = 36 inches
- Length = 6 feet minimum

(h) Reinforced Fill. Provide fill consisting of natural material, having a pH between 5.5 and 9.0 conforming to AASHTO T 289, meeting of one of the following material requirements:

- Section 206.2(a)1. a, Soil, except particles greater than 4 inches must be removed before compaction.
- Section 703.2, AASHTO No. 8 Coarse Aggregate, 2A, 2RC, AASHTO #57s, or AASHTO #67s.
- Well graded granular material meeting the following gradation requirements:

Sieve Size	Percent Passing
50 mm (2 in)	100
4.75 mm (No. 4)	50 - 100
425 μ m (No. 40)	15 - 55
75 μ m (No. 200)	0 - 35

1. Density: Except for AASHTO No. 8 Coarse Aggregate, provide fill with a compacted unit weight density (γ_{tot}) within a range of 110 to 125 pcf, according to PTM No. 106, Method B. For AASHTO No. 8 Coarse Aggregate, provide a minimum compacted unit weight density (γ_{tot}) of 90 pcf.

2. Shear Strength: The reinforced fill material once placed and properly compacted to the required density, must meet or exceed the design shear strength requirements. Provide compacted fill that meets or exceeds the minimum shear strength parameters, as follows:

(see Project Specific Details for following parameters)

Minimum internal friction angle (ϕ) = _____ degrees

Determine shear strength of reinforced fill according to AASHTO T 236, on the portion finer than the 2.36 mm (No. 8) sieve. Prepare sample substituting material coarser than the 2.36 mm (No. 8) sieve, with material passing the 2.36 mm (No. 8) sieve but retained on the 2.00 mm (No. 10) sieve. The percentage of all fractions smaller than the 2.00 mm (No. 10) sieve shall remain proportioned as the original sample before substitution. Shear strength testing of reinforced fill material consisting of AASHTO No. 8 Coarse Aggregate is not required.

(i) Fertile Soil. Fertile soil as specified in Section 206.2(a)1. a, except that it must have greater than 25% passing the 75 μ m (No. 200) sieve. Soil must be capable of supporting and maintaining plant growth. Unless otherwise indicated for special plantings (e.g. wetlands), provide soils within a pH range of a 5.5 to 7.5 determined according to AASHTO T 289.

(j) Seeding and Soil Supplements. Section 804.2(b), Seed Formula C.

(k) Mulching. Section 805.2(a).1.e, Bonded Fiber Matrix (BFM)

(l) Aggregate Lining. Section 703.2, AASHTO No. 1 Coarse Aggregate

(m) Rock Lining. Section 850.2 of the Class Size No. indicated, except minimum size R-4 and the minimum required thickness of rock lining is 2.5 times the top size of the rock lining class indicated.

223.3 CONSTRUCTION—

(a) Material Submittals. Certify as specified in Section 106.03(b)3. Submit electronically the manufacturers' material information that includes identification samples of all primary geosynthetics, and all data necessary to indicate the geosynthetic(s) meet the specified requirements. Submit required information for approval by the Representative as specified in Section 106.02(a)2.c at least 30 days before the beginning of GRS slope construction. For primary geosynthetic reinforcement not listed in Bulletin 15, submit verification samples to the Representative, -a minimum of 6 foot by 6 foot size. Include samples of all primary geosynthetic types to be used in the reinforced slope. Submit verification samples of reinforced fill material to the Representative for testing shear strength parameters, unit weight, gradation and pH. Shear strength testing of reinforced fill material consisting of AASHTO No. 8 Coarse Aggregate is not required.

(b) Foundation Preparation. Prepare foundation horizontal and level to the lines and grade indicated, as specified in Section 206.3, and as follows:

- Excavation for equipment access beyond the line and grade as indicated at no additional cost to the Department.
- Prepare foundation free of deleterious or unsuitable soils.
- Proof roll the foundation to provide a uniform and firm surface as specified in Section 206.3(b).3.
- A foundation will be considered as being unstable if the material exhibits pronounced deformation under the specified proof rolling.
- If the top of rock elevation (bedrock) is encountered during the planned excavation, field adjustments may be made to the foundation elevation as directed, if approved by the District Geotechnical Engineer.
- The foundation will be inspected by the Representative before placing fill or geosynthetics.

(c) Geosynthetics – Delivery Storage and Handling. Protect all geosynthetic materials from temperatures greater than 140F, from direct exposure to sunlight, and from debris that may damage the material. Store geosynthetics elevated from the ground surface. Reject all geosynthetics with defects, tears, punctures, flaws, deterioration, or damage incurred during installation, manufacture, transportation, or storage. Replace any damaged geosynthetic materials at no additional cost to the Department.

(d) Geosynthetic Reinforced Soil (GRS) Slope Construction. Construct the selected GRS slopes as shown on the Standard Drawing, as indicated, and as follows:

- Place primary geosynthetic, of the minimum lengths and strengths indicated, in continuous strips in the primary direction of stabilization, perpendicular to the slope face. Effective length of grid-type geosynthetic is measured beginning and ending at primary transverse ribs. The effective length provided must equal or exceed the minimum length indicated. Maximum allowable vertical spacing of primary geosynthetics is 18 inches. Two layers of secondary reinforcement are placed evenly spaced between layers of primary reinforcement. Vertical spacing between all secondary layers, and between secondary and primary layers above or below, is 6 inches. Splicing of any primary geosynthetic, including seams or connections, is prohibited. Overlap adjacent sections of primary geosynthetic along parallel roll edges a minimum of 2 inches
- For embankments with GRS slopes on both sides, place primary geosynthetics from opposite slope faces, independent of one another. When primary geosynthetic layers from opposite or adjacent (turned corner) slope faces overlap, separate the overlapped portions with a minimum of 3 inches of compacted fill. Do not place secondary geosynthetic at the elevations where a primary geosynthetic is placed.
- All layers of secondary reinforcement must extend from the face of the wire forms for Type A and Type B slopes, from the face of the geosynthetic wraps for Type C slopes, and from the back of the gabions for Type D slopes, to a minimum of the full length of the longer layer of primary geosynthetic reinforcement directly above or below the layer of secondary reinforcement. Place secondary geosynthetic in continuous lengths perpendicular to the slope face whenever possible. Overlap adjacent sections of secondary geosynthetic a minimum of 2 inches along parallel roll edges. If the length of primary reinforcement from

the slope face is less than the roll width of the secondary reinforcement, the secondary reinforcement may be placed in continuous strips parallel to the slope face. Overlap secondary reinforcement in the roll direction (old roll to new roll) a minimum of 1 foot. When placed in lengths perpendicular to the slope face, partial rolls of secondary reinforcement must extend a minimum of 7.5 feet from the slope face before a roll direction (old roll to new roll) overlap is allowed. For Type A and Type B slopes, slit the secondary geosynthetic a length only as necessary to allow installation of the geosynthetic at support struts.

- All geosynthetics, except for face wraps of Type C Slopes, must be backfilled before the end of the workday. Place geosynthetic to lay flat, pulled tight and anchored in place until backfill is placed. Place geosynthetic within $\pm 1/2$ -inch of the plan elevations and to the minimum length indicated. Do not dump fill directly onto exposed geosynthetics. Place fill on previously spread material and blade out. Place and distribute material without wrinkling the geosynthetic.
- Grade the surface of the fill only as necessary to facilitate surface drainage. Seal surface with a smooth drum roller at the end of each workday. No vehicles are allowed on the geosynthetic until a minimum of 8 inches of loose backfill has been placed. Sudden braking and sharp turning of any vehicle, including tracked equipment, on reinforced fill is prohibited. Correct any disturbance or distortion of geosynthetics due to operation of vehicles or equipment, at no additional cost to the Department.

1. Type A Slope-Vegetated. Construct Type A slopes to the slope ratio(s) indicated, but no steeper than 0.5(H):1(V). Type A Slopes are not allowed within a 500-year floodplain.

1.a Wire Mesh Forms. Use wire mesh forms to establish a stepped face to the slope face ratio and dimensions indicated. Internally brace wire mesh forms to maintain verticality of step faces. Place preformed wire mesh units on the exterior (outside) of all primary and secondary geosynthetics and the TRM. Internally brace wire mesh units with a minimum of seven pre-formed wire struts per each 10 foot length of wire mesh unit, with a maximum strut spacing of 20 inches. Puncture TRM only as necessary to allow fastening of wire strut to wire mesh. Overlap edges of adjacent wire mesh units a minimum of 3 inches to maintain alignment during construction.

1.b Turf Reinforcement Mat (TRM). Place the TRM against the back face of the wire mesh form. Lay the excess material that will cover the top of the step over the front face of the wire mesh form. When fill and geosynthetic layers reach the top of the wire mesh form, wrap the TRM over the top layer of fill. Embed the TRM a minimum of 12 inches horizontally underneath the next wire mesh form. Overlap adjacent strips of TRM a minimum of 3 inches along parallel roll edges.

1.c Geosynthetic Placement. Place geosynthetics as specified in Section 223.3(d).

1.d Reinforced Fill Placement. Section 206.3(b), and Section 206.3(c), and as follows:

- For slopes designed to be vegetated (Type A slopes), it is desirable that the reinforced fill be suitable for establishing and supporting vegetation. If the fill selected consists of crushed gravel, manufactured aggregate or aggregate-like material, or is otherwise unable to support vegetation, then fertile soil capable of supporting vegetation must be placed for the first 12 inches of fill behind the wire mesh form.
- Place and compact fertile soil with adjacent layers of reinforced fill in maximum 8-inch loose lifts. Apply minimal compactive effort on the fertile soil, compacting only sufficient enough to stabilize the material.

1.e Vegetation. Hydraulically apply the seeding, soil supplements, and mulch to the finished slope with two separate applications that yield a total of 125% of the recommended seeding rate of Formula C, as specified in Section 804.3.

2. Type B Slope – Rock Lined with Wire Forms. Construct Type B slopes to the slope ratio(s) indicated, but no steeper than 1(H):1(V).

2.a Wire Mesh Forms. Use wire mesh forms to establish a stepped face to the slope of the slope ratio and dimensions indicated. Internally brace wire mesh forms to maintain verticality of step faces. Place preformed wire mesh units on the exterior (outside) of all primary and secondary geosynthetic lifts and geotextile backing. Internally brace wire mesh units with a minimum of seven pre-formed wire struts per each 10 foot length of wire mesh unit, with a maximum strut spacing of 20 inches. Puncture geotextile backing only as necessary to permit fastening of wire strut to wire mesh. Overlap edges of adjacent wire mesh units a minimum of 3 inches to maintain alignment during construction.

2.b Geotextile Backing, Class 4, Type A. Place the geotextile backing against the back face of the wire mesh form as indicated. Lay the excess material that will cover the top of the step over the front face of the wire mesh form. When fill and geosynthetic layers reach the top of the wire mesh form, wrap the geotextile backing over the top layer of fill as indicated. Embed the geotextile backing a minimum of 18 inches horizontally underneath the next layer of wire mesh form. For portions of GRS slopes within a 500-year floodplain, embed the geotextile backing a minimum of 4 feet horizontally underneath the next layer of wire mesh form. Place geotextile backing as the reinforced slope is constructed. Overlap adjacent strips of geotextile backing a minimum of 6 inches along parallel roll edges.

2.c Geosynthetic Placement. Place geosynthetics as specified in Section 223.3(d).

2.d Reinforced Fill Placement. Section 206.3(b) and Section 206.3(c).

2.e Aggregate Lining and Rock Lining. When in a 500-year floodplain, use the rock lining class specified. When not in a floodplain, the minimum size of rock lining is class R-4. Place the rock lining of the type, size, and thickness indicated on the completed stepped-slope face without damaging the wire mesh forms. Do not end-dump the rock onto the slope. A minimum 12-inch cushion layer of AASHTO No. 1 Coarse Aggregate (aggregate lining) must be placed over the stepped face before placement of the rock lining. Place the aggregate lining and rock lining in lifts not exceeding 4.5 feet, so that no more than three wire mesh forms are exposed. Do not proceed with construction of a fourth sequence of wire mesh forms and primary reinforcement if the aggregate lining and rock lining are not in place for the previous three layers of wire mesh forms and primary reinforcement.

3. Type C Slope – Rock Lined with Wrapped Face. Construct Type C slopes to the slope ratio(s) indicated, but no steeper than 1.25(H):1(V).

3.a Geosynthetic Placement. Place geosynthetics as specified in Section 223.3(d), except as follows:

- Use Class 4, Type A geotextile to wrap layers of the slope face (geosynthetic face wrap) to establish a roughly stepped appearance of the slope ratio and dimensions indicated. Place a layer of primary geosynthetic reinforcement before placement of geosynthetic face wrap layers. The wrap must extend a minimum length of 4 feet from the front edge of the primary geosynthetic. Overlap adjacent strips of geosynthetic face wrap a minimum of 6 inches along parallel roll edges.
- Once the slope has been constructed to the elevation of the next layer of primary geosynthetic, wrap the face of the slope with the geosynthetic face wrap. Extend the face wrap over the top of the fill before placement of the next layer of primary geosynthetic. Embed the geosynthetic wrap a minimum length of 4 feet beneath the next wrapped step of the slope. Place the next layer of primary geosynthetic reinforcement. Place the next geosynthetic face wrap directly on the primary geosynthetic reinforcement.

3.b Reinforced Fill Placement. Section 206.3(b), and Section 206.3(c).

3.c Aggregate Lining and Rock Lining. When in a 500-year floodplain, use the rock lining class specified. When not in a floodplain, the minimum size of rock lining is class R-4. Place rock lining of the type, size and thickness indicated over the geosynthetic face wrap. Place the rock lining so as not to damage the geosynthetic face wrap. Repair any face wrap that is damaged by stitching a patch of the same material over any tears or punctures. Do not end-dump the rock onto the slope. A minimum 12-inch cushion layer of AASHTO No. 1 Coarse Aggregate (aggregate lining) must be placed over the geosynthetic face wrap before placement of the rock lining. Place the

aggregate lining and rock lining in lifts not exceeding 4.5 feet, so that no more than three geosynthetic face wraps are exposed. Do not proceed with construction of a fourth sequence of geosynthetic face wrap and primary geosynthetic if the aggregate lining and rock lining are not in place for the previous three layers of geosynthetic face wraps and primary geosynthetic. If not backfilling immediately, do not leave the geosynthetic face wraps exposed for more than 7 days. If UV exposure exceeds 7 days, place a UV protective cover over geosynthetic until backfill is in place.

4. Type D Slope – Gabion. Construct Type D slopes to the slope ratio(s) indicated, but no flatter than 0.5(H):1.0(V), and no steeper than 0.25(H):1.0(V).

4.a Geotextile Backing, Class 4, Type A. Place the geotextile backing that provides a continuous coverage of the rear face of the gabion baskets as indicated. Lay the excess material that will cover the top of the step over the front face of the gabion basket. When fill and geosynthetic layers reach the top of the gabion basket, wrap the geotextile backing over the top layer of fill as indicated. Extend the geotextile backing a minimum of 18 inches horizontally behind the gabion basket at both the bottom and top of the basket. For portions of GRS slopes within a 500-year floodplain, embed the geotextile backing a minimum of 4 feet horizontally behind the gabion basket at both the bottom and top of the basket. Place geotextile backing as the reinforced slope is constructed. Overlap adjacent strips of geotextile backing a minimum of inches along parallel roll edges.

4.b Geosynthetic Placement. Place geosynthetics as specified in Section 223.3(d).

4.c Reinforced Fill Placement. Section 206.3(b), and Section 206.3(c).

4.d Gabions. Section 626 except as indicated and as follows. Use gabions of the type and size indicated to establish a stepped face of the slope ratio and dimensions indicated. When placing an overlying row of gabions, offset the ends of the individual units by half the width of the gabion, to create an approximate half-bond pattern between successive rows. Place gabions directly on layers of primary geosynthetic. The primary geosynthetic must extend to the face of the gabions that will be placed on top of the primary geosynthetic.

4.e Aggregate Lining and Rock Lining. Where constructed in a 500-year floodplain, place rock lining of the type, size and thickness indicated over the gabions up to the 500-year flood elevation. The minimum size of rock lining is class R-4. Do not place the rock lining at a slope steeper than 1(H):1(V). Provide a horizontal bench at the top of the rock lining of a minimum width equal to the required rock lining placement thickness. Place the rock lining so as not to damage the gabions. Repair any gabion that is damaged by stitching a patch of the same material over any tears or punctures. Do not end-dump the rock onto the slope. A minimum 12 inch cushion layer of AASHTO No. 1 Coarse Aggregate (aggregate lining) must be placed over the gabions before placement of the rock lining. Place the aggregate lining and rock lining in lifts not exceeding 4.5 feet, so that no more than three gabions are exposed. Do not proceed with construction of a fourth sequence of gabions and primary reinforcement if the aggregate lining and rock lining are not in place for the previous three layers of gabions and primary reinforcement.

(e) Construction Tolerances. Construction tolerances are as shown in the Standard Drawings and as follows. All geosynthetic lengths and wrap dimensions are minimums.

1. Elevation Requirements. For all slope types, primary and secondary geosynthetics shall be placed within $\pm 1/2$ inch of plan elevation. Top of wire mesh forms must be constructed within $\pm 1/2$ inch of plan elevation, and top of gabions within ± 1 inch of plan elevation.

2. Horizontal Alignment Requirements. For Type A, B, and D slopes, the horizontal alignment for wire mesh forms and gabion baskets must be within ± 1 inch of the plan location anywhere along the face of the wire form and/or gabion for straight and curved alignments. For Type C slopes, the horizontal alignment of the slope face geotextile wrap must be within ± 2 inches of the plan location at the base of the wrap.

3. Plumbness Requirements. The face of the wire mesh forms must be constructed within $\pm 1/4$ inch of plumb, and the face of the gabions within $\pm 1/2$ inch of plumb.

(f) Drainage. Provide surface and subsurface drainage systems as indicated.

(g) Repair of Geosynthetics. For damaged area less than 3 square feet and not on the face of the slope, repair damaged sections by placing a patch over the damaged portion of the geosynthetic, unless otherwise indicated. The patch is to consist of the same geosynthetic material as the damaged material and is to be placed in the same manner and orientation as the undamaged geosynthetic. The patch for the geosynthetic is to extend a minimum of 3 feet beyond the damaged area on all sides. Geosynthetics with damaged areas greater than 3 square feet are required to be completely removed and replaced.

223.4 MEASUREMENT AND PAYMENT—

(a) Geosynthetic Reinforced Soil Slope, Type A. Square Foot

Measured to equal the area of the vertical face of the wire forms, including any vertical face concealed by finished grade. Includes required and discretionary laboratory tests, all excavation except for excavation of unsuitable foundation materials, foundation preparation, all geosynthetics, wire forms, erosion control mulch blanket, all fill materials, all processing of fill materials to obtain specified gradations, topsoil, seeding and soil supplements, mulching, and all drainage components.

(b) Geosynthetic Reinforced Soil Slope, Type B. Square Foot

Measured to equal the area of the vertical face of the wire forms, including any vertical face concealed by finished grade. Includes required and discretionary laboratory tests, all excavation except for excavation of unsuitable foundation materials, foundation preparation, all geosynthetics, wire forms, all fill materials, all processing of fill materials to obtain specified gradations, aggregate lining, rock lining, and all drainage components.

(c) Geosynthetic Reinforced Soil Slope, Type C. Square Foot

Measured to equal the projected vertical area of the geosynthetic reinforced slope face. Includes required and discretionary laboratory tests, all excavation except for excavation of unsuitable foundation materials, foundation preparation, all geosynthetics, all fill materials, all processing of fill materials to obtain specified gradations, aggregate lining, rock lining, and all drainage components.

(d) Geosynthetic Reinforced Soil Slope, Type D. Square Foot

Measured to equal the area of the vertical face of gabions, including any vertical face concealed by finished grade. Includes required and discretionary laboratory tests, all excavation except for excavation of unsuitable foundation materials, foundation preparation, all geosynthetics, all gabions, all fill materials, all processing of fill materials to obtain specified gradations, aggregate lining, rock lining, and all drainage components.

(e) Excavation of Unsuitable Foundation Materials. Cubic Yard

Excavation of unsuitable foundation materials as directed, beyond the limits of excavation indicated, will be paid as specified in Section 110.03.

SECTION 300 BASE COURSES

SECTION 301—PLAIN CEMENT CONCRETE BASE COURSE

301.1 DESCRIPTION—This work is construction of a normal or high early strength plain cement concrete base course. When placed on subgrade, it includes the preparation of subgrade, as specified in Section 210.

301.2 MATERIAL—

- Class A Cement Concrete—Section 704
- High Early Strength Cement Concrete—Section 704
- Supplementary Cementitious Material (SCM)*—Section 724.2
- Expansion Joint Filler—Section 705.1
- Longitudinal Construction Joint Material—Section 705.2
- Concrete Curing Material—Sections 711.1 and 2(b)

* SCM may be substituted for a portion of Portland Cement.

301.3 CONSTRUCTION—As specified in Section 501.3, except interpret references to "pavement" to mean "base course," and for the following sections:

(a) General. Only Section 501.3(a)1 applies.

(d) Forms. Add the following:

Forms are not required for base course widening 6 feet or less in width. However, use acceptable methods to contain the base course.

(g) Slip Form Paving Method. Delete references to reinforcement.

(h) Handling and Placing Reinforcement. Delete this section.

(i) Transverse Joints. Only Section 501.3(i)1 applies.

(j) Longitudinal Joints. Replace with the following:

Where longitudinal joints are indicated or formed for convenience of construction, form a tied joint, as shown on the Standard Drawings for cement concrete pavement joints. In full width construction, sawing is not required.

(k) Final Strike Off, Consolidation, and Finishing. Replace Section 501.3(k)4. with the following:

Rake or broom finish the surface.

(l) Curing Concrete. Modify as follows:

Liquid Membrane Forming Curing Compound, White, will not be allowed.

Liquid Membrane Forming Curing Compound, Black, may be used, provided the cement concrete base course is not accessible to traffic before the surface course is placed. Discontinue use of the compound if it becomes

unsatisfactory as a curing agent; resume curing by other methods, as specified.

(n) Sealing Joints and Cracks. Delete this section.

(o) Surface Tolerance. Replace with the following:

After the concrete has hardened, retest the surface of the base course, using straightedges. Operate the straightedge as specified in Section 501.3(k)3. Remove high points in excess of 1/4 inch by means of grinding or cutting tools, as directed. Remove and replace sections containing depressions of more than 3/8 inch, when directed in writing. Remove the full width of lane in which a depression occurs, for a length of at least 10 feet.

(q) Opening to Traffic. Replace with the following:

The Representative will determine when base course may be opened to traffic. However, do not open to traffic until the base course develops a required minimum compressive strength of 2,750 pounds per square inch as determined by compressive tests made on cylinder specimens in accordance with PTM No. 604 or as determined by maturity method in accordance with PTM No. 640.

(s) Tests for Depth. Revise the traffic lane definition as follows:

A traffic lane will be as indicated or as determined by the Representative.

(t) Defective Work. Replace with the following:

Unless otherwise directed by the Representative in writing, remove and replace pavement defective in surface tolerance, as specified in Section 501.3(o); defective in depth, as specified in Section 501.3(s); defective in air content, as specified in Section 704.1(c)3.; or showing surface defects resulting from the effects of rain, improper final finish, or honeycombing which, in the Representative's opinion, cannot be repaired.

The minimum pavement removal and replacement length is 10 feet, for the full width.

When removing and replacing pavement defective in depth, start at the determined point of deficiency and proceed longitudinally until a section is reached where the deficiency is not more than 1/4 inch, and as specified.

As directed, construct transverse joints needed because of the pavement removal.

301.4 MEASUREMENT AND PAYMENT—Square Yard

(a) Adjustment for Deficient Base Course. Where a deficiency exists, as determined by cores, the Department will pay as follows:

Deficiency in Depth Determined by Cores Inches	Proportional Part of Contract Price Allowed
0.0 to 0.25	100%
0.26 to 0.30	95%
0.31 to 0.35	90%
0.36 to 0.40	85%
0.41 to 0.45	80%
0.46 to 0.50	70%

(b) Defective Base Course Left in Place. Section 501.4(b).

(c) Concrete Base Course Cores. Each

The price includes the measuring apparatus, which remains the Contractor's property upon completion of the project. The Department will not pay for additional cores drilled if the depth is deficient by more than 1/4 inch.

SECTION 303—CEMENT TREATED PERMEABLE BASE COURSE

303.1 DESCRIPTION—This work is the construction of a cement treated permeable base course (CTPBC) on a prepared surface. If placed on subgrade, this work includes the preparation of subgrade as specified in Section 210.

303.2 MATERIAL—

(a) **Aggregate.** Coarse Aggregate, Type A or Type B- Section 703.2 for AASHTO No. 67 or No. 57, except restrict the material passing the No. 200 sieve to a maximum of 2%. Determine the loss by washing according to PTM No. 100. Do not use fine aggregate in the mixture. The use of blast furnace slag or crushed gravel is allowed. When using crushed gravel, provide a minimum of 75% crushed particles with at least two faces resulting from fracture.

(b) **Cement.** Type I or Type II cement, Section 701.

(c) **Water.** Section 720.1

(d) **Supplementary Cementitious Material.** Section 724.2(b)

(e) **Mixture Design.** Provide a mix design as follows:

- Submit, for review by the Representative, a mix design using 200 pounds of cement per cubic yard based on the saturated surface-dry rodded unit weight of aggregate. Fly ash may be substituted for up to 10% of the required cement, with a substitution ratio of 3.3 pound of fly ash for each 2.2 pound of cement. Design and proportion the cement and water based on the saturated surface-dry weight of the aggregate. Do not exceed a water-cement ratio of 0.40. Provide a mix with 100% coverage of aggregate without runoff. Mix and proportion as specified in Section 704.
- Certify as specified in Section 106.03(b)

(f) **Concrete Curing Material.** Section 711.1(a), 711.1(e), and 711.2(a) Type 2

(g) **Admixtures.** Section 711.3

303.3 CONSTRUCTION—

(a) **General.** The Contractor may perform half-pavement or full-pavement width construction.

(b) **Weather Restrictions.** Section 501.3(b).1

(c) **Concrete Mixtures.** Section 501.3(c)

(d) **Conditioning of Rubblized Pavement/Subbase.** Thoroughly sprinkle water on the rubblized pavement/subbase before placing CTPBC, if necessary to ensure a moist condition. Sprinkle with as much water as it readily absorbs, well in advance of CTPBC placement.

(e) **Placement and Compaction.** Use an approved asphalt paver or mechanical spreader, equipped with screed, plate vibrator, and fully automated sensors to control profile and transverse grade. Use mechanical equipment for the entire lane width or as much lane width as practical. Adjust screed assemblies to provide the required cross section and depth.

Compact the CTPBC using steel-wheel power rollers having a manufacturer's certified metal weight from 8 tons to 10 tons. Use of vibratory paver screed as sole means of attaining compaction is not allowed. Perform a minimum of one pass with the roller to achieve compaction and do not compact material to the point that the CTPBC is not free draining or the aggregate is crushed. One roller pass is defined as one trip of the roller in one direction over any one spot. Perform handwork as directed. Do not disturb the freshly placed CTPBC. Do not allow more than 1 hour from

the time water is added to the aggregate and cement to the time compaction is complete. The Contractor may use a retarding admixture to increase the time to 1 1/2 hours.

(f) Surface Tolerance. Test the finished surface at locations the Representative suspects are irregular and at transverse joints and paving notches. Test the surface in stages using a 10-foot straightedge. At each stage, hold the straightedge in contact with the surface and parallel to the road centerline and, in successive positions, test the pavement surface from one side to the other. Advance the test location to the next stage by moving the straightedge along the pavement centerline by not more than 5 feet.

Correct irregularities of more than 1/2 inch by loosening surface mixture and removing or adding CTPBC. For irregularities that develop after compaction is completed, correct the irregularity by a method that does not produce contaminating fines or damage the base. Do not grind or mill the CTPBC. The area is defective if irregularities or defects remain after final compaction.

(g) Curing. Begin curing immediately after compaction. Cure with white membrane forming curing compound as specified in Section 501.3(l)1.c. except apply at a rate of 1 gallon per 100 square feet \pm 10% of the surface area, or as directed. As an alternative curing method, the Contractor may select to cover the CTPBC with white polyethylene sheeting material as specified in Section 501.3(l)1.a. Maintain curing materials for 24 hours. If the CTPBC temperature falls below 40F during the 24 hour curing period, extend the cure period by an additional 24 hours. At no cost to the Department, remove and replace CTPBC if the CTPBC temperature drops to 32F within 72 hours of the placement.

(h) Protection of Courses. Section 105.13 and as follows: Construction traffic is not allowed on the CTPBC for at least 3 days after the CTPBC has been placed. Do not place overlying pavement on the CTPBC during this time period. After the 3 day period, restrict construction traffic to only allow trucks and equipment required to place the next layer or any adjacent CTPBC lift or pavement course. Remove and replace areas damaged or contaminated at no cost to the Department.

(i) Protection Against Rain. Section 501.3(t)

(j) Tests for Depth. After curing the CTPBC, and at locations determined by the Representative, carefully dig or drill one full-depth, test hole for each 3,000 square yards of completed CTPBC. The Representative will measure the depth of the CTPBC. Where the depth is defective, define the defective limits by digging or drilling additional test holes longitudinally and transversely until the depth meets requirements. Backfill test holes with CTPBC mixture.

(k) Defective Work. CTPBC is defective when the depth is deficient by 1/2 inch or more from the indicated depth, deficient in surface tolerance, or when the surface contains defects caused by rain or improper finish that in the Representative's opinion cannot be repaired. Unless otherwise directed in writing by the District Executive, remove and replace defective CTPBC full depth at no additional cost to the Department. Submit a plan with proposed methods to remove and replace the CTPBC. Remove and replace the CTPBC after the plan is approved.

303.4 MEASUREMENT AND PAYMENT—Square Yard

SECTION 310—CRUSHED AGGREGATE BASE COURSE

310.1 DESCRIPTION—This work is construction of a stone or slag base course. When placed on subgrade, it includes the preparation of subgrade, as specified in Section 210.

310.2 MATERIAL—

(a) Coarse Aggregate (Fine Material). Type A or Type B, No. 10, stone or slag, Section 703.2, except as follows: Stone having unsatisfactory cementing qualities may be used, provided limestone fines in an amount of 20% are blended with the material.

Acceptable granulated blast furnace slag, meeting the gradation requirements for No. 10 aggregate may be used.

Granulated blast furnace slag, formed when molten iron slag is rapidly quenched in water, is acceptable providing it does not have a density greater than 90 pounds per cubic foot (dry rodded density, AASHTO T 19). Slag material reasonably uniform and free from harmful amounts of clay, silt, vegetation, or other objectionable substances, is acceptable with a maximum size of 2 inches and not more than 20% passing the No.100 sieve.

(b) Coarse Aggregate (Coarse Material). Type A or Type B, No. 1 stone or slag, Section 703.2.

(c) Calcium Chloride. Section 721

(d) Water. Section 720.2

310.3 CONSTRUCTION—

(a) Equipment.

1. Spreaders. Use mechanical spreaders.

2. Compaction Equipment. Use rollers, as specified in Section 108.05(c)3.a. Use vibratory compaction equipment as required for Method 2.

(b) General.

1. Shoulders. Either build up and compact shoulders for full width, to or above the elevation of each layer of base course, before placing base course; or build up and roll shoulders simultaneously with compaction of each layer.

2. Templates, String Lines, and Straightedges or GPS or Laser Controlled Equipment. Use a template cut to the required cross section of the finished base course. Equip the template with metal or other vertical extensions attached to each end, so the bottom of the template will be at the elevation of the top of the base course. Furnish at least three templates. Test the cross section for surface irregularities at intervals of not more than 25 feet.

Use a 12-foot straightedge to test for longitudinal irregularities in the surface of the base course. Hold the straightedge parallel to the road centerline in contact with the surface. Move the straightedge from one side of the base course to the other. Advance along the base course in 5-foot increments.

Refer to Section 210.3(d) for GPS or Laser Controlled Equipment.

3. Replacement Areas. Areas will be marked where base course is required for existing pavement replacement. Remove pavement in these areas to neat lines, as specified in Section 203.

4. Miscellaneous. In areas where spreading and compacting with mechanical equipment is impractical, spread and compact by another acceptable method.

If base course material is placed on existing pavement as an overlay or build-up, construct in compacted layers.

If subgrade or subbase materials become mixed with the base course, remove the mixture; reshape and recompact the subgrade and/or subbase; reconstruct the unsatisfactory base course area.

Use calcium chloride only when and as directed.

5. Initial Layer of Fine Material. Spread an initial layer of fine material uniformly over the subgrade, subbase, or existing pavement as a bed and filler; spread to a depth of 2 inches on subgrade, or 1 inch on subbase or existing pavement.

Do not place this initial layer of fine material on wet, frozen, or unsuitable subgrade or subbase.

(c) Method 1. Use this method when compacting with rollers only.

If the base course is more than 8 inches in compacted depth, construct in two or more layers of approximately equal depth, with no layer less than 4 inches nor more than 8 inches in depth.

1. Spreading Coarse Material. Spread uniformly on the initial layer of fine material to full width, unless otherwise specified. In areas inaccessible to spreading equipment, spread material directly from trucks, if allowed. Remove segregated material and replace with well-graded material. Do not spread the material more than the distance completed in an average day's work ahead of choking and compacting, as specified in Section 310.3(c)3 and (c)4, respectively.

Test each layer of material for surface irregularities, as specified in Section 310.3(b)2, and correct irregularities before rolling.

2. Compacting Coarse Material. On normal crown section, begin rolling at the sides and progress to the center. On superelevated curves, begin on the low side and progress to the high side.

Install string lines with ample supports, offset along each side to control the elevation and depth of the base course. Maintain string lines until the base course is completed and the deficiencies have been corrected.

Roll parallel with the roadway centerline, uniformly lap each preceding track, cover the entire surface with the rear wheels, and continue until the material does not creep or wave ahead of the roller wheels.

Place red flags at the initial limits of compacted coarse material completed. The flags will be moved ahead as additional material is compacted. Do not apply filler to the coarse material outside of the flag-marked sections.

3. Application of Fine Material. After thoroughly compacting coarse material, spread fine material uniformly over the surface with spreading equipment, to assure filling voids. In areas inaccessible to equipment, spreading with a square-edged shovel may be used; spread in a sweeping motion alternately in opposite directions, until the voids are filled. Do not end-dump the material directly on the surface of the coarse material. Immediately following the spreading, sweep and roll the material until remaining voids in the coarse material are filled and the base course is thoroughly compacted and set. Use brooms attached to the roller and hand brooms. Loosen and scatter excess fines formed in piles or cakes upon the surface.

Spread and roll the material in sections of not less than 150 feet nor more than 1,000 feet in length, unless otherwise directed.

Compact and bond each section, as specified in Section 310.3(c)4, before beginning another.

4. Compacting and Bonding. Begin rolling the sides and progress, as specified in Section 310.3(c)2. Cover the entire surface with the rear wheels, applying additional fines where necessary to fill voids, and continue rolling until the base course is thoroughly compacted and set.

After completion of spreading and rolling of fines, sprinkle with water and roll the surface of single-layer construction or roll the surface of each layer of multi-layer construction. Perform diagonal and cross-rolling, as required or directed. Continue the sprinkling and rolling, applying additional fines until voids are filled and a slight wave of grout forms in front of the roller wheels. Use roller-attached brooms and hand brooms to distribute the grout uniformly, filling the voids. Allow the rolled section to dry before proceeding with the surface course. Sprinkle and reroll the surface on succeeding days, as required, to thoroughly bond and to provide a satisfactory base course. The Inspector-in-Charge will determine the quantity of fines and water required to produce a smooth, hard monolithic surface.

Sprinkle water, using acceptable methods.

(d) Method 2. Use this method when compacting with rollers and vibratory equipment.

If the base course is more than 10 inches in compacted depth, construct in two or more layers of approximately equal depth, with no layer less than 5 inches nor more than 10 inches in depth.

1. Spreading Coarse Material. Spread the coarse material, as specified in Section 310.3(c)1.

2. Compacting Coarse Material. Immediately after making surface corrections to the coarse material, compact, using vibratory equipment. Roll the layer, as specified in Section 310.3(c)2.

3. Application of Fine Material. After the coarse material has been set and keyed by vibration and rolling, spread fine material uniformly over the surface in an amount equal to about one-half of that required to fill the voids in the coarse material. Operate the vibrator over the surface so the fines settle into the voids. Spread and vibrate the remaining fines in one or more applications to satisfactorily fill the voids; however, do not cause flotation of the coarse aggregate. Use manual methods to fill areas not completely filled by vibration.

4. Compacting and Bonding. After completing the vibration of the fine material, sprinkle the surface with water and roll. Continue the operation, as specified in Section 310.3(c)4.

(e) Surface Tolerance. Test the finished base course for surface irregularities, as specified in Section 310.3(b)2. Correct all surface irregularities exceeding 1/2-inch by loosening the surface and removing or adding material as required. Compact the corrected area and surrounding surface by rolling.

(f) Tests for Depth. Cut or dig one test hole to the full depth of the completed base course, where directed, for each 3,000 square yards or less.

The Representative will measure the depth of the base course. The initial bed and filler layer of fine material is considered part of the base course for determining the final compacted depth.

Remove and replace any area in which the depth is deficient by 1/2-inch or more. Additional test holes may be required, if directed, to determine the limits of replacement areas.

After the depth has been measured, backfill test holes with acceptable material and compact.

(g) Maintenance and Traffic. Until placement of the surface course, maintain the completed base course, as specified in Section 901.3(b).

Maintain and protect base course opened to traffic by authority of the Representative, as specified in Section 320.3(j).

Allow only necessary local traffic and essential construction equipment on the base course, unless otherwise directed. Repair or replace marred, distorted, or otherwise damaged pavement.

310.4 MEASUREMENT AND PAYMENT—

(a) Crushed Aggregate Base Course. Square Yard or Ton

(b) Calcium Chloride. Ton

SECTION 312—CRUSHED AGGREGATE BASE COURSE, TYPE DG

312.1 DESCRIPTION—This work is construction of a dense graded stone, gravel, or slag base course, uniformly premixed with a predetermined quantity of water. When placed on subgrade, it includes the preparation of subgrade, as specified in Section 210.

312.2 MATERIAL—

(a) **Aggregate.** Type A or Type B, Section 703.2. Crush the gravel, if used, as required for asphalt surface courses. Acceptable granulated blast-furnace slag, as specified in Section 350.2, meeting the gradation requirements specified in Table A, may be used.

(b) **Calcium Chloride.** Section 721

(c) **Asphalt Material.** Emulsified Asphalt Class E-1, meeting the requirements of Section 702.

(d) **Water.** Section 720.2

(e) **Composition of Mixture.** Uniformly combine materials with a predetermined quantity of water, so the final compacted mixture meets the specified gradation within limits of the reviewed job-mix formula.

1. JMF. Establish the JMF within the limits of Table A, when tested in accordance with AASHTO T 27

Add sufficient water to the mixture to provide optimum moisture content at the time of compaction. Do not vary this quantity by more than 2 percentage points from the optimum moisture, as determined in accordance with PTM No. 106, Method B.

2. Uniformity. The composition limits are shown in Table A.

To maintain specified criteria throughout the progress of work, at least twice daily analyze samples of the completed mixture taken at the plant or after spreading. Unsatisfactory results or changes in the supply source may require a change in the JMF. The supply source may be changed, if permitted. Maintain accuracy of control so at least 90% of test samples fall within the tolerance limits of Table A. Remove and replace material failing to meet this requirement.

TABLE A COMPOSITION OF MIXTURE (Weight Percent Passing Square Openings Based on Laboratory Sieve Tests)		
SIEVE SIZE	PERCENT PASSING	TOLERANCE LIMITS OF THE APPROVED JMF
2 inches	100	
3/4-inch	52-100	± 8%
3/8-inch	36-70	± 8%
No. 4	24-50	± 6%
No. 16	10-30	± 6%
No. 200	0-10	± 3%

3. Testing. Section 313.2

312.3 CONSTRUCTION—

(a) **Equipment.**

1. Plant. Obtain acceptance of the processing and mixing plant and its operation, before start of work.

Measure the coarse and fine material separately, by either volume or weight, and feed into the mixer in proper proportions and at a rate to insure correct blending. Measure added water by weight, volume, or a metering device, and uniformly distribute in the mix.

Use mixing plants equipped with automatic cutoff devices, which stop the feed to the mixer if delivery of any component of the mix stops.

Provide means to check and verify the accuracy of the proportioning and measuring devices.

Stockpile aggregates for proportioning, by any acceptable method, in a manner that will prevent segregation and degradation of aggregates.

Use mass-proportioning plants, equipped with separate bins for each size aggregate.

2. Spreaders. Section 320.3(a)3

3. Compaction Equipment. Sections 108.05(c)3.a, 3.b, 3.f, and 3.h.

(b) Preparation of Mixture. Before adding water, proportion and uniformly blend required quantities of materials. Distribute measured water uniformly by means of a spray system and continue mixing until materials have been combined into a homogeneous mixture. Do not place materials containing either frost or frozen pieces into the mixture.

When directed, add calcium chloride to the mixture, before adding water, to maintain required moisture. Proportion and uniformly blend calcium chloride, at the rate of 7 pounds per ton of mixture for Type 1 and 5.7 pounds per ton of mixture for Type 2.

(c) Delivery. Handle and transport mixture without segregation or loss of moisture. Use clean hauling vehicles, free of harmful material. To prevent loss of moisture during transportation, cover mixture with suitable covers, if necessary, until deposited in the spreader. Frequent moisture control tests will be made at the point of delivery on the project, as directed.

(d) Replacement Areas. Areas will be marked where base course is required for existing pavement replacement. Remove pavement in these areas to neat lines, as specified in Section 203.

(e) Preparation of Subbase or Subgrade and Shoulders.

1. Subbase or Subgrade. Before placing base course, complete and maintain subbase or subgrade at least 1,500 feet in advance of the leading spreader; keep free of ruts, irregularities, and loose materials.

2. Shoulders. Either build up and compact shoulders for full width, to or above the elevation of each layer of base course, before placing base course or build up and roll shoulders simultaneously with compaction of each layer.

(f) Spreading Mixture. If base course is more than 6 inches in compacted depth, construct in two or more layers of approximately equal depth, with no layer less than 3 inches nor more than 6 inches in depth. Place mixture to provide positive bond and uniform compaction between abutting lanes. Accomplish this by working spreaders in echelon or by alternating spreaders frequently between lanes, to minimize moisture loss.

In locations where machine spreading is impractical, spread manually or by other acceptable methods.

Supply sufficient equipment to spread, shape, and compact mixture at the rate produced by the mixing plant. Complete all operations relating to construction of base course during daylight hours. Do not place mixture on a frozen surface, when air temperature is below 40 F, or when freezing temperatures are forecast to occur within the next 24 hours.

To insure proper bonding between layers of base course, place succeeding layers as soon as practical. Keep base layers moist until covered by the next layer.

Do not cut into an underlying completed layer, except as directed for repairs or corrections. Maintain the proper moisture content in the mixture at all stages of construction, including vertical faces of part-width spread material, to assure positive bonding of abutting lanes.

(g) Overlay and Build Up. Where a base course is placed on existing pavement, construct layers, as specified in Section 312.3(f), unless otherwise directed.

(h) Compaction and Density. Compact each layer of base course to not less than 100% of maximum density, determined in accordance with PTM No. 106, Method B. Determine field density, in accordance with AASHTO T 191. When material is too coarse to use these methods, compaction will be determined, based on nonmovement of material under specified compaction equipment. Where density in any layer fails to meet specified requirements additional compaction will be required. If the density cannot be obtained by additional compaction, thoroughly loosen, remoisten, reshape, and recompact the entire area of the layer with low density. If required density cannot be obtained, remove and replace the affected area with a new mixture that can be compacted as required.

(i) Surface Tolerance. Use a template cut to the required cross section of the finished base course. Equip the template with metal or other vertical extensions attached to each end, so the bottom of the template will be at the elevation of the top of the base course. Furnish at least three templates. Test the cross section for surface irregularities at intervals of not more than 25 feet.

Install string lines with ample supports, offset along each side to control the elevation and depth of the base course. Maintain string lines until the base course is completed and the deficiencies have been corrected.

Use a 10-foot straightedge to test for longitudinal irregularities in the surface of the base course. Hold the straightedge parallel to the road centerline in contact with the surface. Move the straightedge from one side of the base course to the other. Advance along the base course in 5-foot increments.

For surface irregularities exceeding 1/2-inch, immediately correct as follows:

Blade off high spots, as directed, provided the surface is left in a uniformly smooth and dense condition. If high spots cannot be removed by blading, loosen the top layer through its full depth over the affected area, remove excess material, and provide moisture in proper quantity to reshape and recompact to the specified density. If high spots cannot be satisfactorily corrected by either of these methods, remove the top layer over the affected area and reconstruct with a new mixture.

Where it is necessary to add material to low spots, loosen the top layer over the affected area. Incorporate additional material, correctly graded, into the loosened material. Reshape and recompact the entire area at the proper moisture content. If the resulting surface is still unsatisfactory, remove the top layer over the affected area and reconstruct with a new mixture. Do not skin patch or fill low spots with small amounts of material.

Refer to Section 210.3(d) for GPS or Laser Controlled Equipment.

(j) Tests for Depth. Cut or dig one test hole to the full depth of the completed base course, where directed, for each 3,000 square yards or less.

The Representative will measure the depth of the base course. The initial bed and filler layer of fine material is considered part of the base course for determining the final compacted depth.

Remove and replace any area in which the depth is 1/2-inch or more deficient. Additional test holes may be required, if directed, to determine the limits of replacement areas.

After the depth has been measured, backfill test holes with acceptable material and compact.

(k) Construction Joints. Where additional base course is joined by the previous day's work, scarify and moisten the end of existing base course, blend with new mixture, and compact to form a continuous section, without a joint.

(m) Prime Coat. Use a distributor, as specified in Section 460.3(b). Broom the base course to produce a granular texture free of loose material and treat the surface with a single application of asphalt material, at a rate not to exceed 0.15 gallon per square yard of base course.

(n) Maintenance and Traffic. Until placement of the surface course, maintain the completed base course, as specified in Section 901.3(b).

Maintain and protect base course opened to traffic by authority of the Representative, as specified in Section 320.3(j).

Allow only necessary local traffic and essential construction equipment on the base course, unless otherwise directed. Repair or replace marred, distorted, or otherwise damaged pavement.

312.4 MEASUREMENT AND PAYMENT—

(a) Crushed Aggregate Base Course, Type DG. Square Yard or Ton

(b) **Calcium Chloride.** Ton

SECTION 313—SUPERPAVE ASPHALT MIXTURE DESIGN, STANDARD CONSTRUCTION, BASE COURSE

313.1 DESCRIPTION—This work is the standard construction of a plant-mixed asphalt base course on a prepared surface using a volumetric mixture design developed with the Superpave Gyratory Compactor (SGC) using prescribed manufactured additives, or plant process modifications or both.

313.2 MATERIAL—Section 413.2

313.3 CONSTRUCTION—Section 413.3 as specified for standard construction and with additions and modifications as follows:

(b) Weather Limitations. Section 413.3(b). Replace with the following:

Do not place base course on prepared surfaces that are wet or if the temperature of the air or the prepared surface is 35F or lower. If work is halted because of weather conditions, the Representative may allow the Contractor to place limited quantities of base course that are en route to the project.

(h) Spreading and Finishing. Revise as follows:

1.b Spreading and Finishing. Add the following:

If the indicated compacted depth of a Superpave 25.0 mm asphalt base course is more than 6 inches, place the asphalt base course in two or more layers of approximately equal compacted depth, with no layer less than 3 inches or more than 6 inches. If the indicated compacted depth of a Superpave 37.5 mm asphalt base course is more than 8 inches, place the asphalt base course in two or more layers of approximately equal compacted depth, with no layer less than 4 inches or more than 8 inches.

(l) Surface Tolerance. Replace the requirement for defective pavement with the following:

The pavement is defective if irregularities are more than 1/4-inch.

(m) Tests for Depth. Replace with the following:

Control the loose depth of each layer to construct the base course to the compacted depth indicated and within the specified tolerance. On the top lift and in the presence of the Inspector, drill full-depth cores at one random location selected by the Inspector according to PTM No. 1 in each 3,000 square yards of completed base course and at other locations the Inspector suspects are deficient.

The Inspector will measure the depth of the full-depth cores according to PTM No. 737. Pavement deficient in depth by 1/2 inch or more and that cannot be satisfactorily corrected is defective. After the Inspector completes depth measurements, backfill, compact, and seal core holes with the mixture used to construct the course. Immediately start correcting courses or pavement that are deficient in depth at the core location and proceed longitudinally and transversely until the depth is less than 1/2 inch deficient of the design depth.

313.4 MEASUREMENT AND PAYMENT—Section 413.4(a), with modifications as follows:

(a) Asphalt Mixtures (Standard). Revise as follows:

1. Asphalt Courses. Add the following:

1.f Superpave Asphalt Mixture Design, Base Course. Square Yard or Ton

SECTION 316—FLEXIBLE BASE REPLACEMENT

316.1 DESCRIPTION—This work is replacing the existing pavement with Superpave Asphalt Mixture Design, Base Course.

316.2 MATERIAL—

- (a) **Subbase.** Section 350.2
- (b) **Superpave Asphalt Mixture Design.**
 - **Base Course, 25.0 mm Mix.** Section 313.2
- (c) **Asphalt Cement, PG 64S-22.** Section 702

316.3 CONSTRUCTION As shown on the Standard Drawings, as specified in Section 313 and as follows:

Mark the perimeter of the area to be replaced. Saw cut or mill the perimeter. Remove all material within the saw cut or milled area to the depth indicated. Compact the existing subgrade or subbase before placing the base course material. Clean all vertical surfaces of the area to be patched and coat the vertical faces with a uniform application of PG 64S-22. Place the asphalt base course in a manner that does not cause segregation and to the lift thickness indicated. Compact to the density specified by use of approved compaction equipment as specified in Section 108.05(c).

316.4 MEASUREMENT AND PAYMENT—Square Yard or Ton

Saw cutting, excavation, hauling and disposal, asphalt tack coat, asphalt material, and sealing of the joints are considered as incidental.

SECTION 323—ROLLER COMPACTED CONCRETE BASE COURSE

323.1 DESCRIPTION—This work is the construction of roller compacted concrete (RCC) base course on a prepared subgrade and subbase for under an asphalt wearing course or a surface treatment, using a stiffer low slump concrete mix, conventional or high-density asphalt paving equipment, and various size rollers to obtain the required thickness and density.

323.2 MATERIAL—Section 502.2, except:

(f) **Concrete Curing Material.** Section 711.1 and Section 461.2

323.3 CONSTRUCTION—Section 502.3, except:

(i) **Joints.** Section 502.3(i), except:

3. Control Joints. Section 502.3(i)2 with the following addition:

After saw cutting the RCC control joints and before placing the asphalt wearing course or surface treatment remove loose debris from the saw cutting operation and apply additional emulsified asphalt along the control joints as specified in Section 323.3(j)5.

(j) **Curing.** Section 502.3(j), except:

3. Curing Compound. Do not use curing compounds.

5. Emulsified Asphalt. Apply emulsified asphalt as specified in Section 460.3(b), over the RCC pavement surface. Provide a uniform void-free application across the RCC pavement surface. Use equipment that does not damage, mar, or alter the surface of the compacted RCC pavement surface when applying the emulsified asphalt. Have the equipment approved by the Representative before placing the emulsified asphalt.

(k) **Surface Tolerance.** Section 502.3(k), except:

3. Finishing. The RCC pavement surface does not need diamond grinding before placing the asphalt wearing course or surface treatment.

(l) **Open to Traffic.** Section 502.3(l) except:

When the cure period is complete, the RCC pavement may be open to local traffic before placing the asphalt wearing course or surface treatment.

323.4 MEASUREMENT AND PAYMENT—

(a) **Roller Compacted Concrete Base Course.** Square Yard

(b) **Defective Pavement Left in Place.** Section 501.4(b).

SECTION 341—COLD RECYCLED ASPHALT BASE COURSE, COLD-IN-PLACE

341.1 DESCRIPTION—This work is the on-grade construction and material processing of a cold recycled asphalt base course (CRABC) that uses emulsified asphalt, or foamed asphalt stabilizing agents, combined with RAP, RAM, cement, or virgin aggregates. Construction typically includes milling to an indicated depth, adding and mixing emulsified asphalt or foamed asphalt, placing, compacting, and testing.

341.2 MATERIAL—

(a) Reclaimed Material. Reduce oversized material until 95 percent of the material passes the 2-inch sieve. Incorporate all reclaimed material into the CRABC.

1. RAM. As specified in Section 703.1, Table A or 703.2, Table B. The Contractor may use RAM from the project or from stockpiles off the project.

2. RAP. Processed paving material containing asphalt and aggregates.

(b) Asphalt Material. Furnish PG 64S-22, PG64V-22, PG64E-22, PG 58S-28, or PG 58V-28 material conforming to AASHTO M 332, for Performance-Graded Asphalt Binder using Multiple Stress Creep Recovery (MSCR) Test, except as revised in Bulletin 25. Obtain material from a source listed in Bulletin 15 for the specified grade. Provide QC testing and certification as specified in Sections 106.03(b) and 702.1(b)1. Provide the Representative a copy of a signed Bill of Lading for asphalt binder on the first day of paving and when the batch number changes.

(c) Emulsified Asphalt Material. Add emulsified asphalt material to the reclaimed material according to the approved mix design. Use one of the following emulsified asphalt materials, conforming to the applicable requirements of Bulletin 25:

- Emulsified Asphalt—MS-2, CMS-2, SS-1, CSS-1, SS-1h, CSS-1h, HFMS-2h, HFMS-2, HFMS-2s, HFMS-2P, SS-1hP, CSS-1hP.

(d) Portland Cement. Section 701

(e) Aggregate. Section 703.2 Type A, AASHTO No. 8, No. 57, or No. 67.

(f) Mixture Design.

- (1) Emulsified Asphalt Stabilizing Agent.** Obtain samples of each reclaimed material and perform testing to establish the mix design. If RAM is included in the depth indicated for removal, take separate samples of RAP and RAM. Establish the mix design according to Bulletin 27 and submit the mix design as specified in Section 108.03(b)3.
- (2) Foamed Asphalt Stabilizing Agent.** Obtain samples of each reclaimed material and perform testing to establish the mix design according to AASHTO MP 38 and submit the mix design as specified in Section 108.03(b)3. Perform the mix design using the asphalt material performance grade and supplier that will be used during the project. If there is a change in source or grade of the asphalt material, a new mix design is required.

(g) Mixture. Combine the reclaimed material, aggregates, and emulsified asphalt or foamed asphalt material according to the mix design and at the mix design recommended optimum moisture and emulsion or foamed asphalt content. If RAP gradations and composition vary sufficiently, make field adjustments as detailed in the QC plan to obtain satisfactory coating and the specified compaction.

1. Review of QC Plan. Prepare a QC Plan, as specified in Section 106, and submit for review at the start of the project. Do not start actual work until the QC Plan has been reviewed.

341.3 CONSTRUCTION—**(a) Equipment.****1. General Requirements.** Provide equipment as follows:

- Use equipment capable of automatically metering liquids with a variation of not more than ± 2.0 percent by weight of liquids.
- Place CRABC mixtures using an asphalt paver as specified in Section 413.3(e)1.
- Maintain all equipment as specified in Section 108.05(c).

2. Emulsified Asphalt Stabilizing Agent. Provide a self-propelled milling machine having a down cutting drum, screening/crushing plant, and pugmill mixer. Use single-unit or multiple-unit machine with plant and/or mixer as trailer(s). Use a pugmill mixer with liquid additive system and spray bar capable of volumetrically controlling liquid additive based on milling depth, milling width, and machine speed.**3. Foamed Asphalt Stabilizing Agent.** Provide a self-propelled milling machine having a down cutting drum with the following minimum capabilities:

- Mill the existing pavement to the indicated depth in one pass, and produce RAP meeting the 1¼ inch maximum requirement according to AASHTO MP 38.
- Maintain a constant cutting depth and width, cross slope, and uniform grade.
- Accurate and uniform injection of water into hot asphalt binder, and uniform mixing of foamed asphalt, RAP material, and water, to meet mix design requirements.
- Provide separate computerized controls and injection bars for injection of foamed asphalt and water in the mixing chamber.
- Equip the foamed asphalt system with a test nozzle to allow field samples of foamed asphalt.
- Equip hot asphalt supply tankers with gauges that continuously display the temperature of the asphalt.

(b) Mixing. Do not place CRABC from September 1 to April 30 in Districts 1-0, 2-0, 3-0, 4-0, 9-0, and 10-0; and from October 1 to April 30 in all other Districts. With written approval of the Representative, the Contractor may place CRABC when no freezing temperatures occur for 24 hours before paving and when the project ambient air temperature is 45F and rising.

Maintain adequate total liquids in the mixture to ensure thorough mixing of the reclaimed material and aggregate with the emulsified asphalt material. If necessary, add water at the mill head using a calibrated meter.

(c) Compaction. After processing, uniformly spread, shape, grade, and compact the base course to the lines, grades, and depth indicated. Before compaction, cure the base course as necessary.

Provide compacted layers between 2 to 5 inches in depth. Use rollers as specified in Section 108.05(c).

Begin rolling at the low side of each layer; except, initially leave 3 to 6 inches from unsupported edges unrolled to prevent distortion.

Determine the target density according to PTM No. 402.

Compact the base course to a minimum density of 96 percent of the PTM 402 target density. Determine the in-place density of each 3,000-square yard area according to AASHTO T 310. If the density of an area is less than the minimum density and if additional compaction does not achieve the minimum density, scarify, adjust the moisture content, and recompact. If the density is still below the minimum, and the base course is uniform in texture, and stable, determine a new target density according to PTM No. 402 and then compact to minimum of 96 percent of the new target density.

If the Representative determines that the Contractor achieved the minimum density with minimal compaction, the Representative may require the Contractor to determine a new target density according to PTM No. 402.

If the completed base course is unacceptable, stop base course construction. Resume construction only after correcting the cause of unacceptable construction.

(d) Finishing. Unless otherwise allowed, complete base course construction during daylight hours.

(e) Protection. Protect completed portions of base course that are opened to construction equipment from marring, distortion, and other damage. Immediately correct damage to the base course caused by construction equipment to the Representative's satisfaction.

(f) Surface Tolerance. If directed, test the completed base course for smoothness and accuracy of grade, both transversely and longitudinally, using a 12-foot straight edge or template. Test a 3,000-square yard area at three locations. At each location determine the maximum space under the straight edge or template. Correct each 3,000-square yard area where the average of the maximum space at the three locations exceeds 1/2 inch. To control dust or raveling, apply a fog seal as specified in Section 472.3(c) using CSS-1h or SS-1h diluted as specified in Section 472.2, Table A or other approved emulsified asphalt material at no additional cost to the Department.

(g) Maintenance and Traffic. Maintain the completed base course and control traffic as specified in Section 413.3(n). Use a pilot car for speed control if damage, such as raveling, is likely to occur.

(h) Curing. Cure CRABC material as follows:

1. **Curing for Emulsified Asphalt Stabilizing Agent.** Cure emulsified asphalt stabilized CRABC for at least 2 weeks before placing the wearing course or binder course or until the average moisture content is less than 2 percent. In addition, before placing a wearing or binder course, dry cut or dry extract a minimum of three samples selected at random according to PTM No. 1 from throughout the entire cold-recycled base course project. Ensure each sample size is a minimum of 1,200 grams. Determine the moisture content of each sample according to PTM No. 749. Back fill and compact core holes with CRABC material or approved alternate material.
2. **Curing for Foamed Asphalt Stabilizing Agent.** Cure foamed asphalt stabilized CRABC until the average moisture content is less than 2 percent. In addition, before placing a wearing or binder course, dry cut or dry extract a minimum of three samples selected at random according to PTM No. 1 from throughout the entire cold-recycled base course project. Ensure each sample size is a minimum of 1,200 grams. Determine the moisture content of each sample according to PTM No. 749. Back fill and compact core holes with CRABC material or approved alternate material.

(i) Tests for Depth. Measure milling depth at time of pulverization. Make at least one measurement for each 3,000 square yards or less of work done and record measurements to ensure that specified milling depth is met. Correct or replace any section deficient by 1/2-inch or more from specified depth at no additional cost to the Department.

341.4 MEASUREMENT AND PAYMENT—

- (a) Cold In-Place Recycled Asphalt Base Course.** Square Yard
- (b) Coarse Aggregate for Cold Recycled Asphalt Base Course.** Ton
- (c) Emulsified Asphalt Material.** Gallon
- (d) Asphalt Material.** Gallon
- (e) Cement.** Ton

SECTION 342—CENTRAL PLANT MIX COLD RECYCLED ASPHALT BASE COURSE

342.1 DESCRIPTION—This work is the construction of a central plant mixed cold recycled asphalt base course (CPMCRABC), using a combination of RAP, RAM, virgin aggregates, or cement, mixed with an emulsified or foamed asphalt stabilizing agent in a continuous or batch type mixer.

342.2 MATERIAL—Section 341.2 and as follows:

(a) **Stockpiling.** Store reclaimed material in a manner that preserves its quality and suitability. Separate different types of RAP to prevent contamination. Build stockpiles in horizontal layers to minimize segregation. Keep stockpile height to a maximum of 10 feet.

342.3 CONSTRUCTION—

(a) **Equipment.** Provide equipment to produce CPMCRABC as follows:

1. Provide a central plant consisting of a RAP feed hopper, conveyor belts, twin shaft pugmill, metered emulsified asphalt, or foamed asphalt additive, metered cement additive, and water additive systems, with pumps and spray bars. Other equipment may include additive storage tanks, belt scales, a stacker belt conveyor, and a storage bin. Provide a screening/crushing unit if the maximum size of RAP cannot be controlled otherwise.

Provide equipment capable of mixing reclaimed material and asphalt material into a homogeneous mixture without stripping the asphalt material. Provide a continuous-flow or batch-type mixer accepted by the Representative and equipped with batching or metering devices to measure the specified quantities of the materials. Equip the foamed asphalt system with a test nozzle to allow field samples of foamed asphalt. Equip hot asphalt supply tankers for foamed asphalt stabilized applications, with gauges that continuously display the temperature of the asphalt. Equip the foamed asphalt system to accurately and uniformly inject water into hot asphalt binder, and uniformly mix foamed asphalt, RAP material, and water, to meet mix design requirements.

For emulsified asphalt additive, use a positive displacement pump capable of accurately metering the flow rate of additives into the reclaimed material down to 4 gallons per minute.

Provide a positive interlock system that automatically shuts off the pump when material is not in the mixing chamber. Provide a meter capable of registering the flow rate and quantity of additive introduced into the reclaimed material.

2. Use equipment capable of automatically metering liquids with a variation of not more than $\pm 2.0\%$ by weight of liquids.

3. Maintain all equipment as specified in Section 108.05(c).

(b) **Mixing.** Maintain adequate total liquids in the mixture to ensure thorough mixing of the reclaimed material and aggregates with the asphalt material. Add water to the RAP by a calibrated meter, as necessary, to aid in mixing and compaction.

(c) **Transporting and Placing.** Transport the mixture in clean, tightly sealed vehicles. The Representative may require vehicle protective covers. Use mechanical spreaders to place the loose mixture on the prepared surface to a uniform depth. Unless allowed, do not use motor graders.

Do not place CPMCRABC from September 1 to April 30 in Districts 1-0, 2-0, 3-0, 4-0, 9-0, and 10-0; and from October 1 to April 30 in all other Districts. With written approval of the Representative, the Contractor may place CPMCRABC when no freezing temperatures occur for 24 hours before paving and when the project ambient air temperature is 45F and rising.

(d) **Compaction.** Section 341.3(c)

(e) **Finishing.** Section 341.3(d)

(f) **Protection.** Section 341.3(e)

(g) **Surface Tolerance.** Section 341.3(f)

(h) **Tests for Depth.** Control the loose depth of each layer to construct the CPMCRABC to the compacted depth indicated and within the specified tolerances. The Representative will designate one test location in each 3,000 square yards of completed CPMCRABC and at locations the Representative suspects the depth is deficient. At each test location, record one depth measurement. If the depth is deficient 1/2 inch or more from the indicated depth, the pavement is defective. Immediately start removal of the defective pavement, beginning at the core location and continuing longitudinally and transversely until the depth is within 1/2 inch of the indicated depth.

(i) **Maintenance and Traffic.** Section 341.3(g)

(j) **Curing.** Section 341.3(h)

342.4 MEASUREMENT AND PAYMENT—

(a) **Cold Recycled Asphalt Base Course, Central Plant Mix.** Square Yard or Ton

(b) **Emulsified Asphalt Material.** Section 341.4(c)

(c) **Coarse Aggregate for Cold Recycled Asphalt Base Course.** Section 341.4(b)

(d) **Asphalt Material.** Section 341.4(d)

(e) **Cement.** Section 341.4(e)

SECTION 344—FULL DEPTH RECLAMATION

344.1 DESCRIPTION—This work consists of in-place pulverizing and mixing a combination of existing roadway material layers, stabilizing additives, and imported aggregate or RAP material, as required, to specified depths and grading, and compacting the mixed materials to form a new pavement base layer upon which an asphalt overlay, or a surface treatment is applied. This work is defined as full-depth reclamation (FDR), and often includes the incorporation of additional materials based on an approved FDR mix design.

344.2 MATERIAL—

(a) Reclaimed Material from Existing Roadway. Pulverize and mix existing roadway material layers, which may include bound pavement layers, aggregate subbase material, and subgrade material, such that 95% of the material passes the 2-inch sieve.

(b) Aggregate.

1. General. Provide fine or coarse aggregate from approved aggregate producers listed in Bulletin 14 or provide reclaimed aggregate material (RAM) meeting the specified size (e.g., AASHTO No. 57) as required by the approved mix design.

2. Fine Aggregate. Section 703.1, Type A or B.

3. Coarse Aggregate. Section 703.2, Type A, B, or C.

(c) Reclaimed Asphalt Pavement (RAP) Material from Other Roadways or Projects. Provide processed RAP material with 95% passing the 2-inch sieve.

(d) Stabilizing Additives. Provide one or more of the stabilizing additive materials listed below as included in the approved mix design. Potential additives are not limited to the materials listed below. Those listed below include references to sections with additional information.

1. Emulsified Asphalt Material.

1.a Emulsified Asphalt Material. Section 702, Class CMS-2, SS-1h, CSS-1h, SS-1hP, HFMS-2 or CSS-1hP.

2. Chemical.

2.a Portland Cement. Section 701

2.a.1 Portland Cement Slurry, Section 701 Portland Cement Slurry must be produced at a concrete plant listed in Bulletin 42 and supplied in Ready Mix Concrete Trucks approved by the DME/DMM. Other slurries must be provided in distributor and tanker trucks equipped with a recirculating pump and/or agitation system to prevent settling of the materials before application.

2.a.1.a Admixtures—Section 711.3

2.b Hydrated Lime. Section 723

2.c Supplementary Cementitious Material. Section 724

2.d. Lime Pozzolan. Section 725

3. Calcium Chloride. Section 721**4. Magnesium Chloride.** Use only as permissible on a project approval basis.**(e) Water.** Section 720.2

(f) FDR Mix Design. Select one or more stabilizing additives based on the composition of the existing roadway materials according to Publication 242 Pavement Policy Manual. A formal design protocol should be followed to optimize the performance of the pavement section. After selecting the appropriate stabilizing additive(s), develop a mix design following the appropriate mix design procedures for the stabilizing additive(s) as follows:

TABLE A
Mix Design Procedure for Primary Stabilizing Additive Type

Primary Stabilizing Additive	Mix Design Procedure
Asphalt	Pub. 27 (Bulletin 27)
Chemical (Portland Cement, Hydrated Lime, Supplementary Cementitious Material**& Portland Cement Slurry)	Pub. 242 Appendix J.3
Calcium Chloride	PTM No. 106 *, Pub. 242 Appendix J.3

*When used as the primary stabilizing material, calcium chloride should be applied as a minimum 35% solution at a rate between 0.10 to 0.15 gallons per square yard for each inch of depth reclaimed.

**Calcium oxide is used to activate the cementitious performance of Supplementary Cementitious Material.

Submit the mix design for the FDR work as specified in Section 108.03.

(g) Emulsified Asphalt Material. Section 702, Emulsified Asphalt Material, Class AEP, E-1 Prime, or EDP.**(h) Asphalt Tack Coat.** Section 460.**(i) Asphalt Fog Seal.** CSS-1h or SS-1h diluted as specified in 472.2, Table A.**(j) Calcium Chloride.** Section 721.

344.3 CONSTRUCTION—Comply with applicable environmental standards. Appropriate equipment and techniques should be used to protect adjacent properties from fugitive dust or other material components of the FDR process. Dry additive will not be applied when the wind conditions are such that blowing additives become objectionable to traffic or adjacent property owners. Manual and/or gravity (tail gate) spreading of the additives is unacceptable.

Stabilization may be accomplished using asphalt material, Portland cement or other chemical stabilization materials, or calcium chloride according to the recommendations of the FDR Best Practices found in Publication 242 and approved in the project mix design.

(a) Equipment. Provide the necessary equipment to pulverize reclaimed material to a maximum particle size of 2 inches in the greatest dimension, blend, shape, and compact the FDR materials.

1. Reclaimer. Provide a self-propelled, traveling rotary reclaimer or equivalent machine capable of cutting through existing roadway to depths of up to 16 inches, or as required by the design, with one pass. The equipment must also be capable of pulverizing “in-place” the existing pavement, subbase, and subgrade materials, at a minimum width of 8 feet, and mixing any added materials to the specified depth. The cutting drum must have the ability to operate at various speeds (rpm), independent of the machine’s forward speed, to control oversized material and gradation.

Use a machine equipped with a computerized integral liquid proportioning system capable of regulating and monitoring the water application rate relative to depth of cut, width of cut, and speed. Connect the water pump on the machine to the water supply tanker or distributor by a hose, and mechanically or electronically interlock the flow of

water with the forward ground speed of the machine. Mount the spray bar to allow the water to be injected directly into the cutting drum/mixing chamber. Provide equipment capable of mixing water, dry or liquid stabilizing additives, emulsion, and the pulverized pavement into a homogenous mixture. Keep the cutting drum fully maintained and in good condition at all times throughout the project. Equipment such as road planers or cold-milling machines designed to mill or shred the existing roadway rather than crush or fracture them is not allowed.

1.a Use equipment capable of automatically metering liquids in the mixture and ensure thorough mixing of the reclaimed materials. Use equipment that is also able to record the volumes metered.

1.b Maintain equipment as specified in Section 108.05(c).

2. Placement Equipment. Use a motor grader or another method approved by the Representative.

3. Compaction Equipment. Provide suitable compaction equipment as follows. Use a 25-ton (or greater) pneumatic tire roller for breakdown and intermediate rolling if the FDR is emulsion or foamed asphalt based and is less than 8 inches in depth. Use a 25-ton vibratory padfoot roller for initial breakdown if FDR is 8 inches or deeper. Perform finish rolling using a single or tandem steel drum static roller of 12 to 14 tons.

(b) Weather Limitations. Do not place FDR materials when air temperature falls, or is anticipated to fall, below 40F within the subsequent required 7-day cure period. Do not perform reclamation in rain, or if rain is anticipated within 2 hours of completion of the work. Cement slurry with accelerating admixtures may be used in periods of cooler temperatures with the written approval of the DME/DMM. Do not place cement slurry mixtures with accelerating admixtures when the air temperature is anticipated to fall below 35F within the first 24 hours following placement.

(c) Quality Control. Provide a QC Plan for the FDR work a minimum of 2 weeks before the start of work. Identify the equipment, personnel, and processes to be used during the work. Ensure that all equipment is operational and functional before deployment to the job site. All equipment must be properly calibrated before application. This calibration should be verified through the test strip. Operators of water and additive applicators must keep proper records of the amount of material applied and the times of application. Describe means of establishing and controlling centerline, proposed crown and any existing or proposed superelevations.

(d) Test Strip. Before starting full production work, construct a 300-foot test strip demonstrating the FDR process including final compaction and shaping. Verify application rates for materials incorporated into the FDR process including stabilization materials and water. Identify and correct aspects of the work not conforming to the contract requirements before proceeding with full production work. If aspects of the work are not found to be adequately controlled to produce the desired mixed and refinished reclaimed roadway, construct additional test strips until the necessary control is established. After completing the test strip and demonstrating that the minimum density can be achieved as specified in 344.3(e)3.a, determine $n=1$ density of the FDR according to PTM No. 402 for each 3,000 square yard lot.

(e) Reclamation.

1. Pulverization. Before the application of stabilizing additives, pulverize the roadway to the size and depth specified. Shape the pulverized material to the approximate line and grade. Adding Calcium Chloride during pulverization is acceptable.

2. Mixing. Combine the FDR material, aggregates (if necessary), RAP (if necessary), stabilizing additive(s), and water according to the mix design and at the mix design recommended moisture content. Maintain adequate liquids in the mixture to ensure thorough mixing of the reclaimed material, aggregates, RAP, and stabilizing additives. If conditions change, make field adjustments to obtain a satisfactory FDR material.

If slurries are used, use Ready Mix Concrete Trucks or equip the distributor and tanker trucks with a re-circulating pump and/or agitation system to prevent settling of the materials before application.

If using slurry delivered in Ready Mix Concrete Trucks, verify "cement" application rate by calculating the weight of cement contained in the mixer truck and the area covered by the slurry after discharge by the Ready Mix Concrete Truck. The cement slurry producer shall supply a written record of the amount of cement, water, and

admixture with each load of cement slurry. Evenly and uniformly distribute the cement slurry, over the area of the prepared subgrade, calculated to provide the required application rate. Accelerating or retarding admixtures maybe added to the cement slurry with the written approval of the DME/DMM.

3. Compaction. Compact the FDR material to a minimum density of at least 95% of the laboratory compacted maximum density at optimum moisture content according to PTM No. 106. Demonstrate that the minimum specified density can be achieved during paving of the compaction control strip. After completing the compaction control strip, and establish the roller pattern as specified in Section 344.3(e)3.a, determine n=1 density according to PTM No. 402 for each 3,000-square yard lot.

Commence rolling at the low side of the course. Leave 3 to 6 inches from any unsupported edge(s) unrolled initially to prevent distortion. Compact the entire reclaimed area using the number of uniform passes of compaction equipment determined from the control strip, ensuring that uniform density is achieved throughout.

Complete compaction of chemically stabilized reclaimed material within 4 hours of the water/additive mixing operation.

3.a Compaction Control Strip. Establish a roller pattern that achieves at a minimum the density specified in Section 344.3(e)3 by the construction of at least one 300-foot long control strip during initial reclamation. The compaction control strip may be contained within the project startup test strip. Take nuclear density reading tests according to PTM No. 402 after each pass of the compaction equipment. The properly calibrated nuclear gauge must be operated in direct transmission mode. Continue compaction with each piece of equipment until no appreciable increase in density is obtained by additional passes. Upon completion of compaction, make a minimum of ten tests at random locations according to PTM No. 1 to determine the average in-place density of the compaction control strip. Provide density results to the Representative for verification to the minimum density requirements as specified in Section 344.3(e)3.

If the density of the compaction control strip is less than the minimum density specified in Section 344.3(e)3, but the base course is uniform in texture, stable, and otherwise acceptable, provide additional compaction. If additional compaction does not achieve the minimum density, construct another compaction control strip to verify that the minimum density is achievable with the FDR process and mix design in use. Take a minimum of ten tests at random locations according to PTM No. 1 to determine the average in place density of the new compaction control strip. The minimum density for the new control strip is 98% of the control strip density.

3.b Moisture Content. Verify the original moisture content of the road material to be reclaimed before starting work. The moisture content can be determined according to ASTM D 2216, ASTM D 44643, or AASHTO T 265. Make appropriate adjustment between the moisture content determined at the time of mix design sampling and current moisture content by adjusting the design recommended water application rate.

The moisture content for compaction must achieve the optimum moisture content as determined from the project mix design but cannot exceed optimum by more than 3%.

4. Finishing. Shape the FDR material surface not to exceed 1 1/2-inch irregularity of the existing centerline, grades and/or cross-slope of the proposed roadway. Avoid excessively working the chemically stabilized FDR material, which may detrimentally affect the ultimate strength of the stabilized layer.

5. Cure. Cure the FDR material until the 7-day strength requirement is met. Do not allow heavy traffic on the reclaimed material during the 7-day cure period. Appropriate traffic signs must be posted to prevent heavy traffic on the constructed base until completion of base curing and application of the overlay.

For chemical stabilization, maintain the reclaimed layer in a damp condition by the daily application of water to the surface, or the application of an emulsified asphalt prime material followed by an asphalt fog seal at a residual asphalt rate between 0.02 and 0.10 gallons per square yard, or Tack Coat as specified in Section 460. Apply while FDR material is at optimum moisture content, but not exceeding more than 3%.

The rate of curing depends on many factors. In favorable weather conditions (no rain, sunshine, low humidity, high temperature), curing can take place at a considerably faster rate. Sufficient curing and strength gain could take from 2 or 3 days to at least 2 weeks depending on the type and amount of materials used and the climatic conditions.

FDR should be proof rolled with a vehicle similar to the heaviest vehicle expected in traffic, or base opening on a strength measurement of the FDR, before opening to traffic. Same day return to car traffic at posted safe speeds is possible. In general, the constructed base could be opened to light traffic (vehicles under 5 tons) 2 hours after completion of the base construction, with proof rolling. For emulsified asphalt stabilized roadways, the moisture

content should be at 50% of the design optimum moisture content or 3% total moisture content, whichever is reached first, before overlay. No damage should be apparent at slow speed, less than 10 miles per hour. Immediately correct the damage. Otherwise verify strength by testing as covered under 344.3(g).

6. Surface Tolerance. Test the completed stabilized base for smoothness and accuracy of grade, both transversely and longitudinally. Satisfactorily correct any 3,000-square yard lot where the average surface irregularity exceeds 1/2 inch under a 10-foot template or straightedge, based on a minimum of at least three measurements within the lot.

Provide a minimum final surface cross slope of 1/4-inch per foot, or as otherwise required by the project design.

(f) Maintenance and Protection of Traffic (MPT). Relocate traffic using approved traffic control devices and procedures as specified in Section 901. Provide MPT until the road can be opened to traffic as specified in Section 344.3(h).

(g) Acceptance. Acceptance will be based on each 3,000-square yard lot complying with requirements for surface tolerance as specified in Section 344.3(e)6, for density as specified in Section 344.3(e)3, and strength as follows.

Any lot failing to meet the acceptance criteria will be identified for rework. Cores may be taken to determine the extent of the failing area. Once a failed area has been identified, develop and obtain approval of a new mix design. Failed areas must be reclaimed again with the additional stabilizing material, as necessary, to achieve the required acceptance criteria. Fill core holes remaining outside the reworked area with an approved repair material listed in Bulletin 15.

Make a minimum of three standard Proctor samples according to ASTM D1633 for strength testing for each lot size of 3,000 square yards. Wrap the specimens in plastic wrap, seal in an airtight, moisture proof bag and cure the test specimens for a period of 7 days. Follow PTM No. 1 for selecting sample locations from the reclaimed material after addition of the stabilizing additive. For emulsion based mixes or mixes stabilized with foamed asphalt, an accepted alternative approach will be compaction of specimens with the Superpave Gyratory Compactor (SGC) to a thickness between 2 and 3 inches using 50 gyrations.

1. Asphalt Stabilized FDR. Achieve a minimum indirect tensile strength of 50 pounds per square inch when tested according to Bulletin 27. This requirement is for specimens compacted in the SGC to a thickness between 2 and 3 inches.

2. Chemical Stabilized FDR. Achieve an unconfined compressive strength of 300 to 500 pounds per square inch in 7 days when tested according to ASTM D1633 for the roads to be surfaced with less than a 3-inch overlay or asphalt surface treatment. Achieve an unconfined compressive strength value of 280 to 500 pounds per square inch in 7 days for roads to be surfaced with an asphalt overlay of 3 inches or greater. For emulsion based mixes as well as mixes stabilized with foamed asphalt, the minimum compressive strength requirement will be 280 pounds per square inch. If the average of the specimens does not meet the minimum required strength listed above, rework will be required. Chemically stabilized material tested to strengths greater than 900 pounds per square inch may result in shrinkage cracking, and rework will be required.

(h) Opening to Traffic. Do not open the road to unlimited traffic until the specified 7-day strength has been achieved. Limited local light vehicular traffic may be allowed once the reclaimed material has obtained a stable condition. Repair damage resulting from local traffic. Do not allow trucks to use the road until the above referenced 7-day strength has been achieved.

344.4 MEASUREMENT AND PAYMENT—

(a) Full Depth Reclamation, Excluding Additive. Square Yard.

1. Additional pay items depending on stabilization method.

1.a Chemical Additive. Gallon or Ton.

1.b Emulsified Asphalt Material. Gallon.

1.c Calcium Chloride Additive. Gallon.

1.d Magnesium Chloride Additive. Gallon.

(b) Asphalt Tack Coat. Section 460.4.

(c) Asphalt Fog Seal. Section 472.4.

SECTION 350—SUBBASE

350.1 DESCRIPTION—This work is preparation of subgrade, as specified in Section 210, and construction of a compacted aggregate subbase.

350.2 MATERIAL—

(a) **Aggregates.** Unless otherwise indicated or directed, Type S or better, No. 2A and/or No. OGS, as specified in Sections 703.2 and 703.5.

350.3 CONSTRUCTION—

(a) Equipment.

1. Compaction Equipment. Sections 108.05(c) 3.i or 4

(b) **General.** For quantities greater than 1,500 tons, prepare and submit a Subbase Delivery Plan to the Representative, if directed. Indicate the construction equipment and methods necessary to deliver and place the subbase in a manner that is not detrimental to the subgrade. Do not begin subbase operations until the Representative reviews the Subbase Delivery Plan.

Prepare the subgrade as specified in Section 210 before placing subbase. Correct any deficiencies in the subgrade, as specified in Section 210, before placing the subbase. Do not place subbase material on soft, muddy, or frozen areas.

If directed, correct unsatisfactory subbase conditions developing ahead of the base and paving operations by removing the subbase, correcting the subgrade problem, and replacing the subbase.

(c) **Mixing.** Use acceptable methods to mix materials and water before delivery to the project. Use a blend of materials from different sources only if allowed. Use material containing enough moisture to prevent segregation during stockpiling, hauling, and placing, and to minimize water added during compaction. Maintain subbase in a well-moistened condition from before placement to compaction.

(d) **Placement.** Before placing subbase, construct berms to confine the material. Verify the Class 4, Type A geotextile has been installed as specified in Section 210.3(b). Place the subbase before paving and as indicated. Control the subbase elevation and depth as specified in Section 210.3(c); except do not use templates if the subbase is trimmed using an automatic grading machine. Place the material on the subgrade and geotextile by back dumping then spreading the subbase ahead of all equipment. Spread, in a manner not causing segregation, to a uniform depth of the layer being placed. Do not make abrupt turns with tracked equipment that would result in pulling, folding, or tensioning of the fabric. Do not disturb or damage the geotextile during the installation of the overlying subbase. Repair any damaged geotextile at no additional cost to the Department. For rigid pavement and shoulders, place a course of No. 2A aggregate to a minimum compacted depth of 3 inches directly on the subgrade and place a course of No. OGS aggregate to a minimum compacted depth of 4 inches on top of the No. 2A aggregate.

For flexible pavement and shoulders, place the indicated type of aggregate courses at the position and depth indicated for the pavement structure. Place each layer of No. 2A aggregate to a minimum compacted depth of 3 inches and place each layer of No. OGS aggregate to a minimum compacted depth of 4 inches. Construct subbase in layers not more than 8 inches in compacted depth; however, when granulated slag is used, limit each layer to not more than 4 inches in compacted depth. If allowed and when using granulated slag, the Contractor may place a maximum compacted layer of 6 inches when the full layer depth is compacted as specified in Section 206.3(b).

If the subbase is constructed in widths less than the full pavement width, neatly trim the edge of completed subbase before placing the abutting subbase.

For simultaneous construction of more than one pavement course, complete and maintain the subbase at least 1,500 linear feet in advance of placing the succeeding pavement course.

(e) **Compaction and Density.** Compact to a condition of non-movement as specified in Section 206.3(b). Compact from the sides to the center, with each pass uniformly overlapping the previous pass.

(f) Surface Tolerance. Section 210.3(c)

(g) Test for Depth. At each density test location and after completing the density test, carefully dig one test hole to the full depth of the completed subbase.

The Representative will measure the depth of the finished subbase.

If the subbase depth is deficient by 1/2 inch or more from the depth indicated, the subbase is defective. The Representative may require additional test holes to determine the limits of the defective area. Scarify the subbase to a depth of 3 inches, blend in additional material, and recompact. After recompacting, the Representative may require test holes to verify the subbase depth is within 1/2 inch of the indicated depth.

Backfill the test holes with subbase material and compact.

(h) Maintenance and Traffic. Section 310.3(g) and as follows:

Do not allow traffic, including construction traffic, on a subbase constructed of No. OGS aggregate. If a subbase constructed of No. 2A aggregate is used as a haul road or if a subbase is exposed to weather in excess of 60 calendar days, retest for surface irregularities and depth and correct deficiencies as specified in Section 210.3(c) and 350.3(g). Do not leave subbase or subbase covered with treated permeable base course exposed during winter shutdowns. Place the required asphalt base course over all prepared subbase for flexible pavements and place the required reinforced or plain cement concrete over all prepared subbase (with or without treated permeable base course) for rigid pavements, before the shutdown of paving operations for the construction season.

If subbase is in place over winter without a protective layer (asphalt base course for flexible pavements or cement concrete for rigid pavements), proof roll as specified in Section 206.3(a)1 before placement of flexible or rigid pavement. Remove subbase in any areas indicating instability and remove and replace or repair the subgrade. Replace the subbase after repairs are completed on the subgrade. If the majority of or all subbase exhibits instability during the proof rolling, remove subbase and repair subgrade. Replace subbase in its entirety. Remove subbase, repair subgrade, and replace subbase at no additional cost to the Department.

350.4 MEASUREMENT AND PAYMENT—

(a) Subbase. For the type indicated, and as follows:

1. Area Basis. Square Yard

The Department will not pay the entire quantity of subbase complete in place until the base course or pavement is constructed over the subbase. However, the Department will pay for up to 75% of the estimated quantity of subbase placed in advance of the succeeding operations, if the Contractor satisfactorily completed and is properly maintaining the subbase.

2. Volume Basis. Cubic Yard

3. Mass (Weight) Basis. Ton

SECTION 360—ASPHALT TREATED PERMEABLE BASE COURSE

360.1 DESCRIPTION—This work is the construction of an asphalt treated permeable base course (ATPBC) on a prepared surface. When placed on subgrade, it includes the preparation of subgrade as specified in Section 210.

360.2 MATERIAL—

(a) **Asphalt Material.** Asphalt Cement, Class PG 64S-22, as specified in Section 702.

(b) **Coarse Aggregate.** Type A, Section 703.2. When using crushed gravel, provide a minimum of 75% crushed particles with at least three faces resulting from fracture.

(c) **Fine Aggregate.** Type A or Type B, Section 703.1.

(d) **Additives.**

1. Hydrated Lime. Before adding the asphalt cement, add hydrated lime to the aggregate to reduce stripping potential.

Furnish hydrated lime conforming to ASTM C 1097 and add the lime as follows:

- Add at least 1% hydrated lime by weight of the total dry aggregate.
- Provide a separate bin or tank and feeder system to store and accurately proportion the lime, in dry form, into the aggregate.
- Provide a convenient and accurate means of calibrating the proportioning device.
- Interlock the proportioning device with the aggregate feed or weight system.
- Mix the lime and aggregate to uniformly coat the aggregate with lime.
- Furnish aggregate containing at least 3% free moisture.
- Do not stockpile lime treated aggregate.
- Control the feeder system by a proportioning device accurate to within 10% of the specified amount.
- Provide a flow indicator or sensor and interlock with the plant controls such that production is interrupted if there is a stoppage of the lime feed.
- Before production, obtain approval of the method to introduce and mix the lime and aggregate.

2. Heat-Stable, Anti-Stripping Additive. The Contractor may use an anti-stripping additive other than hydrated lime. Blend the additive with the asphalt cement before adding the additive and asphalt cement to the mixture. Use the manufacturer's recommended dosage of the additive, but not less than 0.25% by weight of the asphalt. Select an additive that does not harm the completed asphalt concrete mixture and that is compatible with the aggregate and asphalt supplied for the project.

(e) **Mixture Design and Production.**

1. Design. Size, uniformly grade, and combine aggregate fractions according to Table A below. Marshall test requirements do not apply. Design a JMF with an initial target asphalt content of 2.5% by weight. If necessary, adjust

the asphalt content within the range specified in Table A below to uniformly coat the aggregate and ensure the aggregate has no observable runoff of excess asphalt.

Test materials, proportions, and the mixture at the asphalt concrete plant laboratory. Verify conformance with the uniformity requirements specified in this Section. When required, the Department will perform the tests at the LTS. Provide a JMF that conforms to all Department requirements. Submit a copy of the JMF to the DME/DMM at least 3 weeks before the scheduled start of producing the mixture for the project. If the Department has not used the JMF on previous projects, provide test results from previous mixture production that show the mixture conformed to all JMF production tolerances.

2. QC Plan. Prepare and submit a QC Plan, as specified in Section 106, at the start of the project and at least annually thereafter. Do not start ATPBC production until after the Representative reviews the QC Plan.

3. Production. During the first day of production, take at least three asphalt content and gradation tests to verify the mixture conforms to the JMF. After the first day, perform tests for asphalt content and aggregate gradation according to the QC Plan and PTM No. 1. Produce ATPBC conforming to the gradation requirements in Table A and with a asphalt content within 0.8% of the JMF (n=1). Ensure the aggregate is uniformly coated with asphalt and no runoff of excess asphalt is observed.

4. Acceptance of the Mixture. Obtain material certification from the material producer using the results of QC tests for asphalt content and gradation. Provide the certification to the Inspector-in-Charge within 1 working day after taking QC tests.

TABLE A
Composition of Mixture
(Total Percent by Mass (Weight) Passing Square Openings Based on Laboratory Sieve Tests)

Sieve Size	Percent Passing
37.5 mm (1 1/2-inch)	100
25.0 mm (1-inch)	95 – 100
12.5 mm (1/2-inch)	35 - 65
4.75 mm (No. 4)	12 – 24
1.18 mm (No. 16)	6 - 16
75 µm (No. 200)	0 – 5
Asphalt Content	2.0% - 3.0%*

* For approved gravel and slag mixtures, the Representative may allow the Contractor to exceed the upper limit.

360.3 CONSTRUCTION— Section 413.3, with modifications as follows:

(b) Weather Limitations. Replace with the following:

Do not place ATPBC on surfaces that are unstable, frozen, or below a temperature of 35F. Do not place ATPBC when the air temperature is below 35F or during rain. If work is halted because of weather conditions, the Representative may allow the Contractor to place limited quantities of ATPBC that are en-route to the project.

(c) Asphalt Mixing Plant. Add the following:

3. Plant Requirements. The Contractor is not required to provide equipment for developing the design and control test.

4. Preparation of Mixture. Before mixing, dry the aggregate as necessary. Heat the asphalt material so that combining with aggregate produces a completed mixture. Coat the aggregate with the asphalt material to form a film of adequate thickness to provide the required binding properties. Produce ATPBC at a temperature below 320F that

also provides suitable viscosity for adequate coating of aggregate particles, and that does not cause segregation of asphalt and aggregate during transportation.

Do not stockpile ATPBC. The ATPBC must be placed within 8 hours from when it is made.

(f) Rollers. Replace with the following:

Use steel-wheel power rollers with a manufacturer's certified metal weight of 8 tons to 10 tons.

(h) Spreading and Finishing. Replace with the following:

Use a slip form paver, as specified in Section 413.3(e), or a mechanical spreader. Spread and strike off the mixture for the entire lane width or as much lane as practical. Place the mixture in maximum 4-inch compacted lifts. Adjust screed assemblies to provide the cross section and depth indicated. Construct the profile to the design grade line. Use fully automated sensors to control profile and transverse grade. Allow the mixture to cool to 100F before placing subsequent layers or pavement courses. Perform handwork at locations directed by the Representative.

(i) Compaction. Replace with the following:

Perform rolling as soon as the mat has cooled sufficiently to avoid shoving or lateral movement of the ATPBC. Seat ATPBC using an 8 ton to 10 ton, steel-wheeled roller, or vibratory roller operated in the static mode only. Compact ATPBC by applying four roller passes. One roller pass is defined as one trip of the roller in one direction over any one spot. Additional passes are allowed only to eliminate any surface irregularities, or creases. Do not compact the material to the point that it is not free draining or the aggregate is crushed.

(j) Mat Density Acceptance. Delete this section.

(k) Joints. Replace with the following

1. Longitudinal Joints. Spread the ATPBC to overlap the edge of the lane previously placed by 1 inch to 2 inches. Maintain the uniform uncompacted depth adjacent to a compacted lane necessary to provide a smooth joint after compaction.

2. Transverse Joints. At the end of each day's work and when more than a 30 minute interruption occurs in ATPBC paving operations, install a temporary vertical bulkhead to form a straight transverse construction joint. The joint shall be the full depth and width of the ATPBC. Instead of a temporary bulkhead, the Contractor may saw construction joints.

(l) Surface Tolerance. Replace the requirements for correcting irregularities with the following:

Test the finished surface at locations the Representative suspects are irregular and at transverse joints and paving notches. Test the surface in stages using a 10-foot straightedge. At each stage, hold the straightedge in contact with the surface and parallel to the road centerline and, in successive positions, test the pavement surface from one side to the other. Advance the test location to the next stage by moving the straightedge along the pavement centerline by not more than 5 feet.

Correct irregularities of more than 1/2 inch by loosening surface mixture and removing or adding ATPBC. For irregularities that develop after compaction is completed, correct the irregularity by a method that does not produce contaminating fines or damage the base. Do not grind or mill the ATPBC. The area is defective if irregularities or defects remain after final compaction.

(m) Tests for Depth: Binder and Wearing Courses. Replace with the following:

Carefully dig or drill one 6-inch diameter test hole to the full depth of the ATPBC for each 3,000 square yards, or less, of completed base course. The Representative may require additional test holes in areas the Representative suspects are deficient in depth. The Representative will measure the depth of the base course. Using material acceptable to the Representative, backfill the test holes and compact the material to fill the test hole flush with the completed base course.

Remove and replace sections deficient in depth by 1/2 inch or more. Start correction at the point of determined deficiency and continue correction longitudinally and transversely until the depth is within 1/2 inch of the indicated depth.

(n) Protection of Courses. Replace with the following:

Section 105.13 and as follows: Traffic is not permitted on the asphalt treated permeable base material, except for trucks and equipment required to place the next layer. Replace areas damaged or contaminated, as directed and at no cost to the Department. If necessary, re-compact the ATPBC before starting subsequent paving.

Protect the surface from damage before and during the concrete paving process.

(o) Defective Work. Replace with the following:

Unless otherwise directed in writing by the District Executive, remove and replace ATPBC deficient in surface tolerance, deficient in depth, defective in asphalt content, or excessive in percent passing the 75 μm (No. 200 sieve). The ATPBC is defective in asphalt content if production tolerances are exceeded, percent of coated aggregate particles is less than 95%, or the mixture contains observable runoff of excess asphalt.

With written permission from the District Executive, the Contractor may fill low areas during construction of the next pavement course.

Acceptance testing and QA testing does not relieve the Contractor of responsibility for defective material or work.

360.4 MEASUREMENT AND PAYMENT—Square Yard or Ton

SECTION 400 FLEXIBLE PAVEMENTS

SECTION 404—EVALUATION OF ASPHALT PAVEMENT RIDE QUALITY AND PAYMENT OF INCENTIVE

404.1 DESCRIPTION—This work is evaluating an asphalt pavement surface profile and determining the ride-quality incentive associated with the pavement surface profile.

(a) General Requirements. Determine the ride quality of finished pavement surfaces, including overlaid bridge approach slabs and overlaid bridge decks. At least two of the following construction operations must be indicated in areas included in ride-quality lot measurements:

- Profile milling as specified in Section 492.
- Asphalt Base course.
- Asphalt Scratch course.
- Asphalt Leveling course.
- Asphalt Binder course.
- Asphalt Wearing course.

In the presence of the Inspector, measure the pavement surface profile according to PTM No. 428. Provide the resultant International Roughness Index (IRI) data to the Representative. The Representative will determine payment for each ride-quality lot based on the IRI.

Measure the pavement surface of the following excluded areas separate from the pavement surface profile of ride-quality lots. The Representative will not include measurements from excluded areas to determine lot incentive payment;

- Pavement surfaces not constructed as a full-depth overlay, as indicated, such as the vertical transition areas at the limits of paving and at the approaches to bridges.
- Bridge decks unless overlaid.
- Ramps less than 1,500 feet in length.
- Tapered pavements.
- Shoulders, medians, and other pavement surfaces indicated.
- Pavement from 5 feet before and up to 5 feet after any appurtenances such as water boxes, manholes, railroad tracks, and inlets extending out into the pavement.
- Partial lots less than 100 feet
- Roadways with a posted speed limit of 40 miles per hour or lower.

(b) Lot Size. A full lot is 528 feet of a single pavement lane. The Representative will designate lots starting at the beginning limit of paving and continuing to the ending limit of paving for each pavement lane and ramp that is 12 feet or wider. Do not include the length of excluded areas in the 528 feet.

The Representative will designate a partial lot at the ending limit of paving and at an excluded area, when the lot length is less than 528 feet. The Representative will evaluate a partial lot as a percentage of a full lot.

404.3 CONSTRUCTION—

(a) Equipment and Operator. Provide pavement surface profile measuring equipment that has been verified by the Department according to PTM No. 428. In the presence of the Inspector, calibrate the distance sensor and check the profile system calibration before each day's testing.

Provide an operator that is Department certified according to PTM No. 428.

(b) Testing.

1. Lots. Provide the traffic control and station marking necessary to accommodate testing. Remove objects and equipment from the surface and sweep the surface as necessary to remove debris. In the presence of the Inspector, determine the pavement surface profile for each lot according to PTM No. 428. At the completion of testing, immediately submit the lot IRI data, according to PTM No. 428, to the Representative.

2. Excluded Areas. Provide the traffic control necessary to accommodate testing. Test the entire surface of each excluded area in stages using a 12-foot straightedge. At each stage, hold the straightedge in contact with the surface and parallel to the roadway centerline and, in successive positions, test the pavement surface profile from one side of the excluded area to the other. Advance the test location to the next stage by moving the straightedge along the roadway centerline not more than 5 feet.

(c) Acceptance.

1. Lots. The Representative will compare the lot IRI to Table A in Section 404.4 to determine if the lot requires corrective action. Additionally, perform corrective action on any individual bump that requires grinding and where the irregularity is more than 3/16 inch when tested with a 12-foot straightedge.

2. Excluded Areas. Perform corrective action where irregularities are more than 3/16 inch when tested with a 12-foot straightedge. To improve the ride quality and at the Department's expense, the Representative may require grinding of excluded areas that conform to the acceptable straightedge surface tolerances specified in Section 404.3(c).

(d) Corrective Action. Do not produce a deviation, such as a ridge or valley with the adjacent pavement, of more than 3 mm (1/8 inch) when measured on the transverse profile. Correct a sufficient length of pavement to correct the pavement surface profile without producing additional high or low points. Retest the lots and excluded areas after completing corrective action. Perform additional measurements of the pavement surface profile, as necessary, for the Representative to determine which lots do not require additional corrective action. Correct surfaces to a uniform texture and cross section.

Perform all corrective action before testing for pavement depth. Use one or more of the following methods:

1. Carbide Grinding. Use carbide grinding for correcting areas 15 feet in length or less. Use grinders of the walk-behind type that have cutting heads of carbide tipped shackles, stars, or blades and have a locking depth control to produce a uniform pavement surface texture.

Provide a pavement surface texture consisting of parallel grooves between 3/32 inch and 1/4 inch wide with a "land area" between grooves of 1/16 inch and 3/16 inch. Operate the grinder by making multiple passes, if necessary, with a maximum depth of any single pass of 1/8 inch. Grind longitudinally or transversely across the pavement surface.

2. Diamond Grinding. Section 514.3 and modified as follows:

(d) Tolerance. Delete this section.

Unless otherwise approved, grind the entire lane width.

3. Removal and Replacement. Remove the surface course of the entire pavement lane width by milling and replace at least the minimum layer depth of the specified surface course. Place more than the minimum layer depth if necessary to correct the pavement surface profile.

(e) Defective Work. A ride-quality pavement lot is defective if:

- The IRI of the lot exceeds the maximum acceptable IRI according to Table A of Section 404.4.
- Any individual bump (must grind) exists in the lot where the irregularity is more than 3/16 inch when tested with a 12-foot straightedge.
- The surface adjacent to another ride-quality lot contains a ridge or valley of more than 1/8 inch.
- The specifications for pavement construction require removal and replacement of pavement within the ride-quality lot.

Unless the Department and Contractor agree to leave a defective lot in place as specified in Section 404.4, remove and replace defective areas and retest the ride-quality lot.

404.4 MEASUREMENT AND PAYMENT—Dollar

The proposal will include an item and a predetermined amount of money for Evaluation of Asphalt Pavement Ride Quality and Payment of Incentive. The contract item will have a unit of measure of DOLLAR, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the incentive or bonus status of the payment being made, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for, under the Evaluation Of Asphalt Pavement Ride Quality And Payment Of Incentive item as follows:

- If the lot is not defective, Table A and the IRI for each lot will be used to determine the incentive payment for ride quality.
- The incentive payment for a lot subjected to corrective action will be determined according to Table A and the IRI for the lot after the Contractor completes corrective action.
- The incentive payment for a partial lot will be determined as a percentage of a full lot.
- After corrective action, the Contractor may leave a defective lot in place if the District Executive provides written approval and the Contractor accepts a \$4,000 downward adjustment (rebate) of the amount paid for the lot.
- Costs associated with evaluating pavement ride quality will not be paid for separately.

TABLE A
Payment Schedule for Ride Quality Incentive

SCHEDULE A	
For Expressway Work Using Three Operations	
IRI inches/mile/lot	Amount
$\leq 35 \leq 50$	\$600
≤ 60	\$300
$\leq 70 *$	\$150
> 70	\$0
	Corrective action required

SCHEDULE B	
For Expressway Work Using Two Operations and Non-Expressway Work Using Two or More Operations	
IRI inches/mile/lot	Amount
≤ 45	\$600
≤ 55	\$300
≤ 70	\$150
$\leq 90 *$	\$0
> 90	Corrective action required
* Maximum acceptable IRI	

SECTION 405—EVALUATION OF ASPHALT PAVEMENT LONGITUDINAL JOINT DENSITY AND PAYMENT OF INCENTIVE/DISINCENTIVE

405.1 DESCRIPTION—This work is evaluating asphalt pavement longitudinal joint samples on the surface wearing course for determining densities and the incentive/disincentive.

405.3 CONSTRUCTION—

(a) General Requirements. Longitudinal joint density lots will be established as specified in Section 405.3(b). These incentive/disincentive lots are completely independent from lots defined in other sections of these Specifications for pavement acceptance. The Representative will determine the payment addition or deduction.

(b) Lot Size. A full lot is 12,500 feet of longitudinal joint and will consist of five sublots of 2,500 feet. The Representative will designate lots as the longitudinal joints on the project are constructed, beginning on the first day wearing course paving abuts a previously placed wearing course, forming a longitudinal joint. Joints constructed with tandem pavers will be included, unless otherwise indicated. As paving progresses and longitudinal joints are constructed, drill one core per subplot until a full lot is obtained as specified in Section 405.3(e). Do not include the length of excluded joints in the 12,500 feet lot. A single lot need not be contiguous and may include multiple joints throughout the project limits.

Partial lots with less than three sublots will be combined with the previous lot. Partial lots with three or more sublots will stand as a separate lot.

(c) Quality Control Strip. On the first day paving abuts a previously placed mat, forming a longitudinal joint eligible for evaluation, determine the effectiveness of the material placement and compaction operations as well as the mixture design on longitudinal joint density. In addition to any incentive/disincentive payment subplot cores, obtain five 6-inch diameter core samples located randomly on the longitudinal joint for QC density testing. Test the cores according to PTM No. 715 or PTM No. 716 and provide the results of the tests to the Representative within 24 hours. The Contractor may elect to make adjustments to the mixture design or placement and compaction operations to ensure adequate in place density is being achieved. If proposing changes that impact the field quality control plan or job mix formula, submit any modifications or revisions to the Department for review.

(d) Excluded Areas. The following joint areas are to be excluded from the longitudinal joint lots. The Representative will not obtain samples from excluded areas to determine lot incentive/disincentive payment.

- Joints where one or both sides of the pavements forming the joint were accepted for density by means other than pavement cores
- Joints where one side of the joint is formed by existing pavement not constructed under this contract
- Areas within 1 foot longitudinally of an obstruction during construction of the wearing course (manholes, inlet grates, utilities, bridge structures, pavement notches, etc.)
- Small areas, such as intersections, gore areas or transitions, or anywhere the Representative determines paving and phasing methods do not allow for consistent longitudinal joint construction. Prior to paving, submit requests in writing to the Representative for consideration of any areas to be excluded on this basis. The Representative will make the final determination.

(e) Sampling. The Representative will select one location in each subplot according to PTM No. 1 and PTM No. 729. The Contractor may take one companion core per subplot for quality control purposes. For vertical joints center joint cores on the line where the joint between the two adjacent lifts abut at the surface. For notched wedge joints, center joint cores 6-inches or one half the joint taper width away from the joint line in the direction of the wedge. With the Representative present, drill 6-inch diameter cores as soon as possible, but no later than the day following the construction of the longitudinal joint at each subplot location. Do not compress, bend, or distort samples during cutting, handling, transporting, and storing. If samples are damaged, immediately obtain replacement samples, as directed by the Representative, from within 12 inches of the original sample location. Within 24 hours after coring, backfill the hole(s) with mixture of the same JMF or with mixture used for subsequent courses and compact and seal the mixture.

Identify the samples by longitudinal joint lot and subplot number, location, dates of placement, mixture type, and as acceptance samples (Sample Class AS). Provide the daily theoretical maximum specific gravity value as specified in Section 413.2(e)1.d.4 for the mix on each side of the longitudinal joint. The average of the two values will be used for the density calculation of each subplot according to PTM No. 729. Immediately package and deliver the samples to the Representative according to the QC Plan. Use sample containers of sufficient strength to prevent samples from being damaged during transport.

Each joint core will be comprised of portions of two lanes, with the potential for two different JMFs within each core. The Representative will submit separate samples and Forms TR-447 for sublots after work stoppages of more than 5 days.

The LTS will test the density samples according to PTM No. 715, and if necessary PTM No. 716, to determine the percent compaction.

(f) Percent Within Limits (PWL). Once all test results for a lot have been received, the Representative will compute the PWL and average in place density for each lot as specified in Section 106.03(a)3.a and as follows. The lower specification limit (L) will be 91.0 %. No upper specification limit (U) for density will be factored into the PWL determination.

405.4 MEASUREMENT AND PAYMENT—Dollar

The proposal will include an item and a predetermined amount of money for Evaluation of Asphalt Pavement Longitudinal Joint Density and Payment of Incentive/Disincentive. The Contract item will have a unit of measure of DOLLAR, a unit price of \$1.00, and a quantity equal to the predetermined amount. When asphalt pavement longitudinal joint density evaluation indicates that a disincentive adjustment is applicable, the appropriate amount will be deducted from money due or to become due to the Contractor through the processing of a contract adjustment.

Due to the incentive or bonus status of the payment being made the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for, under the Evaluation of Asphalt Pavement Longitudinal Joints and Payment of Incentive item as follows:

For each lot Table A will be used to determine the incentive/disincentive payment for longitudinal joint density.

The incentive/disincentive payment for a lot containing other than 5 sublots will be determined as a percentage of a full 12,500 feet lot, by the following:

- N=3 (60% of the Table A amount)
- N=4 (80% of the Table A amount)
- N=6 (120% of the Table A amount)
- N=7 (140% of the Table A amount)

For a full lot with a $PWL \geq 81$, the Contractor will receive a prorated positive incentive payment up to a maximum of \$7,500 calculated according to Table A.

For a full lot with a $PWL \leq 49$, the Contractor will receive a prorated negative adjustment (disincentive) up to a maximum of \$12,500 for the longitudinal joint lot calculated according to Table A. Lots with $PWL \leq 49$ and average density ≥ 90.0 % will be assessed a disincentive up to a maximum of \$1,000 per subplot regardless of PWL.

Costs associated with providing joint pavement cores will not be paid for separately and will be considered incidental to the construction items for the wearing courses eligible for the longitudinal joint evaluation.

TABLE A

Lot by Lot Payment Schedule for Longitudinal Joint Incentive/Disincentive	
Lot PWL	Amount
$PWL \geq 81$	$(PWL - 80)/20 \times \$7,500$ (Incentive)
$PWL = 50 \text{ to } 80$	\$0
$PWL \leq 49$	$(50 - PWL)/50 \times -\$12,500$ (Disincentive)

SECTION 410 – SUPERPAVE MIXTURE DESIGN, STANDARD AND RPS CONSTRUCTION OF PLANT-MIXED ASPHALT FINE-GRADED COURSES

410.1 DESCRIPTION—This work is the standard and RPS construction of a plant-mixed asphalt wearing course on a prepared surface using a volumetric mixture design developed with the Superpave Gyratory Compactor and modified to be a fine-graded (FG) mixture.

410.2 MATERIALS—Section 413.2 using the procedure and volumetric tolerances for the 9.5 mm nominal maximum aggregate size mixture and modified as follows:

(e) Mixture Composition for Standard and RPS Construction.

1. Virgin Material Mixtures. Submit a JMF meeting all of Bulletin 27 requirements for a 9.5 mm nominal maximum aggregate size mixture, except the JMF must have a minimum percent passing the No. 8 sieve of 47% and a maximum percent passing the No. 8 sieve of 67%.

410.3 CONSTRUCTION—Section 413.3 using the test procedures, limits and tolerances for a 9.5 mm nominal maximum aggregate size mixture except where procedures, limits and tolerances are specifically indicated for a 9.5 mm fine-graded nominal maximum aggregate size mixture and as modified as follows:

Revise Table G to include 9.5 mm Fine Grade Wearing Course as follows:

TABLE G
Mixture Minimum Compacted Depths

Mixture	Minimum Depth
9.5 mm Fine Grade Wearing Course	1 in.

410.4 MEASUREMENT AND PAYMENT—Square Yard or Ton

Paid as specified in Section 413.4 for a 9.5 mm Wearing Course.

SECTION 412—SUPERPAVE MIXTURE DESIGN, CONSTRUCTION OF PLANT-MIXED 6.3 MM THIN ASPHALT OVERLAY COURSES

412.1 DESCRIPTION—This work is the construction of a thin lift wearing course of plant-mixed, dense-graded asphalt concrete with 6.3 mm Nominal Maximum Aggregate Size (NMAS), placed on a prepared surface.

412.2 MATERIALS—Section 413.2 with additions and modifications as follows:

(a) Asphalt Material.

1. Virgin Mix. Furnish PG 64E-22, conforming to the requirements of Standard Specifications for Performance-Graded Asphalt Binder Using Multiple Stress Creep Recovery (MSCR) Test, AASHTO M 332, except as revised in Bulletin 25. Obtain material from a source listed in Bulletin 15 for the specified performance grade. Provide QC testing and certification as specified in Sections 106.03(b) and 702.1(b)1. Provide the Representative a copy of a signed Bill of Lading for asphalt binder material on the first day of paving and when the batch number changes.

1.a. WMA Technology Additives or Modifiers Blended at the Asphalt Material Supplier's Refinery or Terminal. Provide refinery or terminal blended asphalt material blended with an approved WMA Technology additive or modifier from an approved manufacturer and source listed in Bulletin 15. Include in the asphalt material Producer QC Plan, the WMA Technology additive or modifier manufacturer name, WMA Technology name, and source, dosage rates, blending method, QC testing, corrective action points, disposition of failed material, storage, handling shipping, and bill of lading information following the applicable requirements in Section 702. Include the WMA Technology additive or modifier and dosage rate on the bill of lading. Provide certification that the refinery or terminally blended asphalt binder, that when modified with the WMA Technology additive or modifier, meets the requirements for the specified performance grade.

1.b. WMA Technology Additives or Modifiers Blended at the Asphalt Mixture Producer's Plant. Provide a blended asphalt binder consisting of an approved WMA Technology additive or modifier from an approved manufacturer and source listed in Bulletin 15 that is blended with a base asphalt binder of the specified performance grade conforming to the requirements of Standard Specifications for Performance-Graded Asphalt Binder Using Multiple Stress Creep Recovery (MSCR) Test, AASHTO M 332, except as revised in Bulletin 25 and from an approved source listed in Bulletin 15, Section 702. Prepare a Producer QC Plan as specified in Section 106 and conforming to the Producer QC Plan requirements in Section 413.2(e)1.a and the additional Producer QC Plan requirements within this specification.

(b) Aggregate

1. General Requirements. Provide aggregate from approved producers and sources listed in Bulletin 14. Furnish aggregate that conforms to the quality requirements for Superpave Asphalt Mixture Design as specified in Bulletin 27 with modifications as specified in Section 412.2. Provide aggregate with at least the SRL designation specified. To achieve the specified SRL, the Contractor may provide a blend of two aggregates if the blend has an SRL designation equal to or better than that specified. Blends for SRL are 50% by mass (weight) of each aggregate. Blend the aggregates using an approved method.

2. Fine Aggregate. Section 703.1, except Table A gradation does not apply and as follows:

- Determine the uncompacted void content according to AASHTO T 304, Method A, or use the value listed in Bulletin 14, and ensure the uncompacted void content conforms to AASHTO M 323, Table 6.
- Determine the sand equivalent value according to AASHTO T 176 and ensure the sand equivalent value conforms to AASHTO M 323, Table 6.

All manufactured sand fine aggregates used in NMAS 6.3 mm mixtures must be from a source that has a coarse aggregate SRL rating listed in Bulletin 14 as specified. Manufactured sand fine aggregate must be manufactured from

the same parent material(s) as the Bulletin 14 listed coarse aggregate and will have the same SRL rating as the listed coarse aggregate.

All natural sand fine aggregates, and manufactured sand fine aggregates without a coarse aggregate from the same source with an SRL rating listed in the Bulletin 14 used in NMAS 6.3 mm mixture must be submitted to the LTS for SRL determination.

3. Coarse Aggregate. Type A, Section 703.2, except Table C gradation does not apply and revise the following requirements of Table B:

- Abrasion, Maximum Percent Loss as specified in Bulletin 27, Chapter 2A, Table 5A
- Flat and Elongated Particles in Coarse Aggregate maximum percent as specified in ASTM D4791 using material retained on the No. 4 sieve, Maximum 10 percent for 1:5 ratio, and Maximum 20 percent for 1:3 ratio.
- Crushed Fragments, Minimum Percent, as specified in AASHTO M 323, Table 6, for Fractured Faces, Course Aggregate using the material retained on the No. 4 sieve.

The coarse aggregate must satisfy specified SRL requirements. Do not use coarse aggregate or anti-skid aggregate in the mixture until the quality, type, and SRL, are determined.

(c) Recycled Asphalt Material. Do not use Reclaimed Asphalt Pavement (RAP) or Recycled Asphalt Shingles (RAS) in the 6.3 mm Wearing Course.

(d) Filler. Follow Section 703.1(c)1. Do not use fly ash if the design traffic is greater than or equal to 3 million Equivalent Single Axle Loads (ESALs). Hydrated lime is allowed as a filler and may constitute up to 2 % of the weight of total dry aggregate unless otherwise shown on the plans. Provide hydrated lime that conforms to the requirements of ASTM C977.

(e) Mixture Composition.

1. Virgin Material Mixtures. Design 6.3 mm NMAS mix that meets all Department requirements. Size, uniformly grade, and combine aggregate fractions, asphalt binder, and an approved WMA Technology in proportions to develop a JMF that conforms to the material, gradation, and volumetric Superpave Asphalt Mixture Design requirements as specified in Bulletin 27, Chapter 2A, except as modified in Table A.

The WMA Technology Manufacturer Technical Representative (Technical Representative) will address laboratory procedure modifications necessary to prepare, compact, and test WMA mixtures and to achieve a uniform blend. Develop a JMF and incorporate the WMA Technology additive, modifier, or process into that JMF during production. Do not develop a volumetric JMF based on incorporating the WMA Technology additive, modifier or process during the volumetric asphalt mixture design process. For all JMFs, perform moisture susceptibility analysis according to Bulletin 27 and ensure the asphalt mixture used for the analysis includes the WMA Technology. Ensure the WMA Technology additive, modifier, or process is not detrimental to the moisture resistance of the mixture.

Submit a complete copy of the JMF, including a Form TR-448A signed by a certified Asphalt Level 2 Plant Technician, to the DME/DMM at least 3 weeks before the planned start of mixture production. Include a list of all material sources and the asphalt mixture producer on the TR-448A. Provide the calibration factors (C_f for both asphalt content and 75 μm (No. 200) sieve) required by PTM No. 757 with the JMF on the TR-448A. Do not start mixture production until after the DME/DMM reviews the JMF.

Submit a completely new JMF, including a new Form TR-448A, with a change in material sources or if a new JMF is necessary to produce a mixture conforming to this specification.

TABLE A
Mix Design Requirements for Thin Lift 6.3 mm Asphalt Wearing Course

AGGREGATE GRADATION REQUIREMENTS, PERCENT PASSING	
Sieve Size	Min. – Max.
9.5 mm (3/8 inch)	100 Min.
6.3 mm (1/4 inch)	90-100
4.75 mm (No. 4)	0-85
2.36 mm (No. 8)	37-55
300 µm (No. 50)	8-25
75 µm (No. 200)	3-10
VOLUMETRIC DESIGN REQUIREMENTS	
Design Gyration (N_{design}) for All Specified Ranges of Design ESALs	75
Voids in Mineral Aggregate (VMA), Min. %, for All Specified Ranges of Design ESALs	16.5
Design Air Voids (V_a), %, for All Specified Ranges of Design ESALs	3.5-4.0
Binder Draindown (AASHTO T 305), % Maximum, for mixture with greater than 7.0% Asphalt Content	0.3%
Binder Grade for All Specified Ranges of Design AASHTO M 332	PG 64E-22

1.a Producer QC Plan. Section 413.2(e)1.a

1.b Plant Technicians. Section 413.2(e)1.b

1.c Annual JMF Verification. Section 413.2(e)1.c except conform to the single and multiple sample tolerances in Section 412.2(e)1.d Tables B and C.

1.d Production. Section 413.2(e)1.d except as follows:

1.d.1 Apparent Moisture Content. Section 413.2(e)1.d.1

1.d.2 Asphalt Content. Include in the producer QC Plan a frequency of obtaining mixture samples according to PTM No. 1 and performing asphalt content tests to verify that the mixture conforms to the tolerances of Table B. Test the samples according to either PTM No. 757, PTM No. 702, or PTM No. 742. After obtaining a minimum of three test results, determine compliance with the multiple sample tolerances in Table B. After obtaining five or more test results, determine compliance with the multiple sample tolerances in Table B using the running average of the last five consecutive test results.

Printed ticket results may be used in place of laboratory test results for QC of asphalt content of the mixture if the producer is currently approved to use printed tickets according to Bulletin 27. During mixture production, maintain 90% of printed ticket results for each day of production within 0.2 percentage points of the JMF.

1.d.3 Gradation. Sample the completed mixture, the combined aggregate from the hot bins of a batch plant, or the combined aggregate belt of a drum plant, according to PTM No. 1 and at the frequency in the producer QC Plan. If mineral filler is used in the mixture, determine gradation by testing samples of the completed mixture.

- Test the completed mixture according to PTM No. 757 or according to PTM No. 702 and PTM No. 739.
- Test combined aggregate samples according to PTM No. 743.

Produce a mixture within the tolerances of Table B. Determine compliance with the multiple-sample tolerance after obtaining a minimum of three test results for the mixture. After obtaining five or more test results for the mixture, determine compliance with the multiple-sample tolerances using the running average of the last five consecutive test results.

1.d.4 Theoretical Maximum Specific Gravity. Section 413.2(e)1.d.4

1.d.5 Volumetric Analysis of Compacted Specimens. Sample the completed mixture according to PTM No. 1 and at the frequency in the producer QC Plan. Prepare a minimum of two specimens from each sample according to AASHTO T 312.

Produce a mixture with volumetric properties conforming to the tolerances of Table C. Determine the bulk specific gravity of the specimens as specified in AASHTO T 312 and calculate air voids (V_a) and Voids in Mineral Aggregate (VMA) at N_{design} according to AASHTO R 35 and as specified in Bulletin 27.

TABLE B
Composition Tolerance Requirements of the Completed Plant Mix

		Single Sample (n = 1)	Multiple Samples (n ≥ 3)
Gradation			
Passing 6.3 mm (1/4 inch) to 300 μm (No. 50) Sieves (Inclusive)		±6%	±4%
Passing 75 μm (No. 200) Sieve		±3.0%	±2.0%
Asphalt Content			
6.3 mm		±0.6%	±0.4%
Temperature of Mixture (F)			
Class of Material	Type of Material	Minimum	Maximum
PG 64E-22	Asphalt Cement	285	330
Job-Mix Tolerance Requirements for Combined Hot Bin Gradations			
Gradation		Single Sample (n = 1)	
Passing 6.3 mm (1/4 inch) to 300 μm (No. 50) Sieves (Inclusive)		±4%	
Passing 75 μm (No. 200) Sieve		±3.0%	

TABLE C
Volumetric Tolerance Requirements of the Plant Mixed, Laboratory Compacted Mixture

	Single Specimen (n = 1)	Multiple Specimens (n ≥ 2)
Air Voids at N_{design} (V_a) from Target	±2.0%	±1.5%
Minimum VMA %	16.0	-

1.e Corrective Actions. Immediately take corrective actions if one or more of the following occurs:

- QC test results on a single sample (n=1) for percent passing the 6.3 mm (1/4 inch) sieve, 2.36 mm (No. 8) sieve, 300 μm (No. 50) sieve, 75 μm (No. 200) sieve, or asphalt content are not within the tolerances in Table B.
- The average of multiple samples (n≥3) for percent passing any sieve or asphalt content, as determined according to Section 412.2(e)1.d, are not within the tolerances in Table B.
- QC test results on a single specimen (n=1) or on multiple specimens (n≥2) are not within the tolerances in Table C.
- Independent assurance (IA) or QA sample results tested at the producer's plant are not within the tolerances of Tables B or C.

After taking corrective actions, sample the completed mixture within 150 tons of production. After sampling, test the mixture and provide test results to the Representative. If less than three samples are tested for mixture composition, determine conformance with Table B by comparing each result to the multiple sample tolerances. If the mixture does not conform to the single and multiple sample tolerances in Table B and the single and multiple specimen tolerances in Table B, suspend production and shipping to the project and determine the cause of the problem. Provide a written explanation of the problem and a proposed solution to the Department. After the Representative reviews the proposed solution and authorizes production to continue, resume production and perform JMF verification according to the QC Plan. During corrective actions and JMF verification, mixture acceptance is according to the approved acceptance level of Section 413.2(f) Table C.

2. Draindown Sensitivity. For mixtures with greater than 7 percent total asphalt content determine the draindown sensitivity of the mixture using AASHTO T 305 at the maximum mixture temperature listed in Table B

minus 5F. Use Fibers to reduce binder draindown if draindown exceeds the requirements of Table A. Use stabilizer types specified in Section 419.2(d) as needed to address draindown.

(f) Mixture Acceptance. Section 413.2(f) except as follows:

1. General. The Department will accept the mixture according to the certification acceptance in Section 412.2(f)2 or lot acceptance in Section 412.3(h)2.

2. Certification Acceptance. Acceptance by certification is appropriate for the following applications:

- Scratch Courses, Leveling courses and driveway adjustments.
- Mixtures used by Department maintenance forces.
- Mixtures purchased by local municipal governments.
- Mixture placed in quantities less than 350 tons in a continuous placement operation unless otherwise directed by the Representative.
- Other conditions, or applications as approved by the Representative.

2.b Certification of Mixture. Certify each mixture daily if QC test results conform to the single sample and multiple sample JMF production tolerances of Table B. The acceptance values will be:

- Asphalt Content
- Percent Passing the 75 μm (No. 200) sieve

If using printed ticket results in place of laboratory test results for asphalt content, certify that at least 90% of each day's printed ticket results for asphalt content are within 0.2 percentage points of the JMF.

If the mixture does not conform to the above requirements, do not certify the mixture. Instead, provide all QC test results to the Inspector-in-Charge. If using printed ticket results for asphalt content, provide the percentage of daily printed ticket results within 0.2 percentage points of the JMF to the Inspector-in-Charge. Payment will be determined according to Table D based on the QC test results.

If a day's production is interrupted by corrective action, material produced after the corrective action may be certified if QC test results conform to production tolerances.

(g) WMA Technologies (Additive(s), Modifier(s), or Processes) and WMA Manufacturers. Section 413.2(f)

(h) Anti-Strip Additives. Section 413.2(g)

(i) WMA Technology Manufacturer Technical Representative (Technical Representative). Section 413.2(h)

(j) 6.3 mm Mixture use with Membrane Systems Specified in Section 467 or Section 680. Do not use 6.3 mm wearing course paving mixture for material placed directly on top of membrane systems.

412.3 CONSTRUCTION—Section 413.3 with additions and modifications as follows:

(a) Preplacement Requirements. Provide asphalt courses as indicated for the entire project.

1. Paving Operation QC Plan. Prepare a paving operation QC Plan, as outlined on Form CS-413, for field control and evaluation of asphalt concrete paving operations. Submit the QC Plan to the Representative before or at the pre-construction conference. The QC Plan shall describe the construction equipment and methods necessary to construct and test the asphalt concrete courses as specified in Section 412.3. The WMA Technical Representative will provide all recommendations and direction specific to the WMA technology in the paving operation QC Plan. Do not start paving until after the Representative reviews the QC Plan.

2. Preplacement Meeting. At least 2 weeks before placing asphalt paving mixtures, schedule an asphalt preplacement meeting with the Representative to review at a minimum the specification, paving operation QC Plan, sequence of paving operations, mixture acceptance, density acceptance and the care and custody of asphalt acceptance samples.

(b) Weather Limitations. Do not place 6.3 mm wearing course paving mixtures from October 1 to March 31 in Districts 1-0, 2-0 (except Juniata and Mifflin Counties), 3-0, 4-0, 5-0 (Monroe and Carbon Counties only), 9-0 (Cambria and Somerset Counties only), and 10-0; and from October 16 to March 31 in Districts 2-0 (Juniata and Mifflin Counties only), 5-0 (except Monroe and Carbon Counties), 6-0, 8-0, 9-0 (except Cambria and Somerset Counties), 11-0 and 12-0. No exceptions to paving weather limitations will be allowed unless approved in writing by the District Executive. Do not place asphalt paving mixtures when surfaces are wet, when the air or surface temperature is 50F or lower. If work is halted because of weather conditions, the Representative may allow the Contractor to place limited quantities of mixture that are en route to the project.

1. Paving Season Extensions. Section 413.3(b)1. With the following addition:

If an exception to the Weather Limitation dates is approved by the District Executive for 6.3 mm wearing course, the minimum surface temperature of 50F, and an air temperature of 40F will be strictly enforced and compaction of the asphalt mixture completed as quickly as possible.

(c) Asphalt Mixing Plant. Section 413.3(c).

1. Batch Plant. Section 413.3(c)1.

2. Drum Mixer Plant. Section 413.3(c)2.

(d) Hauling Equipment. Section 413.3(d)

(e) Paving Equipment. Section 413.3(e)

(f) Rollers. Use an adequate number of steel-wheeled rollers, each weighing a minimum of 10 tons and as specified in Section 108.05(c)3 to keep up with the paving operation. Operate rollers according to manufacturer's recommendations. Use rollers equipped with a watering or soapy watering system that prevents material from sticking to the rollers. Do not use pneumatic wheeled rollers.

Do not use rollers in vibratory mode unless it can be demonstrated to the satisfaction of the Representative that no breaking of aggregate or flushing of asphalt binder results from the vibration. Monitor pavement cores for aggregate breakage on every lot. Discontinue vibration if aggregate breakage or flushing of asphalt binder occurs.

(g) Preparation of Existing Surface. Section 413.3(g) with the following modification:

1. Conditioning of Existing Surface. Before delivering asphalt mixtures, remove and dispose of loose and foreign material and excess joint sealer and crack filler from the surface of existing pavement or previously placed pavement courses. If necessary, use a power broom. Remove all thermoplastic pavement markings. If practical, do not allow traffic on the existing surface after cleaning, to prevent contamination.

Before placing a wearing course, correct irregularities in the binder course. Repair potholes and gouges greater than 1 inch in depth. Fill and seal all pavement cracks or joints that exceed 1/8 inches in width. Use fillers and sealants conforming to PennDOT specifications.

Paint all existing vertical surfaces of curbs, structures, gutters, and pavements that will be in contact with asphalt mixtures with a uniform coating of either emulsified asphalt, consisting of PennDOT Material Class TACK, or NTT/CNTT, applied in two or more applications or hot asphalt binder of the class and type designated for the asphalt course.

Before overlaying existing surfaces, apply a tack coat to the clean surface according to Section 460. Allow adequate time for tack to break completely prior to placing any material.

(h) Spreading and Finishing. Section 413.3(h) with the following modification:

1. General Requirements.

1.a Placing. Unless otherwise allowed, deliver, place, and compact 6.3 mm paving mixtures during daylight hours. Ensure the mixture does not contain lumps of cold material. Deliver and place 6.3 mm paving mixtures at the laying temperatures specified in Table B.

Utilize a Material Transfer Vehicle (MTV) as specified in Section 108.05(c)5 for 6.3mm paving mixtures unless otherwise approved by the Representative.

1.b Spreading and Finishing. Section 413.3(h)1.b with the following addition:

Plan and schedule operations to minimize hand work of 6.3 mm paving mixtures.

1.c Field Technician. Section 413.3(h)1.c

2. Mixture Lot Acceptance. Section 413.3(h)2 with the following modification:

2.a Lots and Sublots. 413.3(h)2.a.

2.a.1 Partially Completed Lots (n=2 or less). When process conditions change to an extent that a partially completed lot cannot be combined with the most recently completed lot, samples will be independently evaluated on the partially completed lot. For asphalt content and percent passing the 75 μ m (No. 200) sieve, mixture acceptance samples will be evaluated individually as specified in Table B (n=1) criteria. For density, mat density acceptance samples will be evaluated individually using the criteria in Table E.

If samples tested for asphalt content and percent passing the 75 μ m (No. 200) sieve meet the n=1 criteria of Table B, and samples tested for density meet the criteria in Section 413.3(h), Table E, payment will be 100% of the contract unit price. If samples tested for asphalt content and percent passing the 75 μ m (No. 200) sieve do not meet the n=1 criteria of Table B, the material will be considered defective work.

Unless otherwise directed in writing by the District Executive, remove and replace defective work.

2.b Mixture Acceptance Samples. Section 413.3(h)2.b and add the following to the end of the first paragraph:

If a representative mixture acceptance sample cannot be obtained directly behind the paver, the loose mixture acceptance sample for each subplot may be taken from the paver hopper or from the paver screed representing the sample subplot location. Determine the approved mixture acceptance sample collection method for loose mixture acceptance samples at the preconstruction or prepaving meeting.

2.c Mixture Acceptance Sample Testing. LTS Testing will be utilized unless otherwise indicated in the proposal.

2.c.1 LTS Testing. The LTS will test the mixture acceptance samples according to PTM No. 757 or PTM No. 702, Modified Method D, if previously identified problematic aggregates are used in the mixture, to determine asphalt content and the percent passing the 75 μ m (No. 200) sieve. The LTS will use the calibration factors (C_f and 200 C_f) provided with the JMF for PTM No. 757. The minimum sample size for PTM No. 757 is 1000 grams when 6.3 mm mix is used. For individual increment test results outside of the single sample (n=1) tolerances in Table B, the LTS will analyze the test results for extreme values according to PTM No. 4 at the 5% significance level. If discarding an extreme value reduces a lot to less than three remaining test results, the Department will accept the lot as specified in Section 412.3(h)2.a.1. The Department will accept lots with three or more test results as specified in Section 412.4(a)2.

If the asphalt content or the percent passing the 75 μ m (No. 200) sieve is not within the single sample (n=1) or multiple sample (n \geq 3) tolerances in Table B for two consecutive lots or a total of three lots, stop all production of the JMF. Determine the cause of the problem and provide a proposed solution to the Department.

Do not resume production of the JMF until the Representative reviews the proposed solution and authorizes production to continue.

3. Pattern Segregation. Section 413.3(h)3.

4. Flushing. Section 413.3(h)4.

(i) Compaction. Begin rolling immediately after placement of mixture. Compact the 6.33 mm paving mixture to achieve the optimum rolling pattern requirements and to eliminate all roller marks. Compact the mixture while it is in proper condition and adjust roller speed, pattern, and roller size (and/or amplitude and frequency if vibratory rolling

is approved by the Representative) to eliminate displacement, shoving, cracking, and aggregate breakage as specified in Section 412.3(f). Satisfactorily correct displacement resulting from reversing roller directions and other causes. Do not use pneumatic-tire rollers.

Without using excess water, maintain wheels of steel wheel rollers moist and clean to prevent the mixture from adhering to the wheels.

For areas inaccessible to rollers, compact with mechanical vibrating hand tampers.

Remove areas that are loose, broken, mixed with dirt, or show an excess or deficiency of asphalt material. Replace removed mixture with fresh, hot 6.3 mm paving mixture and compact the mixture even with the surrounding pavement surface.

(j) Mat Density Acceptance. The Department will accept the mat density based on non-movement and optimum rolling pattern.

1. Non-Movement. The Department will accept the density when the mixture does not move under the compaction equipment.

2. Optimum-Rolling Pattern. With the Representative and the Contractor's certified asphalt field technician present, determine density with an approved nuclear gauge according to PTM 402, or determine density with an approved electrical impedance gauge according to PTM No. 403. Nuclear gauges must be operated by a licensed nuclear gauge operator. In the presence of the Representative, follow the control strip technique specified in PTM No. 402 to construct at least one control strip to establish the optimum rolling pattern for each course. Document readings using the forms provided in PTM No. 402 and provide the completed forms to the Representative. Compact the course according to the optimum rolling pattern. During paving, the Representative may require the Contractor to construct a new control strip to verify the optimum rolling pattern.

Use one of the following gauges or approved equal:

- Troxler Electronics, Model 3411B or Model 4640B
- Campbell Pacific Nuclear, Model MC-2
- Seaman Nuclear, Model MC-2
- TransTech Systems, Inc., PQI™, Model 300 or Model 301
- Troxler Electronic Laboratories, PaveTracker™

Submit a copy of the certificate of nuclear gauge annual calibration according to ASTM D2950 and documentation of training of the nuclear gauge operator. Recalibrate any nuclear gauge that is damaged or repaired.

(k) Joints. Section 413.3(k)

(l) Surface Tolerance. Section 413.3(l)

(m) Tests for Depth: Wearing Courses. Section 413.3(m)

(n) Protection of Courses. Section 413.3(n)

(o) Defective Work. Section 413.3(o)

412.4 MEASUREMENT AND PAYMENT -

(a) Standard 6.3mm Asphalt Construction.

1. Asphalt Courses.

1.a Thin Lift 6.3 mm Asphalt Wearing Course. Square Yard or Ton

1.b Thin Lift 6.3 mm Asphalt Wearing Course (Scratch). Ton

2. Asphalt Tack Coat. Section 460.4

3. Mixture Acceptance by Certification and Density Acceptance by Non-Movement, Optimum-Rolling Pattern. The Representative will pay at the contract unit price, adjusted according to Table D. The total payment factor percentage is the sum of adjustments for each test criterion subtracted from 100%. The adjustment for an individual test criterion is the payment factor percentage subtracted from 100%. The pavement will be considered defective if the payment factor for asphalt content and percent passing the 75 μ m (No. 200) sieve are both 85%.

TABLE D
Contract Unit Price Adjustments - Mixture Acceptance by Certification

Mixture NMAS	Test Criteria	Test Value		Payment Factor Percentage
Asphalt Content				
6.3 mm	Printed Tickets	At least 90% of Daily Printed Tickets Within 0.2% of JMF		100
		Less than 90% of Daily Printed Tickets Within 0.2% of JMF		85
6.3 mm	QC Sample Testing**	Single Sample (n=1)	Multiple Samples (n≥2)	
		±0.7%	±0.5%	100
		±0.8% to 1.0%	±0.6%	85
		> ±1.0%	≥ ±0.7%	*
Gradation				
		Single Sample (n=1)	Multiple Samples (n≥2)	
6.3 mm	QC Sample Testing for % Passing 75 μm (No. 200) Sieve**	±3.0%	±2.1%	100
		±3.1% to ±4.0%	±2.2% to ±2.7%	85
		> ±4.0%	≥ ±2.8%	*
Mat Density				
6.3 mm	Non-Movement	Section 412.3(j)1.		100
	Optimum-Rolling Pattern	Section 412.3(j)2.		100
* Defective pavement. Remove and replace or, when permitted by the District Executive in writing, leave in place and the Department will pay 70% of the contract unit price.				
** For these test criteria, the daily Payment Factor Percentage will be determined by the single sample test result from the daily QC sample. If more than one QC sample test result is available for a day, the Payment Factor Percentage will be determined based on the average of the results using multiple sample tolerances. If corrective action is taken, Payment Factor Percentages will be separately determined for material placed before and after the corrective action.				

4. Mixture Acceptance by Lot and Density Acceptance by Optimum Rolling Pattern. The Department will pay on a lot-by-lot basis at the contract price, adjusted for Payment Factor Percentages as specified in Table E. For the payment factor percentages based on percent within tolerance, the Department will determine the percent within tolerance according to Section 106.03(a)3, using the upper and lower specification limits in Table F.

TABLE E
Contract Unit Price Adjustments - Mixture Acceptance by Lots

Mixture NMA S	Test Criteria	Test Value	Payment Factor Percentage
Asphalt Content			
6.3 mm	Acceptance Sample Testing	All individual subplot acceptance sample test results for the lot (n=1) are within ± 0.6% and the lot average (n≥3) is within ± 0.4%*	100
		Percent Within Tolerance if any individual subplot acceptance sample test result for the lot is not within the n=1 tolerances or the lot average is not within the n≥3 tolerances listed above.	Table G
Gradation			
6.3 mm	Acceptance Sample Testing for % Passing 75µm (No. 200) Sieve	All individual subplot acceptance sample test results for the lot (n=1) are within ± 3.0% and the lot average (n≥3) is within ± 2.0%*	100
		Percent Within Tolerance if any individual subplot acceptance sample test result for the lot is not within the n=1 tolerances or the lot average is not within the n≥3 tolerances listed above.	, Table G
Mat Density			
6.3 mm	Optimum-Rolling Pattern	Section 412.3(j)2	100
* The Department may elect to randomly select and test only one subplot acceptance sample from each lot to determine conformance to the specifications. If only one subplot acceptance sample is tested, tighter tolerances will be used to determine conformance to the specifications for the entire lot. If the one subplot is within ±0.2% of the JMF for asphalt content and within ±1.0% of the JMF for percent passing the 75 µm (No. 200) sieve, the lot will be considered to conform with the specifications and the lot’s payment factor percentage will be determined according to this table. If the one subplot fails to meet the tighter tolerances, all acceptance samples from the lot will be tested to determine the payment factor percentage according to this table.			

TABLE F
Upper and Lower Specification Limits for
Calculating Percent Within Tolerance

Mixture NMA	Testing Criteria	
	Lower Specification Limit (L)	Upper Specification Limit (U)
	Asphalt Content from JMF Value, %	
6.3 mm	-0.4	+0.4
	Percent Passing the 75 μm (No. 200) sieve from JMF Value, %	
6.3 mm	-2.0	+2.0

69	59
68	57
67	55
66	54
65	52
64	50
Less than 64	Defective Lot**

**Remove and replace the lot. If only one lot characteristic has a percent within tolerance less than 64, the District Executive may allow the Contractor to leave the defective lot in place. The Department will pay for the defective lot at 70% of the contract unit price.

4.a Payment. The Representative will compute the percent of the contract unit price paid as follows:

$$\text{Lot Payment} = C_P(2P_D + P_B + P_A)/400$$

C_P = Contract unit price per lot (unit price times lot quantity)

P_D = Payment Factor Percentage for density

P_B = Payment Factor Percentage for asphalt content.

P_A = Payment Factor Percentage for percent passing the 75 μm (No. 200) sieve

4.b Dispute Resolution. For mixture acceptance testing performed by the LTS, the Contractor may request in writing that the Department retest a lot if the initial test results indicated a defective lot (remove and replace). Provide written retest requests to the District Executive within 3 weeks of the date the LTS test results are released. Retests will not be allowed if a written retest request is not received within 3 weeks of the date the LTS test results are released. Provide quality control test results and control charts, companion sample test results (if available), test data trend evaluation, and any other pertinent information to justify the retest request. The Department will evaluate the information and may allow retesting if the information submitted provides a reasonable basis to conclude that the failing test results may not represent the in-place material. The LTS will perform the retest with the Contractor present, unless otherwise agreed to in writing with the Contractor.

For retesting of materials failing for asphalt content or percent passing the 75 μm (No. 200) sieve, the Inspector will identify the locations where the original box samples were collected. The Inspector will select retest sample locations 24 inches from the original sample locations longitudinally in the direction of traffic. If the 24 inch offset causes the retest sample location to fall outside of the subplot, the Inspector will select the retest sample location 24 inches from the original sample locations longitudinally in the opposite direction from traffic.

With the Inspector present, provide appropriate traffic control and drill two 6-inch diameter cores at each retest sample location for retesting purposes. Rinse all retest cores thoroughly with water immediately after drilling to remove all loose material on the core from the drilling operation. Within 24 hours after coring, backfill the holes with asphalt mixture of the same JMF or with asphalt mixture used for subsequent courses and compact and seal the asphalt mixture. Provide traffic control, core, and backfill the core holes at no cost to the Department. The test method used for asphalt determination during the original acceptance testing (PTM No. 757 or PTM No. 702) will be used for the retest, unless the (DME/DMM) grants written approval for a change in test method. The results of the retest cores will be used to calculate payment for both asphalt content and percent passing the 75 μm (No. 200) sieve for the lot.

The Department will deduct from the payment the cost per lot associated with conducting a retest as follows in Table H:

TABLE H
Dispute Resolution Retest Cost Table

Test Method	Mixture Acceptance Retest Cost if Retest Results Indicate	Mixture Acceptance Retest Cost if Retest Results Indicate
	100% Pay Factor(s)*	<100% Pay Factor(s)
PTM No. 702/739	\$900	\$3,500
PTM No. 757	\$500	\$2,000

SECTION 413—SUPERPAVE MIXTURE DESIGN, STANDARD AND RPS CONSTRUCTION OF PLANT-MIXED ASPHALT COURSES WITH PERCENT WITHIN LIMITS AND LTS TESTING (PWL-LTS)

413.1 DESCRIPTION—This work is the Standard and RPS construction of a plant-mixed, dense-graded, asphalt pavement course on a prepared surface using a volumetric asphalt mixture design developed with the Superpave Gyratory Compactor (SGC), using prescribed manufactured additives or modifiers, or plant process modifications or both. Acceptance of the work is based on testing of field samples by the LTS and statistical evaluation of sample test results by Percent Within Limits (PWL) procedures.

413.2 MATERIALS—Do not incorporate any materials into the asphalt mixture that are not specified including additives, rejuvenators, or other materials.

(a) Asphalt Material

1. Virgin Mix, Mix Containing 5% to 15% RAP, or Mix Containing 5% Recycled Asphalt Shingles (RAS). Furnish material conforming to the requirements of Standard Specifications for Performance-Graded Asphalt Binder using Multiple Stress Creep Recovery (MSCR) Test, AASHTO M 332, except as revised in Bulletin 25. Obtain material from a source listed in Bulletin 15 for the specified grade. Provide QC testing and certification as specified in Sections 106.03(b) and 702.1(b)1. Provide the Representative a copy of a signed Bill of Lading for asphalt binder on the first day of paving and when the batch number changes.

2. Mix Containing More than 15% RAP or Mix Containing Both 5% RAS and 5% or More RAP. The LTS will evaluate the asphalt binder in the RAP and, if applicable, the RAS source material. The LTS will determine the class (grade) of asphalt binder that the Contractor is required to use in the mixture.

Furnish material conforming to the requirements of Standard Specifications for Performance-Graded Asphalt Binder using Multiple Stress Creep Recovery (MSCR) Test, AASHTO M 332, except as revised in Bulletin 25. Obtain material from a source listed in Bulletin 15 for the specified grade. Provide QC testing and certification as specified in Sections 106.03(b) and 702.1(b)1. Provide the Representative a copy of a signed Bill of Lading for asphalt binder on the first day of paving and when the batch number changes.

3. WMA Technology Additives or Modifiers Blended at the Asphalt Binder Supplier's Refinery or Terminal. Provide refinery or terminal blended asphalt binder blended with a WMA Technology additive or modifier from an approved manufacturer and source listed in Bulletin 15. Include in the asphalt binder Producer QC Plan, the WMA Technology additive or modifier manufacturer name, WMA Technology name, and source, dosage rates, blending method, QC testing, corrective action points, disposition of failed material, storage, handling shipping, and bill of lading information as specified in Section 702. Include the WMA Technology additive or modifier and dosage rate on the bill of lading. Provide refinery or terminally blended asphalt binder modified with the WMA Technology additive or modifier as specified in Section 413.2(a)1 or Section 413.2(a)2 for the specified grade.

4. WMA Technology Additives or Modifiers Blended at the Asphalt Mixture Producer's Plant. Provide a blended asphalt binder consisting of an approved WMA Technology additive or modifier from an approved manufacturer and source listed in Bulletin 15 that is blended with a base asphalt binder of the specified grade conforming to the requirements of Standard Specifications for Performance-Graded Asphalt Binder using Multiple Stress Creep Recovery (MSCR) Test, AASHTO M 332, except as revised in Bulletin 25 and from an approved source listed in Bulletin 15, Section 702. Prepare a Producer QC Plan as specified in Section 106 and conforming to the Producer QC Plan requirements as specified in Section 413.2(e)1.a. Provide asphalt binder blended with the WMA Technology additive or modifier at the asphalt mixture production plant as specified Section 413.2(a)1 or Section 413.2(a)2 for the specified grade.

(b) Aggregate and RAM.

1. General Requirements. Provide aggregate from sources listed in Bulletin 14. Aggregate and RAM shall conform to the quality requirements for Superpave Asphalt Mixture Design according to Bulletin 27. For wearing courses, provide aggregate with at least the SRL designation specified. To achieve the specified SRL, the Contractor

may provide a blend of two aggregates if the blend has an SRL designation equal to or better than that specified. Blends are 50% by mass (weight) of each aggregate. Blend the aggregates using an approved method. Do not use 4.75 mm asphalt mixtures in applications that require an SRL designation higher than L.

2. Fine Aggregate. Section 703.1, except Table A gradation does not apply and as follows:

Determine the uncompacted void content according to AASHTO T 304, Method A, or use the value listed in Bulletin 14, and ensure the uncompacted void content conforms to AASHTO M 323, Table 6. Determine the sand equivalent value according to AASHTO T 176 and ensure the sand equivalent value conforms to AASHTO M 323, Table 6.

3. Coarse Aggregate. Section 703.2, Type A, except Table C gradation does not apply and revise the following quality requirements of Table B:

- Abrasion, Maximum Percent according to Bulletin 27, Chapter 2A, Table 5A
- Thin and Elongated Pieces, Maximum Percent according to AASHTO M 323, Table 6, for Flat and Elongated
- Crushed Fragments, Minimum Percent, according to AASHTO M 323, Table 6, for Fractured Faces, Coarse Aggregate

(c) Recycled Asphalt Material

1. RAP. If RAP material is proposed for use in the mixture, use at least 5% RAP consisting of cold milled or crushed asphalt mixture. Include a plan to control RAP and the procedures to handle RAP of significantly different composition in the producer QC Plan. Maintain all processed material free of foreign materials and minimize segregation. Process the RAP so that the final mixture meets requirements as specified in Section 413.2(e).

2. Manufacturer Waste Recycled Asphalt Shingles (RAS). If RAS material is proposed for use in the mixture, use 5% RAS by mass (weight) of the total mixture consisting of manufacturer waste shingles that are rejected asphalt shingles or shingle tabs that are discarded in the manufacturing process of new asphalt roofing shingles. Do not use post-consumer asphalt roofing shingles that are removed from the roofs of existing structures. Due to significant composition differences, keep rejected asphalt shingles manufactured with fiberglass felt or paper or organic felt separate. Do not use both fiberglass felt, and paper or organic felt asphalt roofing shingles in the same mixture. Obtain certification, as specified in Section 106.03(b)3, from the manufacturer of the waste shingles certifying that the waste shingles were discarded during the manufacturing process of new asphalt roofing shingles and certifying the type of felt used during manufacturing of the waste shingles. Maintain and provide the Representative access to all certification records for manufacturer waste shingles.

Process RAS material by shredding, screening or other methods so that 100 percent passes the 9.5 mm (3/8 inch) sieve. RAS may be uniformly blended with fine aggregate as a method of preventing the agglomeration of RAS material. If RAS and fine aggregate are blended, blend at 50% by mass (weight) of each material.

Include a plan to stockpile and control RAS and the procedures to handle RAS of significantly different composition in the producer QC Plan. Maintain all processed material free of foreign materials and minimize segregation. Process the RAS so that the final mixture conforms to Section 413.2(e).

(d) Filler. Section 703.1(c)1. Do not use fly ash if the design traffic is greater than or equal to 3 million Equivalent Single Axle Loads (ESALs).

(e) Mixture Composition for Standard and RPS Construction.

1. Virgin Material Mixtures. Size, uniformly grade, and combine aggregate fractions, asphalt binder, and either WMA Technology additive(s) or modifier(s) in proportions to produce a JMF that conforms to the material, gradation, and volumetric Superpave Asphalt Mixture Design requirements according to Bulletin 27, Chapter 2A. Produce an asphalt mixture for the specified nominal maximum aggregate size and design ESALs except as procedurally modified by the WMA Technology Manufacturer Technical Representative (Technical Representative) to address laboratory procedures when preparing, compacting and testing asphalt mixtures to achieve a uniform blend.

Special additive(s) or modifier(s) need not be used if mixture temperature, workability, and compaction can be achieved solely through plant mechanical modification to produce foamed asphalt. Do not incorporate the WMA Technology additive, modifier or process during the volumetric asphalt mixture design process, so that the JMF volumetrics and material percentages are based on a mixture with no WMA Technology. Only use the WMA Technology additive, modifier or process to evaluate results from moisture susceptibility testing during the mix design process. Develop an asphalt mixture JMF, then incorporate the WMA Technology additive, modifier, or process into that JMF during production. Create an asphalt JMF cover sheet (Form TR-448A) for approval containing the WMA Technology used, additive dosage rate or percent water added for foaming, material code, and the TSR data from the moisture susceptibility testing.

Submit a copy of each completed JMF, signed by a certified Asphalt Level 2 plant technician, to the DME/DMM at least 3 weeks before the planned start of mixture production. Include a list of all material sources and the asphalt mixture producer in the JMF. Provide the calibration factors (C_f and $200 C_f$) according to PTM No. 757 with the JMF. Do not start mixture production until after the DME/DMM reviews the JMF.

Submit a new JMF with a change in material sources or if a new JMF is necessary to produce a mixture conforming to this specification.

1.a Producer QC Plan. Each producer must prepare a QC Plan as specified in Section 106 and conforming to the additional QC requirements of this specification. Submit the QC Plan to the DME/DMM annually at least 3 weeks before the planned start of mixture production and do not start production until the DME/DMM reviews the QC Plan.

1.a.1 QC Organization Chart.

- Names of personnel responsible for QC.
- Area of responsibility of each individual.
- List outside agencies, (e.g., testing laboratories) and a description of services provided.

1.a.2 Testing Plan with Action Points.

- List of all tests to be performed.
- Frequency of testing.
- List action points to initiate corrective procedures.
- Recording method to document corrective procedures.
- Procedures for conducting JMF verification testing.

1.a.3 Materials Storage and Handling.

- Aggregate/RAP/RAM/RAS stockpiles.
- Cold-feed systems for aggregates/RAP/RAM/RAS.
- Additives or modifiers for mixture
- Modified asphalt/liquid additive storage tanks.
- Surge/storage silos for mixture. Do not store more than one JMF in a surge/storage silo at any given time.

- All measuring and conveying devices, including calibration procedures.
- Haul vehicle loading procedures.
- WMA Technology additive or modifier manufacturer name, WMA Technology name, and source as listed in Bulletin 15.
- WMA Technology additive or modifier storage and handling before blending.
- All measuring, conveying and blending devices for the WMA Technology and anti-strip additive (if required), including calibration procedures.
- WMA Technology additive or modifier and anti-strip additive (if required) method of introduction, dosage rates, blending with the asphalt binder and method of automation, recordation and print outs.
- Storage and handling of the blended asphalt binder with the WMA Technology additive or modifier.
- Asphalt production temperature range for normal paving and any specific temperature ranges for special conditions or situations.
- Asphalt laboratory compaction temperature for QC volumetric analysis. Determine the SGC compaction temperature for the production QC which yields the same target air voids as the designed JMF.

1.b Plant Technicians. During mixture production, provide a certified Asphalt Level 1 plant technician at the plant and an on-call certified Asphalt Level 2 plant technician, both meeting the requirements according to Publication 351. Instruct and train the certified technicians to perform all tests and to control plant operation. The Department may use its own certified Asphalt plant technicians to verify tests and to work in coordination with the producer's technicians. All technicians must carry a valid certification card during mixture production.

1.c Annual JMF Verification. During initial production of each JMF, verify, according to the QC Plan, that the mixture conforms to this specification. If the mixture does not conform to the single and multiple sample tolerances in Tables A and B within 2 days of production, suspend shipping the mixture to the project. Do not ship the mixture to the project until after the Representative reviews and verifies that results conform to the single and multiple sample tolerances in Tables A and B. During JMF verification, mixture acceptance is according to the approved acceptance level of Table C.

1.d Production. After JMF verification, sample and test the mixture according to the QC Plan. For daily production of each JMF greater than 50 tons, determine asphalt content, gradation, and theoretical maximum specific gravity from the same sample at least once each day. For daily production of each JMF greater than 150 tons, determine asphalt content, gradation, theoretical maximum specific gravity and perform volumetric analysis of compacted specimens from the same sample at least once each day. Perform additional sampling and testing as directed. Produce a mixture within the following production limits:

1.d.1 Apparent Moisture Content. If the water absorption of a coarse aggregate, determined according to AASHTO T 85, exceeds 2.0%, sample the mixture according to PTM No. 1 and at the frequency in the producer QC Plan. Determine the apparent moisture content in the mixture according to PTM No. 749. Produce a mixture with the apparent moisture content not to exceed 0.5%.

1.d.2 Asphalt Content. Include in the producer QC Plan a frequency of obtaining mixture samples according to PTM No. 1 and performing asphalt content tests to verify that the mixture conforms to the tolerances of Table A. Test the samples according to either PTM No. 757, PTM No. 702, or PTM No. 742. After obtaining a minimum of three test results, determine compliance with the multiple sample tolerances in Table A. After obtaining five or more test results, determine compliance with the multiple sample tolerances in Table A using the running average of the last five consecutive test results.

Printed ticket results may be used in place of laboratory test results for QC of asphalt content of the mixture if the producer is currently approved to use printed tickets according to Bulletin 27. During mixture production, maintain 90% of printed ticket results for each day of production within 0.2 percentage points of the JMF. If RAP or RAS is used in the mixture, determine asphalt content by testing samples of the completed mixture.

1.d.3 Gradation. Sample the completed mixture or sample the combined aggregate from the hot bins of a batch plant or the combined aggregate belt of a drum plant, according to PTM No. 1 and at the frequency in the producer QC Plan. If mineral filler, RAP, or RAS are used in the mixture, determine gradation by testing samples of the completed mixture.

- Test the completed mixture according to PTM No. 757 or according to PTM No. 702 and PTM No. 739.
- Test combined aggregate samples according to PTM No. 743.

Produce a mixture within the tolerances of Table A. Determine compliance with the multiple-sample tolerance after obtaining a minimum of three test results for the mixture. After obtaining five or more test results for the mixture, determine compliance with the multiple-sample tolerances using the running average of the last five consecutive test results.

1.d.4 Theoretical Maximum Specific Gravity. Sample the mixture according to PTM No. 1 at the frequency required in Bulletin 27. Condition and test the samples according to Bulletin 27.

Calculate the percentage of unfilled voids and the theoretical maximum density of the mixture using the most recently determined theoretical maximum specific gravity value or average value according to Bulletin 27. Certify the theoretical maximum specific gravity value to the Inspector daily using Form CS-4171B. If the theoretical maximum specific gravity value varies 0.030 or more from the previous test or from the JMF value, immediately notify the DME/DMM.

1.d.5 Volumetric Analysis of Compacted Specimens. Sample the completed mixture according to PTM No. 1 and at the frequency in the producer QC Plan. Prepare a minimum of two specimens from each sample according to AASHTO T 312.

Produce a mixture with volumetric properties conforming to the tolerances of Table B. Determine the bulk specific gravity of the specimens according to AASHTO T 312 and calculate air voids (V_a) and Voids in Mineral Aggregate (VMA) at N_{design} according to AASHTO R 35 and according to Bulletin 27. Determine compliance with the multiple specimen tolerances using the average of the results for all specimens prepared from the sample.

TABLE A
Job-Mix Formula
Composition Tolerance Requirements of the Completed Mix

	Single Sample (n = 1)	Multiple Samples (n ≥ 3)
Gradation		
Passing 12.5 mm (1/2 inch) and Larger Sieves	±8%	±6%
Passing 9.5 mm (3/8 inch) to 150 µm (No. 100) Sieves (Inclusive)	±6%	±4%
Passing 75 µm (No. 200) Sieve	±3.0%	±2.0%
Asphalt Content		
19.0 mm Asphalt mixtures and smaller	±0.7%	±0.4%
25.0 mm Asphalt mixtures and larger	±0.8%	±0.5%

Temperature of Mixture (F)				
Class of Material	Type of Material	Chemical, Organic, Foaming Additives Minimum*	Mechanical Foaming Equipment/Process Minimum*	Maximum*
PG 58S-28	Asphalt Binder	215	230	310
PG 64S-22	Asphalt Binder	220	240	320
PG 64E-22	Asphalt Binder	240	260	330
All other Binders	Asphalt Binder	The higher of 215 or the minimum temp. specified in Bulletin 25 minus 45F	The higher of 230 or the minimum temp. specified in Bulletin 25 minus 30F	As specified in Bulletin 25
* Outline in the Producer QC Plan and follow more restrictive temperature requirements provided by the WMA technology manufacturer or Technical Representative(s) for production and placement of the mixture. Determine the SGC compaction temperature for the production QC which yields the same target air voids as the designed JMF. Include the SGC compaction temperature in the Producer QC Plan. Compact the completed mixture in the SGC for QC volumetric analysis at the SGC compaction temperature according to the guidelines provided by the Technical Representative.				

TABLE B
Job-Mix Formula
Volumetric Tolerance Requirements of the Laboratory Compacted Mix

Property	Each Specimen	Multiple Specimens
Air Voids at N_{design} (V_a)	($\pm 2\%$)	($\pm 1.5\%$)
Minimum VMA % for 4.75 mm	16.0	-
Minimum VMA % for 9.5 mm	15.0	-
Minimum VMA % for 12.5 mm	14.0	-
Minimum VMA % for 19.0 mm	13.0	-
Minimum VMA % for 25.0 mm	12.0	-
Minimum VMA % for 37.5 mm	11.0	-

1.e Corrective Actions. Immediately take corrective actions if one or more of the following occurs:

- QC test results on a single sample ($n=1$) for percent passing the 2.36 mm (No. 8) sieve, the 75 μm (No. 200) sieve, or asphalt content are not within the tolerances in Table A.
- The average of multiple samples ($n \geq 3$) for percent passing any sieve or asphalt content, as specified in Section 413.2(e)1.d, are not within the tolerances in Table A.
- QC test results on each specimen or on multiple specimens are not within the tolerances in Table B.
- Independent assurance (IA) or QA sample results tested at the producer's plant are not within the tolerances of Tables A or B.

After taking corrective actions, sample the completed mixture within 150 tons of production. After sampling, test the mixture and provide test results to the Representative within 500 tons of production. If less than three samples are tested for mixture composition, determine conformance with Table A by comparing each result to the multiple sample tolerances. If the mixture does not conform to the single and multiple sample tolerances in Table A and the single and multiple specimen tolerances in Table B, suspend production and shipping to the project and determine the cause of the problem. Provide a written explanation of the problem and a proposed solution to the Department. After the Representative reviews the proposed solution and authorizes production to continue, resume production and

perform JMF verification according to the QC Plan. During corrective actions and JMF verification, mixture acceptance is according to the approved acceptance level of Table C.

2. Mixtures with RAM, 5% or More RAP, and/or 5% RAS. Section 413.2(e)1 and as follows:

2.a RAM and RAP SRL. For asphalt wearing courses, limit the total combination of RAM and RAP to a maximum of 15% of the mixture by mass (weight) unless documentation of the SRL designation of the coarse aggregate in the RAM and RAP materials is provided to the DME/DMM and the RAM and RAP meet the specified SRL or can be blended for SRL as specified in Section 413.2(b)1.

2.b RAP and/or RAS Asphalt Content and Gradation. Determine the average asphalt content and gradation of the RAP and/or RAS stockpile(s) according to Bulletin 27. Determine the proportions of RAP, RAM, RAS, and virgin materials necessary to conform to the JMF requirements. Maintain and provide the Representative access to records of all sampling, testing, and calculations.

(f) WMA Technologies (Additive(s), Modifier(s), or Processes) Produce the asphalt mixture using approved or provisionally approved WMA Technologies, including additives, modifiers or processes from manufacturers listed in Bulletin 15. If blending WMA additives or modifiers with asphalt material, provide asphalt material blended with the WMA additive or modifier as specified in Section 413.2(a)3 or Section 413.2(a)4. For WMA Technology additives or modifiers blended with the asphalt mixture at the asphalt mixture production plant, prepare a QC Plan as specified in Section 106 and also conforming to the additional Producer QC Plan requirements within this specification. Submit the QC Plan to the DME/DMM annually and at least 3 weeks before the planned start of the blending of WMA Technologies with asphalt material. Do not start blending until the DME/DMM reviews the QC Plan.

(g) Anti-Strip Additives. Use either a compatible, heat stable, amine-based liquid anti-strip or a compatible alternate anti-strip additive. If the WMA Technology includes an anti-strip additive as part of its WMA Technology, perform moisture susceptibility analysis as specified in Section 413.2(e)1 and add additional anti-strip additive or make other adjustments to the JMF if needed to meet the specified moisture susceptibility requirements.

(h) WMA Technology Manufacturer Technical Representative (Technical Representative). If the Asphalt Producer is using a provisionally or conditionally approved WMA Technology listed in Bulletin 15 or is using a fully approved WMA Technology for the very first time, identify one or more Technical Representative(s) that are knowledgeable in how the WMA Technology will affect the storage, handling, blending, mixture production, mixture QC testing, placement and compaction requirements of the mix. Have one or more Technical Representative(s) on-call and capable of being in direct, verbal contact with the Producer, Contractor, and/or Department within 2 hours after initial contact. Have one or more Technical Representative(s) review the Producer's QC Plan to ensure that all of the data as specified in Sections 413.2(e) 1.a.2 and 413.2(e) 1.a.3 are supported according to current manufacturer's recommendations. Include the Technical Representative's office and mobile telephone numbers in the Producer's QC Plan.

(i) Mixture Acceptance.

1. General. For standard construction, the Department will accept the mixture according to the appropriate level in Table C. For RPS construction, the Department will accept the mixtures by lot acceptance as specified in Section 413.3(h)2.

TABLE C
Mixture Acceptance

Acceptance Level	Acceptance Method
Certification Acceptance	Producer Certification of Mixture (Section 413.2(i)2)
Lot Acceptance	Mixture Acceptance Sample Testing (Section 413.3(h)2)

2. Certification Acceptance. Acceptance by certification is appropriate for the following mixtures, conditions, or applications:

- Scratch courses, leveling courses less than 2 inch depth and driveway adjustments.

- Mixtures used by Department maintenance forces.
- Mixtures purchased by local or municipal governments.
- Mixtures placed in quantities not exceeding 500 tons in a continuous placement operation unless otherwise directed by the Representative (See Section 101.01).
- Mixtures used for parking lots.
- All 4.75 mm NMAS asphalt mixtures.
- Other mixtures, conditions, or applications as approved by the Representative (See Section 101.01).

2.a General. Obtain certification from the mixture producer. Use all QC tests during mixture production as acceptance tests. Certify mixtures using Form CS-4171B. Include, or attach, the QC test results on the form. Provide the form to the Inspector-in-Charge within 1 working day after completing the QC tests. Certify mixtures as specified in Section 106.03(b)3 and the requirements below.

2.b Certification of Mixture. Certify each mixture daily if QC test results conform to the single sample and multiple sample JMF production tolerances of Table A. The acceptance values will be:

- Asphalt Content
- Percent Passing the 2.36 mm (No. 8) sieve (not applicable for 4.75 mm NMAS asphalt mixtures)
- Percent Passing the 75 μ m (No. 200) sieve

If using printed ticket results in place of laboratory test results for asphalt content, certify that at least 90% of each day's printed ticket results for asphalt content are within 0.2 percentage points of the JMF.

If the mixture does not conform to the above requirements, do not certify the mixture. Instead, provide all QC test results to the Inspector-in-Charge. If using printed ticket results for asphalt content, provide the percentage of daily printed ticket results within 0.2 percentage points of the JMF to the Inspector-in-Charge. Payment will be determined according to Table H based on the QC test results.

If a day's production is interrupted by corrective action, material produced after the corrective action may be certified if QC test results conform to production tolerances.

2.c Maintaining Approval to Certify Mixtures. The Department may suspend a plant's approval to certify mixtures if QC is not performed according to the producer QC Plan, mixtures are not produced according to Bulletin 27, a mixture cannot be certified on 2 consecutive production days, or as described below.

The Department may take IA samples of the completed mixture at the plant. In the presence of the Department, test the IA samples for asphalt content and gradation according to the test methods indicated in the producer QC Plan. Take immediate corrective actions if the mixture does not conform to Table A.

The Department may take QA samples of the completed mixture at the plant or on the roadway directly from the uncompacted mixture placed by the paving equipment specified in Section 413.3(e). The Department will test QA samples according to PTM No. 757 or PTM No. 702, Modified Method D, if previously identified problematic aggregates are used in the mixture, for conformance to Table A. If the results of the QA samples do not comply with Table A, review the producer QC Plan and the QC test results that followed the QA samples for conformance to Table A. If QC results do not conform to Table A, perform the corrective actions necessary to provide a mixture conforming to Table A.

After completing corrective actions or the sample review, the Department will perform an on-site evaluation of the producer's plant operation and QC and then take a sample of the completed mixture at the plant. In the presence of the Representative, test the sample. If the sample does not comply with Table A, the Department will suspend certification. Immediately suspend shipping mixtures accepted by certification to the project.

After testing verifies that the produced mixture conforms to Tables A and B and with the Representative present, conduct JMF verification according to the producer QC Plan. After successfully completing JMF verification, resume both certification and shipping mixtures accepted by certification to the project.

413.3 CONSTRUCTION—

(a) Preplacement Requirements.

1. Paving Operation QC Plan. Prepare a paving operation QC Plan, as outlined on Form CS-413, for field control and evaluation of asphalt concrete paving operations that addresses all recommendations and direction from the Technical Representative(s) associated with any WMA Technology being used. Submit the QC Plan to the Representative before or at the pre-construction conference. The QC Plan shall describe the construction equipment and methods necessary to construct and test the asphalt concrete courses as specified in Section 413.3. Do not start paving until after the Representative reviews the QC Plan.

2. Preplacement Meeting. At least 2 weeks before placing asphalt paving mixtures, schedule an asphalt preplacement meeting with the Representative to review at a minimum the specification, paving operation QC Plan, sequence of paving operations, mixture acceptance, density acceptance and the care and custody of asphalt acceptance samples.

(b) Weather and Seasonal Limitations. Do not place any asphalt paving mixtures outside of the following dates, unless an extension of the paving season, as specified in Section 413.3(b)1, is granted in writing by the District Executive.

- For all PG 64E-22 wearing courses, >10 million ESALs wearing courses, 4.75 mm wearing courses, or other wearing courses placed at compacted depths less than 1.5 inches, paving may occur April 1 to October 15.
- For all other courses, paving may occur April 1 to October 31.

Do not place asphalt paving mixtures when surfaces are wet or when the air or surface temperature is 40F or lower. If work is halted because of weather conditions, the Representative may allow the Contractor to place limited quantities of mixture that are enroute to the project.

1. Paving Season Extensions. Submit requests in writing for paving outside of the dates listed in Section 413.3(b) at least 14 calendar days before performing any extended season paving operations. With the written request, submit an Extended-Season Paving Plan on Form CS-413ES that addresses quality control operations in detail. The plan must address steps at the plant and in the field to ensure that a quality product will be delivered and constructed. Do not commence paving during the extended-season until the Representative reviews the Extended-Season Paving Plan.

An extension of the paving season will be granted in writing by the District Executive with the following additional requirements:

- For all PG 64E-22 wearing and binder courses, >10 million ESALs wearing courses, 4.75 mm wearing courses, or other wearing courses placed at compacted depths less than 1.5 inches, paving may occur April 1 to November 15.
- For all other courses, paving may occur March 1 to December 15.
- Density acceptance will be by pavement cores, regardless of quantity, for mixtures placed at the minimum compacted depths in Table G. For pavements not meeting the requirements for pavement cores, density acceptance will be by optimum-rolling pattern. For non-RPS pavements, the Representative may waive the pavement core requirement at their sole discretion provided the contractor's quality control efforts give confidence that optimum density has been achieved throughout the course.
- Utilize a Material Transfer Vehicle (MTV) as specified in Section 108.05(c)5 on any day when the paving length will exceed 1,500 linear feet, unless the Representative determines the MTV to be infeasible for the location.
- Use an approved asphalt JMF, according to the temperature restrictions specified in Section 413, Table A
- Do not ship material to the project until the Representative on the project releases the shipment.
- At least five days before extended-season paving, schedule an extended-season preplacement meeting with the Representative to review, at a minimum, the details of the Extended-Season Paving Plan.

- If the Representative determines that the Extended-Season Paving Plan is not being followed, stop paving operations, modify processes to comply with the Extended-Season Paving Plan, and communicate process modifications to the Representative. Do not resume paving operations until the Representative authorizes paving operations to continue.
- Within 24 hours of paving completion, provide Form CS-413EQC to the Representative with all documentation and measurements associated with the extended-season paving operations outlined in the Extended-Season Paving Plan. Payment will not be made until the documentation is received.
- Paving work completed during the fall portion of the Extended-Season will be subject to a spring evaluation and manual survey by the Department to be conducted by May 1. Manual surveys will be conducted according to Publication 336. The Department will evaluate the material and workmanship looking at characteristics of fatigue cracking, transverse and miscellaneous cracking, raveling/weathering, rutting, flushing, potholing, joint and edge deterioration, and loss of bond/delamination to determine acceptance or remedial action as outlined below:

Extended Season Paving Performance Requirements and Remedial Actions

Performance Criterion	Threshold Level	Remedial Action
Fatigue Cracking**	All low, medium or high severity*	Remove and replace as specified in Section 496, Table A
Transverse and Miscellaneous Cracking	All low to medium severity*	Crack seal as specified in Section 469
	All high severity*	Remove and replace as specified in Section 496, Table A
Raveling/Weathering	All medium or greater severity*	Remove and replace as specified in Section 496, Table A
Rutting	> ¼ inch	Remove and replace as specified in Section 496, Table A
Flushing	All	Remove and replace as specified in Section 496, Table A
Potholes, Loss of Bond, Delamination	All	Remove and replace as specified in Section 496, Table A for Potholes
Longitudinal Joint or Edge Joint Deterioration	All low severity*	Crack seal as specified in Section 469
	All medium or greater severity*	Remove and replace distressed layer full lane width on both sides transversely of the distressed area and a minimum of 24 inches beyond the distressed area in all longitudinal directions.

* The Threshold Level according to Publication 336.

** Fatigue cracking will only be considered in those portions of the pavement under which the contractor has performed base course placement operations

The Department will solely make the determination and notify the Contractor whether the work is accepted, or remedial action is required. The contractor may witness the manual performance survey. As specified in 413.3(o), the BOPD, CMD will review representative determinations of defective material or workmanship. Remove and replace or repair defective work as directed at no additional cost to the Department. Should the distance between repair areas be less than 100 feet, make one continuous repair. All repairs must meet the surface tolerance requirements as specified in Section 413.3(l).

- A Final Acceptance Certificate will not be issued for paving completed during the extended season until the spring evaluation and any repair work is completed.
- Any necessary changes to means, methods, or materials are at no additional cost to the Department. Complete all work by the Required Completion Date or Construction Engineering Liquidated Damages, as specified in Section 108.07(a), will apply. If repairs are required following the spring evaluation, liquidated damages will not be applied during the winter shutdown period on the project and will be applied during the repair and associated work period.

(c) Asphalt Mixing Plant. Obtain asphalt mixtures from a plant fully automated and recorded and currently listed in Bulletin 41. Make any plant modifications, if needed, to introduce the WMA Technology additives, modifiers, or processes according to specific recommendations and direction from the WMA Technology Technical Representative(s) or process manufacturer to achieve a uniform blend of the WMA Technology additive, modifier or foaming process. The necessary facilities for inspection include a plant office as specified in Section 714.5(a), except the minimum floor space is 120 square feet. For recycled mixtures, add the following requirements:

1. Batch Plant. Modify the batch plant to measure the mass (weight) of the RAP and/or RAS before adding it into the pug mill. Design the cold-feed bin(s), conveyor system(s), charging chute(s), and all special bins to prevent RAP and/or RAS from segregating and sticking. Dry the virgin aggregate and RAM and then heat the virgin aggregate and RAM to a temperature that, after adding RAP and/or RAS, produces a completed mixture within the temperatures specified in Table A for the class and type of material used. Dry the aggregate according to the specific recommendations and direction from the WMA Technology Technical Representative(s) and heat to a temperature so the resulting completed mixture temperature is within the mixture temperature recommended by the WMA Technology Technical Representative(s) or manufacturer and Table A. Ensure that the aggregate is free of unburned fuel oil and excess moisture as specified in Section 413.2(e) 1.d.1 when delivered to the pug mill.

2. Drum Mixer Plant. Modify the drum mixer plant to prevent RAP and/or RAS from directly contacting the burner flame and prevent RAP and/or RAS from overheating. Design the cold-feed bin(s), conveyor system(s), charging chute(s), and all special bins to prevent RAP and/or RAS from segregating and sticking. Produce a completed mixture that is within the mixture temperature range recommended by the WMA Technology Technical Representative(s) or manufacturer and Table A. Ensure that the aggregate and completed mixture is free of unburned fuel oil and excess moisture as specified in Section 413.2(e) 1.d.1.

(d) Hauling Equipment. Haul the mixtures in tightly sealed vehicles that do not contain petroleum oils, solvents, or other materials that adversely affect asphalt mixture. Provide covers of sufficient size and quality to protect the entire load under all conditions. Maintain the proper and uniform placement temperature as specified in Section 413.3(h)1. Provide insulation on all sides of the truck body, a double-walled truck body, or a heated truck body when the air temperature is below 50F from October 1 to April 30. Provide a 3/8 inch diameter hole near the center and approximately two-thirds the distance down from the top of the vehicular box, on both sides, to allow for asphalt mixture temperature checks.

(e) Paving Equipment

1. Asphalt Pavers. Provide self-contained, power-propelled units with activated screeds or activated strike-off assemblies and with automatic screed controls, capable of producing a finished surface of specified evenness and texture. Provide heated units capable of spreading and finishing the mixture to the widths and depths indicated. Provide units capable of being operated at forward speeds consistent with satisfactory placement of the mixture, equipped with receiving hoppers having sufficient capacity for uniform spreading, and equipped with distribution systems that place the mixture uniformly in front of the screeds.

Use hydraulic or other extension types against abutting lanes or longitudinal joints only if the unit feeds and activates the extension by the same method as the main screed. For fixed width paving operations on pavers where the screed is fed by augers, provide auger extensions to within 18 inches or less of the end gate. At the outside edge of pavement widths that cannot be uniformly placed, the Contractor may use a non-activated extension when approved by the Inspector-in-Charge.

Do not use equipment that tears, shoves, or gouges the mixture, or that causes tracks, indented areas, flushing, segregation, or other permanent blemishes. Do not use blade graders or drags.

2. Asphalt Wideners. Provide self-contained, power-propelled units with strike-off assemblies capable of producing a finished surface of specified evenness and texture. Provide units capable of spreading and finishing the mixture to the widths and depths indicated. Provide units capable of being operated at forward speeds consistent with satisfactory placement of the mixture, equipped with receiving hoppers having sufficient capacity for uniform spreading, and equipped with distribution systems that place the mixture uniformly in front of the strike-off assemblies.

Do not use equipment that tears, shoves, or gouges the mixture, or that causes tracks, indented areas, flushing, segregation, or other permanent blemishes.

(f) Rollers. Use steel-wheel, pneumatic-tire, vibratory, or oscillating rollers as specified in Section 108.05(c)3a, 3b, 3c, 3e, 3f, 3h, or 4. Operate rollers according to manufacturer's recommendations. Use vibratory and oscillating rollers with separate controls for frequency and amplitude.

(g) Preparation of Existing Surface.

1. Conditioning of Existing Surface. Before delivering asphalt mixtures, remove and dispose of loose and foreign material and excess joint sealer and crack filler from the surface of existing pavement or previously placed pavement courses. If necessary, use a broom.

Before placing a wearing course, correct irregularities in the binder course. If practical, do not allow traffic on the binder course to prevent contamination. Remove and replace binder course that cannot be cleaned to the Representative's satisfaction.

Paint existing vertical surfaces of curbs, structures, gutters, and pavements that will be in contact with asphalt mixtures with a uniform coating of either emulsified asphalt, consisting of PennDOT Material Class TACK or NTT/CNTT and applied in two or more applications, or hot asphalt binder of the class and type designated for the asphalt course.

Before overlaying existing surfaces and previously placed courses, apply a tack coat as specified in Section 460 unless otherwise indicated.

2. Scratch and Leveling Courses. Where indicated, place a separate scratch or leveling course ahead of resurfacing operations. Use a scratch course to fill wheel ruts and other local small depressions even with the surrounding pavement. Use a leveling course to provide a relatively uniform working platform for placing binder or wearing courses.

3. Paving Notches. Mill the existing pavement surface at tie-in locations of the wearing course as shown on the Standard Drawings, or as otherwise indicated. Perform milling as specified in Section 491.

(h) Spreading and Finishing.

1. General Requirements.

1.a Placing. Unless otherwise allowed or indicated, deliver, place, and compact asphalt paving mixtures during daylight hours. Ensure the mixture does not contain lumps of cold material. Deliver and place mixtures at the laying temperatures specified in Table A for the type and class of material used. Do not incorporate any material delivered outside the temperature limits as specified in Table A.

Utilize a Material Transfer Vehicle (MTV) as specified in Section 108.05(c)5 for RPS pavements unless otherwise approved by the Representative (See Section 101.01).

1.b Spreading and Finishing. Spread and strike off the mixture for the entire lane width or as much lane width as practical. Adjust screed assemblies to provide the required cross section and depth. After spreading, do not add mixture to the pavement mat that is segregated, below the minimum temperature, contains either a deficiency or an excess of asphalt content, or is otherwise unsuitable to add to the pavement mat.

If the course is more than 6 inches in compacted depth, construct it in two or more layers of approximately equal depth, with no layer less than 3 inches or more than 6 inches in compacted depth. For binder or leveling courses that have isolated areas exceeding 6-inch compacted depth, use a scratch or leveling course to eliminate the isolated areas before full-depth paving.

Immediately after placing the asphalt mixture, work the exposed outer edges to eliminate sharp, ragged, and open edges, to eliminate an unfinished appearance, and to reduce edge breakdown. Immediately repair edge breakdowns.

In areas where mechanical spreaders cannot be used, place and screed the mixture with suitable hand tools. Do not use rakes.

Adjacent to flush curbs, gutters, and other abutting structures, place the wearing course mixture uniformly higher so that after compaction the finished surface is slightly above the edge of the abutting structure. Remove harmful material, clean, and seal the surface of wearing courses adjacent to curbs to form an asphalt gutter. Seal the mixture surface with a hot asphalt material of the class and type listed in Table A. Evenly apply the asphalt material a minimum width of 12 inches from the curb. The Contractor may use emulsified asphalt, consisting of PennDOT Material Class TACK or NTT/CNTT, instead of hot asphalt binder material if allowed by the Inspector-in-Charge.

Control the application rate so residual asphalt completely fills surface voids and provides a watertight joint along the curb. If necessary, apply emulsified asphalt in two or more applications. After sealing, remove excess sealant material.

1.c Mixture Production, Delivery and Placing Temperatures When Placing Over Membrane Systems as Specified in Section 467 or Section 680. If a project includes an item or items of work for membrane systems, as specified in Section 467 or Section 680, produce and place asphalt mixture on top of the membrane at elevated mixture temperatures as per the membrane manufacturer's recommendation and within the Table A temperature requirements. Ensure proper adhesion between the asphalt pavement overlay and the underlying membrane.

1.d Field Technician. Provide a certified asphalt field technician, with the qualifications according to Publication 351, to control the placement of asphalt mixtures. Instruct and train the certified asphalt field technician to control the paving operation so that the completed paving work complies with the specified requirements. A certified asphalt field technician must be onsite and carry a valid certification card during placement of all asphalt mixtures.

1e. Safety Edge. Construct the Safety Edge as the standard edge treatment on the outside edge of asphalt pavements and shoulders. Use the Safety Edge for both wearing and binder courses with a depth of 1.5 inches or greater. Do not place the Safety Edge at total depths greater than 5 inches. The Safety Edge is not required where curb or sidewalk are encountered or where the face of guiderail is directly over the edge of pavements. Do not place the Safety Edge for base, leveling, or scratch courses.

Construct the Safety Edge with the same material used to construct the roadway course being placed or, if specified, the paved shoulders. Attach a device to the paver to confine material at the end gate and extrude the asphalt material in a wedge shape. Use an adjustable device that allows the operator to vary the slope extruded at the paver to account for the angle becoming steeper during compaction (roll up). Before construction, the Safety Edge device must be approved by the Representative(s) (See Section 101.01).

Compact the roadway or paved shoulder as required by the specifications. Do not delay rolling of the mat adjacent to the Safety Edge. After compaction of the mat is complete, provide a Safety Edge meeting the final shape requirements as shown on the Standard Drawings. The completed angle of the Safety Edge must be 26 to 40 degrees measured from the pavement cross slope extended. At the beginning of each days paving, measure the angle of the Safety Edge from the pavement cross slope extended. Perform measurements after final compaction is complete. If the angle of the Safety Edge does not meet the slope requirements, stop paving and provide corrective action. Do not resume production paving until final shape requirements of Safety Edge are achieved.

Allow automatic transition to intersections, driveways, guiderail sections, and obstructions.

Use the device to constrain the asphalt head, reducing the area and increasing the density of the extruded profile. A single plate strike-off method is not allowed. Do not place the Safety Edge on organic material.

2. Mixture Lot Acceptance (Standard and RPS Construction). Lot acceptance is appropriate for standard construction placed in quantities that allow consistent operation of the plant and is appropriate for RPS construction.

2.a Lots and Sublots. Material will be accepted in the field on a lot by lot basis. Lots will be established cumulatively and will be specific for each JMF. Once the subplot size for each specific JMF has been established based on the project's plan quantity, the subplot size will remain unchanged throughout project completion. A completed subplot has a mixture acceptance box sample as specified in Section 413.3(h)2.b and either a core collected according to PTM No. 1 and PTM No. 729, or other density acceptance as specified in Section 413.3(j).

For JMFs placed in quantities of 2,500 tons or greater, a normal lot size is 2,500 tons with five, 500 ton subplot s (n=5), unless operational conditions or project size dictate otherwise. If operational conditions or project size dictate, readjustment of the lot will be made as specified in Table D. Breakdowns or stoppages of short periods due to such causes as weather or equipment failure will not be considered as reasons to adjust the lot size. The original lot will be continued when work resumes after short stoppages of less than 5 calendar days. If a lot is ended due to a stoppage of 5 calendar days or more, adjust the lot size and number of sublots as specified in Table D. If the work stoppage is 5 calendar days or more, a new lot will be established.

To terminate a lot without a work stoppage of 5 calendar days or more, stop paving operations and notify the Inspector-in-Charge in writing of the lot termination and include the reason for termination. Do not begin paving again until the Inspector-in-Charge authorizes paving activities to resume. If a lot is terminated when quantities exceed a normal size lot of 2,500 tons, the work will be considered two separate lots, a normal size lot and a terminated lot.

The terminated lot will be only that portion of the work which exceeds the 2,500 ton normal sized lot up to the point the paving operations were stopped.

A terminated lot will be evaluated based on the samples obtained before the lot was terminated. For terminated lots with three or more sublots, acceptance will be determined using PWL pay factor adjustments. Terminated lots with two or fewer sublots will be evaluated as specified in Section 413.3(h) 2.a.1. For terminated lots where density acceptance is by pavement cores, if the first randomly selected coring location was not yet reached at the time the lot was terminated, the Inspector will recalculate one new sample location according to PTM No. 1, PTM No. 729, and PTM No. 746 from the pavement placed.

The payment for any terminated lot the Contractor elects to terminate will be 95% of the contract unit price or the payment value determined by evaluating the samples tested, whichever is less. Remove and replace terminated lot pavements when test results indicate defective work. The District Executive will not consider requests for reduced payment on terminated lots when test results indicate defective work.

TABLE D
Re-adjustment of Lot Size and Associated Number of Sublots

Remaining Quantity* Following Last Full Lot	Action
Less than 500 tons without a combination of one mixture acceptance sample and one core**	Quantity combined with the previous lot, (n=5)
Less than 500 tons with a combination of one mixture acceptance sample and one core**	One new subplot defined and quantity combined with the previous lot, (n=6)
500 tons to less than 1,000 tons without a combination of two mixture acceptance samples and two cores**	One new subplot defined and quantity combined with the previous lot, (n=6)
500 tons to less than 1,000 tons with a combination of two mixture acceptance samples and two cores**	Two new sublots defined and quantity combined with the previous lot, (n=7)
1,000 tons to less than 1,500 tons without a combination of three mixture acceptance samples and three cores**	Two new sublots defined and quantity combined with the previous lot, (n=7)
1,000 tons to less than 1,500 tons with a combination of three mixture acceptance samples and three cores**	New lot defined, (n=3)
1,500 tons to less than 2,000 tons without a combination of four mixture acceptance samples and four cores**	New lot defined, (n=3)
1,500 tons to less than 2,000 tons with a combination of four mixture acceptance samples and four cores**	New lot defined, (n=4)
2,000 tons to less than 2,500 tons without a combination of five mixture acceptance samples and five cores**	New lot defined, (n=4)
2,000 tons to less than 2,500 tons with a combination of five mixture acceptance samples and five cores**	New lot defined, (n=5)
*For contract items bid on an area basis, compute equivalent tons based on design depth of paving course and design density as specified in Section 110.04(b)4.b.	
** If mat density is accepted using pavement cores and mixture acceptance is by lots.	

2.a.1 Partially Completed Lots (n=2 or less). When process conditions change to an extent that a partially completed lot cannot be combined with the most recently completed lot, samples will be independently evaluated on the partially completed lot. For asphalt content and percent passing the 75 μ m (No. 200) sieve, mixture acceptance samples will be evaluated individually as specified in Section 413.2(e), Table A (n=1) criteria. For density, mat density acceptance samples will be evaluated individually using the criteria in Table E.

If samples tested for asphalt content and percent passing the 75 μ m (No. 200) sieve meet the n=1 criteria of Table A, and samples tested for density meet the criteria in Table E, payment will be 100% of the contract unit price. If samples tested for asphalt content and percent passing the 75 μ m (No. 200) sieve do not meet the n=1 criteria of Table A, the material will be considered defective work. If samples tested for density are no more than 2.0% below the minimum or no more than 2.0% above the maximum limits of Table E, payment will be 90% of the contract unit price. If samples for density are more than 2.0% below the minimum or more than 2.0% above the maximum limits of Table E, the pavement will be considered defective work.

Unless otherwise directed in writing by the District Executive, remove and replace defective work.

TABLE E
Density Limits for Partially Completed Lots

MIXTURE NMAS	DENSITY LIMITS
All RPS 9.5 mm, 12.5 mm, 19 mm, and 25 mm Wearing or Binder Courses	$\geq 92.0\%$ and $\leq 98.0\%$
All Standard 9.5 mm, 12.5 mm, 19 mm, and 25 mm Wearing or Binder Courses	$\geq 91.0\%$ and $\leq 98.0\%$
All 25 mm and 37.5 mm Base Courses	$\geq 90.0\%$ and $< 100.0\%$

2.a.2 For JMF's placed in quantities less than 2,500 tons. For JMFs placed in quantities of greater than 500 tons and less than 2,500 tons, the tonnage will be considered a lot. The lot will be divided into five equal sublots.

For JMFs placed in quantities of 500 tons or less, mixture acceptance will not be applicable for PWL pay factor adjustments and will be accepted by certification. If density acceptance is by pavement cores, the tonnage will be considered a lot and the lot will be divided into three equal sublots. Density acceptance will be determined using PWL pay factor adjustments.

2.b Mixture Acceptance Samples. The Representative will select different sample locations in each subplot according to PTM No. 1 and PTM No. 746. In the presence of the Inspector, obtain one loose mixture sample for each subplot directly from the uncompacted mixture placed by the paving equipment specified in Section 413.3(e) and immediately package. For 19 mm and smaller NMAS mixtures, package individual samples in cardboard boxes dimensioned approximately 3 3/4 inches x 4 3/4 inches x 9 1/2 inches. For 25 mm and larger NMAS mixtures, package individual samples in cardboard boxes dimensioned approximately 5 inches x 5 1/2 inches x 9 inches. Do not package samples in cardboard boxes with any one dimension greater than 10 1/4 inches or any one dimension smaller than 3 1/2 inches.

Immediately after packaging and in the presence of the Representative, identify the samples by ECMS project number, lot and subplot number, location (station and offset), date of placement, mixture type, and as acceptance samples (Sample Class AS). Leave at least one side of the cardboard sample box free of any writing or marking for LTS use in testing the samples.

Immediately after identifying, submit the samples to the Representative.

For quality control purposes, a maximum of one loose sample per subplot may be obtained. No loose mixture or core samples may be taken by the Contractor for mixture composition testing after the mixture acceptance samples are obtained. Do not obtain any other pavement samples, except those which are directed by and surrendered to the Department, unless allowed in writing from the District Executive.

The Contractor may elect to expedite delivery of the acceptance samples to the LTS at no additional cost to the Department. If the delivery is expedited, the Inspector will secure all containers with Department issued, uniquely numbered security tape. The Inspector will record the information from the security tape onto Form TR-447 which will be packaged inside the secured container and return the secured containers to the Contractor for transport to the LTS.

The Contractor may transport the secured samples to the LTS or utilize a third-party shipping service. If the Contractor elects to utilize a third-party shipping service, the service must provide the ability to track package delivery.

Provide all expedited delivery details in the QC Plan and discuss expedited delivery details at the preconstruction and pre-paving meetings. For expedited delivery, provide all containers, cushioning material, and packaging supplies to the Inspector. The Inspector will package all samples in the provided containers and secure the samples prior to surrendering the secured containers to the Contractor.

Upon arrival at the LTS, the secured containers will be visually examined for evidence that the tape has not been compromised and the unique numbers will be compared between the security tape and the value recorded on Form TR-447 inside the container. If sample security has not been compromised, samples received under expedited delivery will be tested on a priority basis. If the containers show any signs of compromised security, the following conditions apply:

- Obtain replacement samples as directed within 12 inches longitudinally of the original samples.
- Immediately stop expedited delivery and all samples will be delivered to the Inspector for transport.
- Conduct an investigation to determine the cause of the compromised security and provide a written explanation to the Representative.

- Do not resume expedited delivery until the Representative has reviewed the written explanation and is satisfied that proper steps have been taken to address the issue. The Department reserves the right to terminate expedited delivery after the first occurrence of compromised sample security.

2.b.1 Theoretical Maximum Specific Gravity (Gmm) Verification Samples. For federally funded projects or projects on the National Highway System, when density acceptance is by pavement cores, obtain a second loose mixture sample as specified in Section 413.3(h)2.b in each subplot at the same location as the mixture acceptance sample and immediately package in cardboard boxes sized as specified in Section 413.3(h)2.b. The second loose mixture sample at each location will be used to determine the theoretical maximum specific gravity (Gmm) and corresponding theoretical maximum density (lbs/ft³) values for each subplot.

Immediately after packaging and in the presence of the Inspector, identify the sample by ECMS project number, lot and subplot number, location (station and offset), date of placement, mixture type, and as Gmm verification samples (Sample Class FV). Leave at least one side of the cardboard sample box free of any writing or marking for LTS use in testing the samples.

2.c Mixture Acceptance and Gmm Verification Sample Testing. Utilize LTS Testing unless otherwise indicated in the proposal. These procedures apply to standard and RPS construction.

2.c.1 LTS Testing. The LTS will test the mixture acceptance samples according to PTM No. 757 or PTM No. 702, Modified Method D and PTM No. 739, if previously identified problematic aggregates are used in the mixture, to determine asphalt content and the percent passing the 75 μ m (No. 200) sieve. The LTS will use the calibration factors (C_f and 200 C_f) provided with the JMF for PTM No. 757. For individual increment test results outside of the single sample ($n=1$) tolerances in Table A, the LTS will analyze the test results for extreme values according to PTM No. 4 at the 5% significance level. If discarding an extreme value reduces a lot to less than three remaining test results, the Department will accept the lot as specified in Section 413.3(h)2.a.1. The Department will accept lots with three or more test results as specified in Section 413.4(a)4 or Section 413.4(b).

If the asphalt content or the percent passing the 75 μ m (No. 200) sieve is not within the single sample ($n=1$) or multiple sample ($n\geq 3$) tolerances in Table A for two consecutive lots or a total of three lots, stop all production of the JMF. Determine the cause of the problem and provide a proposed solution to the Department.

Do not resume production of the JMF until the Representative reviews the proposed solution and authorizes production to continue.

The LTS will test Gmm verification samples as specified in Section 413.3(j)4.d

3. Pattern Segregation. Pattern segregation is continuous or repeated areas of non-uniform distribution of coarse and fine aggregate particles in the finished mat. The Department will address pattern segregation as follows:

3.a Evaluating Pattern Segregation. If the Representative observes pattern segregation that may result in defective pavement, then:

- The Inspector will notify the Contractor of the observed pattern segregation.
- The Contractor may continue to work at their own risk while immediately and continually adjusting the operation to eliminate the pattern segregation from future work.
- As a minimum and in the presence of the Representative, determine the average depth of pavement surface macrotexture according to PTM No. 751 in areas with the pattern segregation and in areas with non-segregated pavement. The pattern segregation is unacceptable if the difference in average pavement texture depth between the non-segregated and segregated areas exceeds 0.024 inch. The Representative will determine if the pavement is defective as specified in Section 413.3(h)3.c.

3.b Test Section. If the macrotexture tests identify unacceptable pattern segregation, then:

- Immediately suspend placing the asphalt course. Evaluate the cause of pattern segregation according to the Paving Operation QC Plan and as directed. Provide proposed corrective actions to the Representative and do not resume placing the asphalt course until after the Representative reviews the proposed corrective actions and authorizes paving to continue.

- Determine if the pattern segregation resulted in defective pavement as specified in Section 413.3(h)3.c.
- After the Representative allows paving to resume, place a test section not to exceed 200 tons. If the corrective actions do not eliminate observed pattern segregation, the Department will suspend paving, even if it is before the Contractor places the entire test section. Propose additional corrective actions and construct another test section. Resume normal paving operations after constructing an entire test section without pattern segregation as determined by the Representative.

3.c Defective Pavement. At locations selected by the Inspector and with the Inspector present, drill a minimum of three 6-inch diameter cores from the area of pattern segregation and a minimum of three cores from the pavement representing a non-segregated area. Do not compress, bend, or distort samples during cutting and handling and immediately provide the cores to the Inspector. The Inspector will transport cores to the producer's laboratory. With the Inspector present, test the cores at the plant for density, asphalt content, and gradation. The Department may request additional tests as part of its evaluation of pattern segregation. Determine the maximum theoretical density according to Bulletin 27, the core density according to PTM No. 715, and asphalt content according to PTM No. 757 if previously identified problematic aggregates are used in the mixture, PTM No. 702 modified Method D, and PTM No. 739 or other test method identified in the producer QC Plan.

An area of pattern segregation contains defective pavement if the summation of absolute deviations from any two sieves is 20% or more from the JMF, the core density is defective, the mixture is defective in asphalt content, or the mixture is defective for percent passing the 75 μ m (No. 200) sieve. Remove and replace the full width of the affected lane and a minimum of 5 feet beyond each end of the area with unacceptable pattern segregation. Construct replacement pavement conforming to the appropriate surface tolerances as specified in Section 313.3(l) or Section 413.3(l).

4. Flushing. Provide a mix that will not flush. Flushing is continuous or repeated areas of excessive asphalt on the pavement surface. The Department may recognize flushing until the Department approves the project through final inspection. The Department will address flushing as follows:

4.a Evaluating Flushing. When the Representative observes flushing, then:

- The Representative will immediately notify the Contractor of the observed flushing.
- The Contractor may continue work at their own risk while immediately and continually adjusting the operation to eliminate flushing from future work.
- In the presence of the Representative, determine the average depth of pavement surface macrotexture according to PTM No. 751 in areas of suspected flushing. If the average texture depth is less than or equal to 0.006 inches, then the pavement will be considered to be flushed and is defective.

4.b Test Section. If the macrotexture tests identify flushing, then:

- Immediately suspend placing the paving course. Evaluate the cause of flushing according to the Paving Operation QC Plan and as directed. Provide proposed corrective actions to the Representative and do not resume placing the paving course until after the Representative reviews the proposed corrective actions and authorizes paving to continue.
- Remove and replace the defective wearing course at no additional cost to the Department for the full width of the affected lane and a minimum of 5 feet beyond each end of the area of defective wearing course. Construct replacement wearing course conforming to the appropriate surface tolerances as specified in Section 413.3(l).
- After the Representative allows paving to resume, place a test section not to exceed 200 tons. If the corrective actions do not eliminate observed flushing, the Department will suspend paving even if it is before the Contractor places the entire test section. Propose additional corrective actions and construct another test section. Resume normal paving operations after constructing an entire test section without flushing as determined by the Representative.

(i) Compaction. Compact the mixture to achieve the density acceptance requirements and to eliminate all roller marks. Compact the mixture while it is in proper condition and adjust roller speed, amplitude, frequency, pattern, and roller size to eliminate displacement, shoving, cracking, and aggregate breakage. Satisfactorily correct displacement resulting from reversing roller directions and other causes.

Without using excess water, maintain wheels of steel-wheel rollers moist and clean to prevent the mixture from adhering to the wheels. Use suitable methods to clean wheels of pneumatic-tire rollers.

Use pneumatic-tire rollers for compacting scratch courses.

For areas inaccessible to rollers, compact with mechanical vibrating hand tampers.

Remove areas that are loose, broken, mixed with dirt, or show an excess or deficiency of asphalt material. Replace removed mixture with fresh hot mixture and compact the mixture even with the surrounding pavement surface.

(j) Mat Density Acceptance.

1. General. The Department will accept the mat density of standard construction according to one of the levels in Table F. Areas may be accepted by non-movement or optimum-rolling pattern based on the criteria in Sections 413.3(j)2 and 413.3(j)3. Do not place mixtures for non-movement or optimum-rolling pattern acceptance until the Department has approved the density-acceptance level.

The Department will accept the mat density of RPS construction by lots and pavement cores as specified in Section 413.3(j)4. The Department will accept mat density of all 4.75 mm NMA asphalt mixtures by non-movement or optimum-rolling pattern.

TABLE F
Density Acceptance

Density Acceptance Level	Acceptance Criteria
Non-Movement	Table H
Optimum-Rolling Pattern	Table H
Pavement Cores	Table I

2. Non-Movement. The Inspector-in-Charge will approve density acceptance by non-movement for the following materials, conditions, or applications:

- Scratch courses or leveling courses less than 1-inch in depth or equal to or less than 110 pounds per square yard.
- Areas of paving or patching less than 4 feet in width or narrow enough to cause bridging of the area by approved compaction equipment.

The Inspector-in-Charge will accept density by non-movement for the following materials, conditions, or applications if they are determined by the Representative to be non-critical for density:

- Materials placed in small quantities not exceeding 500 tons in a continuous placement.
- Mixtures placed on unstable or non-uniform bases.
- Mixtures used for patching, road widening, shoulders, driveway adjustments, parking lots, and other miscellaneous applications determined by the Representative. Shoulders where density is critical will be accepted by pavement cores as specified in Section 413.3(j)4.a.

The Department will accept the density when the mixture does not move under the compaction equipment.

3. Optimum-Rolling Pattern. The Inspector-in-Charge may accept density using an optimum-rolling pattern for the following materials, conditions, or applications:

- Materials placed in small quantities not exceeding 500 tons in a continuous placement.
- Mixtures placed on unstable or non-uniform bases.
- Leveling courses or other courses that are greater than or equal to 1-inch in depth or greater than or equal to 110 pounds per square yard.
- Mixtures used for patching, road widening, driveway adjustments, parking lots, shoulders where density is not critical, and other miscellaneous applications determined by the Representative. Shoulders where density is critical will be accepted by pavement cores as specified in Section 413.3(j)4.a.
- Mixtures placed at less than the minimum compacted depths in Table G.

With the Representative and the Contractor's certified asphalt field technician present, determine density with an approved nuclear gauge according to PTM No. 402, or determine density with an approved electrical impedance gauge according to PTM No. 403. Nuclear gauges must be operated by a licensed nuclear gauge operator. In the presence of the Representative, establish the optimum-rolling pattern for each course according to PTM No. 402 or PTM No. 403. Document optimum-rolling patterns using the appropriate Form TR-4276B or Form TR-4276C and provide the completed forms to the Representative. Compact the course according to the optimum-rolling pattern. During paving, the Representative may require the Contractor to verify the target density established by the optimum-rolling pattern. If the target density is not achieved, establish a new optimum-rolling pattern as directed. The Representative will suspend paving when the optimum-rolling pattern is not being followed.

Use one of the following gauges or approved equal:

- Troxler Electronics, Model 3411B or Model 4640B
- Campbell Pacific Nuclear, Model MC-2
- Seaman Nuclear, Model MC-2
- TransTech Systems, Inc., PQI™, Model 300 or Model 301
- Troxler Electronic Laboratories, PaveTracker™

Submit a copy of the certificate of nuclear gauge annual calibration according to ASTM D2950 and documentation of training of the nuclear gauge operator. Recalibrate any nuclear gauge that is damaged or repaired.

4. Pavement Cores (Standard and RPS Construction).

4.a General. Pavement cores are required for accepting the density of RPS construction. Pavement cores are required for standard construction of extended-season paving, unless waived by the Representative as specified in Section 413.3(b)1. Pavement cores are appropriate for accepting the density of standard construction if all of the following materials, conditions, or applications exist:

- Materials placed at compacted depths greater than or equal to the minimum depths specified in Table G.
- Materials placed on stable and uniform bases.

TABLE G
Mixture Minimum Compacted Depths

Mixture	Minimum Depth
9.5 mm Wearing Course	1 1/2 in.
12.5 mm Wearing Course	2 in.
19 mm Binder Course	2 1/2 in.
25 mm Binder Course	3 in.

4.b Lots and Sublots. Section 413.3(h)2.a.

4.c Density Acceptance Samples. The Inspector will select different sample locations in each subplot according to PTM No. 1, PTM No. 729, and PTM No. 746. With the Inspector present, drill 6-inch diameter cores as soon as possible but no later than the day following placement. The core at each location will be used to determine the bulk specific gravity (Gmb) and density (lbs/ft³) of the compacted mix. Do not compress, bend, or distort samples during cutting, handling, transporting, and storing. If samples are damaged, immediately obtain replacement samples, as directed by the Inspector, from within 12 inches of the original sample location. Within 24 hours after coring, backfill the hole with mixture of the same JMF or with mixture used for subsequent courses and compact and seal the mixture.

In the presence of the Inspector, identify the samples by ECMS project number, lot and subplot number, location (station and offset), date of placement, mixture type, and as acceptance samples (Sample Class AS). Provide the daily theoretical maximum specific gravity value as specified in Section 413.2(e) 1.d.4 for the density calculation of each subplot in the lot. If density samples from the lot are taken from more than 1 day's placement, the daily theoretical maximum specific gravity values from each production day will be used to calculate the percent of theoretical density for each individual density acceptance core placed on that production day upon Gmm verification as specified in Section 413.3(j)4.d.1. Immediately deliver the samples to the Inspector and provide sample containers of sufficient strength to prevent samples from being damaged during transport. The Representative will submit samples for one lot in one container.

For quality control purposes, a maximum of one pavement core per subplot may be obtained unless the Representative allows additional cores. No cores may be taken by the Contractor after the acceptance cores are obtained. Do not obtain any other pavement cores, except those which are directed by and surrendered to the Department, unless allowed in writing by the District Executive.

The Contractor may expedite delivery of the acceptance samples to the LTS at no additional cost to the Department. If the delivery is expedited, the Inspector will secure all containers with Department issued, uniquely numbered security tape. The Inspector will record the information from the security tape onto Form TR-447 which will be packaged inside the secured container and return the secured containers to the Contractor for transport to the LTS.

The Contractor may transport the secured samples to the LTS or utilize a third-party shipping service. If the Contractor elects to utilize a third-party shipping service, the service must provide the ability to track package delivery.

Provide all expedited delivery details in the Paving Operation QC Plan and discuss expedited delivery details at the preconstruction and pre-paving meetings. For expedited delivery, provide all containers, cushioning material, and packaging supplies to the Inspector. The Inspector will package all samples in the provided containers and secure the samples prior to surrendering the secured containers to the Contractor.

Upon arrival at the LTS, the secured containers will be visually examined for evidence that the security tape has not been compromised and the unique numbers will be compared between the security tape and the value recorded on Form TR-447 inside the container. If sample security has not been compromised, samples received under expedited delivery will be tested on a priority basis. If the containers show any signs of compromised security, the following conditions apply:

- Obtain replacement samples as directed within 12 inches longitudinally of the original samples.
- Immediately stop expedited delivery and all samples will be delivered to the Inspector for transport.
- Conduct an investigation to determine the cause of the compromised security and provide a written explanation to the Representative.
- Do not resume expedited delivery until the Representative has reviewed the written explanation and is satisfied that proper steps have been taken to address the issue. The Department reserves the right to terminate expedited delivery after the first occurrence of compromised sample security.

4.d Acceptance and Gmm Verification Sample Testing. These procedures apply to standard and RPS construction.

4.d.1 LTS Acceptance and Gmm Verification Testing. The LTS will test each density acceptance sample according to PTM No. 715, and if necessary PTM No. 716, to determine the bulk specific gravity (Gmb) and bulk density (lbs/ft³) of the compacted mixture. For individual increment test results outside of the lower and upper specification limits in Table I, the LTS will analyze the bulk density test results for extreme values according to PTM No. 4 at the 5% significance level. If discarding an extreme value reduces a lot to less than three remaining test results, the Department will accept the lot as specified in Section 413.3(h)2.a.1. The Department will accept lots with three or more test results as specified in Section 413.4(a)4 or Section 413.4(b).

For lots with no required Gmm verification loose mixture samples, the Contractor's daily theoretical maximum specific gravity values from each production day will be used for acceptance.

For lots with required Gmm verification loose mixture samples, the LTS will randomly select one of the Gmm verification loose mixture samples obtained as specified in Section 413.3(h)2.b.1 from the lot according to PTM No. 1. The LTS will test the randomly selected Gmm verification loose mixture sample to determine the theoretical maximum specific gravity (Gmm) of the compacted mixture according to AASHTO T 209 as modified in Bulletin 27, with the following exception:

- The samples will be obtained as specified in Section 413.3(h) 2.b.1.

The LTS will compare the randomly selected Gmm verification sample test result with the Contractor's daily Gmm value for that same production or placement date. If the LTS and Contractor Gmm values do not differ by more than ± 0.030 , the Contractor's daily Gmm values in the whole lot will be considered verified and the Contractor's daily Gmm values will be used to determine the percent of theoretical maximum density for each density acceptance sample placed on that date. If the initial randomly selected LTS Gmm verification sample test result differs from the Contractor's daily Gmm value for that same production or placement date by more than ± 0.030 , the LTS Gmm test result value will be used as the acceptance Gmm value to determine the percent of theoretical maximum density for the individual density acceptance cores produced or placed on that same date. The Department reserves the right to select more than one Gmm verification sample from the lot representing the same production or placement date and to select other Gmm verification samples from the lot representing different production or placement dates to verify the Contractor's daily Gmm values. When more than one Gmm verification sample is selected from the lot representing the same production or placement date, the LTS Gmm test results will be averaged and the average will be used to verify the Contractor's daily Gmm value for that same production or placement date.

Individual subplot density values will be calculated and then rounded to the nearest tenth of a percent of theoretical maximum density according to ASTM E 29. Lot average density will subsequently be calculated from the individual subplot values and then rounded to the nearest tenth of a percent theoretical maximum density according to ASTM E 29. The Department will determine acceptance, with respect to density, as specified in Section 413.4(a)4 or Section 413.4(b).

If cores are not taken within 1 day after placing the mixture, or if the density for two consecutive lots or for a total of three lots does not meet the density payment factor percentage of ≥ 100 , stop paving operations for the project as directed. Review and evaluate the operation and determine the cause of the problem. Do not resume paving until after the Representative reviews the proposed solution and authorizes paving to continue.

(k) Joints.

1. Longitudinal Joints.

1.a General. Offset joints in a layer from the joint in the layer immediately below by approximately 6 inches. Plan joint locations to ensure that the joint in the top layer is at the approximate pavement centerline for two-lane roadways and within 12 inches of the lane lines for roadways with more than two lanes. Avoid joint locations directly beneath planned pavement marking applications where possible.

Before placing abutting lanes, paint the entire area of the joint with a uniform coating of asphalt material, the PG-Binder used in the pavement course or PG 64S-22. Painting of the joint face is not required for scratch courses.

Place and compact the mixture at the joint according to the Paving Operation QC Plan. Ensure the surface across the joint and along the joint is within the surface tolerances specified in Section 413.3(l).

Adhere to the following additional requirements for the construction of longitudinal joints that will not be evaluated as specified in Section 405.

Assure a true line when paving. Place and closely follow lines or markings for this purpose. When compacting loose mixture at an unsupported edge, make the first roller pass with the edge of the roller drum extending beyond and overhanging the unsupported edge by 3 to 6 inches. Do not allow pneumatic-tire rollers to cause lateral movement at any unsupported edge.

When placing uncompacted mixture adjacent to a previously compacted lane, operate the paver so that the material overlaps the edge of the previously placed lane by 1 to 1 1/2 inches. Ensure that mixture behind the screed is tightly pushed against the free face of the existing lane. Maintain the uncompacted mixture uniformly higher than the existing lane by at least 1/4 inch per inch of material being placed to assure full compaction. When possible, use automated joint matchers when constructing joints between traveled lanes. Do not bump back or lute the overlapped material unless overlap inadvertently exceeds the specified tolerances. When compacting the loose mix at the longitudinal joint, keep the roller drum approximately 18 inches from the joint for the first pass forward, avoiding the roller edge of the drum operating directly above the bottom edge of any underlying notched wedge joint. On the backward and subsequent passes, overlap the joint 2 to 6 inches. Ensure that the joint receives at least as many roller passes as the rest of the mat.

If traffic or other cause distorts the lane edge, restore the lane edge to its original shape, using acceptable procedures.

Seal the longitudinal joint(s) for surface courses with hot PG 64S-22 asphalt binder at no additional cost to the Department. Heat and maintain asphalt binder sealant between 265F and 320F. Do not place sealant when the air temperature is below 40F, unless permitted by the Representative. Apply the sealant only to joints in pavement surfaces that are clean, dry and free of any loose material and debris. Clean with a power broom as required. Utilize a pressure applicator with a wand or nozzle capable of applying hot asphalt sealant in a straight and consistent width band of 4 inches +/- 1 inch and thickness of 1/16 inch +/- 1/32 inch. Center the sealant band within 1 inch of the joint. Remove and dispose of excess sealant at no additional cost to the Department. Reseal areas of the joint that are inconsistently or not completely covered at no additional cost to the Department. Replace pavement markings that are marred by sealing operations at no additional cost to the Department.

1.b Vertical Joints.

- The Contractor may use vertical joints for base, binder, and wearing courses.
- If traffic or other cause distorts the lane edge, carefully saw a vertical lane edge before painting.
- Place the abutting lane on the same day, and if necessary, leave only short lane sections, normally less than 25 feet in length, where the abutting lane is not placed the same day.

1.c Notched Wedge Joints.

- The Contractor may use notched wedge joints for wearing and binder courses with NMA mixtures of 19.0 mm or smaller.
- Remove and dispose of all loose and foreign material before opening the lane to traffic.
- Construct the joint as shown on the Standard Drawing.
- If the joint is next to opposing traffic, place the abutting asphalt mixture within 1 working day after placing the mixture. If the joint is next to traffic in the same direction, place the abutting asphalt mixture within 2 working days after placing the mixture.
- If both lanes that make the joint are not placed on the same day, amend the Maintenance and Protection of Traffic Plan and install additional signing for uneven lane at no additional cost to the Department. Install "Uneven Lane" signs according to Publication 212, Publication 213, and MUTCD and 1/2-mile before the notched wedge joint area and every 1/2-mile within the uneven pavement area.

2. Transverse Joints. Construct joints perpendicular to the pavement centerline. The Contractor may saw transverse joints. If used, install bulkheads straight and perpendicular to the surface. If a bulkhead is not used and the roller moves over the rounded edge of new mixture, locate the joint a sufficient distance from the rounded edge to provide a true surface and cross section. Paint the joint face with a thin coating of asphalt material, the PG-Binder used in the pavement course or PG 64S-22, before placing fresh mixture against the joint face. Painting of the joint face is not required for scratch courses.

3. Other Joints. Where placing a wearing course abutting to existing pavement at locations such as paving notches, lane additions, or utility openings, seal the joint with hot asphalt material of the class and type designated for the wearing course. Evenly apply the sealant a minimum of 6 inches on both sides of the joint. The Contractor may use emulsified asphalt, consisting of PennDOT Material Class TACK or NTT/CNTT, instead of hot asphalt material. Before sealing, clean and remove harmful material from the area to be sealed. Control the application rate so residual asphalt completely fills surface voids and provides a watertight joint. If necessary, use two or more applications of emulsified asphalt. Remove excess asphalt material and immediately cover the sealed area with a light application of dry sand that is acceptable to the Representative.

(l) Surface Tolerance. Test the finished surface with a 12-foot straightedge at areas the Representative determines may be deficient or irregular, and at transverse joints (including bridge decks and pavement transition) and paving notches. Hold the straightedge in contact with the surface and in successive positions parallel to the road centerline to check the entire width of the pavement. Advance along the pavement in stages of not more than one-half the length of the straightedge until the entire area is tested. The pavement is defective if irregularities are more than 3/16 inch.

(m) Tests for Depth: Binder and Wearing Courses. Construct the pavement to the depth indicated and within the specified tolerances.

For courses with density acceptance by lots, the Inspector will measure the depth of each subplot according to PTM No. 737 using the density acceptance samples.

For courses with a designed course depth and density acceptance by non-movement or optimum rolling pattern, the Inspector will calculate the mass per square meter (weight per square yard) for verification of yield. If yield results indicate insufficient course depth, drill one 6 inch diameter core for each 500 tons of material placed to determine the extent of the deficient depth. Core locations will be determined according to PTM No. 1. For courses with density acceptance by lots, the inspector will measure the depth of each subplot according to PTM No. 737 using density acceptance samples.

Pavement deficient in depth by more than 1/4 inch is defective work. Pavement deficient in depth by more than 1/8 inch in three or more adjacent core locations is defective work. The extent of the defective work is the entirety of all sublots represented by the adjacent deficient core samples. After the Inspector completes depth measurements, backfill, compact, and seal core holes with the mixture used to construct the course. Immediately start correcting courses or pavement that are deficient in depth at the core location and proceed longitudinally and transversely until the depth is within 1/4 inch of the design depth.

(n) Protection of Courses. Do not allow vehicular traffic or loads on newly compacted courses for 24 hours or until the course uniformly cools to a temperature of 140F or less. Provide alternate routes as indicated or as directed. If both lanes that form a longitudinal joint are placed on the same day and public safety is not restricted, do not allow vehicular traffic or loads on the lanes until adequate stability and adhesion is obtained and the material has uniformly cooled to 140F or less. Maintain the course, as specified in Sections 105.13, 107.15, and 901.

(o) Defective Work. As specified in Section 105.12 and as follows:

Department acceptance and QA testing shall not relieve the Contractor of responsibility for material or workmanship that the Representative determines is defective before the Department issues the acceptance certificate. Remove and replace or repair defective work as directed. The BOPD, CMD will review Representative determinations of defective material or workmanship.

Remove and replace pavement defective for pattern segregation as specified in Section 413.3(h)3, for flushing as specified in Section 413.3(h)4, surface tolerance as specified in Section 413.3(l) or Section 313.3(l) and depth as specified in Section 413.3(m), or Section 313.3(m). Remove and replace pavement defective for percent within limits or Payment Factor Percentages as specified in Tables H and I.

413.4 MEASUREMENT AND PAYMENT—**(a) Standard Asphalt Construction.****1. Asphalt Courses.**

1.a Superpave Asphalt Mixture Design, Asphalt Wearing Course. Square Yard or Ton

1.b Superpave Asphalt Mixture Design, Asphalt Wearing Course (Scratch). Ton

1.c Superpave Asphalt Mixture Design, Asphalt Wearing Course (Leveling). Ton

1.d Superpave Asphalt Mixture Design, Asphalt Binder Course. Square Yard or Ton

1.e Superpave Asphalt Mixture Design, Asphalt Binder Course (Leveling). Ton

2. Asphalt Tack Coat. Section 460.4.

3. Mixture Acceptance by Certification and Density Acceptance by Non-Movement, Optimum-Rolling Pattern, or Pavement Cores. The Representative will pay at the contract unit price, adjusted according to Table H. The total payment factor percentage for pavements with density acceptance other than by pavement cores is the sum of adjustments for each test criterion subtracted from 100%. The adjustment for an individual test criterion is the payment factor percentage subtracted from 100%. The pavement will be considered defective if the payment factor for asphalt content, percent passing the 75 μ m (No. 200) sieve, and percent passing the 2.36 mm (No. 8) sieve are all 85%.

For pavements with density acceptance by cores, the payment will be as specified in Section 413.4(a)4 with pay factors from Table H being applied. The pavement will be considered defective if the pavement density cores result in a percent within limits less than 50.

TABLE H
Contract Unit Price Adjustments - Mixture Acceptance by Certification

Mixture NMAS	Test Criteria	Test Value		Payment Factor Percentage
Asphalt Content				
All sizes	Printed Tickets	At least 90% of Daily Printed Tickets Within 0.2% of JMF		100
		Less than 90% of Daily Printed Tickets Within 0.2% of JMF		85
19.0 mm and smaller	QC Sample Testing**	Single Sample (n=1)	Multiple Samples (n≥2)	
		±0.7%	±0.5%	100
		±0.8% to 1.0%	±0.6%	85
		> ±1.0%	≥ ±0.7%	*
25.0 mm and larger	QC Sample Testing**	±0.8%	±0.6%	100
		±0.9% to ±1.2%	±0.7%	85
		> ±1.2%	≥ ±0.8%	*
Gradation				
		Single Sample (n=1)	Multiple Samples (n≥2)	
All sizes	QC Sample Testing for % Passing 75 µm (No. 200) Sieve**	±3.0%	±2.1%	100
		±3.1% to ±4.0%	±2.2% to ±2.7%	85
		> ±4.0%	≥ ±2.8%	*
All sizes	QC Sample Testing for % Passing 2.36 mm (No. 8) Sieve**	±6%	±4%	100
		±7% to ±8%	±5%	85
		> ±8%	≥ ±6%	*
Mat Density				
All sizes	Non-Movement	Section 413.3(j)2.		100
	Optimum-Rolling Pattern	Section 413.3(j)3.		100
Sizes from Table I	Acceptance Sample Testing of Pavement Cores	Table I		Section 413.4(a)4.a
* Defective pavement. Remove and replace or, when permitted by the District Executive in writing, leave in place and the Department will pay 70% of the contract unit price.				
** For these test criteria, the daily Pay Factor will be determined by the single sample test result from the daily QC sample. If more than one QC sample test result is available for a day, the Payment Factor Percentage will be determined based on the average of the results using multiple sample tolerances. If corrective action is taken, Pay Factors will be independently determined for material placed before and after the corrective action.				

4. Mixture Acceptance by Lot and Density Acceptance by Non-Movement, Optimum-Rolling Pattern, or Pavement Cores. The Department will pay on a lot-by-lot basis at the contract unit price, adjusted for Pay Factors (PF) as specified. For the PF based on Percent Within Limits (PWL), the Department will determine the individual PWL values for in-place pavement density (PWL_D), asphalt content (PWL_{AC}), percent passing the 75 µm (No. 200) sieve (PWL₂₀₀), and for percent passing the primary control sieve (PWL_{PCS}) as specified in Section 106.03(a)3, using the upper and lower specification limits in Table I. The Department will determine each PF for in-place pavement density, asphalt content, percent passing the 75 µm (No. 200) sieve, and for percent passing the primary control sieve as specified in Section 413.4(a)4.a. The Department will determine the Overall Lot Pay Factor (OLPF) as specified in Section 413.4(a)4.a.2.

4.a Pay Factors

4.a.1 Pay Factors for In-Place Pavement Density (PF_D), Asphalt Content (PF_{AC}), Percent Passing 75 µm (No. 200) Sieve (PF₂₀₀), and Percent Passing the Primary Control Sieve (PF_{PCS}). For lots with density acceptance by non-movement or optimum-rolling pattern, PF_D = 100.00.

The Department will determine PF_D, for lots with density acceptance by pavement cores and PF_{AC}, PF₂₀₀, and PF_{PCS} for all lots, according to the following:

4.a.1.a All PWL Parameters Greater Than or Equal to 50. When PWL_D, PWL_{AC}, PWL₂₀₀, and PWL_{PCS} are each greater than or equal to 50, the Department will determine the pay factor for each PWL as specified in one of the following equations as appropriate.

When PWL is ≥ 90, determine the pay factor for the specific pay parameter as specified in the following Equation:

$$PF_X = 100 + 0.4(PWL_X - 90)^*$$

Where,

PF_X = Pay Factor of the individual pay parameter (PF_D, PF_{AC}, PF₂₀₀ or PF_{PCS})

PWL_X = Percent within Limits of the individual pay parameter (PWL_D, PWL_{AC}, PWL₂₀₀ or PWL_{PCS})

* For 9.5 mm and 12.5 mm courses with average density < 93.0, the maximum PF_D = 100

When PWL is < 90 and ≥ 50, or when PWL₂₀₀ is less than 50 and the average percent passing the 75 µm (No. 200) sieve is within ± 2.0% from the JMF, determine the pay factor for the specific pay parameter as specified in the following Equation:

$$PF_X = 70 + 0.75(PWL_X - 50)$$

Where,

PF_X = Pay Factor of the individual pay parameter (PF_D, PF_{AC}, PF₂₀₀ or PF_{PCS})

PWL_X = Percent within Limits of the individual pay parameter (PWL_D, PWL_{AC}, PWL₂₀₀ or PWL_{PCS})

4.a.1.b One PWL Parameter Less Than 50. When either one of PWL_D or PWL_{AC} is less than 50, the lot is defective. When PWL₂₀₀ is less than 50, the lot is defective when the average percent passing the 75 µm (No. 200) sieve is greater than ± 2.0% from the JMF. When PWL_{PCS} is less than 50, the PF_{PCS} = 60.00. For defective lots, the DE will direct one of the following:

- Leave the lot in place. The DE will apply an OLPF of 70.
- Remove and replace the entire lot. The District Executive will direct removal and replacement of the entire lot at no additional cost to the Department with new lot acceptance sampling and testing.

4.a.1.c Two PWL Parameters Less Than 50. When two or more of PWL_D, PWL_{AC}, or PWL₂₀₀, with the average percent passing the 75 µm (No. 200) sieve greater than ± 2.0% from the JMF, are less than 50, the lot will be considered defective and the DE will direct removal and replacement of the entire lot with new acceptance sampling and testing.

4.a.2 Overall Lot Pay Factor (OLPF). The Department will determine the OLPF as specified in the following equation and then will round the resulting OLPF to the nearest whole number according to ASTM E29:

$$OLPF = (0.50 \times PF_D) + (0.30 \times PF_{AC}) + (0.10 \times PF_{200}) + (0.10 \times PF_{PCS})$$

Where,

PF_D = Pay Factor for In-Place Density

PF_{AC} = Pay Factor for Asphalt Content

PF_{200} = Pay Factor for Percent Passing the 75 μ m (No. 200) Sieve

PF_{PCS} = Pay Factor for Percent Passing the Primary Control Sieve (PCS)

TABLE I
Upper and Lower Specification Limits for Calculating Percent Within Limits

Mixture NMAS	Testing Criteria	
	Lower Specification Limit (L)	Upper Specification Limit (U)
	Asphalt Content from JMF Value, %	
9.5 mm, 12.5 mm	-0.4	+0.4
19 mm	-0.5	+0.5
25 mm and 37.5 mm	-0.6	+0.6
	Percent Passing the 75 μm (No. 200) sieve from JMF Value, %	
All sizes	-1.5	+1.5
	Percent Passing the Primary Control Sieve from JMF Value, %	
9.5 mm (PCS = 2.36 mm (No. 8) sieve)	-5	+5
12.5 mm (PCS = 2.36 mm (No. 8) sieve)	-5	+5
19 mm (PCS = 4.75 mm (No. 4) sieve)	-8	+8
25 mm (PCS = 4.75 mm (No. 4) sieve)	-9	+9
37.5 mm (PCS = 4.75 mm (No. 4) sieve)	-9	+9
	Mat Density *	
All 9.5 mm, 12.5 mm	92.0	98.5
All 19 mm Courses, 25 mm Binder Courses	91.0	98.0
25 mm and 37.5 mm Base Courses	90.0	No Upper Limit
* Where Limits = Percent of Theoretical Maximum Density		

4.a.3 Lot Payment. The Representative will compute the percent of the contract unit price paid as follows:

$$\text{Lot Payment} = C_p (\text{OLPF})/100$$

Where,

C_p = Contract unit price per lot (unit price times lot quantity)

OLPF = Overall Lot Pay Factor

4.a.4 Evaluation of Overall Lot Pay Factor and Payment of Incentive / Disincentive. Dollar.

The proposal will include a contract item and a predetermined amount of money for Evaluation of Overall Lot Pay Factor and Payment of Incentive. The contract item will have a unit of measure of DOLLAR, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the incentive status of the payment being made, the provisions of Section 110.02(d) are not applicable to this item.

The Evaluation of Overall Lot Pay Factor and Payment of Incentive contract item will be measured and paid as follows:

- **Incentive.** When asphalt pavement evaluation indicates that an incentive adjustment is applicable, the appropriate amount will be paid under this contract item.

- **Disincentive.** When asphalt pavement evaluation indicates that a disincentive adjustment is applicable, the appropriate amount will be deducted from money due or to become due to the Contractor through the processing of a Contract Adjustment.

4.b Dispute Resolution. For mixture acceptance testing or density acceptance testing performed by the LTS, the Contractor may request, in writing, that the Department retest a lot if the initial test results indicated a defective lot (remove and replace), a lot with an OLPF < 90.00, the asphalt content pay factor for the lot is < 80.00, or the density pay factor for the lot is < 80.00, except for density when one or more density acceptance cores in the lot were coated with paraffin wax as a result of PTM No. 716 during the original density acceptance testing. Provide written retest requests to the District Executive within 3 weeks of the date the LTS test results are released. Provide in the written request the preferred test method for asphalt content determination (PTM No. 757 or PTM No. 702, Modified Method D). Retests will not be allowed if a written retest request is not received within 3 weeks of the date the LTS test results are released. Provide quality control test results and control charts, companion sample test results (if available), test data trend evaluation, and any other pertinent information to justify the retest request. The Department will evaluate the information and may allow retesting if the information submitted provides a reasonable basis to conclude that the failing test results may not represent the in-place material. The LTS will perform the retest with the Contractor present, unless otherwise agreed to in writing with the Contractor.

For retesting of materials failing for asphalt content, percent passing 75 μ m (No. 200) sieve, or percent passing the PCS, the Inspector will identify the locations where the original box samples were collected. The Inspector will select retest sample locations 24 inches from the original sample locations longitudinally in the direction of traffic. If the 24 inch offset causes the retest sample location to fall outside of the subplot, the Inspector will select the retest sample location 24 inches from the original sample locations longitudinally in the opposite direction from traffic.

With the Inspector present, provide appropriate traffic control and drill 6-inch diameter cores for retesting purposes according to the procedure for drilling in PTM No. 729. Ensure drilling procedures include washing off and towel drying the core samples immediately after drilling. Within 24 hours after coring, backfill the hole with mixture of the same JMF or with mixture used for subsequent courses and compact and seal the mixture. Provide traffic control, core, and backfill the core holes at no additional cost to the Department. The test method used for asphalt determination during the original acceptance testing (PTM No. 757 or PTM No. 702, Modified Method D, and PTM No. 739) will be used for the retest, unless the DME/DMM grants written approval for a change in test method. If required to separate the applicable pavement course lift from other pavement courses, the cores will be saw cut at the course lift line(s) as determined by the LTS. The results of the retest cores will be used to calculate payment for asphalt content, percent passing the 75 μ m (No. 200) sieve, and percent passing the PCS for the lot.

For retesting of density acceptance, the original density acceptance cores will be utilized. The LTS will not retest a lot for density acceptance when one or more density acceptance cores in the lot were coated with paraffin wax as a result of PTM No. 716 during the original density acceptance testing. The LTS will retest each original density acceptance core according to PTM No. 715 and PTM No. 716, as necessary, to determine the Gmb and bulk density values. The LTS will not perform Gmm testing for lots where the Contractor's Gmm value was previously considered verified as specified in Section 413.3(j) 4.d.1. After Gmb testing is completed, for lots where the Contractor's Gmm was not verified, the LTS will select one original density acceptance pavement core from each production or placement date represented by the density acceptance cores in the lot. Each core selected will be the core with the highest bulk density for that production or placement date from the retest results (e.g., if a lot was placed over 3 production days, and the lot density acceptance cores include at least one core from each production or placement day, the original density cores selected during a density retest to perform Gmm testing will be 3; one from each production or placement date). The LTS will perform Gmm testing on the selected cores according to AASHTO T 209 as modified in Bulletin 27, with the following exceptions:

- The samples will be obtained as specified in Section 413.3(j)4.c
- No conditioning, only drying, will be performed on the sample
- The minimum sample size will be waived, as necessary, to use the 6-inch diameter pavement core sample, and
- The supplemental procedure for mixtures containing porous aggregate will only be performed when either the coarse aggregate or fine aggregate in the mixture has a water absorption of $\geq 1.5\%$ as indicated on the JMF and then only when the calculated percent of theoretical maximum density indicates any one individual failing subplot which results in a density pay factor less than 100.00.

The LTS Gmm value(s) determined will be the Gmm values used to determine the percent of theoretical maximum density for the cores represented by the applicable production or placement dates in the lot. Either the

previously verified Contractor's Gmm values(s) or the newly tested LTS Gmm value(s) will be used for acceptance to determine the percent theoretical maximum density for each subplot core in the lot.

Upon completing the retesting of the original density acceptance cores, the LTS will evaluate testing repeatability for the bulk density results determined according to PTM No. 715 and PTM No. 716, if necessary, using both the bulk original density test values and the bulk density retest values according to PTM No. 5. After evaluating the testing repeatability, the density test values used to determine the final payment factor percentage for density will be as follows:

- If repeatable, the original test values will be used.
- If lack of repeatability (i.e., non-repeatable), the retest values will be used.

The Department will deduct from the payment the cost per lot associated with conducting a retest as follows in Table J:

TABLE J
Dispute Resolution Retest Cost Table

Test Method	Mixture Acceptance Retest Cost if Retest Results Indicate	Mixture Acceptance Retest Cost if Retest Results Indicate
	≥ 100% Pay Factor(s)*	<100% Pay Factor(s)
PTM No. 702/739	\$900	\$3,500
PTM No. 757	\$500	\$2,000
	Density Acceptance Retest Cost if Retest Results Indicate a Lack of Repeatability	Density Acceptance Retest Cost if Retest Results are Repeatable
PTM No. 715, or PTM No. 716 only	\$200	\$750
PTM No. 715, or PTM No. 716, and AASHTO T 209 as specified in Section 413.3(j)4.d.1	\$1,100	\$4,000

* For lots where the original test results indicated a defective lot, only the pay factor(s) where original test results indicated a PWL < 50 for asphalt content, percent passing the 75 µm (No. 200) sieve, or density will be utilized to determine the retest cost. If no original test results indicated PWL < 50 for lots where OLPF < 90, then all pay factors will be utilized to determine the retest cost.

(b) Asphalt RPS Construction. Square Yard or Ton

1. Mixture Acceptance by Lot and Density Acceptance by Pavement Cores. Section 413.4(a)4, except for RPS, the Department will determine mat density by pavement cores only.

SECTION 419—STONE MATRIX ASPHALT MIXTURE DESIGN, RPS CONSTRUCTION OF PLANT-MIXED WEARING COURSES

419.1 DESCRIPTION—This work is the RPS construction of plant-mixed Stone Matrix Asphalt (SMA), on a prepared surface using a volumetric mixture design developed with the Superpave Gyratory Compactor. The SMA is to be produced as WMA using an approved WMA technology and accepted by either the Hands On Local Acceptance (HOLA) process or the LTS acceptance process.

419.2 MATERIALS— Do not incorporate material into the asphalt mixture that are not specified in Section 419.2 including additives, rejuvenators, or other materials.

(a) Asphalt Material

1. Virgin Mix. Furnish material conforming to the requirements of Standard Specifications for Performance-Graded Asphalt Binder using Multiple Stress Creep Recovery (MSCR) Test, AASHTO M 332, except as revised in Bulletin 25. Obtain material from a source listed in Bulletin 15 for the specified grade. Provide QC testing and certification as specified in Sections 106.03(b) and 702.1(b) 1. Provide the Representative a copy of a Bill of Lading for asphalt material on the first day of paving and when the batch number changes.

When producing a mixture with a WMA technology, adhere to the following requirements:

1.a WMA Technology Additives or Modifiers Blended at the Asphalt Material Supplier's Refinery or Terminal. Provide refinery or terminal blended asphalt material blended with an approved WMA Technology additive or modifier from an approved manufacturer and source listed in Bulletin 15. Include in the asphalt material Producer QC Plan, the WMA Technology additive or modifier manufacturer name, WMA Technology name, and source, dosage rates, blending method, QC testing, corrective action points, disposition of failed material, storage, handling shipping, and bill of lading information following the applicable requirements as specified in Section 702. Include the WMA Technology additive or modifier and dosage rate on the bill of lading. Provide refinery or terminally blended asphalt material, that when blended with the WMA Technology additive or modifier, the final blend meets the requirements for the specified performance grade of the asphalt binder.

1.b WMA Technology Additives or Modifiers Blended at the Asphalt Mixture Producer's Plant. Provide a blended asphalt material consisting of an approved WMA Technology additive or modifier from an approved manufacturer and source listed in Bulletin 15 that is blended with a base asphalt material of the specified performance grade conforming to the requirements of Standard Specifications for Performance-Graded Asphalt Binder using Multiple Stress Creep Recovery (MSCR) Test, AASHTO M 332, except as revised in Bulletin 25 and from an approved source listed in Bulletin 15, Section 702. Prepare a Producer QC Plan as specified in Section 106 and conforming to the Producer QC Plan requirements in Section 413.2(e)1.a and the additional Producer QC Plan requirements within this specification.

(b) Aggregate.

1. General Requirements. Provide aggregate from sources listed in Bulletin 14. Provide aggregate with at least the SRL designation specified. To achieve the specified SRL, the Contractor may provide a blend of two aggregates if the blend has an SRL designation equal to or better than that specified. Blends for SRL are 50% by weight of each aggregate. Blend the aggregates using an approved method.

2. Fine Aggregate. Section 703.1, except as follows: Determine Sand Equivalent Value according to AASHTO T 176 and meet requirements of 45% minimum sand equivalent. Do not exceed 15% sodium sulfate soundness loss in five cycles. Determine the uncompacted void content according to AASHTO T 304, Method A, or use the value listed in Bulletin 14. Provide a fine aggregate that meets 45% minimum uncompacted void content.

3. Coarse Aggregate. Type A, Section 703.2, except as follows: Meet the aggregate quality requirements of Table A.

TABLE A
Coarse Aggregate Quality Requirements

Characteristic	Test Method	Required Values
Abrasion Loss, %	AASHTO T 96	≤ 35
Flat and Elongated Particles, % 3:1 Ratio 5:1 Ratio	ASTM D4791, Method B (measured by mass, on material retained on and above the 4.75 mm (No.4) sieve)	≤ 20 ≤ 5
Absorption, %	AASHTO T 85	≤ 2.0
Crushed Fragments, % One Fractured Face Two or More Fractured Faces	ASTM D5821	100 ≥ 90

(c) **Mineral Filler.** Furnish mineral filler consisting of finely divided mineral matter such as rock or crushed limestone dust free of organic impurities. Furnish material with a maximum plasticity index of 4 and conforming to the grading requirements of AASHTO M 17. Submit a hydrometer analysis performed according to AASHTO T 88 for mineral filler.

(d) **Stabilizer.** Provide mineral fiber, cellulose fiber, or crumb rubber (CR) stabilizers conforming to the requirements below and added at a rate specified in Table B. Use the dosage rate prescribed in the JMF.

1. Requirements for All Fiber Types. Fibers must prevent draindown in the mixture according to the tolerances in Table B. Use a fiber of the type and properties appropriate to the plant's metering and delivery system.

2. Cellulose Fibers. Fibers must be of sufficient quality to prevent mixture draindown.

3. Cellulose Pellets. Use cellulose fiber stabilizing additive in pellet form that disperses sufficiently at mixing temperature to blend uniformly into the asphalt mixture. Use pellets that do not exceed 0.25inch average diameter. Pellets may contain binder ingredients such as asphalt binder, wax, or polymer. Do not use pellets if the binder ingredient exceeds 20.0% of the total weight of the pellets. Use binder that produces no measurable effect on the properties of the asphalt binder. Do not use fiber pellets which soften or clump together when stored at temperatures up to 122F.

Note: If the binder material constitutes more than 3% of the pellet weight, base the dosage rate on the net fiber content.

4. Mineral Fibers. Use mineral fibers made from virgin basalt, diabase, slag, or other silicate rock. Use an approved mineral fiber meeting the following requirements for shot content, as tested according to ASTM C612.

Sieve	Percent Passing
250 µm (No. 60)	85 - 95
63µm (No. 230)	60 - 80

5. Crumb Rubber (CR). Use CR derived from the processing of recycled tires. Rubber tire buffings produced by the retreading process qualify as a source of CR. Furnish processed, free flowing CR from a manufacturer listed in Bulletin 15, certified as specified in Section 106.03(b)3.

5.a Gradation. Meet the following gradation as determined according to ASTM D5461 using 200 mm diameter sized sieves and maintaining a maximum allowable loss after sieve analysis of 7.65%. As an alternative dry sieve analysis test method, perform the sieve analysis of the CR according to Florida Test Method, FM 5-559.

CR Gradation	
Sieve Size	Percent Passing
4.75 mm (No. 4)	100
2.36 mm (No. 8)	98-100
75 µm (No. 200)	0-3

5.b Contaminants. Provide CR relatively free from fabric, wire, cord, and other contaminating materials to

a maximum total contaminant content of 2.5% (maximum of 1.0% iron, 1.0% fiber, and 0.5% other contaminants by weight of total CR sample components).

Remove rubber particles from the fiber balls before weighing. Determine the metal content by thoroughly passing a magnet through a 50.0 ± 0.1 g (1.76 ± 0.004 ounces) sample. Determine fiber content by weighing fiber balls, which are formed during the gradation test procedure.

(e) Mixture Composition.

1. Virgin Material Mixtures. Design and control SMA according to Bulletin 27, Chapter 2B. Size, uniformly grade, and combine aggregate fractions, asphalt material, and an approved WMA Technology in such proportions that the total aggregate and asphalt in the JMF conform to the material, gradation, and volumetric requirements for the SMA mixture according to Tables B and C. Do not use RAP in the mix.

For asphalt mixtures, the WMA Technology Manufacturer Technical Representative (Technical Representative) will address laboratory procedure modifications necessary to prepare, compact, and test ASPHALT mixtures and to achieve a uniform blend. Incorporate the WMA Technology additive, modifier, or process into that JMF during production. Do not develop a volumetric asphalt JMF based on incorporating the WMA Technology additive, modifier or process during the volumetric asphalt mixture design process. For all asphalt JMFs, perform moisture susceptibility analysis according to Bulletin 27. Ensure the WMA Technology additive, modifier, or process is not detrimental to the moisture resistance of the mixture.

TABLE B
Mix Design Requirements for SMA Mixtures

AGGREGATE GRADATION REQUIREMENTS, PERCENT PASSING		
Sieve Size	9.5-mm Mixture	12.5-mm Mixture
19.0 mm (3/4 inch)	-	100
12.5 mm (1/2 inch)	100	90 – 99
9.5 mm (3/8 inch)	75 – 95	70 – 85
4.75 mm (No. 4)	30 – 50	28 – 40
2.36 mm (No. 8)	20 – 30	18 – 30
1.18 mm (No. 16)	-	-
600 μ m (No. 30)	-	-
300 μ m (No. 50)	-	-
150 μ m (No. 100)	-	-
75 μ m (No. 200)	8 – 13	8 – 11
VOLUMETRIC DESIGN REQUIREMENTS		
Design Gyration (N_{design})	100	
Voids in Mineral Aggregate	18.0 % Minimum	
Voids in Course Aggregate (VCA)	$VCA_{\text{mix}} < VCA_{\text{dry rodded}}$	
Design air voids	3.5 - 4.0 %	
Minimum asphalt binder content	Table C	
Binder grade	PG 64E-22	
Stabilizer content	Cellulose: 0.2 to 0.4 % by total mix weight Mineral: 0.3 to 0.4 % by total mix weight CR: 0.3 to 1 % by total mix weight	
Draindown	0.3 % maximum	

TABLE C
Minimum Asphalt Binder Requirements for SMA Mixtures

Combined Aggregate Bulk Specific Gravity	Minimum Asphalt Content, % by Total Mix Weight
2.400 - 2.449	7.4
2.450 - 2.499	7.2
2.500 - 2.549	7.1
2.550 - 2.599	7.0
2.600 - 2.649	6.8
2.650 - 2.699	6.7
2.700 - 2.749	6.6
2.750 - 2.799	6.5
2.800 - 2.849	6.4
2.850 - 2.899	6.3
2.900 - 2.949	6.2
2.950 - 2.999	6.1
3.000 - 3.049	6.0

Perform draindown testing according to AASHTO T 305 using a 1 hour reading. Design a mix meeting the tolerances specified in Table B.

Design each SMA mix within the job-mix tolerances according to Tables B and C. Test the materials, proportions, and the mixture at the asphalt plant laboratory.

Submit a copy of each completed JMF, signed by a certified Asphalt Level 2 plant technician, to the DME/DMM at least 3 weeks before the planned start of mixture production. Include a list of all material sources and the asphalt producer in the JMF. Provide the calibration factors (C_f and $200 C_f$) according to PTM No. 757 with the JMF. Do not start mixture production until after the DME/DMM reviews the JMF.

Submit a new JMF with a change in material sources or if a new JMF is necessary to produce an SMA mixture conforming to this specification.

1.a Producer QC Plan. Section 413.2(e)1.a, except RAP/RAS/RAM is not allowed in the mixture.

1.b Plant Technicians. Section 413.2(e)1.b with the following additions: All HOLA mixture and density acceptance testing will be performed by Department Representatives certified as Asphalt Level 1 or Level 2 Plant Technicians.

1.c Annual JMF Verification. During initial production of each JMF, verify, according to the QC Plan, that the mixture conforms to this specification. If the mixture does not conform to the single and multiple sample tolerances according to Tables D and E within 2 days of production, suspend shipping the mixture to the project. Do not ship the mixture to the project until after the Representative reviews and verifies that results conform to the single and multiple sample tolerances in Tables D and E. Perform annual verification of the asphalt mixture JMF.

1.d Production. Section 413.2(e)1.d, except as follows :

Produce and test mixtures, including Superpave Gyratory Compactor (SGC) specimens for quality control , except as modified by the Producer QC Plan. Maintain records of the testing of the asphalt mixture and make available for review by the Representative when requested.

1.d.3 Gradation. Section 413.2(e)1.d.3, except RAP and RAS are not allowed. Produce the mix within the tolerances of Table D.

1.d.5 Volumetric Analysis of Compacted Specimens. Sample the completed mixture according to PTM No. 1 and at the frequency in the producer QC Plan. Prepare a minimum of two specimens from each sample according to AASHTO T 312.

Produce a mixture with volumetric properties conforming to the tolerances according to Table E. Determine the bulk specific gravity of the specimens as specified in AASHTO T 312 and calculate air voids (V_a) and Voids in Mineral Aggregate (VMA) at N_{design} according to AASHTO R 35 and as specified in

Bulletin 27. Determine compliance with the multiple specimen tolerances using the average of the results for all specimens prepared from the sample.

1.d.6 Mixture Draindown. Sample the completed mixture according to PTM No. 1 a minimum of once daily. Perform draindown testing according to AASHTO T 305 along with the first mixture samples for each day's production. Produce a mixture that meets the tolerances of Table D.

1.d.7 Degree of Particle Coating. For all asphalt mixtures, sample the mixture according to PTM No. 1 and at the frequency in the Producer QC Plan. Determine the degree of particle coating of the completed asphalt mixture according to AASHTO T 195. Produce an asphalt mixture with percent coated particles $\geq 95.0\%$. Increase the plant mixing time or make other plant adjustments if the required percent of coated particles is not met. Produce an asphalt mixture capable of being handled, placed, and compacted without stripping the asphalt material from the aggregate.

TABLE D
Composition Tolerance Requirements of the Completed Mix

		Single Sample (n = 1)	Multiple Samples (n ≥ 3)
Gradation			
Passing 9.5 mm (3/8 inch) and Larger Sieves		±5%	±4%
Passing 4.75 mm (No. 4) to 150 µm (No. 100) Sieves (Inclusive)		±4%	±3%
Passing 75 µm (No. 200) Sieve		±3.0%	±2.0%
Asphalt Content			
% Asphalt by Weight		±0.7%	±0.4%
Draindown			
% by Weight		0.3 % maximum	
Temperature of Mixture (F)			
Class of Material	Type of Material	Minimum	Maximum
PG 64E-22	Asphalt Binder	260	330

TABLE E
Volumetric Tolerance Requirements of the Laboratory Compacted Mix

	Single Specimen (n = 1)	Multiple Specimens (n ≥ 2)
Air Voids at N_{design} (V_a)	±2.0% from JMF	±1.5% from JMF
Minimum VMA	17.0	—

1.e Corrective Actions. Immediately take corrective actions if one or more of the following occurs:

- QC test results on a single sample (n=1) for percent passing the 4.75 mm (No. 4) sieve, the 2.36 mm (No. 8) sieve, the 75 µm (No. 200) sieve, or asphalt content are not within the tolerances in Table D.
- The average of multiple samples (n≥ 3) for percent passing any sieve or asphalt content, as determined according to Section 419.2(e)1.d, are not within the tolerances according to Table D.
- QC test results on a single specimen (n=1) or on multiple specimens (n≥ 2) are not within the tolerances according to Table E.
- Draindown test result(s) are not within the tolerances according to Table D.

- Independent Assurance (IA) or QA sample results from testing at the producer's plant are not within the tolerances of Tables D or E.

After taking corrective actions, sample the completed mixture within 150 tons of production. After sampling, test the mixture and provide test results to the Representative within 500 tons of production. If less than three samples are tested for mixture composition, determine conformance with Table D by comparing each result to the multiple sample tolerances. If the mixture does not conform to the single and multiple sample tolerances in Table D and the single and multiple specimen tolerances in Table E, suspend production and shipping to the project and determine the cause of the problem. Provide a written explanation of the problem and a proposed solution to the Department. After the Representative reviews the proposed solution and authorizes production to continue, resume production and perform JMF verification according to the QC Plan.

(f) Mixture Acceptance.

1. General. The Department will accept the mixtures by lot acceptance as specified in Section 419.3(i)2 by either LTS or HOLA acceptance methods as indicated.

The Department or the Contractor may for any reason stop HOLA acceptance and switch to LTS acceptance for lots with samples not yet tested. To change the acceptance method from LTS acceptance to HOLA acceptance, the Contractor and the District Executive must agree to the change in writing. The acceptance method for a lot cannot be changed after acceptance testing for that lot starts.

2. Certification. SMA mixtures will not be accepted by certification. The only exception for SMA accepted by certification is small quantities of SMA mixture used for patches and miscellaneous placements equal to or less than 150 tons as specified in Section 419.3(i)2.a.

(g) WMA Technologies (Additive(s), Modifier(s), or Processes) and WMA Manufacturers. For WMA mixtures, Section 413.2(f)

(h) Anti-Strip Additives. For asphalt mixtures, Section 413.2(g)

(i) WMA Technology Manufacturer Technical Representative (Technical Representative). For asphalt mixtures, Section 413.2(h)

419.3 CONSTRUCTION—

(a) Preplacement Requirements. Provide asphalt mixtures as indicated for the entire project.

1. Paving Operation QC Plan. Prepare a paving operation QC Plan, as outlined on Form CS-409, for field control and evaluation of asphalt concrete paving operations. Submit the QC Plan to the Representative before or at the pre-construction conference. Include in the QC Plan a description of the construction equipment and methods necessary to construct and test the asphalt concrete courses as specified in Section 419.3. For asphalt mixtures, have the Technical Representative provide all recommendations and direction specific to the WMA technology in the paving operation QC Plan. Do not start paving until after the Representative reviews the QC Plan.

2. Preplacement Meeting. At least 2 weeks before placing asphalt paving mixtures, schedule an asphalt preplacement meeting with the Representative to review at a minimum the specification, paving operation QC Plan, sequence of paving operations, mixture acceptance, density acceptance, and the care and custody of asphalt acceptance samples.

(b) Weather Limitations. Do not place SMA paving mixtures from October 1 to March 31 in Districts 1-0, 2-0 (except Juniata and Mifflin Counties), 3-0, 4-0, 5-0 (Monroe and Carbon Counties only), 9-0 (Cambria and Somerset Counties only), and 10-0; and from October 16 to March 31 in Districts 2-0 (Juniata and Mifflin Counties only), 5-0 (except Monroe and Carbon Counties), 6-0, 8-0, 9-0 (except Cambria and Somerset Counties), 11-0 and 12-0. Exceptions require the written permission of the District Executive. Do not place asphalt paving mixtures when surfaces are wet or when the air or surface temperature is 50F or lower. If work is halted because of weather conditions,

the Representative may allow the Contractor to place limited quantities of mixture that are en route to the project.

(c) Asphalt Mixing Plant. Section 413.3(c), except the following requirements are for SMA mixes.

Obtain asphalt mixtures from a plant fully automated and recorded and currently listed in Bulletin 41. The necessary facilities for inspection include a plant office as specified in Section 714.5(a), except the minimum floor space is 120 square feet.

Ensure that both the aggregates and the completed mixture are free of unburned fuel oil and excess moisture as specified in Section 413.2(e)1.d.1.

For asphalt mixtures, make any plant modifications needed to introduce the WMA Technology additives, modifiers, or processes according to specific recommendations and direction from the Technical Representative or process manufacturer to achieve a uniform blend of the WMA Technology additive, modifier or foaming process and produce an asphalt mixture meeting these specifications. For batch plants, dry the aggregate according to the specific recommendations and direction from the Technical Representative.

1. Mineral Filler System. Follow the requirements listed in Chapter 1, Section 2.5 of Bulletin 27.

2. Stabilizer Supply System. Add stabilizer through specialized equipment that can accurately proportion and meter, by weight, the proper amount per batch for batch plants, or continuously and in a steady uniform manner for drum plants. Do not feed fiber, pelletized or loose, through the cold feed bins or through the RAP bins.

Provide proportioning devices that are interlocked with the plant system and controlled to $\pm 10\%$ of the weight of the fibers required. During the trial demonstration specified in Section 419.3(g), perform an equipment calibration to the satisfaction of the Representative to show that the fiber is being accurately metered and uniformly distributed into the mix.

Include the following on the stabilizer supply system:

- low level indicators
- no-flow indicators
- a printout of feed rate status in pounds/ minute
- a section of transparent pipe in the stabilizer supply line for observing consistency of flow or feed.

Have the Representative approve all stabilizer addition systems.

When a batch plant is used, add the stabilizer to the aggregate in the weigh hopper and increase both dry and wet mixing times. Ensure that the stabilizer is uniformly distributed before the injection of asphalt binder into the mixture. When a drum plant is used, do not allow the fibers to become removed by the exhaust system. If there is any evidence of fiber in the bag-house or wet washer fines, relocate the liquid asphalt binder line and/or the fiber line so that the fiber is captured by liquid asphalt spray and incorporated into the mix. If there is any evidence of clumps of fibers or pellets at the discharge chute, increase the mixing time and/or intensity.

Store stabilizer in a dry environment.

3. Hot-Mixture Storage. Ship material within 2 hours of plant mixing. Stored SMA material that does not consistently meet the same quality as material discharged directly into hauling vehicles will be rejected.

4. HOLA Laboratory Testing Facility. For testing of HOLA samples by the Department, identify a laboratory testing facility where the local acceptance testing is to be performed. Identify either the laboratory located at the asphalt mixture production plant, the laboratory where the plant production mixture is being tested for QC, or another agreed upon laboratory location meeting the requirements of Bulletin 27. Identify a laboratory testing facility that has demonstrated testing proficiency through an AASHTO re:source On-Site Laboratory Assessment performed within the last 2 years before the HOLA sample testing. The AASHTO re:source On-Site Laboratory Assessment must have been completed on the equipment proposed for utilization by the Department.

At the project preconstruction meeting, submit the identified laboratory testing facility location, AASHTO re:source On-Site Laboratory Assessment report, and any necessary corrective action documentation to correct any deficiencies on the Laboratory Assessment report for review by the Representative. The Representative will review the laboratory testing facility location and AASHTO re:source assessment documentation and, if acceptable, designate the laboratory testing facility for the project. Use the designated laboratory for testing all HOLA samples.

If a change in the designated laboratory testing facility is necessary, submit the new laboratory testing facility location. Include the AASHTO re:source On-Site Laboratory Assessment report for the new laboratory testing facility

and corrective action documentation for deficiencies noted by the AASHTO re:source On-Site Laboratory Assessment report. The Representative will review the new laboratory testing facility and AASHTO re:source assessment documentation and, if acceptable, designate the new laboratory testing facility for the project. If an acceptable laboratory facility cannot be identified and agreed to, acceptance testing will be performed by LTS.

The Representative will specifically review the testing facility equipment to ensure it meets the required test method requirements, manufacturer installation requirements, standardization or calibration requirements and frequency, manufacturer maintenance requirements and frequency, maintenance log record requirements, and the facility QC plan includes an action plan for removing equipment from service if it fails to meet any requirements, requires standardization or calibration, becomes inoperable or requires repair/maintenance.

Provide dedicated laboratory testing equipment for Department use at the designated laboratory testing facility as required in the specified test methods and as modified in Bulletin 27 for testing mixture and density HOLA samples. The Representative may reject the proposed laboratory facility if it is determined that sufficient equipment is not available to ensure priority of the local acceptance testing. Additional equipment other than the minimum required equipment listed in Bulletin 27 may be required to properly run some of the referenced procedures.

(d) Hauling Equipment. Section 413.3(d)

(e) Asphalt Pavers. Section 413.3(e)1.

(f) Rollers. Use a minimum of three steel-wheeled rollers, each weighing a minimum of 10 tons and as specified in Section 108.05(c)3. Operate rollers according to manufacturer's recommendations. Use rollers equipped with a watering or soapy watering system that prevents material from sticking to the rollers. Do not use pneumatic wheeled rollers.

Do not use rollers in vibratory mode unless it can be demonstrated during the trial demonstration specified in Section 419.3(g) and to the satisfaction of the Representative that no breaking of aggregate or flushing of asphalt binder results from the vibration. Monitor pavement cores for aggregate breakage on every lot. Discontinue vibration if aggregate breakage or flushing of asphalt binder occurs.

(g) Demonstration. Before proceeding with the actual work, demonstrate to the Representative that the proposed SMA mix can be produced, placed, and compacted to meet the requirements of this specification. Place a minimum of 100 tons outside the project limits for each trial demonstration. Simulate the hauling time for the demonstration. Obtain and test three loose mixture samples at the plant for asphalt content, gradation, and draindown and three pavement cores from the demonstration pavement for density. Test one set of volumetric specimens for Air Voids at $N_{\text{design}} (V_a)$ and test for one maximum specific gravity of the mixture value. If test results do not meet specification limits for both single and multiple sample tolerances for any parameter, perform another demonstration.

If vibratory rolling is proposed, demonstrate to the satisfaction of the Representative that no breaking of aggregate or flushing of asphalt binder results from the vibration.

(h) Preparation of Existing Surface. Section 413.3(g)

(i) Spreading and Finishing.

1. General Requirements.

1.a Placing. Unless otherwise allowed or indicated, deliver, place, and compact SMA paving mixtures during daylight hours. Ensure the mixture does not contain lumps of cold material. Deliver and place SMA mixtures at the temperatures specified in Table D.

Use a material transfer vehicle (MTV) as specified in Section 108.05(c)5 to apply the final surface course. Have the MTV perform additional mixing of the SMA material and then deposit the mixture into the paver at a uniform temperature and consistency.

1.b Spreading and Finishing. Section 413.3(h)1.b and as follows: Plan and schedule operations to minimize hand work of SMA. Do not allow the finished pavement surface to flush. Flushing is continuous or repeated areas of excessive asphalt on the pavement surface. Areas that are determined to be flushed will be considered defective work.

1.c Field Technician. Section 413.3(h)1. d

1.d Safety Edge. Construct the Safety Edge as the standard edge treatment on the outside edge of asphalt pavements and shoulders. Use the Safety Edge for SMA courses with a depth of 1.5 inches or greater. The Safety Edge is not required where curb or sidewalk are encountered or where the face of guiderail is directly over the edge of pavements.

Construct the Safety Edge with the same material used to construct the roadway course being placed or, if specified, the paved shoulders. Attach a device to the paver to confine material at the end gate and extrude the asphalt material in a wedge shape. Use an adjustable device that allows the operator to vary the slope extruded at the paver to account for the angle becoming steeper during compaction (roll up). Before construction, the Safety Edge device must be approved.

Compact the roadway or paved shoulder as required by the specifications. Do not delay rolling of the mat adjacent to the Safety Edge. After compaction of the mat is complete, provide a Safety Edge meeting the final shape requirements as shown on the Standard Drawings. The completed angle of the Safety Edge must be 26 to 40 degrees measured from the pavement cross slope extended. At the beginning of each days paving, measure the angle of the Safety Edge from the pavement cross slope extended. Perform measurements after final compaction is complete. If the angle of the Safety Edge does not meet the slope requirements, stop paving and provide corrective action. Do not resume production paving until final shape requirements of Safety Edge are achieved.

Allow automatic transition to intersections, driveways, guiderail sections, and obstructions.

Use the device to constrain the asphalt head, reducing the area and increasing the density of the extruded profile. A single plate strike-off method is not allowed. Do not place the Safety Edge on organic material.

2. Mixture and Density Lot Acceptance (RPS Construction). Lot acceptance is required for RPS construction.

2.a Lots and Sublots. Material will be accepted in the field on a lot by lot basis. Lots will be established cumulatively and will be specific for each JMF. Each lot consists of five equal sublots (n=5). A completed subplot has a mixture acceptance box sample as specified in Section 413.3(h)2.b and a pavement core sample collected according to PTM No. 1 and PTM No. 729 as specified in Section 413.3(j)4.c.

A normal lot size is 2,500 tons with five, 500 ton sublots (n=5), unless operational conditions or project size dictate otherwise. If operational conditions or project size dictate, readjustment of the lot will be made as specified in section 413.3(h)2 Table D. Breakdowns or stoppages of short periods due to such causes as weather or equipment failure will not be considered as reasons to adjust the lot size. The original lot will be continued when work resumes after short stoppages of less than 5 calendar days. If a lot is ended due to a stoppage of 5 calendar days or more, adjust the lot size and number of sublots as specified in Section 413.3(h)2 Table D. If the work stoppage is 5 calendar days or more, a new lot will be established.

For small quantities of SMA placements equal to or less than 150 tons, mixture acceptance will be based on certification as specified in Sections 413.2(i)2.b and 419.2(f)2 and density acceptance will be accepted on optimum rolling pattern or non-movement as specified in Section 413.3(j)

2.a.1 Partially Completed Lots (n=2 or less). When process conditions change to an extent that a partially completed lot cannot be combined with the most recently completed lot, samples will be independently evaluated on the partially completed lot. For asphalt content and percent passing the 75 μ m (No. 200) sieve, mixture acceptance samples will be evaluated individually as specified in Section 419.4(a), Table I (n=1) criteria. For density, mat density acceptance samples will be evaluated individually using the criteria in Table F.

If samples tested for asphalt content and percent passing the 75 μ m (No. 200) sieve meet the n=1 criteria of Table I, and samples tested for density meet the criteria in Table F, payment will be 100% of the contract unit price. If samples tested for asphalt content and percent passing the 75 μ m (No. 200) sieve do not meet the n=1 criteria according to Table I, the material will be considered defective work. If samples tested for density are no more than 2.0% below the minimum or no more than 2.0% above the maximum limits according to Table F, payment will be 90% of the contract unit price. If samples for density are more than 2.0% below the minimum or more than 2.0% above the maximum limits of Table F, the pavement will be considered defective work.

Unless otherwise directed in writing by the District Executive, remove and replace defective work.

TABLE F
Density Limits for Partially Completed Lots

MIXTURE NMAS	DENSITY LIMITS
---------------------	-----------------------

All RPS 9.5 mm, 12.5 mm Wearing Courses	≥ 93.0 and ≤ 98.0
---	-----------------------------

2.a.2 For JMF's placed in quantities less than 2,500 tons. For JMFs placed in quantities of greater than 500 tons and less than 2,500 tons the tonnage will be considered a lot. The lot will be divided into five equal sublots.

For JMF's placed in quantities of 500 tons or less, the tonnage will be divided into three equal sublots and sampled as specified in Section 419.3(i)2.a.

2.b Mixture Acceptance and Theoretical Maximum Specific Gravity (Gmm) Verification Samples. The Representative will select different sample locations in each subplot according to PTM No. 1 and PTM No. 746. In the presence of the Representative, obtain two loose mixture samples (One for acceptance and one for Gmm verification) for each subplot at each sample location and immediately package. Obtain the sample from uncompacted placed mixture or from the paver screed. One loose mixture sample at each location will be used to determine the mixture acceptance and the second loose mixture sample at each location will be used to determine the theoretical maximum specific gravity (Gmm) value. Both sets of mixture samples will be submitted to the testing laboratory on separate Form TR-447 sample identification forms.

Package individual loose mixture samples using interior lined cardboard boxes dimensioned approximately 3 3/4 inches x 4 3/4 inches x 9 1/2 inches. Do not package samples in cardboard boxes with any one dimension greater than 10 1/4 inches or any one dimension smaller than 3 1/2 inches. The lining is homogenously constructed within the interior portion of the cardboard box to prevent asphalt binder absorption/adhesion of the loose mixture sample.

Immediately after packaging and in the presence of the Representative, identify the samples by ECMS project number, lot and subplot number, location (station and offset), date of placement, mixture type, and as either mixture acceptance samples (Sample Class AS) or as Gmm verification samples (Sample Class FV). Leave at least one side of the cardboard sample box free of any writing or marking for LTS use in testing the samples.

For LTS samples, immediately after identifying, submit the samples to the Representative.

For HOLA samples, provide locking containers of adequate size to accommodate at least seven loose mixture samples. Identify each sample by subplot and as either an acceptance or Independent Assurance (IA) sample. The Representative will not package samples from more than one lot in the same container. The Department will inspect the containers provided. Repair, modify or replace all containers determined to be inadequate or not secure. Provide new and sealed locks with two keys, or other acceptable device that will ensure the security of the samples, to the Representative. The containers will be secured by the Representative before being turned over to the contractor for transport to the testing location. Samples received at the testing location will only be opened by the District Materials Representative.

For QC purposes, a maximum of one loose sample per subplot may be obtained. No loose mixture or core samples may be taken by the Contractor for mixture composition testing after the mixture acceptance samples and Gmm verification samples are obtained. Do not obtain any other pavement samples, except those which are directed by and surrendered to the Department, unless allowed in writing from the District Executive.

2.b.1 IA Sampling for HOLA mixture acceptance. The Department will perform IA testing of HOLA mixture samples on the initial lot and a minimum of one lot for every 10 lots thereafter. For the IA lots selected by the Representative, obtain one additional loose mixture sample at each subplot location identified in Section 419.3(i)2b.

Immediately after packaging and in the presence of the Representative, identify each sample by ECMS project number, lot and subplot number, location (station and offset), date of placement, mixture type, and as an IA sample. Leave at least one side of the cardboard sample box free of any writing or marking for LTS use in testing the sample.

The Representative will submit the IA sample from each subplot within the lot to LTS for testing by delivering them to the shipping point within 3 days of receipt.

2.b.1.a Mixture IA Sample HOLA Test Result Analysis. LTS IA sample test results will be compared to the HOLA Acceptance Sample test results on the same lot. If the difference in the average HOLA and IA test results meet the Independent Assurance tolerances in Table G, the Department will continue with IA testing at a minimum of one out of every ten lots thereafter.

Table G
Independent Assurance Tolerances on Lot Averages

Testing Criteria	Max. Difference Between Average Test Results ($n \geq 3$)
------------------	---

Asphalt Content for 9.5 mm and 12.5 mm NMAS Mixtures	$\pm 0.3\%$
Percent Passing the No. 8 sieve for 9.5 mm and 12.5 mm NMAS mixtures	$\pm 4\%$
Percent Passing the No. 200 sieve for all mixtures	$\pm 1.2\%$

If the difference between the lot averages of IA sample test results and HOLA sample test results exceeds the maximum IA tolerances in Table G, specific calibration factors (C_f and $200 C_f$) will be determined for each ignition furnace used for testing the IA samples and HOLA samples according to PTM No. 757 and additional IA samples will be collected as specified in Section 419.3(i)2.b.1 from the project directly behind the paving equipment for IA comparison. If the IA tolerances in Table G are still exceeded, the Representative will perform an investigation of the cause of the non-comparison of the test results.

Provide information to the Representative, as requested, on the integrity of samples and the testing equipment used in the sample testing. The Representative will also review personnel and test methods used in the HOLA testing. Implement corrective measures for any noted deficiencies to ensure the tests are performed according to the prescribed procedures. The Representative will record the HOLA sample test results, the IA sample test results and any applicable corrective measures. The Representative will select the next lot on the project for IA and will submit the IA samples to LTS for testing. If the difference between subsequent IA sample test results and HOLA sample test results exceeds the IA tolerances in Table G, the Department may discontinue testing of HOLA samples and begin LTS testing of the mixture acceptance samples for the remainder of the project. If the difference between subsequent IA sample test results and HOLA sample test results meets the IA tolerances in Table G, the Department may continue testing of HOLA samples with IA testing at a minimum of one out of every ten lots.

2.c Mixture and Density Acceptance Sample Testing. LTS Testing will be utilized unless otherwise indicated in the contract. The Contractor may elect to expedite delivery of the acceptance samples as specified in section 413.3(h) 2.b.

2.c.1 LTS and HOLA Acceptance Testing. Density acceptance samples will be tested according to PTM No. 715, and if necessary PTM No. 716, to determine the percent compaction. For individual increment test results outside of the individual mat density tolerances in Table I, the LTS or the District HOLA Representative will analyze the bulk density test results for extreme values according to PTM No. 4 at the 5% significance level. If discarding an extreme value reduces a lot to less than three remaining test results, the Department will accept the lot as specified in Section 419.3(i)2.a.1.

The Department will then randomly select one of the Gmm verification loose mixture samples obtained as specified in Section 419.3(i)2.b for either LTS or HOLA from the lot according to PTM No. 1. The LTS or the District HOLA Testing Representative will test the randomly selected Gmm verification loose mixture sample to determine the theoretical maximum specific gravity (Gmm) of the compacted mixture according to AASHTO T 209 as modified in Bulletin 27, with the following exception:

- The samples will be obtained as specified in Section 419.3(i)2.b.

Randomly selected Gmm verification sample test result will be compared with the Contractor's daily Gmm value for that same production or placement date. If the Department and Contractor Gmm values do not differ by more than ± 0.030 , the Contractor's daily Gmm values in the whole lot will be considered verified and the Contractor's daily Gmm values will be used to determine the percent of theoretical maximum density for each density acceptance sample placed on that date. If the initial randomly selected Gmm verification sample test result differs from the Contractor's daily Gmm value for that same production or placement date by more than ± 0.030 , the Department Gmm test result value will be used as the acceptance Gmm value to determine the percent of theoretical maximum density for the individual density acceptance cores produced or placed on that same date. The Department reserves the right to select more than one Gmm verification sample from the lot representing the same production or placement date and to select other Gmm verification samples from the lot representing different production or placement dates to verify the Contractor's daily Gmm values. When more than one Gmm verification sample is selected from the lot representing the same production or placement date, the Department Gmm test results will be averaged and then rounded to the nearest 0.001 according to the rounding method of ASTM E29 and the average value used to verify to the Contractor's daily Gmm value for that same production and placement date.

The Department will accept density lots with three or more test results as specified in Section 419.4(a)3.

The Department will test the mixture acceptance samples according to PTM No. 757 or PTM No. 702,

Modified Method D, if previously identified problematic aggregates are used in the mixture, to determine asphalt content and the percent passing the 75 μm (No. 200) sieve. For PTM No. 757, the LTS will use the calibration factors (C_f and $200 C_f$) provided with the JMF. For individual increment test results outside of the single sample ($n=1$) tolerances in Table D, the Department will analyze the test results for extreme values according to PTM No. 4 at the 5% significance level. If discarding an extreme value reduces a lot to less than three remaining test results, the Department will accept the lot as specified in Section 419.3(i)2.a.1. The Department will accept lots as specified in Section 419.4(a).

Stop all paving operations if any of the following conditions exist:

- cores are not taken within 1 day after placing the mixture
- the density for two consecutive lots or a total of three lots does not meet the density payment factor percentage of 100
- asphalt content is not within the single sample ($n=1$) or multiple sample ($n\geq 3$) tolerances in Table D for two consecutive lots or a total of three lots
- the percent passing the 75 μm (No. 200) sieve is not within the single sample ($n=1$) or multiple sample ($n\geq 3$) tolerances in Table F for two consecutive lots or a total of three lots
- the pavement exhibits flushing as outlined in 419.3(i)1.b.

Determine the cause of the problem and provide a proposed solution to the Department. Do not resume paving until the Representative reviews the proposed solution and authorizes production to continue.

(j) Compaction. Begin rolling material immediately after placement. Compact the SMA mixture to achieve the density acceptance requirements and to eliminate all roller marks while not producing flushing of the asphalt binder. Compact the mixture while it is in proper condition and adjust roller speed, pattern, and roller size (and/or amplitude and frequency if vibratory rolling is approved by the Representative) to eliminate displacement, shoving, cracking, and aggregate breakage as specified in Section 419.3(f). Satisfactorily correct displacement resulting from reversing roller directions and other causes.

Without using excess water, maintain wheels of steel-wheel rollers moist and clean to prevent the mixture from adhering to the wheels.

For areas inaccessible to rollers, compact with mechanical vibrating hand tampers.

(k) Mat Density Acceptance.

1, General Requirements. The Department will accept the mixtures by lot acceptance as specified in Section 419.3(i)2. The acceptance criteria will be as shown in Table F. The Department will determine acceptance with respect to density, as specified in Section 419.4(a)3.

1.a. Density Acceptance Samples. The Representative will select different sample locations in each subplot according to PTM No. 1 and PTM No. 729. With the Representative present, drill 6-inch diameter cores as soon as possible but no later than the day following placement. The core at each location will be used to determine the bulk specific gravity (G_{mb}) and density (pounds per cubic foot) of the compacted mix. Do not compress, bend, or distort samples during cutting, handling, transporting, and storing. If samples are damaged, immediately obtain replacement samples, as directed by the Representative, from within 12 inches of the original sample location. Within 24 hours after coring, backfill the hole with mixture of the same JMF or with mixture used for subsequent courses and compact and seal the mixture.

In the presence of the Representative, identify the samples by ECMS project number, lot and subplot number, location (station and offset), date of placement, mixture type, and as acceptance samples (Sample Class AS). Provide the daily theoretical maximum specific gravity value as specified in Section 419.2(e)1.d.4 for the density calculation of the lot. If density samples from the lot are taken from more than 1 day's placement, the daily theoretical maximum specific gravity values from each production day will be used to calculate the percent of theoretical density for each individual density acceptance core placed on that production day upon Gmm verification as specified in Section 419.3(i)2.c.1.

For LTS samples, immediately deliver the samples to the Representative and provide sample containers of sufficient strength to prevent samples from being damaged during transport and sufficient size to accommodate the density samples from one lot. The Representative will submit samples for one lot in one container.

For HOLA samples, provide locking containers of adequate size to accommodate seven core samples. Identify each sample by subplot and as either acceptance or IA sample. The Representative will not package samples from more

than one lot in the same container. The Department will inspect the containers provided. Repair, modify or replace all containers determined to be inadequate or that are not secure. Provide new and sealed locks with two keys, or other acceptable device that will ensure the security of the samples to the Representative. The containers will be secured by the Representative before being turned over to the contractor for transport to the testing location. Samples received at the testing location will only be opened by the District Materials Representative.

For quality control purposes, a maximum of one pavement core per subplot may be obtained unless the Representative allows additional cores. No cores may be taken by the Contractor after the acceptance cores are obtained. Do not obtain any other pavement cores, except those that are directed by and surrendered to the Department, unless allowed in writing by the District Executive.

1.b. IA Density Samples. The Department will perform IA testing of HOLA density samples on the initial lot and a minimum of one out of every ten lots thereafter. The Representative will identify one HOLA sample as specified in Section 419.3(k)1.a to also serve as an IA sample. Cores coated with paraffin wax according to PTM No. 716 are omitted from IA testing.

With the Representative present, identify the samples by ECMS project number, lot and subplot number, location (station and offset), date of placement, mixture type, and as AS/IA samples. Provide the daily theoretical maximum specific gravity value as specified in Section 419.3(i)2.b for the density calculation of the lot. Immediately after identifying, submit the density samples to the Representative as specified in Section 419.3(k)1.a. Upon testing of the sample for HOLA density as specified in Section 419.3(i)2.c.1, the Representative will package the density IA samples in the containers and submit the IA samples to LTS for testing.

1.b.1. LTS Testing of IA HOLA Density Samples. The LTS will test the density samples for IA according to PTM No. 715, and if necessary PTM No. 716, to determine the percent compaction.

1.b.1.a Density IA Sample Test Result Analysis. LTS IA density sample test results will be compared to the HOLA density sample test results on the same lot. If the difference in the average test results of the HOLA and IA meet the IA tolerances in Table H, the Department will continue with IA testing at a minimum of one out of every ten lots thereafter.

Table H
Independent Assurance Tolerances on Lot Averages

Testing Criteria	Max. Difference Between Test Results (n≥3)
PTM No. 715 or PTM No. 716, Gmb	0.020
AASHTO T 209 as modified in Bulletin 27	0.030

If the difference between the lot averages of IA sample test results and HOLA sample test results exceeds the maximum IA tolerances in Table H, the Representative will perform an investigation as to the cause for the non-comparison of the test results. Provide information to the Representative, as requested, on the integrity of samples and on the equipment used in the sample testing. The Representative will also review personnel and test methods used in the HOLA testing. Implement corrective measures for any noted deficiencies to ensure the tests are performed according to the prescribed procedures. The Representative will record the HOLA Sample test results, the IA sample test results and any applicable corrective measures in the Field Inspector's Diary. The Representative will select the next lot on the project for IA and will submit the IA companion density samples to LTS for testing. If the difference between subsequent IA sample test results and HOLA sample test results exceeds the IA tolerances in Table H, the Department may discontinue testing of HOLA samples and begin LTS testing of the acceptance samples for the remainder of the project and revert to Section IV for measurement and payment. If the difference between subsequent IA sample test results and HOLA sample test results meets the IA tolerances in Table H, the Department may continue testing of HOLA samples with IA testing at a minimum of one out of every ten lots.

(l) Joints. Section 413.3(k).

(m) Surface Tolerance. Section 413.3(l)

(n) Tests for Depth. Section 413.3(m)

(o) Protection of Courses. Section 413.3(n)

(p) Defective Work. As specified in Section 105.12 and as follows:

Department acceptance and QA testing does not relieve the Contractor of responsibility for material or workmanship that the Representative determines is defective before the Department issues the acceptance certificate. Remove and replace or repair defective work as directed. The CMD will review Representative determinations of defective material or workmanship.

Unless otherwise directed in writing by the District Executive, remove and replace pavement defective for flushing as specified in Section 419.3(i)1.b, surface tolerance as specified in Section 413.3(l) and depth as specified in Section 413.3(m). Remove and replace pavement defective for percent within limits or Payment Factor Percentage according to Table I.

419.4 MEASUREMENT AND PAYMENT—

(a) SMA RPS Construction.

1. **SMA Wearing Course RPS.** Square Yard or Ton

2. **Asphalt Tack Coat.** Section 460.4.

3. **Mixture and Density Acceptance by Lot using Pavement Cores.** The Department will pay on a lot-by-lot basis at the contract unit price, adjusted for Payment Factor Percentages as specified in Table I. For the payment factor percentages based on percent within limits, the Department will determine the percent within limits as specified in Section 106.03(a)3, using the upper and lower specification limits in Table J.

3.a Payment.

The Representative will compute the percent of the contract unit price paid as follows:

$$\text{Lot Payment} = C_P(2P_D + P_B + P_A)/400$$

C_P = Contract unit price per lot (unit price times lot quantity)

P_D = Payment Factor Percentage for density

P_B = Payment Factor Percentage for asphalt content.

P_A = Payment Factor Percentage for percent passing the 75 μm (No. 200) sieve

TABLE I
Contract Price Adjustments

Test Criteria	Test Value	Payment Factor Percentage
Asphalt Content		
Acceptance Sample testing of % Asphalt	All acceptance sample test results are within $\pm 0.7\%$ for $n=1$ and $\pm 0.4\%$ for $n \geq 3$ of the JMF	100
	Percent Within Limits if all acceptance sample test results are not within $\pm 0.7\%$ for $n=1$ and $\pm 0.4\%$ for $n \geq 3$ of the JMF	Table K
Gradation		
Acceptance Sample Testing of % Passing 75 μm (No. 200) Sieve	All acceptance sample test results are within $+3.0\%$ and -3.0% for $n=1$, and $+2.0\%$ and -2.0% for $n \geq 3$ of the JMF	100
	Percent Within Limits if all acceptance sample test results are not within $+3.0\%$ and -3.0% for $n=1$, and $+2.0\%$ and -2.0% for $n \geq 3$ of the JMF	Table K

Mat Density		
Acceptance Sample Testing of Pavement Cores	All individual results for the lot are \geq 93.0 % and \leq 98.0 % of the maximum theoretical density	100
	Percent Within Limits if any individual subplot test result for the lot is not \geq 93.0 % and \leq 98.0 % of the maximum theoretical density.	Table K

Less than 64	Defective Lot**

**Remove and replace the lot. If only one lot characteristic has a percent within limits less than 64, the District Executive may allow the Contractor to leave the defective lot in place. The Department will pay for the defective lot at 50% of the contract unit price.

3.b Dispute Resolution. For mixture acceptance testing or density acceptance testing performed by the LTS, the Contractor may request in writing that the Department retest a lot if the initial test results indicated a defective lot (remove and replace) except for density when one or more density acceptance cores in the lot were coated with paraffin wax as a result of PTM No. 716 during the original density acceptance testing. For HOLA acceptance, the Contractor may only request in writing that the Department retest a mixture acceptance lot if the initial test results indicate a remove and replace defective lot. All retesting for HOLA and LTS will be performed by the LTS lab. Provide written retest requests to the District Executive within 3 weeks of the date the LTS test results are released. Retests will not be allowed if a written retest request is not received within 3 weeks of the date the LTS test results are released. Provide quality control test results and control charts, companion sample test results (if available), test data trend evaluation, and any other pertinent information to justify the retest request. The Department will evaluate the information and may allow retesting if the information submitted provides a reasonable basis to conclude that the failing test results may not represent the in-place material. The LTS will perform the retest with the Contractor present, unless otherwise agreed to in writing with the Contractor.

For retesting of materials failing for asphalt content or percent passing 75 μ m (No. 200) sieve, the Representative will identify the locations where the original mixture acceptance samples were collected. The Representative will select retest sample locations 24 inches from the original sample locations longitudinally in the direction of traffic. If the 24-inch offset causes the retest sample location to fall outside of the subplot, the Representative will select the retest sample location 24 inches from the original sample locations longitudinally in the opposite direction from traffic.

With the Representative present, provide appropriate traffic control and drill 6-inch diameter cores for retesting purposes according to the procedure for drilling in PTM No. 729. Ensure drilling procedures include washing off and towel drying the core samples immediately after drilling. Within 24 hours after coring, backfill the hole with SMA or Superpave mixture of the same NMAS and PG asphalt grade as the material sampled or with mixture used for subsequent courses and compact and seal the mixture. Provide traffic control, core, and backfill the core holes at no cost to the Department. The test method used for asphalt determination during the original acceptance testing (PTM No. 757 or PTM No. 702) will be used for the retest, unless the DME/DMM grants written approval for a change in test method. The results of the retest cores will be used to calculate payment for both asphalt content and percent passing the 75 μ m (No. 200) sieve for the lot.

When a request is received for retesting of density acceptance, the original density acceptance cores will be utilized. The LTS will not retest a lot for density acceptance when one or more density acceptance cores in the lot were coated with paraffin wax as a result of PTM No. 716 during the original density acceptance testing. The LTS will retest each original density acceptance core according to PTM No. 715 and PTM No. 716, as necessary, to determine the Gmb and bulk density values. The LTS will not perform Gmm testing for lots where the Contractor's Gmm value was previously considered verified as specified in Section 413.3(j)4.d.1. After Gmb testing is completed, for lots where the Contractor's Gmm value was not verified, the LTS will select one original density acceptance pavement core from each production or placement date represented by the density acceptance cores in the lot. Each core selected will be the core with the highest bulk density for that production or placement date from the retest results (e.g., if a lot was placed over three production days, and the lot density acceptance cores include at least one core from each production or placement day, the original density cores selected during a density retest to perform Gmm testing will be 3; one from each production or placement date). The LTS will perform Gmm testing on the selected cores

according to AASHTO T 209 as modified in Bulletin 27, with the following exceptions:

- the samples will be obtained as specified in Section 413.3(j)4.c,
- no conditioning, only drying, will be performed on the sample,
- the minimum sample size will be waived, as necessary, to use the 6-inch diameter pavement core sample, and
- the supplemental procedure for mixtures containing porous aggregate will only be performed when either the coarse aggregate or fine aggregate in the mixture has a water absorption value $\geq 1.5\%$ as indicated on the JMF and then only when the calculated percent of theoretical maximum density indicates any one individual failing subplot which results in a density pay factor less than 100.00.

The LTS Gmm value(s) determined will be the Gmm values used to determine the percent of theoretical maximum density for the cores represented by the applicable production or placement dates in the lot. Either the previously verified Contractor's Gmm value(s) or the newly tested LTS Gmm value(s) will be used for acceptance to determine the percent theoretical maximum density for each subplot core in the lot. Upon completing the retesting of the original density acceptance cores, the LTS will evaluate testing repeatability for the bulk density results of PTM No. 715 and PTM No. 716, if necessary, using both the original bulk density test values and the bulk density retest values according to PTM No. 5. After evaluating the testing repeatability, the density test values used to determine the final payment factor percentage for density will be as follows:

- If repeatable, the original test values will be used.
- If lack of repeatability (i.e., non-repeatable), the retest values will be used.

The Department will deduct from the payment the cost per lot associated with conducting a retest as follows in Table L:

TABLE L
Dispute Resolution Retest Cost Table

Test Method	Mixture Acceptance Retest Cost if Retest Results Indicate	Mixture Acceptance Retest Cost if Retest Results Indicate
	100% Pay Factor(s)	<100% Pay Factor(s)
PTM No. 702/739	\$900	\$3,500
PTM No. 757	\$500	\$2,000
	Density Acceptance Retest Cost if Retest Results Indicate a Lack of Repeatability	Density Acceptance Retest Cost if Retest Results are Repeatable
PTM No. 715, or PTM No. 716 only	\$200	\$750
PTM No. 715, or PTM No. 716, and AASHTO T 209 as specified in Section 413.3(j)4.d.1	\$1,100	\$4,000

4. Demonstration. Section 419.3(g) PDA

SECTION 420—PERVIOUS ASPHALT PAVEMENT SYSTEM

420.1 DESCRIPTION—This work is the construction of plant-mixed asphalt concrete pervious pavement on a prepared surface designed to allow the infiltration of storm water into the subsoil. The pervious asphalt surface layer is a horizontal plane that is permeable to water and air. The second layer of the storm water system is an open graded, angular stone layer that is used for temporary storm water detention.

420.2 MATERIAL—

(a) Aggregate. Section 703

1. Coarse Aggregate.

1.a For use in Asphalt JMF. Course Aggregate, Type A, Section 703.2, except Table C gradation does not apply and revise the following quality requirements of Table B.

- Abrasion, Maximum Percent as specified in Bulletin 27, Chapter 2A, Table 5A
- Thin and Elongated Pieces, Maximum Percent as specified in AASHTO M 323, Table 5, for Flat and Elongated
- Crushed Fragments, Minimum Percent, as specified in AASHTO M 323, Table 5, for Fractured Faces, Coarse Aggregate

1.b For use in Detention Basin. Either AASHTO No. 3 as the primary detention coarse aggregate topped with AASHTO No. 57 as a choker and leveling coarse; or AASHTO No. 57 only, as designed and specified.

2. Fine Aggregate.

2.a For use in Asphalt JMF. Section 703.1, except Table A gradation does not apply and as follows: Determine the un-compacted void content according to AASHTO T 304, Method A, or use the value listed in Bulletin 14, and conform to AASHTO M 323, Table 5. Determine the sand-equivalent value according to AASHTO T 176 and conform to AASHTO M 323, Table 5.

2.b For use in Detention Basin. Fine Aggregate, Type A or Type B.

(b) Fibers. Section 711.3(g)

(c) Geotextile, Class 4, Type A. Section 212

(d) Edge Restraints. Provide asphalt edge restraints (as a locally approved material as specified in Section 106.02(a)2.c) when specified and of sufficient strength to resist lateral roller forces where the pervious asphalt adjoins landscaped areas to provide a clean, durable edge for the pavement. Other edge restraints may be utilized with the approval of the Representative. For manufactured edge restraints, install in accordance with the manufacturer's guidelines. Provide black edge restraints when permanently incorporated into the project.

(e) Asphalt Binder Material.

1. Pervious 9.5 mm Wearing Course. Asphalt Cement, Class PG 64H-22 or PG 64E-22 as specified in Section 702. Approved polymer additives or ground tire rubber may be used to meet the PG grade.

2. Pervious 19.0 mm Binder Course. Asphalt Cement, Class PG 64S-22 as specified in Section 702.

(f) Recycled Asphalt Pavement. Limit RAP to a maximum of 10% of the mixture.

(g) Additives. Incorporate an anti-strip additive or hydrated lime for pervious mixes utilizing the same aggregates as approved 9.5 mm or 19.0 mm dense graded mixtures and with the same PG grade binder where an anti-strip additive

was required. If no history exists for an approved dense graded mixture, perform testing in accordance with ASTM D 3625 on the finished mix with a minimum of 90% coating to determine moisture susceptibility and an anti-strip additive is required.

1. Heat-Stable, Anti-Stripping Additive. Blend the additive with the asphalt cement before adding the additive and asphalt cement to the mixture. Use the manufacturer's recommended dosage of the additive, but not less than 0.25% by weight of the asphalt. Select an additive that does not harm the completed asphalt concrete mixture and that is compatible with the aggregate and asphalt supplied for the project.

2. Pervious Asphalt Stabilizer. Perform testing in accordance with AASHTO T 305 to determine whether a stabilizer is required. When required, provide cellulose fibers in the mixture according to the tolerances in Table B. Stabilizer dosage rate must be within 0.2% to 0.4% by weight of the total mix.

(h) Mixture Design and Production.

1. Design. Size, uniformly grade, and combine aggregate fractions according to Table A. Determine air voids using any method from Table B for bulk specific gravity. Determine the maximum theoretical specific gravity in accordance with AASHTO T 209. Gyrate two specimens in accordance with AASHTO T 312 and determine bulk specific gravity by averaging them, employing one of the methods in Table B to calculate air voids.

Test materials, proportions, and the mixture at the asphalt concrete plant laboratory. Verify conformance with the uniformity requirements of this specification. Verification testing may be performed by the LTS at the Department's discretion. Provide a JMF that conforms to all Department requirements. Submit a copy of the JMF to the DME/DMM at least 3 weeks before the scheduled start of producing the mixture for the project. If the Department has not used the JMF on a previous project, provide test results from previous mixture production that indicate the mixture conformed to all JMF production tolerances when submitting the design for initial review.

TABLE A
Composition of Mixture
(Total Percent by Mass (Weight) Passing Square Openings Based on Laboratory Sieve Tests)

Sieve Size	Pervious 9.5 mm Wearing Percent Passing	Pervious 19.0 mm Binder Percent passing
25.0 mm (1-inch)		100
19.0 mm (3/4-inch)	100	85 - 100
12.5 mm (1/2-inch)	95 - 100	35 - 68
9.5 mm (3/8-inch)	70 - 100	
4.75 mm (No. 4)	20 - 40	10 - 25
2.36 mm (No. 8)	10 - 20	5 - 15
75 µm (No. 200)	0 - 4	0 - 4
Asphalt Content	5.5% - 7.0%	3.0% - 5.0%

TABLE B
Mixture Composition

Gyrations	N _{initial}	N/A
	N _{design}	50
	N _{maximum}	N/A
Air Voids	ASTM D 6752	16.0% - 20.0%
	AASHTO T 275	18.0% - 22.0%
	AASHTO T 269*	18.0% - 22.0%
Draindown	AASHTO T 305	≤ 0.3%

*When using AASHTO T 269 the height of the specimen will be determined by the gyratory compactor reading at N_{design}.

2. QC Plan. Prepare and submit a QC Plan, as specified in Section 106. Provide the QC plan to the Representative at the start of the project. Do not begin production until receiving approval of the QC Plan from the Representative.

3. Production. Perform QC Tests in accordance with Table C.

TABLE C
Production Testing

Property	Frequency	Range
Asphalt content	Daily	$\pm 0.7\%$
Gradation	Daily	Table A
Air Voids	Daily	Table B
Draindown	Daily	$\leq 0.3\%$ at design compaction temperature

4. Acceptance of the Mixture. Obtain material certifications from the material producer using the results of QC tests for asphalt content, gradation, and air voids. Provide copies of the certifications to the Inspector-in-Charge within 1 working day after performing QC tests.

420.3 CONSTRUCTION—

(a) Test Sections. Produce two test sections using the approved JMF and placement and finishing operations to be used in production and construct at the project site on a prepared subgrade and base, using the material and construction requirements used in production. Each section must have an area of at least 225 square feet. Perform infiltration on both test sections in accordance with ASTM C 1701. The average of both infiltration values must exceed 200 inches per hour. Compacted thickness cannot be more than 1/4-inch less than the design thickness.

(b) Subgrade Preparation. Excavate subgrade to undisturbed soil without compaction, allowing the subgrade to be left as permeable as possible. Where erosion of subgrade has caused accumulation of fine materials and/or surface ponding, remove the accumulated material using light equipment and scarify the underlying soil to a minimum depth of 6 inches using a spring tooth rake or equivalent and a light tractor. Avoid driving haul trucks or other heavy equipment through the installation area. Repair damaged areas to the satisfaction of the Representative. Do not compact or otherwise subject the existing subgrade under pavement areas to excessive construction equipment traffic before geotextile and stone bed placement. Satisfactorily correct and repair any damaged or compacted areas to the satisfaction of the Representative. Notify the Representative upon completion of subgrade work for final inspection and acceptance before proceeding with basin and choker course installation.

(c) Detention Basin. Prevent sediment from washing into beds during site development. Cover the bottom of the detention base with a minimum of 2 inches of fine aggregate to prevent soils from migrating into the storm water storage area. Wrap basin sides with a non-woven geotextile fabric. Install detention basin coarse aggregate in 8 inch maximum lifts. Compact the course in as specified in Section 360.3. Install aggregates to grades indicated on drawings. Place the specified depth(s) of coarse aggregate on top of the fine aggregate and roll as specified in Section 420.3(f). Remove temporary sediment control materials when the site is fully stabilized.

(d) Asphalt Treated Permeable Base Course. Section 360.3, where required for buses or light trucks.

(e) Weather Limitations. Do not place pervious pavement mixtures when the air or surface temperature is lower than 50F.

(f) Rollers. Use smooth steel-wheeled rollers in the static mode and seat with one to four passes. Do not use pneumatic tire rollers.

(g) Conditioning of Existing Surface. Before placing a wearing course, correct irregularities in the binder course. If practical, do not allow traffic on the binder course to prevent contamination. Remove and replace binder course that cannot be cleaned to the Representative's satisfaction.

Coat existing vertical surfaces of curbs, structures, gutters, and pavements that will be in contact with asphalt mixtures with a thin, uniform coating of emulsified asphalt (AASHTO SS-1, CSS-1, SS-1h, CSS-1h, or TACK) applied in two or more applications, or of the class and type designated for the asphalt course.

Do not use a tack coat between lifts of any pervious asphalt. Place the wearing course as soon as practical after the placement of the binder course.

(h) Spreading and Finishing. Use a track paver, as specified in Section 413.3(e), or a mechanical spreader. Spread or strike off the entire for the entire lane width or as much lane as practical. Place the mixture in maximum 4-inch compacted lifts. Adjust screed assemblies to provide the cross section and depth indicated. Construct the profile to the design grade line. Use fully automatic sensors to control profile and transverse grade. Allow the mixture to cool to 100F before placing subsequent layers or pavement courses. Perform handwork at locations directed by the Representative. For multiple lift construction, second lift may be placed and rolled perpendicular to the direction of placement and rolling of the first lift.

Do not use pervious pavement beds for storage of equipment, materials, or soils during construction.

(i) Compaction. Compact the pervious asphalt pavement when the surface is cool enough to resist a 10-ton steel-wheeled static roller or vibratory roller operated in the static mode. Limit compaction to not more than four passes to preclude a reduction in the surface porosity. One roller pass is defined as one trip of the roller in one direction over any one spot. Do not over compact the material to the point that it is not free draining or the aggregate is crushed.

(j) Joints.

1. Longitudinal Joints. Spread the pervious paving course to overlap the edge of the lane previously placed by 1 inch to 2 inches. Maintain the uniform un-compacted depth adjacent to a compacted lane necessary to provide a smooth joint after compaction.

2. Transverse Joints. At the end of each day's work and when more than a 30 minute interruption occurs in pervious paving operations, install a temporary vertical bulkhead to form a straight transverse construction joint. The joint must be the full depth and width of the pervious paving course. In lieu of a temporary bulkhead, a full depth transverse joint may be sawed before resuming paving.

(k) Surface Tolerance. Test the finished surface at locations the Representative suspects are irregular and at transverse joints and paving notches. Test the surface in stages using a 12-foot straightedge. At each stage, hold the straightedge in contact with the surface and parallel to the road centerline and, in successive positions, test the pavement surface from one side to the other. Advance the test location to the next stage by moving the straightedge along the pavement centerline by not more than 5 feet.

Immediately correct irregularities of more than 3/8-inch by loosening surface mixture and removing or adding pervious paving course. For irregularities exceeding 3/8-inch that develop after compaction is completed, correct the irregularity by a method that does not produce contaminating fines or damage the base. Do not grind or mill the pervious paving course. The area is defective if irregularities or defects remain after final compaction. Remove and replace defective areas. If allowed, submit a corrective action plan to the representative for approval.

(l) Tests for Depth: Binder and Wearing Courses. Carefully dig or drill one 6-inch diameter test hole to the full depth of the pervious course for each 3,000 square yards or less of completed base course. The Representative may require additional test holes in areas the Representative suspects are deficient in depth. The Representative will measure the depth of the pervious course. Using material acceptable to the Representative, backfill the test holes and compact the material to fill the test hole flush with the completed course.

Remove and replace sections deficient in depth by 1/2-inch or more. Start correction at the point of determined deficiency and continue correction longitudinally and transversely until the depth is within 1/2-inch of the indicated depth.

(m) Infiltration Testing. Perform infiltration testing on three areas selected in accordance with PTM No. 1 for every 10,000 square feet of pervious asphalt pavement placed in accordance with ASTM C 1701. Remove and replace pervious asphalt pavement not meeting or exceeding a minimum average infiltration rate of 200 inches per hour. Document the average infiltration value from testing for use in future maintenance activities.

(n) Defective Work. Unless otherwise directed in writing by the District Executive, remove and replace pervious asphalt that is deficient in surface tolerance, depth, asphalt content, percent of coated aggregate particles is less than 95%, or when percent passing the 4% maximum for the No. 200 sieve for the composite mixture is exceeded.

Pervious courses are also considered defective if the ASTM C 1701 infiltration rate is less than 200 inches per hour.

With written permission from the District Executive, low areas may be filled during construction of the next pavement course.

420.4 MEASUREMENT AND PAYMENT—

(a) Pervious Asphalt Pavement System. Square Yard or Ton

1. Pervious Wearing Course. Square Yard or Ton

2. Pervious Binder Course. Square Yard or Ton

(b) Asphalt Treated Permeable Base Course. Section 360.4

SECTION 450—MANUAL ASPHALT PATCHING

450.1 DESCRIPTION—This work is preparing and patching of potholes, abrupt depressions, and deteriorated edges of pavement, and repatching temporarily patched potholes using asphalt plant mix material placed manually or with mechanical spreading and finishing equipment.

450.2 MATERIAL—

(a) **Superpave Asphalt Mixture Design.**

- **Asphalt Wearing Course.** Section 413.2

(b) **Superpave Asphalt Mixture Design.**

- **Asphalt Binder Course.** Section 413.2

(c) **Asphalt Tack Coat.** Section 460.2

450.3 CONSTRUCTION—As specified in Sections Section 413.3 and as follows:

(d) **Manual Asphalt Patching, Type A.** For potholes and abrupt depressions 3 inches and less in depth, perform the work manually with asphalt wearing course as indicated.

1. Preparation. Cut out and patch the outlined area as marked by the Representative. Ensure each patch has a minimum area of 1 square foot. Excavate outlined area to sound, stable material. The use of a milling or planing machine will be allowed. Cut all edges vertically.

After removal of the debris, thoroughly clean the area to be patched and the surrounding pavement of all loose and foreign material. Thoroughly dry all surfaces of the area to be patched.

Apply tack coat to the bottom and vertical surfaces of the area to be patched as specified in Section 460.3(b).

2. Patching. After the tack coat is cured, place asphalt wearing course. Compact with a steel wheeled roller or other approved compaction equipment. Ensure that, after compaction, the surface of the patch conforms to the grade of the surrounding pavement. Fill all excavated areas before the close of each work day.

Potholes which extend into the shoulder do not require excavation beyond the edge of roadway. If the existing shoulder has an asphalt base, fill the shoulder portion of the pothole with asphalt and compact in the same manner as the roadway.

For other shoulder types, fill the pothole with suitable material excavated from the roadway pothole and compact. Seal edges with emulsified asphalt, Class TACK or NTT, the PG-Binder used in the pavement course or PG 64S-22.

(e) **Manual Asphalt Patching, Type B.** For potholes and abrupt depressions over 3 inches in depth, perform the work manually with asphalt wearing course and asphalt binder course as indicated.

1. Preparation. Section 450.3(d)1.

2. Patching. After the tack coat is cured, place asphalt binder course in lifts not to exceed 3 inches in uncompacted depth. After leveling each lift, compact with an approved mechanical tamper. Place asphalt wearing course material in the topmost 1 1/2 inches of the patch. Ensure that, after compaction, the surface of the patch conforms to the grade of the surrounding pavement. Compact the last lift with steel wheeled roller or other approved compaction equipment. Fill all excavated areas before the close of each work day, except that the 1 1/2 inch wearing course may be placed on the following day.

Potholes which extend into the shoulder do not require excavation beyond the edge of roadway. If the existing shoulder has an asphalt base, fill the shoulder portion of the pothole with asphalt wearing course and compact in the same manner as the roadway.

For other shoulder types, fill the pothole with suitable material excavated from the roadway pothole and compact. Seal the edges with emulsified asphalt, TACK or NTT, the PG-Binder used in the pavement course or PG 64S-22.

450.4 MEASUREMENT AND PAYMENT—

(a) Superpave Asphalt Mixture Design.

- **Asphalt Wearing Course (Manual Patching). Ton**

(b) Superpave Asphalt Mixture Design.

- **Asphalt Binder Course (Manual Patching). Ton**

SECTION 460—ASPHALT TACK COAT

460.1 DESCRIPTION—This work is the conditioning and treating of an existing surface with an application of emulsified asphalt bonding material.

460.2 MATERIAL

(a) **Emulsified Asphalt Material.** One of the following as specified in Section 702. Submit a Certificate of Compliance as specified in Section 106.03(b)3 and a Bill of Lading as specified in Section 702.1(c) to the Representative indicating the asphalt residue content (ARC) of the material being used. If the emulsified asphalt material is stored for 30 days or longer after certification, resample and retest the emulsified asphalt material at no additional cost to the Department to determine if it meets Bulletin 25 specification requirements.

TABLE A
Emulsified Asphalt Materials

Class of Material	Type of Material	Application Temperature F	
		Minimum	Maximum
TACK	Anionic or Cationic Emulsified Asphalt	90	150
NTT/CNTT	Anionic or Cationic Emulsified Asphalt	140	180

(b) **Fine Aggregate (For Blotting).** Section 703.1

460.3 CONSTRUCTION—

(a) **Conditioning Existing Surface.** Section 413.3(g).

(b) **Application of Emulsified Asphalt Material.** Use a distributor designed, equipped, calibrated, maintained, and operated to apply material uniformly on surfaces with varying widths and up to 15 feet wide. Provide a distributor capable of maintaining a uniform distributing pressure and controlling the application rate (AR) within a tolerance of 0.02 gallon per square yard. Provide a distributor equipped with a tachometer, pressure gauges, accurate volume-measuring devices or a calibrated tank, a thermometer for measuring temperatures of tank contents, a power-operated pump, and full circulation spray bars with lateral and vertical adjustments. Provide nozzles sized according to the manufacturer's recommendations for the material selected for application. In the field, determine the distributor's application rate according to PTM No. 747.

The Contractor may use hand-spraying equipment in areas inaccessible to the distributor.

Apply tack coat at an application rate, approved by the Representative, to leave a uniform asphalt residual rate within the ranges per surface type according to Table B. Identify the application rates and the residual rates on the Paving Operation QC Plan and review the QC plan application rates and residual rates with the Representative at the Preplacement Meeting.

TABLE B
Uniform Asphalt Residual Rates by Surface Type

Surface Type	Uniform Asphalt Residual Rates (RR) (gallons per square yard)
New Asphalt Paving	0.03 to 0.05
Existing Asphalt Paving	0.04 to 0.07
Milled Surface (Asphalt & Portland Cement Concrete)	0.04 to 0.08
Portland Cement Concrete	0.04 to 0.07

The application rate to achieve a uniform asphalt residual rate can be determined using the following equation:

$$AR = (RR / ARC)$$

AR = Application Rate, (gallons per square yard); the amount of emulsified asphalt sprayed by the distributor truck.

RR = Residual Rate; (gallons per square yard); the amount of emulsified asphalt remaining on the surface after it has broken and set.

ARC = Asphalt Residue Content; (% divided by 100); the percentage amount of asphalt in the emulsified asphalt. Provided on the Bill of Lading and expressed as a decimal.

When paving operations begin, apply tack coat on a 100-linear foot minimum test section on the project for each paving course. Apply tack coat at the distributor's application rate to achieve the proposed residual rate within the ranges listed in Table B. Adjust distributor application rate and spray bar height to obtain a uniform surface coverage. Review adequacy of the tack coat coverage with the Representative before continuing with the tack coat application.

Apply the tack coat only when the air temperature is 40F and rising and when the existing surface is dry. Before each paving course, apply the tack coat at an application rate to be within ranges of the uniform asphalt residual rate for the surface type according to Table B. Uniformly distribute the tack coat over the entire surface. Extend the tack coat a minimum of 6 inches beyond the longitudinal joint of the paving course being placed.

Correct all uncoated or lightly coated areas as directed to the Representative's satisfaction. At designated locations, correct areas with an excess of emulsified asphalt material by covering the area with sufficient dry fine aggregate to blot up or remove excess tack coat.

Allow the tack coat to break and set, without being disturbed. Do not begin paving until the Representative determines the tack coat has cured to the point that tracking is minimized.

(c) Protection of Treated Surface. Maintain and protect the treated surface against damage. Repair damaged areas to the Representative's satisfaction before placing the next pavement course.

460.4 MEASUREMENT AND PAYMENT—

(a) Area Basis. Square Yard

(b) Material Used Basis. Gallon

SECTION 461—ASPHALT PRIME COAT

461.1 DESCRIPTION—This work is the conditioning and treating of an absorbent non-asphalt base course or an absorbent existing surface with an application of emulsified asphalt and, if required, a blotter material.

461.2 MATERIAL—

(a) **Emulsified Asphalt Material.** One of the following, as specified in Section 702:

Class of Material	Type of Material	Application Temperature °F	
		Minimum	Maximum
AE-P	Emulsified Asphalt	90	150
E-1 Prime	Emulsified Asphalt	100	170

(b) **Fine Aggregate (for Blotting).** Section 703.1

461.3 CONSTRUCTION—

(a) **Conditioning Existing Surface.** Section 413.3(g), except delete emulsified asphalt painting of existing surfaces and the application of a tack coat.

(b) **Application of Emulsified Asphalt Material.** Use a distributor as specified in Section 460.3(b). Within the specified temperature range, select application rates for AE-P and E-1 Prime emulsified asphalt from 0.30 gallon per square yard to 0.70 gallon per square yard. Obtain approval of the application rates.

Uniformly distribute the tack coat at the junction of adjacent applications.

Following application, do not disturb the prime coat. Allow the emulsified asphalt to penetrate the treated surface and the treated surface to absorb the emulsified asphalt until the Inspector-in-Charge determines the emulsified asphalt is completely cured.

Apply additional emulsified asphalt to uncoated or lightly coated areas.

Twenty-four hours after applying the prime coat, cover areas the Representative identifies as showing an excess of prime coat material with sufficient dry fine aggregate to blot up or remove excess prime coat material.

(c) **Protection of Treated Surface.** Maintain and protect treated surface against damage. Repair damaged areas to the Representative's satisfaction before placing succeeding construction.

461.4 MEASUREMENT AND PAYMENT—

(a) **Area Basis.** Square Yard

(b) **Material Used Basis.** Gallon

SECTION 466 – ASPHALT PAVING FABRIC

466.1 DESCRIPTION– This work is furnishing and placing a geotextile paving fabric on an existing pavement surface and prior to an overlay or construction of pavement layer as a waterproofing and stress relieving membrane interlayer.

466.2 MATERIAL –

(a) **Geotextile Paving Fabric.** As listed in Bulletin 15, meeting the requirements of AASHTO M 288, Paving Fabrics Type II. Provide a stable fiber, needle-punched, nonwoven material consisting of at least 85% by weight polyolefins, polyesters or polyamides. The paving fabric shall be resistant to chemical attack, rot and mildew and have no tears or defects that will adversely alter its physical properties. The fabric shall be specifically designed for pavement applications and be heat-set on one side to reduce tack coat bleed-through and to minimize fabric pick-up by construction equipment during installation. Identify each geotextile paving fabric roll according to ASTM D4873.

(b) **Asphalt Material.** Performance-Graded Asphalt Binder (PGAB), meeting the requirements of AASHTO M 322, PG 64S-22 as modified in Bulletin 25 as specified in Section 702.

466.3 CONSTRUCTION–

(a) **General/Manufacturer Technical Representative.** Provide a copy of the geotextile paving fabric manufacturer's installation instructions to the Representative before installation. Ensure that a trained Manufacturer's Technical Representative is present during every phase of installation, unless applied by a factory trained licensed installer, as indicated by written approval from the material supplier. The Manufacturer's Technical Representative will provide training and technical assistance on surface preparation, equipment, method of application and finish. The paving fabric shall be labeled according to AASHTO M288, "Standard Guide for Identification, Storage and Handling of Geotextiles."

(b) **Shipping and Storage.** Keep geotextile paving fabric dry and wrapped so it is protected from outdoor weather elements during shipping and storage. Store geotextile paving fabric elevated off the ground and covered to protect it from damage, ultraviolet light, precipitation, chemicals and sparks. The paving fabric shall be labeled according to ASTM D4873, "Standard Guide for Identification, Storage, and handling of Geosynthetic Rolls and Samples."

(c) **Weather Limitations.** Place as specified in Section 413.3(b). Do not place asphalt material and geotextile paving fabric when weather conditions are not suitable for installation according to the fabric manufacturers recommendations and the Representative.

(d) **Surface Preparation.** Dry and clean pavement surface of dirt and oil. Seal cracks as specified in Section 469.3(d). Allow crack-filling material to cure before placement of the geotextile paving fabric. Repair potholes and other pavement distresses as specified in Section 450. Perform repairs identified by the Representative. The geotextile paving fabric must be placed on a drainable surface with no depressions which may hold water in the overlying asphalt concrete.

(e) **Asphalt Material Application.** Apply asphalt material using a calibrated distributor truck spray bar. Hand spraying, squeegee and brush application may only be used in locations where the distributor truck cannot reach. Make every effort to keep hand application to a minimum. Apply asphalt material uniformly to the prepared, clean, dry pavement surface. The application rate must saturate the geotextile paving fabric to ensure bonding of the geotextile fabric to the existing pavement surface. Apply asphalt material at a rate of 0.22 to 0.28 gallons per square yard as required to completely cover the roadway and as approved by the Manufacturer's Technical Representative. Maintain the temperature of the asphalt material to allow a uniform spray pattern. For performance grade asphalt binders, the minimum temperature will be 290F. Asphalt material temperature must not exceed 350F to avoid

damage to the geotextile paving fabric. The target width of the asphalt material application will be equal to the paving fabric width plus 6 inches.

Asphalt material application must be wide enough to cover the entire width of geotextile fabric overlaps. Apply asphalt material only as far in advance of geotextile paving fabric installation as is appropriate to ensure a tacky surface at the time of geotextile paving fabric placement. Do not allow traffic on the tack coat. Clean excess tack coat from the pavement.

(f) Geotextile Paving Fabric Placement: Place the paving fabric onto the asphalt material using mechanical or manual laydown equipment capable of providing a smooth installation with a minimum amount of wrinkling or folding. Place geotextile paving fabric before the asphalt cement cools and loses its tackiness. Do not install geotextile paving fabric in areas where the overlaid asphalt tapers to a minimum compacted thickness of less than 1.5 inches. Slice and lay flat wrinkles severe enough to cause folds. Brooming and/or rubber-tire rolling will be required to maximize geotextile paving fabric contact with the pavement surface. Apply additional hand-placed asphalt material at overlaps and repairs identified by the Representative. Turning of the paver and other vehicles must be done gradually and kept to a minimum to avoid movement and damage to geotextile paving fabric. Avoid abrupt starts and stops to avoid damage to paving fabric. Remove damaged geotextile fabric and replace with same type of geotextile fabric.

(g) Fabric Joints and Overlaps: At joints, overlap fabric rolls by a 1 inch minimum. End joints and joints from repair of wrinkles must be made to overlap or “shingle” in the direction that the pavement overlay will be placed. Overlaps of adjacent rolls may vary due to variations between the width of the roadway and paving fabric. Apply asphalt material between all fabric overlaps. Apply asphalt material between all fabric overlaps. Overlaps that do not have asphalt material will be corrected by manual placement of asphalt material or trimmed to a 1 inch overlap before overlay construction. No traffic except necessary construction traffic will be allowed to drive on the paving fabric.

(h) Overlay Placement: Asphalt overlay construction will closely follow fabric placement. Verify minimum asphalt material temperature with Manufacturer’s Technical Representative and as identified in field QC Plan. All areas in which paving fabric has been placed shall be paved during the same day. Blot excess tack coat that bleeds through the paving fabric by broadcasting sand on the paving fabric. Remove loose sand before beginning the paving operation. In the event of rainfall on the paving fabric before the placement of the asphalt overlay, the paving fabric must be allowed to dry before the asphalt overlay is placed. Overlay asphalt thickness must meet the requirements for the contract drawings and documents. The minimum compacted thickness of the first lift of overlay asphalt will not be less than 1.5 inches in areas of paving fabric installation.

466.4 MEASUREMENT AND PAYMENT –

- (a) Geotextile Paving Fabric.** Square Yard
- (b) Manual Asphalt Patching.** Section 450.4
- (c) Crack Filling and Sealing.** Section 469.4

SECTION 467—HEAVY DUTY MEMBRANES

467.1 DESCRIPTION—This work is placing heavy duty membranes over transverse and longitudinal joints and random cracks in existing concrete pavements at locations indicated or directed by the Representative.

467.2 MATERIAL—

(a) **Heavy Duty Membrane.** As listed in Bulletin 15 and include the certification specified in Section 106.03(b)3 with each shipment.

(b) **Asphalt Cement, Class PG 64S-22 or PG 58S-28.** Section 702

467.3 CONSTRUCTION—

(a) **General.** Provide a copy of the manufacturer's written installation instructions.

(b) **Surface Preparation.** Remove dirt and debris from all joints and cracks that will be under the membrane. Fill joints or cracks over 1/4 inch wide flush to the surface with PG 64S-22 or PG 58S-28. Before placing the membrane, ensure the pavement is sound, dry, and free of any debris or deteriorated and loose materials and prepare the surface according to the manufacturer's recommendations.

(c) **Primers or Binders.** Apply a primer or binder material to milled surfaces according to the manufacturer's recommendations.

(d) **Membrane Placement.** Place the membrane according to the manufacturer's recommendations including temperature and equipment requirements. Unless otherwise specified by the manufacturer, place the membrane approximately centered over the joints and cracks. Slit the membrane and overlap the edges of wrinkles over 3/8 inch in width that cannot be smoothed out. Securely bond the edges and corners of the strips to the surface. Before placing the overlay, re-bond or replace strips with loose edges or corners.

(e) **Traffic Control.** Before paving, the Contractor may only allow traffic on the membrane during the 7 calendar-day period immediately after placing the membrane.

(f) **Manufacturer Technical Representative.** Ensure that a trained manufacturer's technical representative is present during every phase of application, unless applied by a factory trained licensed installer providing written approval from the material supplier.

The manufacturer's technical representative will provide training and technical assistance on surface preparation, equipment, mixing of components, type and method of placement and finish.

467.4 MEASUREMENT AND PAYMENT—Square Yard or Linear Foot for the width indicated.

SECTION 469—ASPHALT JOINT AND CRACK SEALING

469.1 DESCRIPTION— This work is the cleaning and sealing of longitudinal and transverse joints and random cracks in existing pavement surfaces.

469.2 MATERIAL—

- (a) **Asphalt Rubber Sealing Compound.** Section 705.4(g)
- (b) **Rubberized Joint Sealing Material.** Section 705.4(c)
- (c) **Asphalt Wearing Course 4.75 mm.** Section 413.2

469.3 CONSTRUCTION—

- (a) **General.** Obtain material from a source listed in Bulletin 15 or Bulletin 41 as applicable.
- (b) **Heating Procedures.** Heat the material within the safe heating temperature range and recommended pouring temperatures found on the label on the manufacturer's shipping container. Place the material according to the manufacturer's recommendations. Do not maintain batches of material at the pouring temperature for more than 6 hours. Reheat according to the manufacturer's recommendations.
- (c) **Surface Preparation.** Clean, dry, and remove debris and loose material from cracks, joints, and adjacent pavement surfaces. If required, rout cracks to create a reservoir 1/2 inch deep. Clean the pavement for 4 inches to 6 inches on either side of the joint or crack. Immediately before sealing, use a compressed air stream of at least 100 pounds per square inch measured at the source, or a hot compressed air lance to clean and dry damp cracks in asphalt pavements. If using the hot compressed air lance, do not damage the surrounding pavement area from overheating. Clean, dry, and remove debris and loose material from cracks, joints, and adjacent pavement surfaces.
- (d) **Sealing.** Seal joints and cracks from 1/4 inch to 1 inch wide with asphalt sealant and fill joints and cracks over 1 inch wide with Asphalt Wearing Course 4.75 mm.
If using asphalt sealant, fill prepared joints and cracks level with the pavement surface. Wipe the sealant flush with the pavement surface, leaving a thin film of sealant from 1/32 inch to 1/16 inch thick and from 1 inch to 3 inches wide. After wiping the joint or crack, remove and dispose of excess sealant. Unless allowed with written approval by the Department, do not place sealant when the air temperature is below 40F or above 90F.

469.4 MEASUREMENT AND PAYMENT—

- (a) **Asphalt Joint and Crack Sealing.** Linear Foot or Gallon
For the type specified.
- (b) **Asphalt Wearing Course 4.75 mm.** Ton Section 413.4(a)3

SECTION 470—ASPHALT SEAL COAT

470.1 DESCRIPTION—This work is the application of emulsified asphalt, immediately followed by application of coarse aggregate.

470.2 MATERIAL—

(a) **Emulsified Asphalt Material.** One of the following, as specified in Section 702.

Class of Material	Type of Material	Application Temperature F	
		Minimum	Maximum
RS-2PM	Polymer-Modified Emulsified Asphalt	140	175
CRS-2PM	Polymer-Modified Cationic Emulsified Asphalt	140	175
HFRS-2PM	Polymer-Modified High Float Emulsified Asphalt	140	175
RS-2 ⁽¹⁾	Emulsified Asphalt	140	175
CRS-2 ⁽¹⁾	Cationic Emulsified Asphalt	140	175
HFRS-2 ⁽¹⁾	<u>High-Float Emulsified Asphalt</u>	140	175

(1) Only for use on municipal projects and State projects approved by the District Executive in writing.

(b) **Coarse Aggregate.** Type A, No. 8, or on roadways with less than 1,000 ADT No. 89, Section 703.2 or a gradation listed in Table A and with the SRL designated in the Contract Item. Supply aggregate from a source listed in Bulletin 14. The Contractor may use an aggregate or blends of aggregates with an SRL equal to or better than that specified. Blends are 50% by weight of the two aggregates. Mix the aggregates using an approved method.

Table A
Aggregate Gradations for Seal Coats

Sieve Size	Total Percent Passing Type SC-1 ⁽¹⁾
12.5mm (1/2 inch)	100
9.5mm (3/8 inch)	90-100
6.25mm (1/4 inch)	0-70
4.75mm (No. 4)	0-25
2.36mm (No. 8)	0-5
75µm (No. 200)	0-1.0
Note: Material finer than 75µm (No. 200) sieve will be determined according to PTM No. 100. Aggregate is to meet the requirements of Table B, Type A specified in Section 703.2, except 703.2(c)3 flat and elongated particles must have a ratio of 1:3 (3:1) conforming to ASTM D4791, Method A.	

470.3 CONSTRUCTION—At least 2 weeks before the scheduled start work, submit a seal coat design for the Representative's review. Design the seal coat according to the method in Appendix E of Bulletin 27. If the source or gradation of aggregate changes or if type of asphalt changes, submit a new seal coat design.

(a) **Preparing Existing Surface.** Remove and dispose of all unsuitable material. Where indicated, seal cracks as specified in Section 469.

(b) **Application of Emulsified Asphalt.** Apply emulsified asphalt when the entire surface is in condition to allow satisfactory material penetration and adhesion and when the air, surface, and aggregate temperatures are above 60F.

Do not apply emulsified asphalt if, in the Representative's opinion, rain is imminent or if freezing temperatures are expected within 24 hours after application.

Except when approved by the District Executive in writing, do not apply RS-2PM(, or CRS-2PM from September 15 to May 1 in Districts 1-0, 2-0, 3-0, 4-0, 9-0, 10-0, 11-0, 12-0, and 5-0 (Monroe, Carbon, and Schuylkill Counties only); and from October 1 to May 1 in Districts 6-0, 8-0, and 5-0 (Berks, Lehigh, and Northampton Counties only).

Use a distributor as specified in Section 460.3(b). Use a rate of application within $\pm 10\%$ of the design rate. Determine the distributor application rate in the field according to PTM No. 747. If the Representative determines that the design application rate for the emulsified asphalt is too low or too high, the emulsified asphalt application rate may be adjusted in the field to account for unforeseen or changing conditions.

For inaccessible areas, uniformly spread the emulsified asphalt over the surface using portable pressure units. The quantity of material placed at one time shall be consistent with the facilities for handling, spreading, and rolling coarse aggregate, as well as the temperature of the surface and emulsified asphalt.

Uniformly spread the emulsified asphalt at the junction of separate applications.

(c) Spreading and Rolling Coarse Aggregate. Use dry aggregates or damp aggregates for seal coats. Avoid aggregates with excessive free moisture. Before spreading aggregate, verify the calibration of the spreader using a method acceptable to the Inspector-in-Charge.

Immediately after applying the emulsified asphalt, uniformly spread a single layer of coarse aggregate at the design rate using a mechanical spreader capable of spreading 15 pounds per square yard to 25 pounds per square yard.

Within 5 minutes after application of the emulsified asphalt begin rolling the aggregate with pneumatic-tire rollers, as specified in Section 108.05(c)3.f. Provide a sufficient number of rollers to roll the width of stone spread within 5 minutes after the start of rolling. Overlap each pass by 1 foot with the adjacent roller pass. Make a minimum of two roller passes over the aggregate between the wheel paths. Roll each pass at a speed of less than or equal to 10 miles per hour to prevent turning over aggregate. Use a contact pressure from 40 pounds per square inch to 50 pounds per square inch.

(d) Protection of Surface. Do not allow vehicular traffic or loads on the newly completed surface until the material obtains adequate stability and adhesion and the material is sufficiently cured to prevent distortion, flushing of emulsified asphalt to surface, and loss of aggregate. Check the surface to ensure that the emulsified asphalt has set in shaded areas. Shaded areas may require longer set times.

Provide sufficient flaggers and pilot vehicles to move traffic through the work zone or over the completed work at speeds that prevent aggregate distortion or pick-up. If needed, sweep the surface with a power broom to remove surplus aggregate before and after opening the road to traffic. Provide a shadow vehicle for sweeping operations after opening the road to traffic.

Utilize only Waterborne Pavement Markings as specified in Section 962 on asphalt seal coats.

(e) Evaluation of Completed Seal Coat Surface. The Representative will evaluate the completed seal coat surface 1 day after completion of the seal coating operations and after final sweeping has been completed. If the surface of the seal coat aggregate is less than 50 percent embedded in the asphalt, the Representative may require the application of a fog seal as specified in Section 472.

470.4 MEASUREMENT AND PAYMENT—

(a) Area Basis. Square Yard

(b) Crack Filling and Sealing. Section 469.4

SECTION 471—ASPHALT SEAL COAT USING PRECOATED AGGREGATE

471.1 DESCRIPTION—This work is application of asphalt material immediately followed by an application of asphalt precoated aggregate.

471.2 MATERIAL—

(a) **Asphalt Precoating Material.** One of the following, as specified in Section 702:

Class of Material	Type of Material	Application Temperature °F	
		Minimum	Maximum
MC-30	Cut-back Asphalt	70	120
MC-70	Cut-back Asphalt	100	150
SS-1h (E-8A)	Emulsified Asphalt	70	150
CSS-1h (E-8C)	Cationic Emulsified Asphalt	70	150
PG 64S-22	Asphalt Cement	275	350
PG 58S-28	Asphalt Cement	250	325

(b) **Asphalt Material.** One of the following, as specified in Section 702:

Class of Material	Type of Material	Application Temperature °F	
		Minimum	Maximum
RS-2 (E-2)	Emulsified Asphalt	140	175
CRS-2 (E-3)	Cationic Emulsified Asphalt	140	175
PG 46S-40	Asphalt Cement	240	300

Only use PG 46S-40 on shoulders.

(c) **Coarse Aggregate.** Section 470.2(b)

(d) **Preparation of Pre-Coated Aggregate.** Use free-flowing, pre-coated aggregate so it can be stocked, handled, and uniformly spread by a self-propelled spreader. Prepare pre-coated aggregate as follows:

1. Asphalt Cement. Use an asphalt cement to pre-coat the aggregate only if it pre-coats the aggregate to the Representative's satisfaction. Provide a pre-coating with 0.6% to 1.2% residual asphalt binder (by weight of the mix). Dry the aggregate in a batch or continuous type asphalt plant conforming to the requirements of Bulletin 27. Precoat the aggregate in the pug mill. Mix the materials at a mixing temperature not exceeding 350F. Stock mixed material on a suitable base area and no higher than 4 feet.

2. Other Asphalt Materials. The Contractor may use damp aggregate and a stabilization plant. Provide a pre-coating with 0.4% to 1.0% residual asphalt binder. If using damp aggregate with cut-back asphalts, sufficiently cure the pre-coated aggregate before use to prevent pickup. Do not exceed an aggregate temperature of 150F if using cutback asphalts.

Select an application rate sufficient to provide a thin, brownish, and translucent film on the aggregate. Cover at least 90% of the total visible surface area of the aggregate. Before producing the pre-coated aggregate, prepare a sample of the pre-coated aggregate for the Representative's inspection. The Representative will use the sample to establish the visual inspection standard associated with at least 90% of the visible surface area covered.

During production, the Representative will determine if less than 90% of the visible surface area is covered. If the Representative determines less than 90% of the visible surface area is covered, the Contractor may determine the percent of uncoated material passing the 75 µm (No. 200) sieve after dry sieving for 10 minutes. The

Representative will accept the pre-coated aggregate if the percent passing does not exceed 0.5%. Stock mixed material on a suitable base area and, if using heated aggregates, no higher than 4 feet.

471.3 CONSTRUCTION—Section 470.3 and as follows:

(d) **Protection of Surface.** If required, sweep the surface with a power broom to remove loose chips before and after opening the road to traffic. For emulsified asphalt, allow sufficient time for the seal coat to completely cure before opening the road to all traffic.

471.4 MEASUREMENT AND PAYMENT—

(a) **Area Basis.** Square Yard

(b) **Material Used Basis.**

1. **Coarse Aggregate.** Square Yard

The unit price includes the asphalt precoating material.

2. **Other Asphalt Material.** Gallon

(c) **Crack Filling and Sealing.** Section 469.4

SECTION 472—ASPHALT FOG SEAL FOR ASPHALT SEAL COATS

472.1 DESCRIPTION—This work is the treatment of an asphalt seal coat with an application of asphalt material and an application of fine aggregate.

472.2 MATERIALS—

(a) **Emulsified Asphalt Material.** One of the following, as specified in Section 702:

TABLE A
Fog Seal Materials

		Application Temperature (F)	
Class of Material	Type of Material	Minimum	Maximum
CSS-1h ⁽¹⁾	Cationic Emulsified Asphalt	70	150
SS-1h ⁽²⁾	Emulsified Asphalt	70	150
SS-1hPM	Polymer-Modified Emulsified Asphalt	70	150
CSS-1hPM	Cationic Polymer-Modified Emulsified Asphalt	70	150
Dilute Material using 1 part emulsion to 1 part water. All dilution must be done by the emulsified asphalt supplier at the emulsified asphalt supplier plant location. Provide a Bill of Lading from the emulsified asphalt supplier certifying the base emulsified asphalt properties before dilution, the quantity of emulsified asphalt, and the water added for dilution, or certify the diluted product. Diluted emulsified asphalt must be applied within 48 hours after dilution. Dilution of asphalt emulsion in the field is not allowed.			
Notes: Material selection for the Fog Seal application:			
1. Use a Cationic Emulsified Asphalt material CSS-1h when a Cationic Emulsified Asphalt was used for the Asphalt Seal Coat.			
2. Use an Anionic Emulsified Asphalt material SS-1h when an Anionic Emulsified Asphalt was used for the Asphalt Seal Coat.			

(b) **Fine Aggregate (Cover Sand).** Type A, Type B1, or B3, Section 703.1

472.3 CONSTRUCTION—Place the fog seal on an asphalt seal coat constructed as specified in Section 470, or as directed by the Representative. Allow the seal coat to cure a minimum of 1 day before fog sealing. Place the fog seal application within 1 to 45 days after the last day of the seal coat placement.

(a) **Weather Limitations.** Apply fog seal when the air, surface, and aggregate temperatures are above 60F. Do not apply emulsified asphalt if, in the Representative's opinion, rain is imminent or if freezing temperatures are expected within 8 hours after application. The fog seal will normally cure within 2 hours under dry conditions and temperatures above 60F.

(b) **Surface Preparations.** The road surface must be clean and dry prior to placing the fog seal. If needed, lightly sweep the pavement with a motorized broom to remove excess seal coat aggregate. If the seal coat surface aggregate is damaged by the sweeping operation stop sweeping. Cover manholes, valve covers, sensors, etc. to prevent adherence of the emulsified asphalt. Remove protective coverings prior to opening the road to traffic.

(c) **Emulsified Asphalt Application.** Apply the emulsified asphalt with a distributor meeting the requirements of Section 460.3(b). Place emulsified asphalt on all completed seal coated areas.

Construct a 100-foot test strip. Review the application of diluted (1:1) emulsified asphalt and adjust the application rate as needed. Apply between 0.1 to 0.2 gallons per square yard, diluted. Determine the distributor's application rate in the field according to PTM No. 747. Apply the emulsified asphalt to minimize the amount of overspray.

(d) Fine Aggregate (Cover Sand) Application. Apply fine aggregate uniformly over the surface treatment within 5 minutes of applying the emulsified asphalt. The fine aggregate application rate is 2 to 5 pounds per square yard. Lightly cover remaining spots of excess emulsified asphalt with fine aggregate, before opening to traffic. Sweep the pavement with a motorized broom prior to opening to traffic.

(e) Pavement Markings. Interim pavement markings can be placed after the fog seal cures. Do not place permanent pavement markings on the fog seal until 3 days after the last day of fog seal placement.

(f) Opening to Traffic. Check shaded areas to ensure the fog seal has cured fully before opening fog sealed roadways to traffic. Do not allow traffic on the emulsified asphalt until it has cured.

472.4 MEASUREMENT AND PAYMENT—

(a) Area Basis. Square Yard

(b) Material Used Basis.

1. Fine Aggregate. Ton

2. Emulsified Asphalt Material. Gallon

SECTION 473—ASPHALT SEAL COAT USING AGGREGATE FROM RAP

473.1 DESCRIPTION—This work is an application of emulsified asphalt immediately followed by application of seal coat aggregate made from RAP.

473.2 MATERIAL—

(a) **Emulsified Asphalt Material.** One of the following, as specified in Section 702.

Class of Material	Type of Material	Application Temperature (F)	
		Minimum	Maximum
RS-2P	Polymer-Modified Emulsified Asphalt	140	175
CRS-2P	Polymer-Modified Cationic Emulsified Asphalt	140	175
HFRS-2P	Polymer-Modified High Float Emulsified Asphalt	140	175
RS-2	Emulsified Asphalt	140	175
CRS-2	Cationic Emulsified Asphalt	140	175
HFRS-2	High-Float Emulsified Asphalt	140	175

(b) **Coarse Aggregate.**

1. Seal Coat Aggregate from RAP. Crush, screen, and grade RAP material that is free of deleterious construction debris to meet the gradation requirements of Table A. Provide documentation certifying that the unprocessed RAP material was obtained from a source that required the use of only Bulletin 14 approved aggregates.

TABLE A
Gradation Requirements of Seal Coat Aggregate from RAP

Sieve Size	% Passing by Weight*
12.5 mm (1/2 inch)	100
9.5 mm (3/8 inch)	85 – 100
4.75 mm (No. 4)	0 – 30
2.36 mm (No. 8)	0 – 15
1.18 mm (No. 16)	0 – 10
75 µm (No. 200)*	0 – 1

* Determined by PTM No. 100 (Material finer than 75 µm (#200) by wash)

The requirements of Section 703.2 do not apply to Seal Coat Aggregate from RAP.

2. Acceptance of Seal Coat Aggregate from RAP. Section 703.5(b) with the following modifications and additions:

2.a QC. Replace Section 703.5(b)1 with the following:

Section 106.03(b)2 and as follows:

- Submit for annual review a QC plan according to POM B.7.14 except the minimum testing frequency is as follows:

- During processing of the seal coat aggregate from RAP, sample and test the gradation of the finished seal coat aggregate from RAP the first day of production and a minimum of once every 1,000 tons of seal coat aggregate from RAP produced.

Before shipment, the Representative will inspect the stockpile and truck loading of seal coat aggregate from RAP for clumps and oversized material. If clumps or oversized material retained on the 12.5 mm (1/2 inch) sieve are detected in the stockpile or during loading of vehicles, reprocess the seal coat aggregate from RAP to remove clumped or oversized material. Processed seal coat aggregate from RAP stored in uncovered stockpiles and not used within one month after production, or processed seal coat aggregate from RAP stored in covered stockpiles and not used within three months of processing must be reprocessed to remove clumps and oversized material retained on the 12.5 mm (1/2 inch) sieve.

2.b Source Verification Samples. Section 703.5(b)3. With the following addition:

Department force projects are not required to obtain project verification samples as required in Section 703.5(b)3.

473.3 CONSTRUCTION—Section 470.3, with the following additions:

Placement of seal coat aggregate from RAP on routes over 1,000 ADT must be approved in writing by the District Executive. Provide documentation of the SRL of the unprocessed RAP material. All documentation must be signed by the DME/DMM certifying that the unprocessed RAP is from a Bulletin 14 approved source and is the SRL level indicated. Do not use seal coat aggregate from RAP on roads over 5,000 ADT.

(b) Application of Emulsified Asphalt. Add the following:

Apply seal coat aggregate from RAP when the temperature of the existing roadway surface exposed to direct sun light is below 120F. If material starts to stick to the tires of reclaimed seal coat aggregate delivery trucks, stop seal coat placement operations until the existing roadway temperature is below 120F.

473.4 MEASUREMENT AND PAYMENT—

(a) Area Basis. Square Yard

(b) Material Used Basis.

1. Coarse Aggregate. Square Yard or Ton

The square yard unit price includes the production and placement of seal coat aggregate from RAP. The tonnage item only includes the seal coat aggregate from RAP.

2. Other Asphalt Material. Gallon

(c) Crack Filling and Sealing. Section 469.4

SECTION 480—ASPHALT SURFACE TREATMENT

480.1 DESCRIPTION—This work is two applications of emulsified asphalt, with each application of emulsified asphalt immediately followed by an application of coarse aggregate.

480.2 MATERIAL—

(a) **Emulsified Asphalt.** Section 470.2(a)

(b) **Coarse Aggregate.** Type A, No. 8 and No. 67, Section 703.2.

Provide aggregate to achieve at least the SRL designation indicated in the Contract Item and from sources supplying aggregate for use in wearing courses. The Contractor may provide a blend of two aggregates if the blend has an SRL equal to or better than that specified. Blends are 50% by weight of each aggregate. Mix the aggregates by an approved method.

480.3 CONSTRUCTION—At least 2 weeks before the scheduled start of work, submit a surface treatment design for the Representative's review. Design the surface treatment according to Appendix E of Bulletin 27.

(a) **Conditioning Existing Surface.** Section 470.3(a)

(b) **Application of Emulsified Asphalt and Coarse Aggregate.** Section 470.3(b) and (c), except apply at the following rates and according to the following sequence:

FIRST APPLICATION

Apply emulsified asphalt at a rate of 0.25 gallon per square yard to 0.50 gallon per square yard. Use a mechanical spreader to spread 25 pounds per square yard to 45 pounds per square yard of No. 67 coarse aggregate. Roll the aggregate as specified below and then sweep off the loose material. Allow the first application to cure to the Representative's satisfaction before spreading the second application.

SECOND APPLICATION

Apply emulsified asphalt at a rate of 0.25 gallon per square yard to 0.50 gallon per square yard. Use a mechanical spreader to spread 15 pounds per square yard to 30 pounds per square yard of No. 8 coarse aggregate. Roll the aggregate as specified below.

(c) **Rolling.** Provide pneumatic-tire rollers as specified in Section 108.05(c)3.f and with a contact pressure from 40 pounds per square inch to 50 pounds per square inch. Use a sufficient number of rollers to cover the width of stone spread during the first pass. When the emulsified asphalt has a tacky surface, backroll the aggregate with a pneumatic-tire roller or a steel-wheel tandem roller until the aggregate adheres to the emulsified asphalt. If directed, eliminate backrolling. Do not roll in the vibratory mode.

(d) **Protection of Surface.** Section 470.3(d)

480.4 MEASUREMENT AND PAYMENT—

(a) **Area Basis.** Square Yard

(b) **Material Used Basis.**

1. **Coarse Aggregate.** Square Yard

2. **Emulsified Asphalt.** Gallon

(c) **Crack Filling and Sealing.** Section 469.4

SECTION 481—ASPHALT SURFACE TREATMENT USING PRECOATED AGGREGATE

481.1 DESCRIPTION—This work is two applications of asphalt material, each immediately followed by an application of precoated aggregate.

481.2 MATERIAL—

- (a) **Asphalt Precoated Material.** Section 471.2(a)
- (b) **Asphalt Material.** Section 471.2(b)
- (c) **Coarse Aggregate.** Section 480.2(b)
- (d) **Preparation of Precoated Aggregate.** Section 471.2(d)

481.3 CONSTRUCTION—Section 480.3

481.4 MEASUREMENT AND PAYMENT—

- (a) **Area Basis.** Square Yard
- (b) **Material Used Basis.**
 - 1. **Coarse Aggregate.** Square Yard
The unit price includes the asphalt precoating material.
 - 2. **Asphalt Material.** Gallon

SECTION 482—SLURRY SEAL

482.1 DESCRIPTION—This work is construction of an emulsified asphalt slurry seal course of the type designated.

482.2 MATERIAL—

(a) **Emulsified Asphalt Material.** Emulsified Asphalt, Class SS-1h(E-8A), or CSS-1h(E-8C), Section 702.

(b) **Fine Aggregate.** Section 703.1

Provide aggregate with the SRL designation in the Contract Item. Supply the aggregate from an acceptable source for use in wearing courses. The Contractor may supply an aggregate or aggregate blend with an SRL equal to or better than in the Contract Item. Blends are 50% by weight of each aggregate. Mix aggregates by an approved method.

(c) **Filler.** Section 703.1(c)1

(d) **Water.** Section 720.2, and free from harmful soluble salts. If water exceeds 150 ppm (9 grains) hardness, lower to below 150 ppm (9 grains) by adding water softener.

(e) **Mixture Composition.** Design and test the slurry seal mixture according to ASTM D 3910.

Provide fine aggregate, asphalt emulsion, water, and, if required, filler conforming to the Representative directed composition by weight percentages that are within the limits of Table A.

TABLE A
Composition by Weight Percentages
Combined Aggregate Gradations

Passing Sieve	Percentages by Weight		
	Type I	Type II	Type III
3/8-inch	100	100	100
No. 4	100	90 - 100	70 - 90
No. 8	90 - 100	65 - 90	45 - 70
No. 16	65 - 90	45 - 70	28 - 50
No. 30	40 - 60	30 - 50	19 - 34
No. 50	25 - 42	18 - 30	12 - 25
No. 100	15 - 30	10 - 21	7 - 18
No. 200	10 - 20	5 - 15	5 - 15
Asphalt Residue Percent by Weight of Dry Aggregate	10.0 - 16.0	7.5 - 13.5	6.5 - 12.0

1. Type I. Use to seal cracks, fill voids, and correct surface erosion. Apply dry aggregate at a rate from 6 pounds per square yard to 10 pounds per square yard.

2. Type II. Use to fill surface voids, correct severe surface erosion conditions, and provide a minimum wearing surface. Apply dry aggregate at a rate of 10 pounds per square yard to 15 pounds per square yard.

3. Type III. Use to provide a new moderate wearing surface or to build up a crown. Apply dry aggregate at a rate of 15 pounds per square yard or more.

482.3 CONSTRUCTION—

(a) Weather Limitations. As specified in Section 413.3(b), except do not place mixture if the air temperature is 50F or lower, or if the pavement temperature is 50F or lower.

(b) Equipment Requirements. Produce the mixture in a self-propelled, continuous-flow mixing apparatus capable of accurately proportioning, combining, and mixing the materials into a homogeneous mixture with an asphalt film of sufficient thickness to furnish the desired binding properties.

Use an apparatus that contains bins, tanks, and receptacles of sufficient size and volume; proportioning feeders; liquid measuring meters or devices; and a mechanical mixer and distributor for placing the finished mixtures. Materials are to be delivered to the mixer simultaneously and in time-adjusted sequence by integrated, mechanized, and synchronized components.

(c) Mixer. A mixer of the spiraled, multi-blade type, or other acceptable type, with the following components, is required:

- mixing chamber having a stated capacity (not to be exceeded);
- mechanical equipment to regulate mixing time up to, but not exceeding, 4 minutes;
- equipment to pre-wet the aggregate before aggregate contact with asphalt emulsion; and
- a gate for controlling discharge of mixture into the distributor spreader.

(d) Spreading Equipment.

1. Distributor. A mechanically-operated, squeegee-type distributor is required, one which is integrally assembled with the slurry mixer and which includes the following:

- a strike-off, lined with flexible material to prevent loss of slurry mixture during spreading;
- a strike-off, with vertical adjustment available for changing grade and cross slope to ensure uniform spreading of mixture; and
- a pressure system and a fog-type spray bar, adequate for placing a complete fog coat of water over pavement surface immediately preceding spreading of mixture, with a maximum 0.05 gallon per square yard application rate of water.

2. Auxiliary Equipment. Provide hand squeegees, shovels, surface-cleaning machines, and other hand equipment, as necessary.

(e) Conditioning of Existing Surface. Section 413.3(g)1, except:

- Seal open joint and cracks with an acceptable crack sealer or emulsion.
- In addition to the surface cleaning specified, also remove heavy paint build-up.
- Cover and satisfactorily protect existing raised pavement markers.
- Replace damaged markers.

(f) Placement. Control the temperature of the components of the completed mixture so application temperature of the slurry seal is within the range designated, but not less than 50F or more than 125F.

(g) Joints.

1. Transverse Joints. Construct by either overlapping previously cured slurry with 10 feet to 15 feet of fresh slurry, or by lightly wetting the area the spreader box will touch, while the slurry is in a completely uncured, semi-fluid condition.

2. Longitudinal Joints. Construct as follows:

Do not wet the slurry if it is completely uncured. Pull a burlap bag, or other suitable device, along the joint seam, to cause fresh slurry from the spreader box to distribute itself evenly over the joint.

Wet the slurry with the spring bar, if the slurry is completely cured.

(h) Curing. Do not allow traffic on the surface until directed, to allow the slurry seal to completely cure to a firm condition that will prevent pick-up of the mixture.

482.4 MEASUREMENT AND PAYMENT—Square Yard

SECTION 483—POLYMER-MODIFIED EMULSIFIED ASPHALT PAVING SYSTEM (MICRO SURFACING)

483.1 DESCRIPTION—This work is the construction of a polymer-modified emulsified asphalt paving system, commonly known as micro-surfacing, to fill ruts and/or resurface existing pavements.

Micro-surfacing material is classified into three mix types as follows:

(a) **Type A.** Used to seal cracks, fill voids and shallow (less than 1/2 inch) ruts, and provide a scratch course or surface seal. Use a double application, when specified, to meet total design pounds per square yard for surface courses.

(b) **Type B.** Used to fill moderate (1/2 inch to 1 1/4 inch) ruts; and provide a scratch course, a leveling course, a seal coat, or a surface treatment. Use a double application, when specified, to meet total design pounds per square yard for surface courses.

(c) **Type Rut Fill (RF).** Used to fill deep (2 inch) ruts in a single pass.

483.2 MATERIAL—

(a) **Emulsified Asphalt Material.** Class CQS-1hPM as specified in Bulletin 25. Obtain material from an approved producer and source listed in Bulletin 15 and provide quality control testing and certification as specified in Sections 106.03(b) and 702.1(b)1.

1. Polymer Modifier. Provide a latex based modifier capable of making a micro-surfacing mix which cures fast enough to allow traffic to be placed on the pavement within 1 hour, without damaging the surface.

(b) **Aggregate.** Provide coarse or fine aggregates from sources listed in Bulletin 14. Provide fine aggregate Type B or better meeting the quality requirements of Table A, Section 703.1(c) and coarse aggregates meeting the quality requirements of Table B, Section 703.2(a). The final gradation must meet the final gradation specified in Table A of this specification. For wearing courses, provide aggregate with at least the SRL designation specified. To achieve the specified SRL, the Contractor may provide a blend of two aggregates if the blend has an SRL designation equal to or better than that specified. Blends are 50% by weight of each aggregate. Blend the aggregates using an approved method.

(c) **Filler.** Supply filler, when required to maintain the percent by weight passing the 75 µm (No. 200) sieve, as specified in Section 703.1(c)1 consisting of any approved, non-air entrained, Type 1, Portland cement free of lumps or hydrated lime as specified in Section 723.1.

(d) **Water.** Section 720.2 and free of harmful soluble salts.

(e) **Other Additives.** Supplied by the manufacturer to control mix set time in the field due to varying ambient environmental conditions.

(f) **Mixture Composition.** Size, uniformly grade, and combine aggregate fractions in such proportions that the total aggregate and filler in the JMF conform to the composition by weight percentages specified in Table A. Perform the tests identified in Table B for each mix design and provide the test results to document each mix design's characteristics.

Submit a certified mix design(s) using a Micro-Surfacing Mix Design and Materials Analysis Form TR-483 to the DME/DMM at least 2 weeks before its use in the work. Clearly show for each mix design the proportions of aggregate, filler, percent polymer-modified emulsified asphalt and asphalt residue, based on the dry weight of the aggregate, and the design cure time. Ensure all the materials used in the mix design represent the materials proposed for use on the project. If minor adjustments are required during construction, based on field conditions, provide the changes in writing to the Representative.

1. QC Plan and JMF. Prepare a QC Plan, as specified in Section 106, and submit it for review at the start of the project and at least annually thereafter. Include the number of applications and the mix design used with each

application in the QC Plan. Do not start work until the QC Plan has been reviewed and the JMF has been submitted.

When unsatisfactory results or other conditions make it necessary, a new JMF may be required. If a change in sources of materials is made, submit a revised JMF to the DME/DMM before using any new material.

2. Uniformity. Produce each mix type within the ranges specified in Table C.

TABLE A

SIEVE SIZE	COMPOSITION, TOTAL PERCENT BY MASS (WEIGHT PASSING)		
	TYPE A	TYPE B	TYPE RF
12.5 mm (1/2 inch)	100	100	100
9.5 mm (3/8 inch)	100	95 - 100	90 - 100
4.75 mm (No. 4)	85 - 100	65 - 85	55 - 75
2.36 mm (No. 8)	50 - 75	46 - 65	40 - 55
1.18 mm (No. 16)	40 - 65	28 - 45	24 - 40
600 µm (No. 30)	25 - 45	19 - 34	19 - 34
300 µm (No. 50)	13 - 25	10 - 23	10 - 20
75 µm (No. 200)	5 - 15	5 - 15	5 - 15

Note: Material finer than the 75 µm (No. 200) sieve will be determined as per PTM No. 100.

TABLE B

MICRO-SURFACING MIX DESIGN PROPERTIES		
Property	Test Method	Test Requirements
Wet Cohesion:	ISSA TB 139 30 Minutes	12 kg-cm min
	ISSA TB 139 60 Minutes	20 kg-cm min or near spin
Wet Track Abrasion Loss:	ISSA TB 100 1 Hour Soak	50 g/ft ² max
	ISSA TB 100 6 Day Soak	75 g/ft ² max
Mix Time:	ISSA TB 113	120 seconds min
Classification of Compatibility:	ISSA TB 144	11 grade points min
Wet Stripping:	ISSA TB 114	Pass (90% min)
Loaded Wheel Test:	ISSA TB 147	Vertical 10% max, Lateral 5% max

Note: Provide aggregate with a minimum sand equivalency of 65 as determined by AASHTO T 176. If the sand equivalency is < 65, the aggregate may be approved as long as the Plasticity Index (PI) is zero. Test the PI as per AASHTO T 89 and AASHTO T 90 and meets the methyl blue test.

TABLE C

MIX TYPE	MINIMUM SURFACING APPLICATION THICKNESS (inch)	ASPHALT RESIDUE (% by Weight of Aggregate)	SINGLE APPLICATION RATE (Pounds per Square Yard)	DOUBLE APPLICATION RATE (Pounds per Square Yard)
A	1/4	6.0 - 8.5	25-30	35-40
B	3/8	5.5 - 7.5	35- 40	40- 55
RF	N/A	5.5-7.5	22-38	

Note A: Provide mix set additive for each mix type as required.

Note B: Filler for each mix type to be from 1% to 2%± 0.5% by weight of dry aggregate depending on weather conditions.

Note C: It is permissible to increase asphalt content for slag and other absorptive aggregates at the discretion of the DME/DMM.

(g) Mixture Acceptance. Provide a certified calibration sheet for the mixing equipment for each mix design to be used within 60 days before its use on the project. Record mixing equipment meter readings of material control devices

on a Run Sheet, daily, for each mix design. Calculate the percent cement or hydrated lime, total emulsion, asphalt residue based on the dry weight of the aggregate, and the yield square yard.

Certify the mixture composition and application rate based on quality control tests and Run Sheet calculations. Send certifications to the Inspector-In-Charge within 1 working day following any quality control testing. Certify mixtures and each shipment of material delivered to the job site as specified in Section 106.03(b)3.

(h) Asphalt Tack Coat. Section 460.2

(i) Certification. Section 106.03(b)3.

Certify each shipment of material delivered to the job site.

483.3 CONSTRUCTION—

(a) Preplacement Meeting. Hold a preplacement meeting on site or at a location that is acceptable to the Representative with both Contractor and PennDOT personnel present before placing any material on the project. Identify any areas of concern in the pavement that may show any signs of fatigue or excessive rutting at the pre-placement meeting. Also review the Specification, QC Plan, source of supply list, and the Aggregate Delivery Plan. It may be necessary to hold more than one preplacement meeting on larger projects with multiple State Routes.

(b) Weather Limitations. Apply when entire surface is in a condition to allow satisfactory penetration and adhesion and the atmospheric temperature is 50F minimum during the entire placement. Under no circumstances will the 50F minimum temperature requirement to be waived even for night work. Do not apply mixture if rain is imminent or if freezing temperatures are expected within 24 hours after application. Remove and replace rained on mixture before it sets. Do not apply from September 16 to April 30 in Districts 1-0, 2-0, 3-0, 4-0, 10-0, and 5-0 (Monroe, Carbon, and Schuylkill Counties only) and from October 1 to April 30 in Districts 6-0, 8-0, 9-0, 11-0, 12-0, and 5-0 (Berks, Lehigh, and Northampton Counties only). No exceptions to weather limitations will be allowed, unless directed in writing by the District Executive.

(c) Aggregate Delivery Plan. Before the start of work, submit an Aggregate Delivery Plan to the DME/DMM for approval. Include in the plan the number of trucks that will be used to haul aggregates to the micro-surfacing machine in order to keep it moving continuously to limit starting and stopping.

All aggregates being delivered to the micro-surfacing machine must be screened directly into the truck.

All screening plants must be equipped with a scalping screen with a 3/8 inch maximum square opening for Type A and with a 1/2 inch maximum square opening for Type B and Type RF.

(d) Mixing Equipment. Produce mixture in a self-propelled, front feed, continuous-loading mixing machine equipped with a chain-dragged conveyor belt aggregate delivery system interconnected with a positive displacement, water-jacketed gear pump to accurately proportion ingredients. Truck mounted units may be allowed on projects less than 20,000 square yards except for limited access highways and for all municipal projects. Locate filler feed so that the proper amount of cement is coating the aggregate before charging into the mixer. Provide a spray bar to completely wet the aggregate dropping down into the pug mill with additive and water.

Provide a continuous-flow, twin shafted, multi-bladed pug mill at least 50 inches long. Introduce polymer-modified emulsified asphalt beyond the first quarter point of the mixer to ensure thorough mixing of aggregate, cement, additive, and water before polymer-modified emulsified asphalt is added. Meet manufacturer's recommendations for blade size and side clearance. Provide readily accessible material control devices, placed so that the Inspector is able to determine the amount of each material being used at any time. Calibrate each material control device before production of each mix type. Equip the machine with a water pressure system and nozzle spray bar to provide a water spray ahead of and outside the spreader box, when required.

(e) Spreading Equipment. Spread the mixture uniformly by means of a mechanical type squeegee box attached to the mixer and equipped with paddles mounted on adjustable shafts to continually agitate and distribute the material throughout the box. Provide sufficient turbulence to prevent the mix from setting up in the box, forming excessive side build-up, or forming lumps. Attach flexible front and rear seals, in contact with the road, to prevent loss of mixture from the box. Furnish rut filling equipment with movable steel strike-off bar. Operate spreading equipment to prevent loss of the mixture on super elevated curves and to leave a uniform, skid-resistant application of aggregate and asphalt on the surface. Operate spreading equipment to achieve a uniform consistency without skips, lumps, or

tears in the finished surface.

(f) Conditioning of Existing Surface. Section 413.3(g)1 and as follows:

Immediately before placing mixture, clean the surface of vegetation, loose materials, dirt, mud, and other objectionable items. Ensure all pavement markings and legends are completely removed before placing any mixture. Before placing mixture on existing concrete surfaces, apply tack coat over the entire area as specified in Section 460. Do not apply tack coat on existing asphalt surfaces. Apply water to dampen entire surface immediately before placing mixture.

(g) Spreading and Finishing. Section 413.3(h) and as follows:

Spread the mixture to seal cracks, fill voids, and to leave a uniform surface. When filling ruts, take care to restore the designed profile of the pavement cross section. Avoid excess crowning (over filling) of rutted areas. Use squeegees and lutes in areas inaccessible to the spreader box.

Carry a sufficient amount of material at all times, in all parts of the spreader box, to obtain complete coverage. Water may be sprayed into the spreader box, to facilitate spreading, without harming the mix. Lumps, balls, or unmixed aggregate in the finished surface is not allowed.

Adjustments to the additive may be required to slow mixture set time where hand spreading is needed. When hand spreading, pour mixture in a small windrow along one edge of the surface to be covered and spread uniformly by hand squeegee or lute.

Make a neat seam where two passes join. Immediately remove excess material from the ends of each run.

1. General Requirements. Ensure mixture properly sets within one hour of placement. If mixture takes longer than one hour to properly set, the Representative will give the Contractor a warning and an opportunity to immediately correct mixture application and set time. If the mixture takes longer than one hour and twenty minutes to properly set, stop placement operations immediately.

2. Mixture Set Time. Remove and replace mixture if mixture set time takes longer than one hour and twenty minutes.

(h) Compaction. Before opening to traffic, compact using a pneumatic-tire roller as specified in Section 108.05(c)3.f, except having tire pressures of 40 pounds per square inch to 60 pounds per square inch. Roll the entire surface area of the placed mixture. On a double application, roll the entire surface area of the placed mixture for each application.

(i) Sampling and Testing. At least 2 weeks before the start of work, under the direction and supervision of the Representative, obtain samples of the aggregates from stockpiles designated and constructed for each mixture type and each project. Obtain a minimum sample size of 3 pounds using guidelines for stockpile sampling specified in PTM No. 607. Immediately deliver the samples to the Representative for testing. Passing aggregate acceptance test results are required before placement of the mixture. All acceptance samples will be obtained and all acceptance tests will be performed by the Representative according to PTM No. 616 and PTM No. 100 using the following frequency:

- **When the projected quantity of aggregate for the specified mixture type is less than 500 tons.** The entire quantity will be designated as one lot and divided into three equal sublots for sampling. Under the direction and supervision of the Representative obtain a sample from each subplot and immediately deliver the samples to the Representative for testing. One of the three subplot samples will be randomly selected and tested according to PTM No. 1 by the Representative and tested for compliance with Table A. If the sample tested meets the specification, the entire lot will be considered acceptable for delivery to the designed project. If the sample fails, the remaining two samples will be tested and the Representative will determine the percent within limits (PWL) according to Section 106.03(a)3. If results indicate a PWL for the material less than 90, the Representative will reject the stockpile. After the entire rejected lot has been blended, screened, or replaced, retesting for acceptance of the aggregate will be performed. If retesting is performed, all subplot samples will be tested as specified in Section 703.5(b)2. All acceptance testing will be performed by the Representative. All test results will be recorded on a TR-4126A aggregate report form.

- **When the projected quantity of aggregate for the specified mixture type is 500 tons or greater.** The aggregates will be divided into equal lots at the discretion of the aggregate supplier, but in no case will the lot exceed 1000 tons. Each lot will be divided into three equal sublots. Under the direction and supervision of the Representative obtain a sample for each sublot. All three samples for each lot will be tested and the Representative will determine the percent within limits (PWL) according to Section 106.03(a)3. If results indicate a PWL for the material less than 90, the Representative will reject the stockpile. If the test results for each lot meets the specification and are in compliance with Table A, the entire lot is acceptable for shipment to the project. If the test results fail to meet the specifications, the lot will be rejected. Retesting for lot acceptance will be performed as described above. All acceptance testing will be performed by the Representative. All test results will be recorded on a TR-4126A aggregate report form.

(j) Blending Aggregates on the Project. Requests to blend aggregates on the project to meet gradation requirements from Table A and the method of blending must be approved in writing by the DME/DMM before the start of work. Include on the QC Plan a detailed description of equipment used to blend aggregates, a list of supplier codes for aggregates being blended, and the percentages of each aggregate being blended. Set up a portable laboratory at the blending site equipped to perform PTM No. 616 and PTM No. 100 tests for acceptance of aggregates on the project. The Contractor's aggregate technician must be a PennDOT certified aggregate technician before performing any aggregate testing at the staging area in the presence and direction of the Representative. Aggregates will be accepted as specified in Section 483.3(i). Provide aggregate for use in all mixture Types including each application of a double application of a mixture Type having the SRL designation indicated in the bid proposal. An aggregate designation or blends, equal to or better than that specified, may be supplied.

(k) Test Strip. On the first day of work the Representative will identify a location to perform the test strip. The test strip will be prohibited on a limited access highway. Construct a test strip to demonstrate the mixture's ability to be laid in multiple stone thicknesses and to be opened to traffic within one hour after placement. Construct the test strip in the same manner and condition as required on the project. Construct the test strip over one-full lane width and between 100 feet and 550 feet long. Apply the mixture at an application rate representative of the application rate for the project. Test the mixture according to ISSA Test Method TB 102 in the presence of the Representative. The Representative will evaluate and approve the test strip based on its ability to be opened to traffic within one hour and on its ability to have a set time of 10 minutes, maximum, as determined by ISSA Test Method TB 102.

Do not continue with work until the Representative has approved the test strip. The Representative does not have the authority to waive or eliminate the test strip requirement. If this work is to be performed a test strip is mandatory. The test strip will be payable as specified in Section 483.4.

(l) Defective Work. As specified in Section 105.12 and as follows:

Unless otherwise directed in writing by the District Executive, satisfactorily correct pavement not meeting the following criteria:

1. Application Rate. Calculate yield at the end of each day's application. Areas where application rates deviate from the acceptable ranges in Table C will be considered defective work. Failure to meet the acceptable ranges in Table C will require an additional minimum 15 pounds per square yard application or the District Executive, with the concurrence of the Director of the Bureau of Project Delivery, may allow the Contractor to leave the defective lot in place. The Department will pay for the defective lot at 50% of the contract unit price.

2. Finished Surface. Provide a finished, uniform surface texture meeting the following requirements:

- No areas of excess emulsified asphalt (flushing) greater than 5% of the finished surface area. Areas of excess emulsified asphalt are characterized by a smooth, shiny surface that may be tacky to the touch. Bleeding at joints is not allowed.
- No tear and/or drag marks greater than 1 inch wide and 3 inches long.
- No more than 12 tear and/or drag marks greater than 1/2 inch wide and 4 inches long per 10 feet of a lane.
- No clumps and/or other foreign objects greater than 1 1/2 inch in diameter.

- No completed sections of micro-surfacing which exhibit washboard or ripple patterns exceeding 100 linear feet. If these areas exist they will be considered defective work, as determined by the Representative, and will require surface correction.
- No longitudinal streaks with greater than a 1/4 inch ridge, bump or depression, as measured with a 10 foot long straightedge.

3. Longitudinal Joints. Make a neat seam where two longitudinal passes join with no greater than a 1/4 inch bump, ridge, or depression as measured with a 12 foot straightedge. Do not overlap longitudinal joints more than 4 inches, except on irregular roadway widths when approved by the Representative.

4. Longitudinal Edges. Place material to the final widths specified. Make a neat longitudinal edge along the roadway lane, shoulder, and/or curb lines. Place edges flush with curbs. Place edges with no more than ± 3 inches horizontal variance in any 100 feet of roadway.

5. Transverse Profile. Fill ruts to have no depressions as measured with a 12 foot long straightedge.

(m) Opening to Traffic. Do not allow traffic on newly completed surface course until mix has set sufficiently to prevent pick-up and until directed by the Representative.

483.4 MEASUREMENT AND PAYMENT—

(a) Micro-Surfacing.

1. Area Basis. Square Yard

2. Weight Basis. Ton

Under the direction and supervision of the Representative complete measurements based on the combined tonnages of aggregate, filler, and polymer-modified emulsified asphalt actually used; computed as follows:

- **Aggregate.** Measure aggregate quantity using the calibrated, dry weight from the aggregate control device. Make a deduction for moisture naturally occurring in the aggregate by using PTM No. 513.
- **Filler.** Compute filler quantity from the fines feeder control device.
- **Polymer-modified emulsified asphalt.** Compute polymer-modified emulsified asphalt quantity by weight used.

(b) Asphalt Tack Coat. Section 460.4

SECTION 489—ULTRA-THIN BONDED WEARING COURSE

489.1 DESCRIPTION—This work is the construction of a polymer-modified emulsified asphalt membrane (UTFCEM – Ultra-Thin Friction Course Emulsified Asphalt) immediately overlaid with an ultra-thin bonded wearing course of hot-mix asphalt concrete (UTWC – Ultra-Thin Wearing Course) in one pass of a single paving machine.

489.2 MATERIAL—

(a) Asphalt Material.

1. Asphalt Binder. Provide material as specified meeting the requirements of the Standard Specification for Performance-Graded Asphalt Binder, AASHTO M 332, except as revised in Bulletin 25. Obtain material from an approved producer and source listed in Bulletin 15 for the specified grade and provide quality control testing and certification as specified in Sections 106.03(b) and 702.1(b)1.

2. Emulsified Asphalt. Class UTFCEM as specified in Bulletin 25. Obtain material from an approved producer and source listed in Bulletin 15 and provide quality control testing and certification as specified in Sections 106.03(b) and 702.1(b)1.

(b) Aggregate.

1. Fine Aggregate. Manufactured sand from an approved source, listed in Bulletin 14 and meeting the requirements in Table A.

TABLE A

FINE AGGREGATE PROPERTIES			
TEST	TEST METHOD	MINIMUM	MAXIMUM
Sand Equivalent	AASHTO T 176	45	-
Methylene Blue	AASHTO T 330	-	10
Uncompacted Void Content	AASHTO T 304	40	-

2. Coarse Aggregate. Coarse aggregate from an approved source, listed in Bulletin 14 and meeting the requirements in Table B.

TABLE B

COARSE AGGREGATE PROPERTIES				
TEST	TEST METHOD	AVERAGE DAILY TRAFFIC (ADT)		
		< 5,000	5,000 < 20,000	> 20,000
Abrasion Max. %	AASHTO T 96	35	30	30
Micro-Deval (MD)* Max. %	AASHTO T 327	18	18	18
Skid Resistance Level (SRL) .	Bulletin 14	G or higher	H or higher	E
Absorption Max. %	AASHTO T 85	2	2	2
Thin and Elongated Pieces Max. %	ASTM D4791	10	10	10
Soundness Max. %	PTM No. 510	10	10	10
Min % Crushed, 1 Face	ASTM D5821	95	95	100
Min % Crushed, 2 Face	ASTM D5821	85	85	85

*MD > 18, requires approval of DME/DMM.

(c) Filler. Do not use fly ash if the design traffic is greater than or equal to 3 million Equivalent Single Axle Loads (ESALs).

(d) Mixture Composition. Provide a wearing course of plant mixed asphalt concrete consisting of fine aggregate, coarse aggregate, filler, and asphalt binder. Size, uniformly grade, and combine aggregate fractions in such proportions that the total aggregate and the asphalt in the JMF conform to the composition specified in Table C, and meet the mixture characteristics of Table D.

TABLE C

COMPOSITION, TOTAL PERCENT BY MASS (WEIGHT) PASSING			
SIEVE SIZE	TYPE A	TYPE B	TYPE C
19.0 mm (3/4 inch)	100	100	100
12.5 mm (1/2 inch)	100	100	85 - 100
9.5 mm (3/8 inch)	100	75 - 100	65 - 85
6.3 mm (1/4 inch)	75 - 100	28 - 45	28 - 45
4.75 mm (No. 4)	40 - 60	23 - 37	23 - 37
2.36 mm (No. 8)	15 - 30	21 - 31	21 - 31
1.18 mm (No. 16)	12 - 20	15 - 23	15 - 23
600 μ m (No. 30)	8 - 15	10 - 18	10 - 18
300 μ m (No. 50)	6 - 12	8 - 14	8 - 14
150 μ m (No. 100)	5 - 10	5 - 10	6 - 10
75 μ m (No. 200)	4.0 - 6.5	4.0 - 6.5	4.0 - 6.5
Asphalt % by mass (weight)	4.5 - 5.8	4.5 - 5.7	4.5 - 5.7

Note: Material finer than the 75 μ m (No. 200) sieve will be determined as per PTM No. 100.

TABLE D

MIXTURE CHARACTERISTICS			
MIXTURE CHARACTERISTIC	TEST METHOD	MINIMUM	MAXIMUM
Moisture sensitivity, % TSR	AASHTO T 283*	80	-
Average % Draindown	AASHTO T 305	-	0.1
Apparent Asphalt Film Thickness, microns	Bul. 27, Sec 12.4.1	10.0	-

*Prepare specimens according to Department's modified procedures for Superpave Mix Design, detailed in Bulletin 27, Chapter 2A referencing AASHTO R 35 Section 11, with the following exceptions:

1. Condition the mixture according to Bulletin 27.
2. Compact to 100 gyrations.
3. Extrude as soon as possible without damage to the sample.
4. Use AASHTO T 269 to determine void content.
5. Record the void content of the specimens. (Maintain the range from the lowest to the highest air void content of all specimens at a maximum difference of 1.0%)
6. Condition specimens, compute the Tensile Strength Ratio, and evaluate the specimens according to Bulletin 27.
7. Visual stripping will require modification or readjustments or both as directed by the Representative.

1. Producer QC Plan and JMF. Prepare a QC Plan, as specified in Section 106, and submit it for review at the start of the project and at least annually thereafter. Do not start work until the QC Plan has been reviewed and the JMF has been submitted.

When unsatisfactory results or other conditions make it necessary, a new JMF may be required. If a change in sources of materials is made, submit a revised JMF to the DME/DMM before using any new material.

2. Uniformity. Produce the asphalt mixture to meet the requirements as specified in Table C. Produce the mixture within the JMF tolerances specified in Table E.

TABLE E

JMF TOLERANCE REQUIREMENTS OF COMPLETED MIX (n≥1)			
Percent Passing 9.5 mm (3/8 inch) and larger sieves		±5%	
Percent Passing 6.3 mm (1/4 inch) to 2.36 mm (No. 8) sieves		±4%	
Percent Passing 1.18 mm (No. 16) to 0.3 mm (No. 50) sieves		±3%	
Percent Passing 150 μm (No. 100) sieve		±2%	
Percent Passing 75μm (No. 200) sieve		±1.5%	
Asphalt % by mass		±0.5%	
TEMPERATURE OF MIXTURE (F)			
CLASS OF MATERIAL	TYPE OF MATERIAL	MINIMUM	MAXIMUM
PG 64S-22	Asphalt Binder	285	330
PG 64E-22	Asphalt Binder	295	340

(e) **Mixture Acceptance.** Obtain material certification from the material producer. Send certification to the Inspector-In-Charge within 1 working day following any QC tests for asphalt determination and sieve analysis of the mixture.

The mixture will be accepted by certification at the plant when quality control tests conform to the JMF within the tolerances specified in Table E. Acceptance by certification may be suspended if QC tests or QA samples obtained by QA Teams from the BOPD deviate from the tolerances in Table E for acceptance values. The acceptance values are:

- Asphalt Content by mass (weight),
- Percent passing the 75µm (No. 200) sieve,
- Percent passing the 2.36 mm (No. 8) sieve, and
- Percent passing the 6.3 mm (1/4 inch) sieve.

If at any time during the course of the work any acceptance values deviate from the tolerances in Table E in consecutive tests, immediately make necessary changes to comply with the JMF. If the material cannot be brought into compliance within 150 tons of production, suspend operations and notify the Inspector-In-Charge. Do not resume production for the project until the Representative has reviewed any corrective action.

If the asphalt content or the percent passing the 75µm (No. 200) sieve deviates from the tolerances specified in Table E, the material represented will be considered defective and acceptance will be determined as specified in Section 413.3(o).

(f) **Certification.** Section 106.03(b)3.

Certify each day's shipment of material delivered to the job site.

489.3 CONSTRUCTION—Section 413.3 with additions and modifications as follows:

(a) **Preplacement Requirements.** Add the following

Address in the QC plan material delivered to the paver as it relates to paver speed. Provide calculations to support material production, haul units used for delivery and paver speed to eliminate placement stoppages during laydown.

(b) **Weather Limitations.** Replace with the following:

Do not place asphalt paving mixtures containing PG 64S-22 from November 1 to March 31 and asphalt paving mixtures containing PG 64E-22 from October 15 to March 31, unless allowed in writing by the District Executive. Do not place asphalt paving mixtures when the surfaces are wet or when the air or surface temperature is below 50F. If work is halted because of weather conditions, the Representative may allow the Contractor to place limited quantities of mixture that are en route to the project.

(e) Paving Equipment.**1. Asphalt Pavers.** Add the following:

Use pavers that include a built-in spray bar placed in front of the variable-width heated screed unit, so that the operations of spreading UTFCEM and the UTWC are performed in succession, within a period of less than 5 seconds.

(g) Preparation of Existing Surface.**1. Conditioning of Existing Surface.** Replace with the following:

At least 24 hours before paving operations, seal longitudinal and transverse joints and cracks 1/4-inch and wider as specified in Section 469. Use rubberized sealant as specified in Section 469 and minimize the sealant over-band thickness and width. Do not exceed Section 469 over-band tolerances. Remove thermoplastic and tape traffic markings greater than 0.2 inches thick. Thoroughly clean pavements impregnated with grease, oil, or fuel. Immediately prior to applying the UTFCEM and the UTWC, clean the surface by sweeping or other means necessary to remove all loose particles and unsuitable material.

(h) Spreading and Finishing.**1.b Spreading and Finishing.** Replace with the following:

Apply UTFCEM with a metered mechanical pressure sprayer, at a temperature of 120F to 180F. Continuously monitor the rate of spray, ensuring a uniform application rate over the entire width to be overlaid. Determine the spray rate given the existing pavement porosity, and apply between 0.15 and 0.25 gallons per square yard. Do not allow wheels or other parts of the paving machine to come in contact with the UTFCEM before the UTWC is applied. Within 5 seconds of applying the UTFCEM, lay the UTWC within the temperature range specified in Section 489.2 Table E for the class and type of material used, and at the placement rate specified in Section 489.3 Table F.

Continuously adjust operations to obtain a quality surface free from drags marks, open areas or suspect quality. If adjustments do not obtain a quality surface free from visual surface segregation the Representative may direct work to stop. Areas identified by the Representative to have visual surface segregation are to be removed and replaced at no additional cost to the Department. Do not begin spreading and finishing until the Representative is satisfied with proposed corrective actions to provide a satisfactory surface.

TABLE F

TYPE	NMAS	PLACEMENT RATES FOR UTWC
A	6.3 mm (1/4 inch)	45 to 65 pounds per square yard
B	9.5 mm (3/8 inch)	55 to 80 pounds per square yard
C	12.5 mm (1/2 inch)	60 to 85 pounds per square yard
Note: Placement rates are intended as a guide and additional material may be required to obtain a quality surface. In no case should material yield be below the lower limits of the placement rate range.		

(i) Compaction. Replace with the following:

Roll the UTWC immediately after placement and before the material temperature has fallen below 185F. Roll using a minimum of two passes with a steel double-drum asphalt roller having a mass of not less than 8 tons. Do not allow roller(s) to remain stationary on the freshly placed UTWC. Maintain roller(s) in reliable operating condition and equipped with functioning water system and scrapers to prevent adhesion of the fresh mix onto the roller drums. A release agent (added to the water system) may be required. Compact in the static mode, with the exception of joints where vibration may be necessary. A pneumatic-tire roller may be used to prevent the "bridging" effect of the steel drum roller.

(j) Mat Density Acceptance. Density testing is not required.**(k) Joints.** Replace with the following:

1. Longitudinal Joints. Form butt joints only and compact with rollers. Seal the longitudinal joint(s) for surface courses with hot PG 64S-22 asphalt cement at no additional cost to the Department. Heat and maintain asphalt cement sealant between 265F and 320F. Do not place sealant when the air temperature is below 40F, unless otherwise allowed by the Representative. Apply the sealant only to joints in pavement surfaces that are clean, dry and free of any loose material and debris. Clean with a power broom as required. Utilize a pressure applicator with a wand or nozzle capable of applying hot asphalt sealant in a straight and consistent width band of 4 inches +/- 1 inch and thickness of 1/16 inch +/- 1/32 inch. Center the sealant band within 1 inch of the joint. Remove and dispose of excess sealant at no additional cost to the Department. Re-seal areas of the joint that are inconsistently or not completely covered at no additional cost to the Department. Replace pavement markings that are marred by sealing operations at no additional cost to the Department.

2. Transverse Joints. Minimize the number of transverse joints. Maintain continuous forward paving wherever possible. Construct joints perpendicular to the direction of traffic and compact. If the QC plan proves ineffective for minimizing the number of transverse joints, stop paving and submit a plan for corrective action to the Representative. Do not begin paving until the Representative has reviewed the plan and authorizes paving to resume.

(m) Tests for Depth. Loose depth or compacted depth tests are not required. However, control the depth of courses by the weight per square yard.

489.4 MEASUREMENT AND PAYMENT—

(a) Ultra-thin Bonded Wearing Course. Square Yard.
For the type indicated.

(b) Crack Filling and Sealing. Section 469.4

SECTION 490—REMOVAL OF EXISTING SURFACE COURSE

490.1 DESCRIPTION—This work is removal of an existing surface course.

490.3 CONSTRUCTION—Carefully remove the existing asphalt surface course, within limits shown on the plans or as directed. Use an acceptable removal method. Neatly trim the edges of remaining asphalt surface to a vertical line. At locations determined by the Representative, clean the surface of the existing base course and repair damage to the adjacent surface or underlying base.

490.4 MEASUREMENT AND PAYMENT—Square Yard

SECTION 491—MILLING OF ASPHALT PAVEMENT SURFACE

491.1 DESCRIPTION—This work is the milling of an existing asphalt pavement surface.

491.3 CONSTRUCTION—

(a) **Equipment.** Provide a milling machine designed and built for milling existing asphalt pavements with an automatic grade and slope control system and be capable of milling concrete patches.

(b) **Milling Operation.** Mill to provide a finished surface that is free from gouges, grooves, and ridges and that conforms to the surface tolerance requirements of Section 413.3(l). Immediately after milling, remove milled material. Carefully remove the existing asphalt material around utility facilities within work areas. Repair or replace utility facilities that are damaged by the milling operation to the satisfaction of the utility owner. Control the rate of milling to avoid tearing of the mat, which causes chunky and non-uniformly milled material. If directed, separate oversized and chunky milled material. Maintain the milled pavement surface free of all loose materials and dust.

Do not allow traffic to drive on any milled surface for more than 6 calendar days. Place the first overlaying asphalt course within 7 calendar days from the start of the milling operation. Failure to overlay a milled section of roadway within 7 calendar days after it has been milled will constitute a failure to comply with a contract traffic control requirement for which work zone liquidated damages, as specified in section 108.07(c), will be assessed. Work stoppages caused by the Department, Utilities, and documented weather delays will not count towards the 7 calendar days for calculating Work Zone Liquidated Damages. Maintain all milled surfaces and repair or replace any areas damaged due to the asphalt overlay not being placed within 7 calendar days of the milling operation methods accepted by the Representative at no additional cost to the Department.

If the first course of the asphalt overlay is not placed on the same day of the milling operation, install ROUGH ROAD (W8-8) signs according to Publication 212, Publication 213, and MUTCD 1/2- mile in advance of the project and at a minimum of 1/2- mile intervals throughout the project before the end of the day. Eliminate vertical edges around utilities and inlets within all open travel lanes at the end of each day. If this is not feasible, install a BUMP (W8-1) sign in advance of the appurtenance, and consider a reduced regulatory speed limit sign. Install these signs at no additional cost to Department.

(c) **Disposition of Milled Material.** The proposal/contract will indicate which one of the following conditions will apply with regard to the disposition of milled material.

1. Milled Material Retained by Contractor. When indicated that milled material is to be retained by the Contractor, satisfactorily dispose of milled material immediately after milling.

2. Milled Material Retained by Department (Delivered to Stockpile). When indicated that milled material will be retained by the Department, deliver milled material to the designated stockpiling location immediately after milling. The proposal/contract will include a special provision that identifies where milled material is to be stockpiled, as well as the approximate distance (miles) from the project site to the designated stockpiling location. Advance notification of a scheduled delivery of milled material to the designated stockpile is to be provided to the individual whose name and telephone number are listed in the special provision.

491.4 MEASUREMENT AND PAYMENT—

(a) **Milling of Asphalt Pavement Surface, Milled Material Retained by Contractor.** Square Yard

(b) **Milling of Asphalt Pavement Surface, Milled Material Retained by Department (Delivered to Stockpile).** Square Yard

The cost of delivering milled material to the designated stockpiling location is incidental to this item of work.

SECTION 492—PROFILE MILLING OF ASPHALT PAVEMENT SURFACES

492.1 DESCRIPTION— This work is profile milling of existing asphalt pavement surface with parameters to control surface tolerances in both longitudinal and transverse directions.

492.3 CONSTRUCTION—

(a) Equipment. Provide a self-propelled milling machine capable of milling a full-lane width up to 12-feet wide in one pass.

Equip the milling machine with a built in automatic grade control system to control the longitudinal profile and the transverse cross-slope. Provide longitudinal controls capable of operating from a longitudinal grade reference, including string line, ski 30 feet minimum, mobile string line 30 feet minimum, or matching shoe. Provide the transverse controls with an automatic system for controlling cross-slope at a given rate.

Mount profiler cutters to the carrier in order to adjust and control them according to depth of cut and cross-slope. Longitudinal milling action may be produced either by a suitable carrier wheelbase or use of an automatic control system having an external reference. Produce either a variable or a constant cross-slope with cross-slop adjustments or automatic controls.

Design, maintain, and operate milling cutters to produce a surface free from grooves, ridges, gouges, or other irregularities detrimental to the safe operation of vehicles in traffic routed onto the profiled surface.

Suitable supplemental equipment or methods, approved by the Representative, may be used in small or confined areas and around utility facilities. Complete adjustment of utility facilities before the milling operation, when pavement is not to be resurfaced. Repair or replace utility facilities that are damaged by the profiling operation to the satisfaction of the utility owner at no additional cost to the Department.

(b) Profiling Operation. Remove irregularities such as bumps, corrugations, and wheel ruts, and establish the specified pavement surface elevation or cross-slope with one or more passes over the designated area, operating the milling machine in automated mode.

Remove milled material from the surface following each pass of the equipment. Before opening the completed area to traffic, thoroughly clean the surface of all loose material that would create a hazard, a nuisance, or would be redeposited into the surface texture.

Maintain the milled surface free of all loose material and contaminants during milling and cleaning operations.

Repair areas where sound pavement has been damaged by milling operations at no additional cost to the Department, in a manner satisfactory to the Representative. The repaired area must conform to the adjacent pavement in smoothness and durability.

Do not allow traffic to drive on any milled surface for more than 6 calendar days. Place the first overlaying asphalt course within 7 calendar days from the start of the milling operation. Failure to overlay a milled section of roadway within 7 calendar days after it has been milled will constitute a failure to comply with a contract traffic control requirement for which work zone liquidated damages, as specified in section 108.07(c), will be assessed. Work stoppages caused by the Department, Utilities, and documented weather delays will not count towards the 7 working days for calculating Work Zone Liquidated Damages. Maintain all milled surfaces and repair or replace any areas damaged due to the asphalt overlay not being placed within 7 calendar days of the milling operation methods accepted by the Representative at no additional cost to the Department.

If the first course of the asphalt overlay is not placed on the same day of the milling operation, install ROUGH ROAD (W8-8) signs according to Publication 212, Publication 213, and MUTCD 1/2- mile in advance of the project and at a minimum of 1/2- mile intervals throughout the project before the end of the day. Eliminate vertical edges around utilities and inlets within all open travel lanes at the end of each day. If this is not feasible, install a BUMP (W8-1) sign in advance of the appurtenance, and consider a reduced regulatory speed limit sign. Install these signs at no additional cost to Department.

(c) Surface Patching. Areas of the milled surface to be patched due to spalling or dislodgement of unsound pavement during profile milling operation will be designated by the Representative. Excavate to match depth of existing surface. Clean the areas of loose material, coat with Emulsified Asphalt Tack Coat (TACK), and fill with asphalt mixture of the same type. Level and compact the asphalt mixture to conform to the adjacent pavement.

(d) Surface Tolerances. Profile the surface to a smoothness of 1/8 inch in 12 feet, and match the surface at the

edge of adjacent passes within 1/8 inches. Conform the cross-slope of the profiled surface to the specified cross-slope within 1/8 inch in 12 feet. Provide a positive cross slope, as shown in the plans, such that the pavement drains.

(e) Disposition of Milled Material. The proposal/contract will indicate which one of the following conditions will apply with regard to the disposition of milled material.

1. Milled Material Retained by Contractor. When indicated that milled material is to be retained by the Contractor, satisfactorily dispose of milled material immediately after milling.

2. Milled Material Retained by Department (Delivered to Stockpile). When indicated that milled material will be retained by the Department, deliver milled material to the designated stockpiling location immediately after milling. The proposal/contract will include a special provision that identifies where milled material is to be stockpiled, as well as the approximate distance (miles) from the project site to the designated stockpiling location. Advance notification of a scheduled delivery of milled material to the designated stockpile is to be provided to the individual whose name and telephone number are listed in the special provision.

(f) Defective Work. Profile milling that fails to meet the surface tolerances in Section 492.3(d) will be considered defective. Payment for defective work will be made at 50% of the Contract Unit Price (CUP) for the full-lane width of the defective area.

492.4 MEASUREMENT AND PAYMENT—

(a) Profile Milling, Milled Material Retained by Contractor. Square Yard

(b) Profile Milling, Milled Material Retained by Department (Delivered to Stockpile). Square Yard
The cost of delivering milled material to the designated stockpiling location is incidental to this item of work.

(c) Surface Patching. The Department will separately measure and pay for the following item(s), when indicated or required:

1. Class 1 Excavation. Section 203.4

2. Patching. Section 450.4

SECTION 496—ASPHALT CONCRETE PAVEMENT, 60-MONTH WARRANTY

496.1. DESCRIPTION—This work is construction of a plant-mixed, asphalt concrete pavement on a prepared surface with a 60 month warranty and includes the furnishing of a warranty bond. Acceptability of this work will be determined by construction end-result and the warranty performance criteria.

496.2. MATERIAL—Provide material which ensures that the asphalt concrete pavement meets the warranty performance criteria. Select the type and class of asphalt material, type of aggregate, and, when necessary, type of filler to be used in the constructed pavement. For wearing courses, use aggregate, having the specified SRL designation, from a source listed in Bulletin 14. An aggregate designation or blends, equal to or better than that specified, may be supplied. Blends are 50% by weight.

(a) Composition of Mixtures. Establish the JMF(s) using a volumetric mix design procedure with the Superpave Gyratory Compactor (SGC).

Submit mix design(s) on the most current version of the TR-448A form, signed by a Certified Asphalt Level 2 Plant Technician, to the DME/DMM at least 7 calendar days before its use in the work. The submitted mix design(s) will be used for information only and will become part of the as-built project files. Submission of the mix design(s) will not relieve the Contractor from responsibility for meeting the specified construction end-result or warranty performance criteria. Stone Matrix Asphalt (SMA) wearing course mixes may be submitted for consideration. For each mix design, provide the following information:

- Date of Submission
- Project S.R., Section, and County
- Project Contract No.
- Asphalt Concrete Producer: Name and Location
- Asphalt Plant Type
- Aggregate Producer: Supplier Code, Material Code/Class, Percent in Mix, Bulk Specific Gravity and Percent Absorption
- Asphalt Cement Producer: Supplier Code, Material Code/Class, Percent in Mix and Bulk Specific Gravity
- Volumetric Mix Design Method
- Other JMF Materials: Source, Material Code/Class, Percent in Mix, Bulk Specific Gravity and % Absorption (if applicable)
- JMF: Design and Upper and Lower Tolerances for production control
- SGC Gyrations at Nini, Ndes, and Nmax
- Combined Aggregate Bulk Specific Gravity (Gsb)
- Theoretical Maximum Specific Gravity (Gmm) or Density
- Laboratory Specific Gravity at Ndes (Gmb) or Density
- Voids in Mineral Aggregate (VMA), percent by volume
- Voids in Total Mixture (VTM), percent by volume
- Voids Filled with Asphalt (VFA), percent by volume
- Ignition Furnace Correction Factors for Asphalt Binder and 0.75 μ m (No. 200) Sieve
- Moisture Sensitivity Data (Tensile Strengths, Tensile Strength Ratio, Date Performed) or (Hamburg Wheel Tracking Results)
- Combined Aggregate Consensus Properties (Sand Equivalency, Fine Aggregate Angularity, Coarse Aggregate Angularity, Flat & Elongated Pieces)
- Gradation Chart (FHWA 0.45 Power Type) with JMF plotted
- Types and results of additional mixture testing, if performed
- Designer's signature

Ensure all component materials shown in the mix design are representative of the materials that will be used on the project. If, for any reason, a change in material source or other adjustments are necessary during construction, before using any new material notify the DME/DMM in writing, explaining the need for the change. Submit a copy of the revised JMF with the written notification.

1. QC Plan. Prepare a QC plan, as specified in Section 106, and submit it at the start of the project. Do not start work until the QC plan and the JMF have been submitted. The submitted QC plan will be used for information only and will become part of the as-built project files.

Provide certified results of QC testing to the Representative within 48 hours of material sampling. The submitted test results will be used for information only and will become part of the as-built project files.

(b) Warranty Bond and Liability Insurance. When awarded the contract, in addition to the required bonds specified in Section 103.04, furnish a Warranty Bond, with sufficient surety or sureties, in an amount equal to 50% of the total contract amount for all pavements to be constructed under the pavement warranty item(s). Have the bond specify that remediation work will be completed in a manner satisfactory to the Secretary. Have the bond state that the State is to be saved harmless from any expense or damage incurred through the failure of the Contractor to complete remediation work, as specified, or from any damages growing out of the carelessness of the Contractor, the Contractor's employees, or subcontractors in performing remediation work.

Have a corporate surety, legally authorized to transact business in the State and satisfactory to the Secretary, execute the bond. If the Secretary decides the bond surety is unsatisfactory, promptly furnish any additional required security to protect the State's interests and the interests of all persons, firms, or corporations who/which have furnished material, provided equipment on rental, or supplied/performed labor services on, or in connection with, the performance of the remediation work for this contract.

The Warranty Bond is to be effective beginning on the date of physical work completion, established by the Representative for the whole project or any substantial project section, as specified in Section 110.08(a). The Warranty bond is to remain in effect for a period of 60 months from the effective date or until completion of all remediation work identified in the final annual performance surveys, whichever is later. If a substantial section of the project is completed in advance of the whole, the Contractor may request that a final inspection of that section be conducted. If the Department accepts the work on the section of the project, in writing, and the section is opened to normal traffic, the warranty period for that section will start in advance of the date of physical work completion for the entire project. The Warranty Bond, however, must remain in effect until all criteria established in Section 496.3(c)6 are satisfied, and the Warranty Acceptance Notification has been issued. The amount of the warranty bond will be reduced proportionately if the warranty period for a portion of the work expires in advance of the warranty period for the remainder of the work.

Maintain insurance to indemnify and save harmless the Commonwealth, the Department, and all of its officers and employees from all suits, actions, or claims of any character, name, and description, brought for or on account of any injuries or damages received or sustained by any person, persons, or property related to the performance of any work by the Contractor, these pavement items, or to remedial actions taken throughout the warranty period, whether the same is due to the use of defective material, defective work, neglect in safeguarding the work or public interests, or by or on account of any act, omission, neglect or misconduct of the Contractor.

496.3. CONSTRUCTION—Provide an asphalt concrete pavement meeting the requirements specified herein and capable of meeting the warranty performance based criteria specified herein.

Construct the pavement as a combination of two or more different asphalt concrete pavement courses to achieve the total depth indicated.

(a) Tests for Depth of Binder and Wearing Courses. Within 24 hours after final compaction, in the presence of the Inspector, drill one, 4-inch diameter or larger core through all lifts and courses placed under this item of work to the top of the existing pavement or base, for each 2,000 linear feet of pavement lane. The Inspector will determine core locations using PTM No. 1, excluding any transitional areas indicated.

The Inspector will measure the depth of each core according to PTM No. 737. When any one core depth measurement indicates the pavement is deficient in depth by more than 1/4 inch, which cannot be satisfactorily corrected, the affected pavement area will be considered defective work. When core depth measurements indicate that the pavement is uniformly deficient in depth by more than 1/8 inch in any three consecutive core locations and the deficiency cannot be satisfactorily corrected, the affected pavement area will be considered defective work. After the Inspector completes depth measurements, backfill, compact, and seal core holes with mixture used to construct the wearing course. After depth measurement, the cores may be used for QC testing.

Immediately correct pavement that is deficient in depth starting at the point of the determined deficiency, and proceed longitudinally and transversely until the depth within the limits of the entire repair area is within 1/4 inch of the required depth. Drill additional cores as needed, both forward and back of the cores determined to have deficient

depth, to determine the actual starting and ending point of the deficiency. Coring operations will not exclude pavement from the warranty performance criteria.

(b) Information Samples for the Department. The Department reserves the right to direct the Contractor to obtain loose mixture box samples and/or pavement core samples at random locations selected by the Inspector according to PTM No. 1 for testing at the LTS for informational purposes only.

If directed and in the presence of the Inspector, obtain $n=1$ loose mixture box samples from directly behind the paver before the material is compacted. Immediately package loose mixture samples in individual cardboard boxes sized no larger than 240 cubic inches and identify each sample by number, location (lane, direction, and station), date of placement, mixture type, and as Information Samples (Sample Class IF). Immediately deliver the packaged loose mixture box samples to the Inspector.

If directed and in the presence of the Inspector, drill and obtain $n=1$ 6-inch diameter pavement core samples for each 1,000 tons of material placed. Do not bend, compress, or distort samples during cutting, handling, transporting, and storing. If core samples are damaged, immediately obtain replacement samples, as directed by the Inspector, from within 12 inches of the original sample location. Obtain samples no later than 24 hours after placement. Identify the samples by number, location (lane, direction, and station), date of placement, mixture type, and as Information Samples (Sample Class IF). Immediately package and deliver the samples to the Inspector. Within 24 hours after coring, backfill the hole with mixture of the same JMF or with mixture used for subsequent courses and compact and seal the mixture.

(c) Warranty.

1. Performance Criteria. Performance results will be determined by automated surveys. These distresses will be identified, measured, and reported using the survey techniques, rating procedures, and extent estimation procedures in accordance with Publication 336. Surveys will be performed by the Department or a designee. Manual surveys, when necessary, will be performed according to Publication 336. Performance results for flushing and potholes will be determined by manual surveys.

For each Segment, or partial Segment, performance criteria limits for distresses are indicated in Table A. A segment is defined as a division of the State Route approximately one-half mile in length with termini designated by the Department typically beginning and ending at physical features. The segment beginning points will be designated on the plans.

If the last performance survey (year 5) determines that 30% of segment area has two or more distresses with low severity, then remedial action is required by microsurfacing, or other treatment approved by the Department.

TABLE A
Performance Criteria Distress Limits

PERFORMANCE CRITERION	THRESHOLD LEVEL	REMEDIAL ACTION
FATIGUE CRACKING	All medium or greater severity*	Remove and replace distressed layers full lane width to a depth necessary to correct observed distress but not to exceed warranted pavement and length not less than 10 feet beyond the distressed area.
CRACKING (Transverse Cracking & Miscellaneous Cracking)	All low to medium severity*	Crack seal as specified in Section 469.
RAVELING / WEATHERING	All high severity*	Remove and replace distressed layers full lane width to a depth necessary to correct observed distress but not to exceed warranted pavement and length not less than 10 feet beyond the distressed area.
	All medium or greater severity*	Remove and replace distressed layers full lane width to a depth necessary to correct observed distress but not to exceed warranted pavement and length not less than 10 feet beyond the distressed area.
RUTTING	> 3/8 inch	Remove and replace distressed layers full lane width to a depth necessary to correct observed distress but not to exceed warranted pavement and length not less than 10 feet beyond the distressed area.
FLUSHING	ALL	Remove and replace distressed layer full depth and full or half lane width (longitudinal joint at center of lane for half lane width) and a minimum of 24 inches beyond distressed pavement in all longitudinal directions.
POTHoles (INCLUDING SLIPPAGE AREAS)	ALL	Remove and replace distressed layers full lane width to a depth necessary to correct observed distress but not to exceed warranted pavement and length not less than 10 feet beyond the distressed area.
LONGITUDINAL JOINT DETERIORATION	All medium severity*	Crack seal as specified in Section 469.
EDGE DETERIORATION (shoulder joint)	All high severity*	Remove and replace distressed layer one foot either side of the joint transversely and a minimum of 24 inches beyond distressed pavement in all longitudinal directions.
LONGITUDINAL JOINT DETERIORATION	All medium severity*	Crack seal as specified in Section 469.
LEFT EDGE JOINT (lane joints)	All high severity*	Remove and replace distressed layer one foot either side of the joint transversely and a minimum of 24 inches beyond distressed pavement in all longitudinal directions.

*The Threshold Level as defined in Publication 336.

NOTE: Should deviations beyond the threshold levels indicated in Table A in combination total a remedial action area greater than 20% of the surface area of any segment of pavement as defined herein, (except that, for this determination, a medium severity crack referenced above will be considered to be a deviation affecting 6 inches on either side of the crack for the entire length of the crack) remove and replace the entire segment.

Should the distance between repair areas be less than 100 feet, make one continuous repair.

All repairs must meet the surface tolerance as specified in Section 413.3 (I).

2. Remediation Work under the Pavement Warranty.

2.a Department's Responsibility. To determine compliance with specified performance criteria the Department will be responsible for conducting an annual performance analysis, the basis of which will be the distress criteria established in Table A.

The Department will schedule and perform annual surveys, and additional surveys if needed, of the warranted pavement for flushing and potholes. When needed, Rut Depth measurements will be verified using a 12 foot straight edge, across the lane width, to determine the severity and extent. Surveys will be conducted annually throughout the warranty period. The Contractor will be notified at least 14 calendar days in advance of all scheduled manual surveys. In addition, the Department will routinely schedule and perform traffic classification counts to confirm that Equivalent Single Axle Load (ESAL) estimates remain within the projected values included in the contract documents.

The Department reserves the right to schedule and perform additional or more frequent performance surveys if, at any time during the warranty period, evidence exists that performance criteria are not being met. The Department will provide the Contractor with access to the results of all performance surveys and traffic counts. Performance survey results will be reported for each individual State Route Segment as established under the Department's Location Reference System (LRS) or partial Segment within the limits of the warranty project. Within 14 calendar days after completion, the Department will notify the Contractor, in writing, of the results of performance surveys, identifying the Segment (location) and the performance criterion, and indicating whether specified distress limits have been met or exceeded. After performance surveys are completed, if the Department determines remedial action is necessary, the Contractor will be notified within 5 calendar days, from the date of that determination, that remediation work is required.

During the warranty period, the Department will not perform routine pavement maintenance, such as crack sealing and base repairs, on the warranted pavement. If the Department determines emergency repair work is necessary, the Contractor will be notified immediately of the emergency repair work that is required. The Contractor will be given 24 hours to review the emergency repair work that is needed and notify the Department if they will perform the required repairs. When the Contractor notifies the Department agreeing to make the required emergency repairs, they must begin repair work within 48 hours of the Department's initial notification. If the Contractor does not notify the Department within 24 hours or begin the repair work within 48 hours of the Department's initial notification, the Department reserves the right to make emergency repairs to the warranted pavement during the warranty period. If the pavement condition is determined to be potentially harmful or unsafe, the Department reserves the right to make immediate emergency repairs to the warranted pavement during the warranty period. The Department will then notify the Contractor of the location of all emergency repairs performed. The costs expended by the Department for any emergency repair work needed to correct deficiencies covered under the terms of this warranty specification will be the responsibility of the Contractor.

2.b Contractor's Responsibility. The Contractor's obligation to perform required remediation work shall survive acceptance of the work and final settlement of the Contract.

The Contractor may witness all manual performance surveys. Where survey results for a given Segment indicate that performance criteria distress limits for one or more distress types have been exceeded, perform the remediation work described in Table A. If proposing to utilize a method of testing, measurement, or remedial action other than that prescribed, submit a plan that includes a detailed description of the proposed testing, measurement, or remedial action to the Representative for review and approval. The Department will review and approve or disapprove the submitted testing, measurement, or remedial action plan within 5 calendar days of receipt of the submission.

Complete remediation work required as part of the pavement warranty, at the location(s) indicated, within 60 calendar days after receipt of the Department's written notification that remediation work is required. Perform remediation work to meet the material and performance criteria requirements contained herein. Notify the District Executive of the tentative start date for remediation work and submit a schedule for remedial repairs within 5 calendar days of that notification. If remediation work does not begin by the start of the 61st calendar day after the date of the Department's written notification, the Contractor will be responsible to pay an amount equivalent to the Construction Engineering Liquidated Damages as specified in Section 108.07. This cost will accrue until the required remedial work ends. In addition to the continuing cost equivalent to the Construction Engineering Liquidated Damages, costs equivalent to Road Users Liquidated Damages as specified in Section 108.07 will be assessed no sooner than the 61st calendar day after the date of the Department's written notification, for each calendar day that the roadway is not open

to unrestricted traffic. If inclement weather prohibits quality repairs, the Contractor will be responsible for placing and maintaining temporary repairs until permanent remediation work can be properly completed. Charges equivalent to Road Users Liquidated Damages will not be assessed following temporary repair work, provided the temporary repairs are properly maintained. Permanent repairs are to be constructed as soon as weather permits. The Department will notify the Contractor in writing when weather conditions permit permanent repairs. Charges equivalent to Construction Engineering Liquidated Damages and Road Users Liquidated Damages will resume beginning 5 calendar days beyond this notification until permanent repairs are completed. In the final year of the warranty period, segments with distresses that cannot be repaired due to inclement weather will have the warranty period extended for these segments only until permanent repairs are satisfactorily completed. The warranty bond can be reduced proportionately to cover only the distressed segments. All charges equivalent to Liquidated Damages as referenced herein will be determined from original contract documents.

Furnish all materials, equipment, and labor needed to perform remediation work required as part of the pavement warranty, including traffic control, at no cost to the Department. When the remedial action specified in Table A calls for removal and replacement, use only plant-mixed, asphalt concrete unless other materials are accepted, in writing, by the District Executive. Under adverse weather conditions, temporary repair methods and materials may be used in remediation work, provided traffic safety and normal traffic patterns are maintained. Remove temporary repairs and perform permanent remediation work as soon as weather conditions permit.

The Department's notice to perform required remediation work, or the Department's approval of the Contractor's written proposal to perform elective or preventative maintenance work, shall serve as a right-of-entry that authorizes the work to be done, subject to time and location limitations contained in that notification, or those agreed to by the Contractor and the Department. Perform remediation work, including replacements, to meet the specified performance criteria indicated in Table A. Restore, according to Department specifications, all features removed and/or damaged during remediation work.

Except for allowable crack sealing, as indicated in Table A, repair distress areas to the limits specified with square or rectangular patches using materials meeting the requirements of this specification and constructed to meet the construction end-result and performance criteria of this specification.

Provide and maintain traffic control for operations involved in remediation work performed as part of the pavement warranty. Use the traffic control plan (TCP) provided in the original contract for remediation work, or submit an alternate TCP to the District Executive for approval. Submit alternate TCPs at least 14 calendar days before the start of remediation work. Alternate TCPs are to comply with the provisions of Publications 212 and 213, the MUTCD, and the contract special provisions.

If the Department's written notification indicates that remedial action is required as part of the pavement warranty and the Department's performance survey results are disputed, notify the Department, in writing, within 30 calendar days from the date of the Department's written notification. Base disputes on appraisals of the performance survey results supplied by the Department. The Contractor may base a dispute on a third party appraisal of the performance results. If the Department and Contractor cannot resolve a dispute over remediation work within 14 calendar days from the date of the Contractor's written notification, the dispute will be submitted to the Conflict Resolution Team identified in Section 496.3(c)3.

Remove material placed by the Department, during emergency repair work within warranted pavement areas and perform required remediation work if it is determined that the emergency repair was required due to faulty work or construction.

The Contractor may monitor or test warranted pavement course(s), using nondestructive methods, at any time during the warranty period. Notify the District Executive at least 7 calendar days in advance of any nondestructive testing. Provide all nondestructive test results to the Department for information. Obtain written authorization from the Department before conducting nondestructive Testing.

Do not perform any remediation work without prior written notification from the Department. Submit a written proposal, to the District Executive, setting forth the reason(s) for performing elective or preventative remediation work not directed by the Department. The Department will review and approve or disapprove elective or preventative remediation work initiated by the Contractor within 5 calendar days from receipt of the written proposal.

3. Conflict Resolution Team. The Conflict Resolution Team (Team) will consist of two representatives selected by the Contractor, two representatives selected by the Department (District and Bureau of Project Delivery), and a fifth person mutually agreed upon by both the Department and the Contractor. Any costs incurred for the fifth Team member will be shared equally by the Department and the Contractor. The Team members, who will be identified at the pre-construction meeting, must be knowledgeable in the terms and conditions of the warranty specification and the methods used in the measurement and calculation of pavement distress. Each Team member

will have an equal vote and the decision of the majority will be final. If a change in the team is required the same selection procedure will be used as stated above.

The Team will resolve disputes concerning defective work, warranted pavement performance, survey results, required remediation work, proposed alternate repair methods and material selection, and disputes over probable causes.

The Team will meet and resolve disputes within 30 calendar days from the date of submission.

4. Probable Cause. The Department will furnish the Contractor with the results of performance surveys and traffic counts, noting those distresses considered to be caused by factors beyond the control of the Contractor. The Contractor will not be held responsible for meeting specified performance criteria or performing remediation work within these distress areas, which will be calculated by multiplying the maximum transverse width of the distress by the maximum longitudinal length. The area of non-responsibility will be defined as a square or rectangular area centered over and equal to 150% of the distress area, but extending no more than 10 feet on either side of the distress area.

The Department may repair distresses determined to be caused by factors beyond the control of the Contractor using routine repair techniques.

Factors beyond the control of the Contractor include the following:

4.a Base Condition. If performance surveys detect fatigue cracking or other distresses which might indicate an unacceptable base condition, a series of 6-inch diameter cores will be drilled within the distress area, as necessary, at locations directed by the Department. The Inspector will measure the depth of each core. The cores will be tested according to PTM No. 715 and AASHTO T-209 to determine the percent of unfilled voids, PTM No. 702 or other approved test methods to determine the percent asphalt, and PTM No. 739 to determine gradation. Have a Representative witness the testing. Test results will be provided to the DME/DMM. If the warranted pavement meets the specified minimum thickness, the density is $\geq 92\%$ of theoretical maximum density and test results for percent asphalt and gradation are within the tolerances indicated in the Contractor's mix design(s), or if field evaluation clearly indicates base failure beyond the Contractor's control, the Contractor will not be held responsible for repair of the distress and will be reimbursed, by the Department, the total cost of the testing. Should these criteria not be achieved, further investigation may be necessary to determine the cause of the distress.

4.b Traffic Loadings. If, during the warranty period, the Department's traffic counts indicate that estimated cumulative ESALs have exceeded 100% of the estimated 20-year design life ESALs or if the ESAL's increase enough to warrant a change in the mix design in the number of gyrations, the Contractor will not be held responsible for repair of rutting or base condition distresses for the remainder of the warranty period.

4.c Routine Maintenance by the Department. During the warranty period, the Department will perform routine maintenance such as snow removal, application of anti-skid material and/or de-icing chemicals, repairs to safety appurtenances, application and maintenance of pavement markings, mowing, and sign maintenance. Routine pavement maintenance activities, such as crack sealing, pothole patching, or milling, will not be performed by the Department during the warranty period.

4.d Destructive Procedures by the Department. The Contractor will not be held responsible for repair of distresses caused by coring, milling or other destructive procedures performed by the Department.

4.e Uncontrolled Forces of Nature. The Contractor will not be held responsible for repair of distresses caused by floods, earthquakes, tornadoes, brush or forest fires, landslides, sinkholes, or other natural disasters.

4.f Traffic Accidents. The Contractor will not be held responsible for repair of distresses caused by traffic accident-related fuel or chemical spills, vehicle fires, and/or gouging or goring of the pavement surface unless the Contractor or its representative is the cause of the distress.

5. Final Warranty Inspection. At the end of the warranty period, and when any remediation work, if required, is substantially complete (at least 90%), make arrangements for a mutual final warranty inspection. At the time of final warranty inspection, the Representative, along with the Contractor, will establish the following:

- The list of all physical work items requiring completion and/or correction; and
- A list of all documents requiring submission, completion, and/or correction.

As established during the final warranty inspection, perform work as necessary for required correction or completion of all physical work items, and complete, correct, and submit all outstanding documents.

6. Release from Warranty. To be released from warranty responsibility, satisfy all of the following:

- Meet minimum requirements for each of the specified performance criteria through the end of the warranty period,
- Complete all required remediation work identified during the warranty period at no additional cost to and to the satisfaction of the Department, and
- Submit all required warranty documents.

When the warranty period has expired, all physical remediation work has been satisfactorily completed, and all required warranty release criteria have been met, the Representative will establish the date of physical warranty work completion; the date on which the Contractor will be relieved of responsibility for further physical remediation work and maintenance on the project or any substantial project section.

Upon receipt and verification, the Representative will establish the date that all required warranty documents are satisfactorily furnished.

When all physical remediation work has been satisfactorily completed and all contractually required warranty documents have been properly furnished, the date of warranty project acceptance will be established.

If the warranty period for a substantial project section expires in advance of the whole, a final warranty inspection will be made of that section, as specified for the entire project, and the Contractor notified, in writing, that the warranty terms for the specific section of the project have been satisfied. No further remediation work will be required on the section as specified in Section 108.04(b). The Contractor will then be allowed to reduce their warranty bond proportionately.

7. Warranty Acceptance Notification. Upon completion of the requirements of Section 496.3(c)6, a Warranty Acceptance Notification will be issued indicating that the project warranty has been satisfactorily completed and certifying that the project is accepted as of that date.

8. Warranty Default and Termination of Contract. As specified in Section 108.08 and as follows:

- Failure of the Contractor to perform remediation work within the time specified.

496.4. MEASUREMENT AND PAYMENT—

(a) Asphalt Concrete Pavement, 60-Month Warranty. Square Yard

Payment will be made, as specified in Section 110.05, as work progresses, based on the quantity of each separate pavement course placed meeting specified construction criteria.

The Inspector will measure the quantity of each pavement course placed, on a daily basis, and compute the payable quantity by multiplying the measured area by a factor equal to the depth of the pavement course being placed divided by the total, indicated pavement depth. The placement depth will be determined as indicated in Section 496.3(a). No additional payment will be made for pavement depths in excess of the total, indicated depth.

(b) Asphalt Concrete Pavement, 60-Month Warranty, Warranty Bond and Liability Insurance. Lump Sum

SECTION 500—RIGID PAVEMENTS

SECTION 501—REINFORCED OR PLAIN CEMENT CONCRETE PAVEMENTS

501.1 DESCRIPTION—This work is construction of normal strength, accelerated strength, or High Early-Strength (HES) cement concrete pavement, plain or reinforced, on a prepared surface, as indicated.

501.2 MATERIAL—

(a) **Class AA Cement Concrete, Modified.**—Section 704, except as follows:

- Section 704.1(b) revise the third bullet completely to read:
 - Coarse Aggregate, Type A, Section 703.2, except as follows: AASHTO No. 467, No. 57, No. 67, or No. 8. Do not exceed 3.0% absorption for gravels and 2.0% absorption for all other aggregates. Coarse aggregates with higher absorption may be allowed provided mix design specimens meet 300 freeze-thaw cycles according to ASTM C666 with less than 0.04% dilation and/or durability factor greater than 80.

Revise Section 704 **TABLE A – Cement Concrete Criteria** and referenced Notes to read as follows:

Class of Concrete	Use	Cement Factor (lbs./cu.yd.)		Water Cement Ratio ⁽¹⁾⁽²⁾		Minimum Mix Design Compressive Strength (psi)			Proportions Coarse Aggregate Solid Volume (cu.ft./cu.yd.)	28-Day Structural Design Compressive Strength (psi)
		Min.	Max.	Min.	Max.	3	7	28 ⁽³⁾		
AA	Slip Form Paving	517	611	0.37	0.42	—	3,000	4,000	—	3,500
AA	Form Paving	517	611	0.37	0.45	—	3,000	4,000	—	3,500
AA	Accelerated Paving ⁽⁴⁾	517	752	0.37	0.45	—	3,000	4,000	—	3,500
HES	Paving	517	752	0.37	0.42	2,000		4,000	—	3,500

- (1) Where the cement is replaced by supplementary cementitious material, use a water to cement plus supplementary cementitious material ratio by weight.
- (2) Lower Cement Factor can be permitted by DME/DMM if the mix design is demonstrated to perform adequately.
- (3) DME/DMM may accept mix designs based on the 56-day strength based on qualification testing.
- (4) For accelerated cement concrete, submit a mix design as specified in Section 704.1(c) having a minimum target value compressive strength of 1,500 pounds per square inch at 7 hours when tested according to PTM No. 604. The minimum required compressive strength for opening an accelerated strength pavement to traffic is 1,200 pounds per square inch as specified in Section 501.3(q).

- Section 704.1(c) Design Basis. Revise to read as follows:
 - Section 704.1(c)1. Add the following to the first paragraph:

Provide concrete pavement mix designs according to PTM No. 529, to determine the optimized aggregate gradation, and coarse and fine volumes of the fine aggregate portion of the optimized gradation, for the mix design. The coarse and fine volumes of the fine aggregate portion of the mix design gradation must be within

the limits in PTM No. 529. Gradations less than 5% outside of the limits of PTM No. 529 on one sieve may be allowed by the DME/DMM on a case by case basis.

- Section 704.1(c)1. Add the following after the first paragraph:

Design the cement concrete for paving applications to meet the following requirements:

- Permeability – Design the concrete mixture to meet a target chloride ion penetration of Low, Very low, or Negligible after a 56 day or less curing period according to AASHTO T 277 or AASHTO T 358; and
- Shrinkage (Microstrain) – The maximum 28-day shrinkage according to ASTM C157, after 28-day air storage method, does not exceed 0.05%.
- The DME/DMM has the option of accepting mix designs with a chloride ion penetration of Moderate, however, the chloride ion penetration must meet one of the following:

AASHTO T 277, Table 1, not to exceed 2,800 coulombs; or

AASHTO T 358, Table 1, not to exceed 15.6 kΩ-cm for 4-inch by 8-inch cylinders and 12.3 kΩ-cm for 6-inch by 12-inch cylinders.

- Section 704.1(c)1. Revise the second paragraph to read:

Provide a concrete pavement mix design having an overdesign compressive strength of 500 pounds per square inch.

- Section 704.1(c)3. Revise the first sentence to read:

Design cement concrete to have an air content of 7.0% +/- 1.5% in the plastic state.

- Once material control is established, as specified in Section 704.1(d)4.a, the frequency of testing may be reduced to a minimum of one set of tests every 50 cubic yards or 30 minutes, whichever is greater.

(b) Class AA Cement Concrete, Accelerated, Modified. Use only where indicated or directed and is prohibited for use in long-term lane closures except to accommodate local traffic. Section 704, except as follows:

- Section 704.1(b) revise the third bullet to read:

- Coarse Aggregate, Type A, Section 703.2, except as follows: AASHTO No. 467, No. 57, No. 67, or No. 8. Do not exceed 3.0% absorption for gravels and 2.0% absorption for all other aggregates. Coarse aggregates with higher absorption may be allowed provided mix design specimens meet 300 freeze-thaw cycles according to ASTM C666 with less than 0.04% dilation and/or durability factor greater than 80.

- Section 704.1(c)3. Revise the first sentence to read:

Design cement concrete to have an air content of 7.0% +/- 1.5% in the plastic state.

- Once material control is established, as specified in Section 704.1(d)4.a, the frequency of testing may be reduced to a minimum of one set of tests every 50 cubic yards or 30 minutes, whichever is greater.

(c) HES Cement Concrete, Modified. Use only where indicated or directed and is prohibited for use in long-term lane closures except to accommodate local traffic. Section 704, except as follows:

- Section 704.1(b) revise the third bullet to read:
 - Coarse Aggregate, Type A, Section 703.2, except as follows: AASHTO No. 467, No. 57, No. 67, or No. 8. Do not exceed 3.0% absorption for gravels and 2.0% absorption for all other aggregates. Coarse aggregates with higher absorption may be allowed provided mix design specimens meet 300 freeze-thaw cycles according to ASTM C666 with less than 0.04% dilation and/or durability factor greater than 80.
- Section 704.1(c)3. Revise the first sentence to read:
Design cement concrete to have an air content of 7.0% +/- 1.5% in the plastic state.
- Once material control is established, as specified in Section 704.1(d)4.a, the frequency of testing may be reduced to a minimum of one set of tests every 50 cubic yards or 30 minutes, whichever is greater.

(d) Reinforcement. Sections 709.3 and 709.4

(e) Premolded Expansion Joint Filler. Section 705.1

(f) Longitudinal Joint Material. Section 705.2

(g) Load-Transfer Units (LTU). Sections 705.3(a), (b) and (g)

(h) Joint Sealing Material. Section 705.4(a), (b), or (d)

(i) Bond Breaker Lubricant. Provide a commercially available bond-breaking lubricant with a flash point of not less than 149F, and recommended for contact with steel materials according to manufacturer's recommendations. Do not use graphite-based lubricants.

(j) Concrete Curing Material. Sections 711.1, 711.2(b) and 711.2(c)

(k) Intermediate Curing Compound. Section 711.2(d)

(l) Concrete Admixtures. Section 711.3

(m) Mortar. Section 705.7(b)

(n) Tape Bond Breaker. An acceptable self-adhesive tape the width of the sealant reservoir.

(o) Joint Backing Material. Section 705.8

(p) Anchor Material.

1. General. An approved adhesive anchoring material listed in Bulletin 15 and meeting the requirements for unbonded area.

2. Unbonded Area. Furnish adhesive anchoring material that results in an average percentage of unbonded area, for n=3 test unit assemblies, of less than or equal to 10% when tested according to PTM No. 634.

(q) Epoxy Bonding Compound. Section 706.1

(r) Preformed Cellular Polystyrene. ASTM C578

(s) Fiberglass Dowel Sleeve. An approved type as listed in Bulletin 15.

(t) Pre-mixed Non-shrink Grout. Section 1080.2(c)

501.3 CONSTRUCTION—

(a) General. Construct pavements in one or two traffic lane widths as shown on the Standard Drawings, unless otherwise directed. Use one-lane construction if two-lane construction interferes with traffic. For projects with more than 15,000 square yards of mainline concrete paving, monitor aggregate gradations during concrete production by performing sieve analysis using plant stockpiled aggregate before beginning daily production and when restocking bins, but no more than daily. From the results of the sieve analysis, generate the cumulative percent retained chart. Verify that the daily production plots within the limits defined by the Combined Gradation Percent Retained Chart according to PTM No. 529.

If necessary, adjust aggregate proportions during production to maintain the combined gradation percent retained within limits according to PTM No. 529. Adjustments to aggregate proportions that also require adjustments to cementitious material or water content will require the development of new mix designs, including trial concrete batches. The DME/DMM may allow combined gradations during production that are less than 5% outside of the required percent retained according to PTM No. 529.

1. Field Operation QC Plan. At least 2 weeks prior to the start of paving operations, submit a comprehensive paving operation QC Plan for field control and evaluation of concrete paving operations for review. Do not start paving until the QC Plan is accepted. At a minimum, include the following:

- Personnel and responsibilities for controlling the concrete paving operations;
- QC sampling and testing frequencies and action points to initiate corrective measures;
- Method requested for determining opening to traffic strength;
- Method requested for determining pavement depth;
- Procedures addressing cool and hot weather placements;
- Procedures for monitoring and controlling the rate of evaporation;
- Procedures for subgrade and subbase/treated base course control and maintenance;
- Procedures to ensure proper placement and consolidation;
- Procedures to ensure proper joint construction;
- Procedures to prevent edge slump;
- Procedures to ensure proper grade and depth control;
- Procedures for straightedge testing and to ensure proper final texture;
- Procedures to ensure proper curing application and temperature monitoring;
- Procedures to ensure timely sawing and proper sealing of joints; and
- Procedures to eliminate damage to pavement prior to opening to traffic.

(b) Weather Restrictions. Do not place concrete when the evaporation rate exceeds 0.20 pounds per square foot per hour unless mitigation measures are employed. The use of windbreaks and fog misting are acceptable methods to mitigate an excessive evaporation rate. When fog misting is employed, use equipment that atomizes droplets in the air surrounding the concrete without causing water deposits.

1. Cold Weather. Unless otherwise permitted in writing, discontinue concreting operations when the descending air temperature, away from artificial heat, falls to 40F (45F for accelerated strength concrete). Do not resume operations until the air temperature, away from artificial heat, rises above 40F (45F for accelerated strength concrete). Do not allow water above 90F to come in direct contact with the cement, until the cement has been mixed with the aggregates. Place concrete when the concrete temperature is between 50F and 90F. Do not use materials containing frost, lumps, or crusts of hardened materials. Do not place concrete on frozen base, subbase, or subgrade.

2. Hot Weather. When the air temperature in the immediate vicinity of concrete operations rises to 85F, take thermometer readings of the plastic concrete, at 1/2-hour intervals and at the conclusion of the mixing cycles. Discontinue concrete operations if the plastic concrete temperature exceeds 90F after mixing. When the plastic concrete temperature rises to 90F, cool the mixing water or aggregates to maintain a plastic concrete temperature within 50F to 90F at the time of placing.

(c) Concrete Mixture. Do not use mixtures from volumetric mixing plants or mobile mixers, unless approved by the District Executive in writing. For slip-form paving, the Contractor may use plant mixed cement concrete, volumetric mixing plants or mobile mixers as specified in Section 704.1(a).

(d) Forms. Use steel forms for concrete pavement except as specified herein. Use forms not less than 10 feet in length, with form depth and base width equal to pavement depth. Forms may be built-up no greater than 1/2-inch to meet the required pavement design thickness. Built-up form sections must be continuous, equal to the width of the steel form and secured to the form in a manner that prevents movement during concrete placement. Do not exceed 1/8 inch in 10 feet from the true plane of the face or top. The Contractor may use forms with a base of not less than 6 inches in width and meeting all other requirements for narrow strips of widening if approved by the District Executive in writing.

Use forms of an approved section without horizontal joints, and with flange bracing extending outward on the base not less than two-thirds of the form height. Use forms that do not deflect or deform more than 0.01 inch when a center load of 1,700 pounds is applied within a 4-foot span. Use form sections equipped with three stake pockets, each of which have positive non-detachable wedges, and positive interlocking devices, which form a neat tight joint.

Use a sufficient quantity of steel pins to securely hold the forms in place and provide the necessary rigidity. For curves with a radius of less than 150 feet, the Contractor may use wood forms. Use two 1-inch (nominal) seasoned, surfaced planks properly joined together. Brace all wood forms with steel pins. Do not exceed 24 inch spacing between pins.

Clean and oil forms before each concrete placement. Cut and firm the subbase under the forms true to grade, and set forms accurately to line and grade for their entire length and width. Forms may be shimmed provided that the material used to shim the forms creates continuous contact between the form and the base course surface. The forms and shimming material must result in a full vertical face of concrete when removed. If concrete extrudes outside the shims or forms, remove this extruded concrete, as directed, before placing the adjacent concrete.

For concrete pavement constructed on aggregate subbase, if the grade is low, add additional subbase in 1/2-inch compacted lifts. If the grade is high, cut the subbase to the required grade and recompact.

For concrete pavement constructed on cement treated base courses or asphalt treated base courses, cut and trim high areas to required grade.

If the base course along the form is low, place shims to maintain vertical form alignment during the concrete placement. Shim forms to a height no greater than 1 inch. Shimming material shall be equal to or greater than the width of the form base and spaced so the forms do not deflect or deform more than 0.01 inch when a center load of 1,700 pounds is applied within a 4-foot span. Shimming material shall be secured to the form in a manner that prevents movement during concrete placement and shall not protrude beyond the inside face of the form. If concrete extrudes outside the forms, remove the extruded concrete, before placing the adjacent concrete.

(e) Preparation and Protection of Base Course. When placing concrete on the completed base course, do not disturb the form line after final testing. Remove accumulation of material adjacent to forms, to full depth of forms, in conjunction with final testing. If the prepared area is disturbed by any operations, or by traffic, check and correct before placing concrete.

Thoroughly sprinkle water on the base course before paving, if necessary, to ensure a moist base course and to cool the surface temperature of treated permeable base courses below 115F. Discontinue paving operations if the surface temperature of treated permeable base courses cannot be maintained below 115F. Do not create water puddles or mud. Sprinkle the base course with as much water as it readily absorbs, well in advance of paving.

If non-destructive depth testing is being utilized as specified in Section 501.3(s)2, place targets at locations determined by the Representative as specified in Section 501.3(s)2 and according to PTM No. 605. The measuring device and targets must be verified daily according to PTM No. 605 in the presence of the Representative before the installation of the targets. The Representative will verify the targets have been placed at the proper locations before paving operations. Remove and replace improperly located targets and repair any damage to the base course before paving operations at no cost to the Department.

(f) Placement and Initial Strike-Off of Concrete. Before placing concrete, ensure adequate equipment and trained personnel are available, and sufficient hauling units scheduled, to maintain continuity in placement.

For pavement construction around manholes, inlets, valve boxes, and similar appurtenances, place premolded expansion joint filler not less than 1/2 inch in total thickness, for the full depth of the pavement, around the outer sides of structures within the paved areas. Where pavements adjoin other rigid structures, bridges, or culverts, place premolded expansion joint filler, not less than 3/4-inch thick, adjacent to the structures. Before placing pavement

adjacent to railway tracks, fill the spaces along the web and below the head and top flange of the rail with mortar. If construction crosses railway tracks, place a minimum 3/4-inch thick expansion joint filler against the mortar-filled rails. If constructing along tracks, place a minimum 1/4-inch thick expansion joint filler along each mortar-filled rail.

Do not use concrete that has developed an initial set.

If implanting dowel bars by mechanical means, the Contractor may deposit the concrete directly on the subgrade or prepared surface in front of the paver. Spread concrete as close as possible to joint assemblies to ensure proper concrete consolidation without disturbing the joint. Do not damage the prepared surface while transporting or depositing concrete ahead of the paver. If the prepared surface is an asphaltic leveling course on rubblized concrete, treated base course of cement or asphalt, or an aggregate subbase, travel on the prepared surface only in the immediate area of the paving operation for the purpose of depositing concrete ahead of the paver. Do not use the prepared surface for hauling. Satisfactorily repair or replace any damaged areas at no additional cost to the Department.

Use vibrators capable of transmitting vibration to concrete with a frequency of not less than 100 impulses per second. Operate the vibrator around, but not in contact with transverse or longitudinal joint assemblies. Do not cause segregation when vibrating. Do not operate manual vibrators in one place more than 5 seconds. Use vibrators only to consolidate concrete after it has been properly placed. Do not use vibrators to move or spread concrete. Remove and discard segregated concrete, as directed. Maintain sufficient reserve vibratory equipment to prevent shutdown due to failure of equipment.

(g) Slip-Form Paving Method.

1. Equipment. Use a fully energized, self-propelled, slip-form paving machine, equipped with side forms to support concrete laterally to prevent edge slumping. Use a paver equipped with automatic controls to control alignment and grade. Use a paver that vibrates or tamps concrete for the full width and depth of the layer being placed.

2. Line and Grade. Unless otherwise specifically shown on the construction drawings, construct pavement so the longitudinal joints do not traverse a driving lane or conflict with the final pavement markings. Construct longitudinal joints parallel to and within 12 inches of final pavement markings unless otherwise detailed on the construction drawings.

3. Placing Concrete. Place the concrete and spread in one or more layers, provided the concrete is fully consolidated, the reinforcement is satisfactorily embedded, and a satisfactory finished surface is obtained.

Operate the slip-form paver in a continuous forward movement. Coordinate operations of mixing, delivering, placing, and spreading concrete to provide uniform progress with stopping and starting of the paver held to a minimum. If the paver's forward movement is stopped, immediately disengage vibrating and tamping elements.

4. Joints. When load transfer units are used, stake in place in advance of paving operations, at the designated locations. Implanting of dowel bars by mechanical means is permitted. Accurately mark the dowel-bar locations to ensure sawing the transverse joints over the center of dowels. Saw, cure, and protect transverse and longitudinal contraction joints, as specified in Sections 501.3(i) and (j).

5. Edge Slumping.

5.a During Paving Operations. Test the pavement surface for edge slumping with a 12-foot straightedge, before the concrete becomes non-plastic. Strive to avoid edge slump. Edge slump not exceeding the following will be acceptable:

- 1/8 inch between adjacent lanes, and lanes and ramps.
- 1/4 inch between lanes and shoulders, and ramps and shoulders.

Measure edge slump for the 6-inch width contiguous to the pavement edge.

Suspend paving operations after 200 feet if edge slumping cannot be prevented or controlled within the above stated acceptable limits. The pavement within this 200-foot section will be evaluated as specified in Section 501.3(g)5.b.

5.b After the Concrete Hardens. Test the pavement surface with a 12-foot straightedge to ensure the requirements as specified in Section 501.3(g)5.a have been met.

If testing confirms edge slumping exists in the hardened concrete, submit methods for correction to the District Executive for review. Make corrections according to the reviewed methods to eliminate the edge slumping. Remove and replace pavement determined defective, as specified in Section 501.3(t), at no additional cost to the Department.

(h) Handling and Placing Reinforcement. Use reinforcement free of rust, dirt, oil, grease, or other foreign substances, which impair bond of steel with concrete. A light, powdery coating of rust, formed during project storage, does not require cleaning. Remove loose, scaly, or thick rust by suitable methods. The Representative will reject reinforcement with rust that has caused detectable reduction in cross-sectional area.

If placing reinforced concrete pavement in two layers within fixed forms, strike off the entire bottom layer and lay the reinforcement full length on the concrete, in its final position, without further manipulation. Place reinforcement directly upon the concrete and place, strike-off, and screed the top layer of concrete. Remove and replace bottom-layer portions of concrete placed more than 1/2 hour without being covered with the top layer of freshly mixed concrete.

If placing reinforced concrete pavement in one layer, position mesh reinforcement on acceptable supports as specified in Section 1002.3(d)2 in advance of concrete placement. If a mechanical installer is used, avoid segregation of concrete or displacement of reinforcement.

(i) Transverse Joints. In new multilane pavements, place transverse joints perpendicular to centerline to form a continuous joint across the entire pavement width and locate dowels as shown on the Standard Drawings, except where paving operations must cease temporarily due to unavoidable conditions.

Handle LTU assemblies with care to avoid damaging the corrosion protection barrier. Remove and replace dowels with damaged coating before placement of concrete.

Place and anchor LTU assemblies so that dowel misalignments before concrete placements do not exceed the following limits:

- Vertical tilt or horizontal skew (relative to the plane of the grade and the centerline of the constructed pavement): 0.25 inch maximum displacement of each end of the dowel relative to the midpoint of the dowel.
- Longitudinal translation (relative to the intended transverse joint location, along the direction of travel): 1 inch maximum.
- Horizontal translation (relative to the intended location, across the joint): 1 inch.
- Vertical translation (relative to the intended depth of the constructed pavement): as shown on the standard drawings.

When LTU are used, secure them in place at the designated locations as shown on Standard Drawings in advance of paving operations to prevent their movement during paving operations.

Before paving, demonstrate the fastening method to the Representative for approval.

Before paving, apply bond-breaker lubricant to at least one-half of the length of Type B coated dowel bars, unless a bond-breaker lubricant has been applied in the shop. Stir the lubricant well and apply to the free end of dowels by spraying, or with a gloved hand, to produce a thorough coating. Do not use brushes for lubricant application. Apply the bond-breaker lubricant, as specified, at least 1 hour before placing the concrete around the dowel assembly. Type A coated dowel bars do not need lubricant.

Where existing concrete pavements are widened, align transverse construction or contraction joints, if possible, with existing construction or contraction joints or cracks; otherwise, do not place within 10 feet of a joint.

When constructing adjacent concrete pavement, shoulders or structures after pavement construction, seal the ends of all transverse joints and cracks to prevent intrusion of cement mortar into the joints and cracks. In these cases, when saw cutting transverse joints in the newly constructed lane or shoulders, saw cut the existing transverse joint in the previously placed lane to ensure the removal of any mortar that might have intruded into the joint.

1. Construction Joints. If more than a 30-minute interruption occurs in concreting operations, construct a transverse joint using a bulkhead. Place dowels in bulkheads by drilling or inserting into fiberglass dowel sleeves. Do not construct a transverse joint within 10 feet of another transverse joint. If not enough concrete has been placed or mixed at the time of interruption to form a slab at least 10 feet long, remove concrete to the preceding joint and dispose of excess mix.

2. Contraction Joints. Accurately mark using tacks or other approved methods the location for the center of the sawed transverse contraction joints. The sawed transverse joint must be located directly ± 1 inch over the centerline of the dowel basket assemblies or the centerline of the mechanically implanted dowels. Saw joints with equipment having guides, a blade guard, water cooling system, and cut-depth control. Provide adequate and extra equipment and parts at the site, before placing concrete and during sawing operations.

Saw joints as soon as concrete has sufficiently hardened to permit sawing without excessive raveling resulting from the sawing operation and to prevent random cracking. Saw joints to a depth of $D/3$ and a width of $1/8$ inch. If initial saw cuts do not extend through the slab edge to avoid blowouts or edge damage of green concrete, extend these cuts through the edge as soon as it can be done without causing damage. If damage to the pavement occurs, repair in an approved method at no additional cost to the Department. If necessary, conduct sawing operations continuously, both day and night, regardless of weather conditions.

If the pavement is cured by means other than white membrane curing compound, remove curing materials from pavement, at the location where a joint is to be cut. Only remove sufficient covering to provide space necessary for sawing joints. Immediately after sawing the initial saw cut, thoroughly clean the joint as necessary to remove all deleterious material. Place oversized (width plus 50%) backer rod in the top of the sawed joint to maintain cure. Monitor the movement of the joint throughout the cure period and up to placement of permanent seal. If at any time the joint opens, remove and replace backer rod with appropriate oversized backer rod. The maximum time period permitted for curing covers to be removed for sawing is $1/2$ hour. If white membrane curing compound is used, reapply curing compound as specified in Section 501.3(1)1.c.

The Representative will not allow displacing coarse aggregate from the joint location by use of a vibrating T-bar, or by use of a filler strip at the joint.

When constructing adjacent concrete pavement, shoulders or structures, mark the dominant joints (first joints that have cracked and opened) on the previous lane placed. Align the location of the first joints sawed in the adjacent lane with the marked dominant joints on the previous lane to encourage dominant joint development in the adjacent lane. In lanes adjacent to previously constructed lanes, saw remaining joints before uncontrolled cracking occurs. Make the full required depth cut from edge to edge of the pavement. In formed paving, do this by loosening or removing the side forms or by other acceptable methods. When paving from October 1 to April 1, the use of early entry saws or another approved method is recommended to encourage dominant joint development in the adjacent lane at the same location of dominant joints in the previous lane.

If a crack or spall occurs at any location and any time before final inspection and resolution of all issues regarding the condition of the pavement, repair the pavement according to Table A, Repair Procedures for Deficiency in New Concrete Pavement, at no additional cost to the Department. Field coat the dowels with the bond-breaker lubricant, as specified in Section 501.3(i), where necessary as determined by the Representative. Join original pavement to replacement pavement and test as specified in Section 507; if Ride Quality and Incentive are not applicable, test as specified in Section 501.3(o).

For second stage sawing of joints, saw the sealant reservoir 72 hours or more after placing the concrete.

Clean joints of all deleterious material immediately after sawing. Patch voids or spalls, in excess of the specified width, as specified in Section 525. Continue curing and protect joint until sealed.

Table A Repair Procedures for Deficiency in New Concrete Pavement				
Item	Deficiency	Location	Description	Contractor Repair Options
1	Partial Depth Crack	Anywhere	≤ 0.007 inches wide	Do nothing
			> 0.007 inches wide AND $\leq D/3$ deep	Epoxy inject crack as specified in Section 1091
			> 0.007 inches wide AND $> D/3$ deep	Repair as specified in Section 516 Partial Panel Full Depth Patch ^{a, b, c}
2	Spall	Mainline or shoulder panel	Minimal spalling ^d ≤ 2 inches wide AND $\leq D/3$ deep	Do nothing
			Significant spalling ^e > 2 inches wide (measured perpendicular to joint)	Spall Repair as specified in Section 525 (Repair must perform)

			AND $\leq D/3$ deep or > 12 inches wide (not at a joint) AND $\leq D/3$ deep	satisfactorily for 1 year or replace with Partial Panel Full Depth Patch as specified in Section 516) ^{a, b, c}
			Significant spalling ^e > 2 inches wide (measured perpendicular to joint) AND $> D/3$ deep or > 12 inches wide (not at a joint) AND $\leq D/3$ deep	Repair as specified in Section 516, Partial Panel Full Depth Patch ^{a, b, c}
			Significant spalling ^e > 2 inches wide (measured perpendicular to joint) AND $> D/3$ deep or > 12 inches wide (at a joint)	Repair as specified in Section 516, Partial Panel Full Depth Patch ^{a, b, c} OR as specified in Section 516, Full Depth Corner Repair OR as specified in Section 519, Full Depth Longitudinal Joint Repair
3	Single Full Depth Crack (any orientation)	Shoulder	Non-working crack with minimal spalling ^d	Epoxy inject crack as specified in Section 1091
			Working crack with minimal spalling ^d	Seal crack as specified in Section 590
			Crack with significant spalling ^e	Repair as specified in Section 516 Partial Panel Full Depth Patch ^{a, b, c} OR Full Panel Replacement ^c
		Mainline or Shoulder panel is affected by irregular geometry (construction joints do not line up)	Crack with minimal spalling ^d	Seal crack as specified in Section 590
		Mainline	Entire length of crack ≤ 9 inches from longitudinal joint AND crack is parallel to longitudinal joint ± 1 inch	Seal crack as specified in Section 590
		Mainline crack is in center one-third of dowelled panel.	Crack $\leq 1/8$ inch wide AND spalling $\leq 1/4$ inch from edge of crack.	Dowel Retrofit as specified in Section 527: three dowels per wheel path (panels ≤ 10 inches thick); four dowels per wheel path (panels > 10 inches thick) OR Partial Panel Full Depth Patch ^{a, b, c} repaired as specified in Section 516 OR Full Panel Replacement ^c

		Mainline	All other conditions	Partial Panel Full Depth Patch ^{a, b, c} OR Full Panel Replacement ^c
4	Multiple Cracks > D/3 deep (any orientation)	Mainline or Shoulder	Panel has more than 1 crack > D/3 deep	Partial Panel Full Depth Patch ^{a, b, c} OR Full Panel Replacement ^c

Notes:	
a	Minimum patch length is 6 foot for Plain Cement Concrete (PCC) or 10 foot for Reinforced Concrete Pavement (RCP).
b	Minimum amount of panel left in place is 6 foot.
c	All patches (partial panel and full panel replacements) must be full width and depth.
d	Minimal spalling is defined as ≤ 2 inches total width AND ≤ 12 inches (combined length) along crack.
e	Significant spalling is defined as > 2 inches total width OR > 12 inches (combined length) along crack.
D	Design pavement depth.
<p>Payment for new pavement where the crack has been removed is at the Contract Unit Price (CUP) with NO additional cost to the Department for the repair.</p> <p>Payment for new pavement where the crack has not been removed but sealed as specified in Section 590 is at five percent CUP for the slab with NO additional cost to the Department for the repair.</p> <p>Payment for slabs with Partial depth Crack or Spall is at the CUP with NO additional cost to the Department for the repair</p> <p>Crack depth is to be determined by coring at no cost to the Department</p>	

3. Expansion Joints. Place transverse expansion joints, where indicated. If existing concrete pavements are widened, align transverse expansion joints, if possible, with existing expansion joints. Place transverse expansion joints, without load transfer units, in the plain cement concrete pavement in paved divisor areas. Conform to the dimensions and locations in adjacent concrete curb. Place expansion joint filler, as indicated or as directed.

(j) Longitudinal Joints. Place tie bars as indicated or directed. Ensure no tie bars are installed within 24 inches of a dowelled contraction joint. When paving from October 1 to April 1, remove one tie bar in each slab adjacent to dominant joints, as specified in Section 501.3(i)2, to minimize shear cracking in the previous lane placed.

The Representative will select 15 tie bars from the first day's concrete placement according to PTM No. 1. Test each selected tie bar for pull-out resistance after the concrete has attained a compressive strength of 3,500 pounds per square inch, or epoxy anchoring material has met manufacturer's requirements. Use a center-pull hydraulic jack with a load measuring gage and bearing ring capable of testing each tie bar to 12,000 pounds or to a 1/32-inch slippage. Do not use jack and gage having a calibration date older than 6 months. Record the gage reading at point of slippage or 12,000 pounds, whichever occurs first. Determine the average of pull-out test results. Divide pull-out test average by the tie bar spacing to determine pull-out resistance of tie bars, in pounds per cubic foot, for compliance with Table B. If the pounds per cubic foot is not in compliance with Table B, replace failed tie bars or install additional tie bars until compliance with Table B is attained, at no additional cost to the Department. Install additional tie bars from the center of slab out in an approved pattern. Do not install additional tie bars within 30 inches of a transverse joint. Do not construct adjacent lanes until the tie bars comply with Table B. Perform additional testing as directed.

Saw tied, longitudinal contraction joints to prevent random cracking, as specified in Section 501.3(i)2. Clean joints of all deleterious material immediately after sawing. Continue curing and protect the joint until it is sealed, as specified in Section 501.3(n).

TABLE B
Pull-Out Resistance of Tie Bars

Tied Width of Pavement (Distance from Joint Being Constructed to Nearest Free Edge)	Minimum Average Pull-Out Resistance of Tie Bars
	lb/ft of Joint
12 feet or less	2,200
Over 12 feet to 17 feet	3,200
Over 17 feet	4,500

If a longitudinal crack occurs within a lane, remove and replace slabs containing the crack at no additional cost to the Department. If damage to the pavement surface occurs, repair in an approved method at no additional cost to the Department. Join original and replacement pavements. Field coat dowels with bond-breaker lubricant, as specified in Section 501.3(i), where necessary.

(k) Final Strike-Off, Consolidation, and Finishing. Complete these operations during hours of natural light, unless using an acceptable lighting system.

1. Strike-Off and Consolidation.

1.a Machine Method. Immediately after placing, strike off and screed the concrete, with a finishing machine, as necessary, to properly consolidate the concrete and to leave a uniform textured surface.

Keep the top of forms free from accumulation of concrete or of foreign material. Maintain true machine travel on the forms without lift, wobble, or other variations that affect accurate finishing. Use equipment that does not groove the concrete pavement edges for a width greater than can be eliminated by edging tools. Use a rubber-tired wheel to support the spreader and a transverse finishing machine on the adjoining concrete pavement surface, keeping the wheel approximately 12 inches from the pavement edge.

Maintain a uniform roll of concrete ahead of the finishing machine front screed for its entire length. Overlap the previously screeded concrete on the last pass.

Place and vibrate concrete adjacent to joints and other areas, as specified in Section 501.3(f), then bring the finishing machine forward. Operate the machine carefully to avoid damage, misalignment of joints, or concrete segregation.

Do not add water or monomolecular film to the concrete surface to assist in finishing.

1.b Manual Method. Unless otherwise directed, do not use manual strike-off methods, except to strike off concrete already deposited on the subbase if a breakdown of mechanical equipment occurs or on small turnout areas and patches up to 10 feet in length.

If finishing manually, use screeds contoured to the pavement cross section. Provide screeds sufficiently rigid to retain their shape and at least 2 feet longer than the maximum slab width to be struck off. Operate the equipment in a manner to obtain consolidation and a uniform textured surface free of porous areas. Consolidate as specified in Section 501.3(f).

2. Floating. After the concrete has been struck off and consolidated, smooth and fill in open-textured pavement areas with a float, as necessary. Do not add water or monomolecular film to the surface to assist in finishing and do not overfinish. Mechanical floats or long handled floats may be used. Do not use steel or Fresno floats.

3. Straightedge Testing and Surface Correction. While concrete is still plastic, test the surface using a 12-foot straightedge, swung from handles 3 feet longer than one-half the slab width, as required. Hold the straightedge in contact with the surface in successive positions. Advance in successive stages of not more than 5 feet a stage. Immediately correct low areas, then strike off, consolidate, and refinish. Cut down high areas and refinish. Make sure the surface across joints meets requirements for smoothness as specified in Section 501.3(o). Continue straightedge testing and surface corrections until the entire surface is free from observable departures from the straightedge and until the slab conforms to the required grade and cross-section.

4. Final Finish. After floating, straightedge testing and surface corrections have been completed, all excess moisture has disappeared, and before concrete becomes non-plastic, provide initial texturing with a turf drag or broom device to produce striations parallel with centerline.

4.a Longitudinal Texture. Install turf drags, brooms and tine devices on self-propelled equipment having external alignment control. Maintain the area of texture device in contact with the pavement surface constant at all times during texturing. Provide positive elevation control for texture devices. Maintain down pressure on pavement surface at all times during texturing to achieve uniform texturing without measurable variations in pavement profile. Operate self-propelled texturing machines to maintain constant travel speed when texturing. For small or irregular areas, or during equipment breakdown, hand methods may be approved. If unsatisfactory results are obtained, stop the placement of concrete until the equipment deficiency or malfunction is corrected.

Perform final texturing with a spring steel tine device to produce grooves parallel with centerline. Operate the spring steel tine device within 5 inches, but not closer than 3 inches, of pavement edges. Produce a textured finish with grooves that have the following characteristics:

- 1/8 inch (\pm 1/32 inch) in width;
- 1/8 to 3/16 inch in depth; and
- 1/2 to 3/4 inch nominal center-to-center tine spacing.

4.b Transverse Texture. For shoulders, gore areas, traffic separators, sidewalks, or other applications smaller in width, texture the surface transversely for the full width. Produce a textured finish with grooves that have the following characteristics: rectangular in shape; from 3/32 inch to 3/16 inch in width; and from 1/8 inch to 3/16 inch in depth.

For a 10-foot rake use center-to-center tine spacing as follows:

TABLE C
Center-to-Center Tine Spacing

1 3/8	1 3/8	1 7/8	2 1/8	1 7/8	1 3/4	1 1/4	1 1/4	1 1/8	1 3/8	1 1/8	1 3/4	7/8	1 3/4	7/8
1 5/8	2	1	3/4	1 1/8	1 5/8	1 3/8	1 1/8	1	1	1 1/8	3/4	1 1/2	1 1/2	2
2	1 3/4	1 1/2	1 3/4	2 1/8	1/2	1 1/8	1 1/2	1 5/8	1 5/8	1 1/8	1 3/4	1/2	1 3/4	1 3/4
1 1/8	1 1/2	1 1/4	1 5/8	1 1/8	1 1/4	2	1 3/8	1 3/4	5/8	3/4	1 3/4	2	5/8	2 1/8
2	1 1/8	1	3/4	5/8	2 1/8	3/4	1 1/2	2	1 5/8	5/8	5/8	1 7/8	2	1 1/2
2	1 3/8	1 3/8	1 1/2	1 3/4	1 1/8	1 1/2	2	1	1 1/4	(in)				

When using this chart begin in the upper left corner and read across the entire row then start again on the left side in the next row.

Produce the texture in one pass, without overlapping the previous pass, to provide a uniform finish. Keep the texturing device free of hardened concrete particles. If unsatisfactory results are obtained, stop the placement of concrete until the equipment deficiency or malfunction is corrected.

4.c Macrotexture. For pavements exposed to traffic with a radii less than 50 feet, ensure the final surface finish meets a minimum Mean Texture Depth (MTD) of 0.040 inches, unless otherwise directed or indicated.

Conduct the test for macrotexture depth according to ASTM E965 in the presence of the Representative. Conduct a minimum of four test locations for each lane of pavement. The Representative will determine each test location and will document the 4 rotated diameter measurements, the calculated average diameter, and the MTD at each location.

If any determined MTD is less than 0.040 inches, conduct additional tests every 50 feet to determine the extent of deficient macrotexture. Mechanically groove the pavement, determined deficient in macrotexture, perpendicular to the roadway, at no additional cost to the Department, having the following characteristics:

- Rectangular in shape
- 1/8 inch (\pm 1/32 inch) in width
- 1/8 inch to 3/16 inch in depth
- 1 1/2 inch nominal center-to-center sawed groove spacing

Terminate grooves as follows:

- No closer than 2 inches of transverse joints
- No closer than 3 inches of longitudinal joints
- Not greater than 15 inches any joint

Use smaller machine to minimize non-grooved areas of the pavement. Do not overlap grooves.

When diamond grinding surface corrections are made in the hardened concrete for pavement smoothness, no additional texturing is required.

(l) Curing Concrete. Apply curing materials after finishing and texturing, and within 30 minutes of the dissipation of bleed water. Maintain the curing materials until the pavement has achieved sufficient strength for opening to traffic as specified in Section 501.3(q). Do not mar the concrete surface. After removing forms and correcting honeycombed areas, cure the sides with the same method as the surface. When using covers, secure over the entire surface and sides. The Representative will suspend concrete operations immediately if sufficient curing is not provided. Cure by the same method throughout the work unless directed to change by the Representative. Have material available for emergency curing.

If normal curing is delayed, apply an intermediate monomolecular film curing compound to all cement concrete patches before normal curing.

Apply the monomolecular film in a light-fog application, using a pressure spray tank with an adjustable nozzle. Use a water-to-curing-agent ratio and rate of application both according to the manufacturer's recommendations. Agitate the solution before each application.

Apply the curing compound in a continuous film, immediately after finishing and texturing operations are completed on any area. Do not provide any additional finishing after application of the monomolecular film. Apply additional applications as required, if surface drying is taking place and curing covers have not been placed.

After application of the monomolecular film, provide normal curing as specified.

1. Normal Curing. The Contractor may use methods other than those described below to protect and cure joints, if the procedure and materials are acceptable. The Representative may require a change in method if unsatisfactory results are obtained.

For all accelerated strength concrete pavements, provide insulation or heating of pavements during the curing operation. Control the curing temperature and monitor at least hourly to ensure that the concrete pavement does not experience a curing temperature change in excess of 40F within any 1-hour period during the curing operation. If a change in curing temperature in excess of 40F occurs in the concrete pavement within any 1-hour period, the work will be considered defective.

1.a White Polyethylene Curing. Use sheeting wide enough to cover the pavement surface and sides. Provide lengths consistent with pavement joint spacing. Overlap sheets a minimum of 12 inches and secure sides and seams to form a tight seal. After form removal, fold sheeting down over the sides for the full pavement depth, then secure with suitable material.

1.b White Polyethylene Burlap-Backed Curing. Use sheeting wide enough to cover the pavement surface and sides. Provide lengths consistent with pavement joint spacing. Overlap sheets a minimum of 12 inches, then secure sides and seams to form a tight seal. Saturate the burlap side with water, then place and secure with the burlap side down. After form removal, fold sheeting down over the sides for the full pavement depth, then secure with suitable material.

1.c White, Poly-alpha-methylstyrene (PAMS) Liquid Membrane Forming Curing Compound. The Representative will allow this method of curing if the air temperature is above 40F at the time of application and the air temperature is forecasted to remain above 40F a period of 4 hours after application.

Following the final finishing, immediately after free water has left the pavement surface and while the surface is still damp, seal exposed concrete areas with an application of curing compound. Apply curing compound homogeneously to produce a uniform, solid white opaque coverage on all exposed concrete surfaces. Apply at a rate of 1 gallon per 150 square feet, or according to manufacturer's recommendations. Using a self-propelled mechanical spreader, apply in a fine mist, without marring the concrete surface. Use atomizing type spraying equipment, equipped with a tank agitator providing continual compound agitation during application. Provide proper calibration to allow

accurate control of the amount of material being placed. Use a hood to protect the spray device against the wind and control so the spray overlaps transversely 50%, to produce two coverages of a continuous, uniform membrane. Do not drip curing compound on the pavement. If rain falls on newly coated pavement before the film has dried sufficiently to resist damage or if film is damaged in any way before the pavement is cured, apply a new coat immediately, in an amount equal to the original specified application. Alternate methods for the application of curing compound may be approved in writing by the District Executive. Areas inaccessible to self-propelled mechanical spray equipment may be coated using manual or alternate methods.

After form removal, apply a uniform coat to the sides, at the rate specified for the surface. Manual spraying equipment may be used for spraying the sides and for any small or irregular areas not reached by surface spraying equipment.

Cure and protect joints during the curing period to prevent moisture loss from concrete in and adjacent to joints. Include the method of joint curing in the pavement QC plan as specified in Section 501.3(a)1.

Keep workers, materials, and equipment off the membrane film during curing, unless adequate precautions are taken to protect the film.

1.d Burlap Curing. Place burlap in double-thickness by overlapping each strip one-half its width on the pavement surface. Keep this covering saturated with water for the full curing period. After sides are exposed, fold burlap down over the sides and secure with suitable material.

1.e White Polypropylene Fiber-Backed Curing. Use sheeting wide enough to cover the pavement surface and sides. Provide lengths consistent with pavement joint spacing. Overlap sheets a minimum of 12 inches, then secure sides and seams to form a tight seal. Saturate the burlap side with water, then place and secure with the burlap side down. After form removal, fold sheeting down over the sides for the full pavement depth, then secure with suitable material.

1.f Black Membrane-Forming Curing Compound. Liquid Membrane-Forming Curing Compound, Black, may be used, provided the cement concrete pavement will be overlaid with an asphalt pavement and is not accessible to traffic before the surface course is placed. Apply at a rate not to exceed 0.015 gallon per square yard to produce a uniform continuous film. Discontinue use of the compound if it becomes unsatisfactory as a curing agent; and resume curing by other methods, as specified.

2. Cold Weather Curing. If the forecasted air temperature during concrete curing is expected to fall below 50F, place high-low thermometers on the concrete surface and monitor concrete curing temperatures. Protect the pavement surface and sides to effectively maintain a temperature of not less than 40F until the pavement has achieved sufficient strength for opening to traffic as specified in Section 501.3(q). If at any time during this period the high-low thermometer falls between 40F and 35F, extend the cure period by an additional day. If at any time during the curing period the high-low thermometer temperature falls below 35F, the concrete will be considered defective. Remove and replace defective pavement as specified in Section 501.3(t) at no additional cost to the Department.

For applications less than 6 inches in nominal depth, provide adequate insulating blankets to prevent rapid heat loss if the air temperature is 45F or less. Insulation may be removed when the air temperature exceeds 45F or when the pavement has achieved sufficient strength for opening to traffic as specified in Section 501.3(q).

When insulation is used to protect the pavement, remove insulation in a manner such that the rate of temperature change at the concrete surface does not exceed 40F within any 1-hour period. Concrete that experiences a higher rate of temperature change will be considered defective.

The application or removal of insulation covers may be controlled by the use of maturity method as specified in Section 501.3(q), with full removal of insulation allowed after the minimum required degree-hours of curing has been accumulated at the top of the slab.

(m) Removal of Forms. Do not remove forms from freshly placed concrete until it has set. Remove the forms carefully to avoid pavement damage.

(n) Sealing Joints and Cracks. Seal all joints widened with second stage saw cuts before opening any pavement section to traffic including construction equipment, and before discontinuing work for the winter season. When permitted, the Contractor may open pavement to construction equipment provided second stage sawing has not occurred, a backer rod is installed and maintained near the surface, initial concrete strength is attained, and curing requirements are met. Provide construction equipment within vehicle code limits. Seal cracks as indicated or directed.

Thoroughly clean the joint and the joint sidewalls of all scale, dirt, curing compound, temporary joint sealing material, and other foreign material using methods that will not damage the joint, but will be sufficient enough to remove all contaminants and debris. Immediately before placing bond breaker or joint sealing material, ensure the joint is free of moisture and other contaminants. Do not place joint sealing material until the faces are thoroughly clean and dry to the satisfaction of the Representative.

1. Poured In Place Seal. Do not place poured joint-sealing material if the air temperature is less than 40F, unless permitted.

For hot-poured seals, seal all joints with an approved hot-pour or silicone sealant material according to the manufacturer's recommendations. Use heating equipment of an indirect heating type, constructed as a double boiler. Provide positive temperature control and mechanical agitation. Determine the safe heating temperature range and recommended pouring temperature from the manufacturer's shipping container. Heat and maintain the material temperature within these recommended safe temperatures. Place the material as close as possible to the recommended pouring temperature. Do not maintain any single batch of material at the pouring temperature for more than 6 hours. Reheat according to the manufacturer's recommendations.

Fill the joint reservoir with sealing material to the level shown on the Standard Drawings. Do not allow sealing material to spread over the pavement surface.

When required, place the tape bond breaker and/or backer rods on the bottom surface of the joint reservoir before sealing. Do not extend tape up the reservoir face more than 1/8 inch. If necessary for support, install an acceptable joint backing material below the tape.

2. Neoprene Seals. Install preformed neoprene seals as specified, using installation equipment capable of placement without cutting, nicking, twisting, or damaging the seal. Install seals with lubricant adhesive applied, according to manufacturer's recommendations, to the contact surfaces of the joint faces or sides of the seal. Install seal in one piece to the depth indicated unless approved. Do not elongate the seal more than 3% or compress longitudinally more than 2%.

Prepare and submit a QC Plan to the Representative at the start of the project, as specified in Section 106.03(a)2. As a minimum include the following in the QC Plan: Contractor's and manufacturer's representatives; list of equipment and construction sequence; list of material, along with sampling and testing procedures; test section schedule; and procedure to replace unacceptable seals.

Before sealing joints, seal a minimum of three full-width pavement joints, according to the test section schedule specified in the QC Plan. Have the manufacturer's representative witness the test section(s) unless otherwise permitted in writing. The Representative will inspect the test section(s). Do not seal the remaining pavement joints until the Representative accepts an installation procedure. Conduct test(s) according to QC Plan when material is changed or seal installations are unacceptable.

Replace seals exceeding 3% elongation or 2% compression, or otherwise not conforming to the specifications at no additional cost to the Department. Patch pavement damaged by removing unacceptable seals and adhesive as specified in Section 525.

3. Silicone Seals. Prepare the joint and place silicone sealant material according to the manufacturers recommendations.

(o) Surface Tolerance. After the concrete has hardened, test the surface of pavement again as specified in Section 501.3(k)3. The pavement surface will be accepted when the surface does not vary more than:

- 3/16 inch when the straightedge is laid parallel with the centerline
- 3/16 inch when the straightedge is laid perpendicular to the centerline and within a traffic lane.

Remove high points by means of grinding or cutting tools, as directed.

1. Longitudinal Joints. Test the surface of pavement at all longitudinal joints, including the joint between the pavement and shoulder, again for the following tolerance requirements:

- Where there is no change in the design cross slope across a joint, the tolerance will not be greater than 1/4 inch as measured by holding a 12-foot straightedge centered across and perpendicular to the joint.

- Where there is a change in the design cross slope across a joint, the tolerance will not be greater than 1/4 inch as measured by holding a 4-foot straightedge perpendicular to and on each side of the joint.
- Remove high points in excess of 1/4 inch by means of grinding or with cutting tools, as directed. Pavement containing depressions of 3/16 inch or more between adjacent lanes will be considered defective.

Retest corrected areas of the pavement surface. Corrected areas must be within 3/16 inch as tested above.

(p) Protection of Pavement. Protect pavement, as specified in Section 901, and exclude traffic, including construction equipment. When required to complete adjacent pavement, do not operate heavy equipment on any pavement until the pavement has achieved sufficient strength for opening to traffic as specified in Section 501.3(q).

Perform operations on new pavement as approved and according to the following:

- When moving on and off the pavement, construct a ramp to prevent damage to the pavement slab.
- Take positive action to prevent damage to the pavement surface and joints.
- Before placing the protective mats, sweep the pavement surface free of debris.
- Operate equipment on a slab without causing damage. If damage results, suspend operations and take corrective action as approved.
- New pavement will not be opened to any traffic until all joints have been sealed unless an acceptable method to protect joints from damage and keep non-compressible materials from entering the joint is approved.

1. Late Season Pavements. Apply Boiled Linseed Oil Mixture as specified in Section 503.3 on all concrete pavements and shoulders constructed after September 1.

(q) Opening to Traffic. From the same sample of concrete selected for acceptance testing as specified in Section 704.1(d)5, mold a sufficient number of concrete QC cylinders to be tested for opening to traffic compressive strength testing. In addition, mold a sufficient number of concrete QC cylinders from the last mixer load of the day for opening to traffic compressive strength testing of accelerated strength pavements.

For normal strength pavements, cure the QC cylinders as specified in Section 704.1(d)4.b. The Representative will determine when pavement may be opened to traffic based on when the concrete attains the minimum required compressive strength according to Table D as measured by either compressive strength testing of cylinders according to PTM No. 604 or estimating concrete strength by the maturity method according to PTM No. 640.

Table D

Slab Thick, inches	Strength for Opening to Traffic, psi			
	Slab Length < 10 ft		Slab Length ≥ 10 ft	
	f'c	MR (3rd)	f'c	MR (3rd)
6.0	3000	490	3600	540
7.0	2400	370	2700	410
8.0	2150	340	2150	340
9.0	2000	275	2000	300
10.0 +	2000	250	2000	300

For accelerated strength pavements, cure the QC cylinders as specified in Section 501.3(l). The Representative will determine when the accelerated strength pavement may be opened to traffic based on when the concrete attains the minimum required compressive strength of 1,200 pounds per square inch as measured by either compressive strength testing of cylinders according to PTM No. 604 or estimating concrete strength by the maturity method according to PTM No. 640.

Pavement opened to traffic before meeting the required compressive strength will be considered defective work as specified in Section 501.3(t). If not removed and replaced, continue testing cylinders for compressive strength until the 28-day minimum mix design compressive strength specified in Section 501.2(a) Table A is attained or for a maximum of 56 days

(r) Protection Against Rain. Provide sufficient materials on site, at all times, to properly protect the pavement edges and surface against rain, before initial set of concrete. If rain appears imminent, stop paving operations, immediately protect the pavement sides, and cover the concrete surface with protective material.

(s) Tests for Depth. Complete any surface corrective work before testing for pavement depth. Before final acceptance of each phase of the project, the concrete pavement thickness will be determined in the presence of the Representative by drilling cores according to PTM No. 606 or by non-destructive thickness measurements according to PTM No. 605. Other methods of non-destructive thickness testing may be requested in writing for approval by the District Executive.

The Department will divide the pavement into Lots representing not more than 3,000 square yards of pavement (n=5) in each traffic lane. Include ramps in a separate Lot(s).

Select one of the following options for thickness determination:

1. Measurement of Drilled Cores.

The Representative will select one coring location at random within each Lot according to PTM No. 1. Provide a measuring apparatus conforming to PTM No. 614. The Representative will determine the core depth according to PTM No. 614.

If any core measurement is deficient by more than 1/4 inch in required depth, drill additional cores in the presence of and for measurement by the Representative. Drill the additional cores at 100-foot intervals in both directions longitudinally from each deficient core, in the same traffic lane, until the depth is no more than 1/4 inch deficient. Each core will represent the condition in the same traffic lane for a distance of 50 feet in both directions longitudinally.

The pavement is defective if any core measurement is deficient by more than 1/2 inch in required depth.

Submit every fifth core as an information sample to the LTS where an evaluation will be made of the entrained air content according to PTM No. 623, and for 28-day compressive strength testing according to PTM No. 606. For a partial Lot, the Representative will randomly select one core, according to PTM No. 1, for testing. If the core strength is less than 3,500 pounds per square inch immediately perform an investigation of the concrete operations to determine the cause of the low strength. Provide a written evaluation of the problem and the proposed solution to the Department.

2. Measurement by Non-Destructive Testing.

The Representative will select pavement thickness measurement locations within each Lot according to PTM No. 605. Determine the pavement thickness according to PTM No. 605 in the presence of the Representative. One retest will be permitted if any average subplot thickness measurement is determined to be deficient by more than 1/4 inch in required depth.

If any average subplot thickness measurement is deficient by more than 1/4 inch in required depth, drill a core over the target in the presence of the Representative for confirmation of the deficient depth at no additional cost to the Department. If the core measurement confirms the pavement thickness is deficient more than 1/4 inch in required depth, drill additional cores to determine the extent of pavement deficient in depth as specified in Section 501.3(s)1. If the core measurement does not confirm the pavement thickness is deficient more than 1/4 inch in required depth, stop paving operations to investigate the equipment and targets used in the non-destructive testing to determine if re-verification is needed.

For Independent Assurance of non-destructive thickness measurements, the Representative will select one location within the initial Lot and one location within the subsequent ten Lots thereafter. Drill one core over the selected target locations as specified in Section 501.3(s) in the presence of the Representative. Cores drilled based on deficient non-destructive thickness measurements or based on suspect deficiencies may be used for Independent Assurance purposes. If the core measurement confirms the pavement thickness is deficient more than 1/4 inch in required depth, drill additional cores to determine the extent of pavement deficient in depth as specified in Section 501.3(s)1. If the core measurement confirms the pavement thickness is not deficient by more than 1/4 inch in required depth, the drilling of the core will be paid as specified in Section 501.4(c).

Thoroughly clean the vertical surface of any core hole of laitance and loose and foreign material. Fill the holes with the mixture used to construct the course and consolidate. As an alternative, use a premixed, non-shrink grout.

(t) Defective Work. Unless otherwise directed in writing by the District Executive, at no additional cost to the Department, remove and replace pavement that is:

- Defective in construction or sawing of transverse joints as specified in Section 501.3(i);
- Defective in curing requirements as specified in Section 501.3(l)2;
- Defective in surface tolerance, as specified in Section 501.3(o);
- Defective in depth, as specified in Section 501.3(s);
- Defective in air content, as specified in Section 704.1(c)3;
- Defective in compressive strength as specified in Sections 501.3(q) or 704.1(d); or
- Showing surface defects resulting from the effects of freezing and thawing, rain, improper final finish, or honeycombing which, as determined by the Representative, cannot be repaired.

Repair pavement that is cracked or spalled according to Table A, Repair Procedures for Deficiency in New Concrete Pavement.

The minimum pavement removal and replacement length between transverse joints is 10 feet if constructing reinforced cement concrete pavements or 6 feet if constructing plain cement concrete pavements. After removal of defective pavement, construct required transverse joints according to the methods for joining pavements, as shown on the Standard Drawings. Where replacement extends to an existing transverse joint, satisfactorily salvage the joint or replace in kind, as directed.

If removing and replacing pavement defective in depth, start at the determined point of deficiency as determined by the Representative. Remove and replace defective work transversely for the full-lane width and longitudinally, until the pavement is not more than 1/4 inch deficient in depth, as specified in Section 501.3(s).

501.4 MEASUREMENT AND PAYMENT—Square Yard

(a) Adjustment for Deficient Pavement. Where a deficiency exists, as determined by cores, the Department will pay as follows:

Deficiency in Depth Determined by Cores inches	Proportional Part of Contract Price Allowed
0.0 to 0.25	100%
0.26 to 0.30	95%
0.31 to 0.35	90%
0.36 to 0.40	85%
0.41 to 0.45	80%
0.46 to 0.50	70%
≥ 0.51	Defective Work

(b) Defective Pavement Left in Place. The Department will not pay for defective pavement left in place, unless otherwise directed in writing by the District Executive. When the District Executive directs that defective pavement be left in place, final payment for this pavement will be at 50% of the contract price.

(c) Tests for Depth. Each

The price includes the measuring apparatus, which remains the Contractor's property upon completion of the project and targets provided for non-destructive testing. The Department will not pay for additional cores drilled if the depth is deficient by more than 1/4 inch.

SECTION 502—ROLLER COMPACTED CONCRETE PAVEMENTS

502.1 DESCRIPTION—This work is the construction of roller compacted concrete (RCC) pavement as indicated, on a prepared subgrade and subbase, using a low slump concrete mix, conventional or high-density asphalt paving equipment, and various size rollers to obtain the required thickness, density, and surface texture.

502.2 MATERIAL—

- (a) **Cement.** Section 701
- (b) **Supplementary Cementitious Materials.** Section 724
- (c) **Aggregate.** Section 703, except use well-graded aggregate according to the following Table A:

TABLE A
Aggregate Gradation Requirements for RCC Material

Sieve Size	Percent Passing by Weight Based on Maximum Nominal Aggregate Size		
	Wearing Surface		Base Course
	Gradation A	Gradation B	Gradation C
1" (25 mm)	100	100	82 – 100
3/4" (19 mm)	100	87 – 100	72 – 91
1/2" (12.5 mm)	81 – 100	71 – 91	61 – 81
3/8" (9.5 mm)	71 – 91	60 – 85	50 – 71
No. 4 (4.75 mm)	49 – 70	42 – 63	36 – 55
No. 8 (2.36 mm)	33 – 54	30 – 49.5	23 – 42
No. 16 (1.18 mm)	24 – 40	18 – 36	15 – 32
No. 30 (0.60 mm)	12 – 28	11.5 – 27.5	8 – 22
No. 50 (0.30 mm)	7.5 – 22	5 – 19	4.5 – 17
No. 100 (0.15 mm)	3 – 16	1 – 13	1 – 12
No. 200 (0.75mm)	0 – 10	0 – 9	0 – 8

- (d) **Water.** Section 720.1
- (e) **Admixtures.** Section 711.3
- (f) **Concrete Curing Material.** Section 711.1 and Section 711.2.
- (g) **RCC Mixture.**

1. Mix Design. As specified in Section 704.1(c), except 704.1(c)3 and add the following: Use the same mix design and materials for the entire project. Optimize moisture content of mix according to AASHTO T 180, Method D. Any material change requires submission of a new mix design.

2. Mix Duration. Assure complete and uniform mixing. Do not exceed the manufacturer's rated volume capacity for dry concrete in the mixing chamber. Keep the sides of the mixer and mixer blade surfaces free of hardened concrete and other materials. Check mixer blades frequently for wear and replace if wear is sufficient to cause inadequate mixing.

3. Mix Ingredient Tolerances. Produce RCC meeting the tolerances as specified in Section 704.1(e). Supply daily plant records of production and quantities of materials used that day to the Representative. These records will be used as a check on plant calibration.

(h) Rapid Set Concrete Patching Material. Section 525.2(c). Use within the shelf life and temperature limitations set by the manufacturer.

502.3 CONSTRUCTION—

(a) General Requirements.

1. Field Operation QC Plan. Prepare a paving operation QC Plan, as specified in Section 704.1(d)1.a, for field control and evaluation of concrete paving operations for the Representative's review. Do not start paving until after the Representative reviews the QC Plan.

2. Concrete Technician. Provide a concrete technician as specified in Section 704.1(d)2 and a concrete field testing technician as specified in Section 704.1(d)2.a.

(b) Test Section. Construct a minimum 50-foot long test section of the RCC placement. Size the test section using the plan thickness by plan width. Use the proposed equipment for the project. Use placement to verify: the plant can produce a consistent mix and resolve any mix design issues; determine if the equipment will achieve the proper placement; establish the best combination of rollers to achieve thickness and best surface conditions; review testing procedure of field density acceptance testing; establish curing procedures and determine compressive strength. Place the test section within the RCC plan location as a portion of the pay item.

(c) Weather Restrictions. If work is halted because of weather conditions, the Representative may allow the Contractor to place limited quantities of RCC mixture that are en route to the project. Do not place RCC pavement during a hard rain that may damage the pavement surface. Placement may continue during a light rain or mist as determined by the Representative as long as the RCC pavement surface is not damaged and hauling equipment meets the requirements as specified in Section 502.3(d)2.

1. Cold Weather. Unless otherwise approved in writing, discontinue RCC placement when the descending air temperature, away from artificial heat, falls to 40F. Do not resume paving until the air temperature, away from artificial heat, rises above 40F.

2. Hot Weather. If the air temperature in the immediate vicinity of RCC placement rises to 85F, take temperature readings of the plastic RCC mixture, at 1/2-hour intervals and at the conclusion of the mixing cycles. When the RCC mixture temperature has risen to 90F, cool the mixing water or aggregates to maintain a plastic RCC mixture temperature within 50F to 90F during placement. Discontinue RCC placement if the RCC mixture temperature exceeds 90F after mixing.

3. Environmental Conditions. Do not place concrete when the evaporation rate exceeds 0.20 pounds per square foot per hour unless mitigation measures are employed. The use of windbreaks and fog misting are acceptable methods to mitigate an excessive evaporation rate. When fog misting is employed, use equipment that atomize droplets in the air surrounding the concrete without causing water deposits.

(d) Equipment. Have all equipment on hand and approved by the Representative before work can proceed. Comply with, but is not limited to, the following:

1. Mixing Plant. Produce an RCC pavement mixture in the proportions defined by the approved mix design and within the specified tolerances. The plant must be able to produce a uniform mixture at a rate compatible with the placement equipment.

1.a Batch Type Plant. Meet the requirements as specified in Section 704.2 and 704.3.

2.a Continuous Mix Plant. Meet the requirements of AASHTO M 241.

2. Haul Trucks. Provide a sufficient number of trucks to ensure a continuous supply of RCC mixture to the paver. Equip haul trucks with covers to protect the RCC mixture during transit from inclement weather and to reduce surface moisture loss. Use clean trucks with no buildup of hardened or foreign material.

3. Paver. Use a paver of suitable weight and stability to spread and finish the RCC mixture without segregation, to the required thickness, smoothness, surface texture, cross-section, and grade. Do not use pavers that tear, shove, or gouge the mixture or that cause tracks, indented areas, segregation, or other permanent surface blemishes.

For single lift placement less than 6 inches, use either a conventional or high-density paver equipped with compaction devices capable of producing RCC pavement with a minimum compaction of 85% of the maximum wet density prior to using rollers. For single lift placement greater than or equal to 6 inches but less than 9 inches, use a high-density paver equipped with compaction devices capable of producing a minimum compaction of 90% of the maximum wet density prior to using rollers.

For multiple-lift placement, use either a conventional or a high-density paver equipped with compaction devices capable of producing RCC pavement with a minimum compaction of 85% of the maximum wet density in each lift before using rollers.

For areas inaccessible to pavers, submit alternate paving equipment for approval.

4. Compactors. Use rollers conforming to Section 108.05(c)3.

If a minimum 95% field density is not achieved with the paver, use a self-propelled smooth dual steel drum roller operating in static or vibratory mode having a minimum weight of 8 tons to achieve primary compaction before final compaction. Increased weight may be needed for thicker lifts. Use either a steel drum roller, operating in static mode; or a rubber-tired roller, or a combination of rollers for final compaction, surface finishing, and removal of equipment marks.

If a minimum 95% field density is achieved with the paver, use either a steel drum roller, operating in static mode; or a rubber-tired roller, or a combination of rollers for final compaction, surface finishing, and removal of equipment marks.

Use walk-behind vibratory rollers or vibratory plate tampers, for compacting areas inaccessible to large rollers.

5. Water Trucks. Have at least one water truck on site and available throughout the paving and curing process. Equip the water truck with a water distribution system containing fog nozzles capable of evenly applying a fine mist of water to the RCC pavement surface without damaging the final surface.

(e) Preparation of Base Course. Before placing the RCC, prepare the subgrade/subbase as required by the Plans and Specifications. Provide a subgrade/subbase surface clean and free of foreign material, ponded water and frost or frozen material before RCC placement. Do not place RCC pavement on frozen base, subbase, or subgrade. At the time of RCC placement, uniformly moisten the subgrade/subbase. If the subbase becomes dry, uniformly water without forming mud or pools of freestanding water.

(f) Transporting RCC Mixture. Use haul trucks to transport the RCC mixture from the plant to paver. Deposit the RCC mixture directly into the hopper of the paver or into a secondary distribution system, which deposits the material into the paver hopper. Discharge the trucks clean with no buildup or hanging of RCC mixture in the corners.

(g) Placing RCC Material. Use an RCC mixture that is within the temperature range of 50F to 90F. Do not use RCC material containing frost, lumps, or crusts of hardened materials. If needed, adjust moisture content of mix for paving equipment selected for placement. Place RCC pavement in a pattern so that the curing water from the previous placements do not pose a potential surface erosion or runoff problem on the fresh RCC surface or on the subbase layer.

1. RCC Placement. Adjust the paver and regulate the speed to prevent segregation and provide a surface course that is smooth, continuous without tears, and pulling. Limit the spread of the RCC material to a length that can be compacted and finished within the available period under the prevailing air temperature, wind, and climatic conditions. Proceed in a steady, continuous operation with minimal starts and stops. Regulate speed to assure a constant supply of RCC material in the hopper. Maintain RCC material above the auger shaft at all times during paving.

2. Lift Thickness. Minimum lift thickness is 4 inches. Construct pavements between 4 inches and less than or equal to 9 inches in single lifts. Construct pavements greater than 9 inches in multiple lifts of equal thickness, to achieve density requirements.

3. Multiple-Lift Placement. Place the second lift within 60 minutes of the completion of the first lift. If more than 60 minutes has elapsed, the interface between the first and second lift shall be considered a cold joint. Prepare the cold joint as specified in Section 502.3(i)2. At the discretion of the Representative, this time limit may be increased

or decreased depending on the use of retarding admixtures or the ambient weather conditions of temperature, wind, and humidity. Multiple pavers in tandem formation may be used to reduce the opportunity for cold joints to develop.

4. Adjacent Lane Placement. Place adjacent paving lanes within 60 minutes. If more than 60 minutes has elapsed between placements of adjacent lanes, the vertical joint is considered a cold joint. Prepare the cold joint as specified in Section 502.3(i)2. At the discretion of the Representative, this time may be increased or decreased depending on the use of retarding admixtures or the ambient weather conditions of temperature, wind, and humidity.

(h) Compaction. Allow for in-field density readings and then begin compaction of the RCC material behind the paver. Perform field density readings with the Representative present. Plan operations and supply sufficient rollers to minimize cold joints. Determine the sequence and number of passes by vibratory and non-vibratory rolling to achieve the density acceptance requirements and to achieve a surface finish without uneven roller marks. Operation of rollers in the vibratory mode while stopped or reversing-direction is not allowed. Use a steel drum roller, operating in static mode; a rubber-tired roller or a combination of rollers for final compaction, surface finishing, and removal of equipment marks.

1. Rolling at Joints. Do not operate rollers within 12 to 18 inches of the freshly placed lane edge until the adjacent lane is placed. Within the allowable time, roll together both edges of the two adjacent lanes. If the lane edge will not have an adjacent lane or if the lane edge is the outside pavement edge, the lane may be placed wider to achieve compaction for the required width with the additional uncompacted RCC pavement material cutoff after density acceptance. As an alternative to saw cutting, use an edge shoe on the paver. The shoe should have an angle of 15 to 30 degrees and should compact the edge as required. When a cold joint is planned, roll the complete lane and follow cold joint procedures as specified in Section 502.3(i)2.

Provide additional rolling for longitudinal joints with a vibratory roller as necessary to produce the specified density for the full depth of the lift and provide a tight smooth transition across the joint. Remove any uneven marks left during the vibratory rolling utilizing a static or rubber-tired roller. Roll until a smooth, flat surface, free of tearing and cracking is obtained. Avoid deformation of the RCC pavement, by operating the rollers at slow enough speeds at all times. Correct any deformations of the RCC pavement resulting from reverse direction of the roller or from any other causes.

2. Density Requirements. Perform in-place field density tests according to ASTM C 1040, Test Method A-Direct Transmission, as soon as possible, and no later than 30 minutes after completion of rolling. Use only the wet density reading for this test requirement. If the testing equipment does not calculate the compaction percentage, calculate the compaction percentage using the following equation.

$$X = \frac{\rho_w}{\rho_t} \times 100$$

X = Compaction percentage %

ρ_w = Recorded density in pounds per cubic foot

ρ_t = Computed RCC unit weight in pounds per cubic foot as provided on the project CS-4220 Batch-Mixer Slip

Determine field density test locations according to PTM No. 1. Perform at least five tests directly behind the paver and at least five tests after final compaction for each 500 cubic yards of RCC material placed. Determine the compaction percentage.

Directly behind the paver, achieve a minimum compaction of 85% of the maximum wet density for thicknesses less than 6 inches, and 90% of the maximum wet density for thicknesses greater than or equal to 6 inches.

After final rolling, achieve a minimum compaction greater than 96% of the maximum wet density for all thicknesses. Record compaction percentages after final rolling for determining density acceptance as specified in Section 502.3(m)2.

(i) Joints.

1. Fresh Joints. A fresh joint is a vertical joint between lanes or a horizontal joint between multiple-lifts where the adjacent RCC material is placed within 60 minutes of placing the previous lane or lift. The time limit may be adjusted by the Representative depending on the use of retarders in the RCC mixture or ambient weather conditions.

Construct fresh vertical joints to assure a continuous bond between new and previously placed lanes of RCC pavement.

For fresh horizontal joints, maintain a moist surface to prevent excess moisture loss. Before placement of the second lift, clean all loose material from the surface.

2. Cold Joints. A cold joint is any planned or unplanned longitudinal or transverse construction vertical joint or any horizontal joint between multiple lifts in the RCC pavement that does not qualify as a fresh joint.

Before placement of an adjacent RCC lane, prepare the cold vertical joint as follows: Cut the pavement vertically for the full depth in sound compacted material, at least 6 inches from the exposed edge. Use an approved saw, wheel cutter, or other method that does not tear or ravel the vertical edge. Remove the excess RCC material. Clean the joint of any loose or foreign material. Moisten the vertical face of the cold joint immediately prior to placement of the fresh adjacent lane to prevent excess loss of moisture.

Cold vertical joints that are constructed utilizing a drop extension or edging shoe are exempt from the above cutting requirement when placed up to 15 degrees from vertical.

For cold horizontal joints, maintain a moist surface to prevent excess moisture loss. Before placement of the second lift, clean all loose material from surface and, if required by the Plans, place cement slurry or mortar grout (made with the same materials as in the RCC mixture) on the cold horizontal joint.

3. Control Joints. Saw cut control joints, as indicated on the Plans, to 1/4 depth of the compacted RCC pavement. Saw cut pavement, behind the rolling operation as soon as possible to prevent random cracking, using early entry saws set to the manufacturer's recommendations. Saw cut without causing raveling or other damage to the pavement; begin sawing no later than 18 hours after placement. If random cracking occurs in the pavement before the saw cutting operation, repair cracks as directed by the Representative at no additional cost to the Department.

4. Sealing Joints. If indicated, seal joints as specified in Section 501.3(n).

(j) Curing. Immediately after final rolling and in-field density testing, keep the RCC pavement surface moist until one or more of the following curing methods are used. Maintain the selected curing method(s) for a minimum of 72 hours and the RCC pavement has developed a compressive strength of at least 3,000 pounds per square inch, determine compressive strength as specified in Section 502.3(m)3.

1. Water Cure. Apply water cure using a water truck equipped with misting spray nozzles, soaking hoses, sprinkler system or other means to maintain a uniform moist condition on the RCC pavement surface. Apply moisture in a manner that does not wash out or damage the surface of the finished RCC pavement.

2. White Polyethylene Sheeting. Apply sheet material as specified in Section 501.3(l)1.

3. Curing Compound. Apply curing compound as specified in Section 501.3(l)1.c. Apply curing compound immediately after final rolling is complete. Apply curing compound at a rate which produces a uniform solid opaque coverage.

4. Cold Weather Curing. Section 501.3(l)2.

(k) Surface Tolerance.

1. Testing. Test the finished RCC pavement surface with a 12-foot straightedge or crown surface template at areas the Representative determines may be deficient or irregular. Hold the straightedge in contact with the surface and in successive positions parallel to the road centerline to check the entire width of the pavement. Advance along the pavement in stages of not more than 5 feet a stage until the entire area is tested.

2. Correction. When the pavement surface varies by more than 1/4 inch, remove high points by grinding the surface to within the tolerance; use a self-propelled diamond grinder or cutting tools at no additional cost to the Department. The Representative will consider depressions in the pavement surface of more than 1/4 inch to be defective. Continue straightedge testing and surface corrections until the entire surface is free from observable departures from the straightedge and until the slab conforms to the required grade and cross-section.

3. Finishing. For RCC pavement with an exposed pavement surface and a speed limit of 35 miles per hour or greater, texture the pavement surface by diamond grinding as specified in Section 514.3(c).

(l) Open to Traffic. Protect the RCC pavement from vehicular traffic for the duration of the curing period. Open to traffic when the cure period is complete as specified in Section 502.3(j).

(m) Acceptance.

1. Lots and Sublots. Material will be accepted on a lot by lot basis. Lots will be established cumulatively and will be specific for each mix design. Each lot consists of five equal sublots (n=5). Test completed lots and sublots for density, compressive strength, and pavement thickness.

A normal lot size is 500 cubic yards. If breakdowns or stoppages of short periods due to such causes as weather or equipment failure occur, the lot's size is the quantity placed for that day.

2. Density. Determine density acceptance using the recorded compaction percentages after rolling in Section 502.3(h)2. The final average for each lot cannot be less than 98% of the maximum wet density and no test less than 96% of the maximum wet density. Properly placed and compacted RCC material not meeting these requirements should be cored and tested for compressive strength at 28 days according to AASHTO T 24 at no expense to the Department. Fill core holes with RCC material and consolidate or with a rapid set concrete patching material. If the tested area has achieved the minimum compressive strength of 3,500 pounds per square inch, the RCC material will be paid for at full price and left in place. If the lot does not meet the maximum wet density and the compressive strength requirements, the pavement is considered defective.

3. Compressive Strength. Mold and test cylinders according to ASTM C 1435 and PTM No. 604 to determine the 3-day, 7-day, and 28-day compressive strengths for each lot of RCC material.

Test the 3-day test cylinders to determine the compressive strength for the lot. If the 3-day compressive strength test result is greater than or equal to 3,000 pounds per square inch, the field cure on the lot of RCC pavement represented by the test cylinders may be discontinued unless otherwise directed. If the 3-day test cylinders do not meet the minimum value, continue curing the lot until the 7-day test cylinders are tested for verification. Test the 7-day test cylinders for compressive strength. If the 7-day compressive strength test result is greater than or equal to 3,000 pounds per square inch, the field cure on the lot of RCC pavement represented by the test cylinders may be discontinued unless otherwise directed. If the 7-day test cylinders do not meet the minimum value, continue curing the lot until the 28-day test cylinders are tested for verification.

Test the 28-day test cylinders to verify the RCC pavement has achieved a minimum compressive strength of 3,500 pounds per square inch. RCC pavement that fails to meet the 28-day compressive strength requirement is considered defective. Any cores taken for pavement depth measurements may be used for compressive strength testing if needed.

4. Pavement Depth. Using PTM No. 1, the Representative will designate one location within a lot to be tested for depth. For each lot, drill one core according to AASHTO T 24 in the presence of the Representative. Provide a measuring apparatus conforming to PTM No. 614 for the Representative to measure the core depth according to PTM No. 614. If the measured depth is within 1/4 inch of plan depth, the RCC pavement is acceptable. If the depth is deficient by more than 1/4 inch, core two additional cores in the presence of the Representative for measurement. If the average depth of the three cores is less than a 1/4 inch deficient, the pavement depth is acceptable. If the average depth is greater than 1/4 inch, the pavement depth is defective. Fill core holes with RCC material.

(n) Defective Work. Unless otherwise directed in writing by the District Executive, remove and replace pavement lots that are: defective during curing as specified in Section 502.3(j)4, defective in surface tolerance, as specified in Section 502.3(k)2, defective in density as specified in Section 502.3(m)2, defective in compressive strength as specified in Section 502.3(m)3, or defective in depth as specified in Section 502.3(m)4.

502.4 MEASUREMENT AND PAYMENT—

(a) Roller Compacted Concrete Pavement. Square Yard

(b) Defective Pavement Left in Place. Section 501.4(b)

SECTION 503—PROTECTIVE COATING FOR CEMENT CONCRETE PAVEMENT

503.1 DESCRIPTION—This work is the application of protective coating, to concrete pavements and shoulders.

503.2 MATERIAL—

- Boiled Linseed Oil, AASHTO M 233, from a manufacturer listed in Bulletin 15. Certify as specified in Section 106.03(b)3.

503.3 CONSTRUCTION—

(a) General. Thoroughly dry and clean concrete surfaces of all foreign matter, which would prevent protective coating penetration, adhesion, or drying. Allow a minimum of 28 days to elapse before applying protective coating on surfaces cured with white membrane curing compound. Allow 7 days to elapse after removing curing covers and before applying protective coating on all other types of curing methods. Apply the protective coating before subjecting the concrete surface to deicing chemicals.

(b) Application. Apply protective coating according to manufacturer recommendations. At a minimum, apply in two coats, at a rate of 0.02 gallon per square yard for each coat. Apply, as directed, by pressure-spray equipment, by portable hand spray equipment, by brushing, or by a combination of methods, to ensure complete coverage of treated concrete surfaces.

Apply in weather suitable for drying when the air temperature and concrete surface temperature are between 35F and 100F.

Unless otherwise recommended by the manufacturer, allow the first application to dry for a period of at least 24 hours before the second application. If the initial application is made on concrete surfaces carrying traffic, close these surfaces for a period of at least 4 hours, until penetration is complete and tackiness has disappeared.

After the second application, close surface to traffic for a period of at least 6 hours or until tackiness has disappeared and no pickup results from use.

(c) Safety Precautions. Protect traffic, workers, and concrete surface against the occurrence of fire, if in the presence of flammable and volatile mineral spirits blended into the protective coating. Before using the treated pavement surface, satisfactorily correct slippery pavement conditions, other hazards, or inconvenience to traffic, resulting from the protective coating application as directed.

503.4 MEASUREMENT AND PAYMENT—Square Yard

SECTION 504—PAVEMENT RELIEF JOINT

504.1 DESCRIPTION—This work is construction of a pavement relief joint, including sawing, sealing, subbase material, and necessary excavation.

504.2 MATERIAL—

- Class AA Cement Concrete—Section 704
- High Early Strength Cement Concrete—Section 704
- Reinforcement Bars— Section 709.1
- Asphalt Cement, PG 64S-22—Section 702
- Subbase—Section 350.2
- Asphalt Base Course—Section 313.2 and as follows: PG 64S-22, 3 to <10 million ESALs, or as indicated.
- Asphalt Wearing Course—Section 413.2 and as follows: PG 64S-22, 0.3 to <3 million ESALs, or as indicated.
- Polyethylene Sheeting – Section 505.2
- Sealing Material —Section 705.4(b), 705.4(c), or 705.4(g)
- Tape Bond Breaker— Section 513.2(c)

504.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in Section 501.3, and as follows:

- (a) **Excavation.** Excavate for the sleeper slab after constructing the subbase.
- (b) **Sleeper Slab.** Construct the sleeper slab as specified in Section 501.3.
- (c) **Polyethylene Sheeting.** Construct as shown on the Standard Drawings.
- (d) **Base Course.** Paint the entire joint faces of adjacent pavement with a thin coating of PG 64S-22 before placing fresh asphalt mixtures. Construct the asphalt base course as specified in Section 313.3.
- (e) **Wearing Course.** Construct the asphalt wearing course as specified in Section 413.3.
- (f) **Transverse Joints at Interface of Pavement Relief Joint and Concrete Pavement.**

1. Sawing. Make a saw-cut directly above the interface between the asphalt courses of the pavement relief joint and the concrete pavement within $\pm 1/4$ inch. Saw cuts which do not meet this tolerance will be declared defective as specified in Section 105.12. Do not saw cut until the asphalt wearing course has cooled below 140F. Perform saw cutting within 7 days after placing the pavement relief joint. Perform this work on all finished pavement relief joints before discontinuing work due to seasonal paving limitations.

Extend the saw-cuts through all existing widening.

Saw cut to form a reservoir with dimensions 1 inch deep by $1/2$ inch wide.

If wet sawing, immediately flush the reservoir with water.

2. Sealing. Do not place sealing material unless the reservoir faces are thoroughly clean and dry. Clean the reservoir immediately before placing sealing material. If using compressed air, use air free of oil, moisture, or any other substance that would prevent bonding of sealing material to the reservoir faces.

Do not place sealing material if the air temperature is less than 40F or above 90F, unless otherwise allowed by the Representative.

Determine the safe heating temperature and recommended pouring temperature from the manufacturer's shipping container. Heat and maintain the material temperature within these recommended safe temperatures. Place the material as close as possible to the recommended pouring temperature. Do not maintain any single batch of material at the pouring temperature for more than 6 hours. Reheat according to the manufacturer's recommendations. Place tape bond breaker on bottom of joint reservoir immediately before sealing. Do not allow tape to extend up the reservoir face more than 1/8 inch.

Fill the reservoir with sealing material to a level 1/8 inch to 1/4 inch below the pavement surface. Do not allow sealing material to spread over the pavement surface.

504.4 MEASUREMENT AND PAYMENT—Linear Foot

Measured transversely.

SECTION 505—BRIDGE APPROACH SLABS

505.1 DESCRIPTION—This work is construction of reinforced cement concrete approach slabs and associated sleeper slabs, including the subbase material and necessary excavation.

505.2 MATERIAL—

- (a) **Subbase** – Section 350.2
- (b) **Reinforced Cement Concrete Pavement** – Section 501.2
- (c) **Asphalt Impregnated Paper** – Section 727
- (d) **Polyethylene Sheeting**– Section 711.1(a)
- (e) **Concrete Curing Materials** – Section 711.1

505.3 CONSTRUCTION—As shown on the Standard Drawings, approved Contract Drawings, as specified in Section 501.3, except Section 501.3(l), and as follows:

- (a) **Excavation.** Excavate for the sleeper slab after constructing the subbase.
- (b) **Polyethylene Sheeting.** Two layers of 4.0 mil minimum polyethylene sheeting to be used as a bond breaker under bridge approach slabs. Provide surface that is smooth without excessive depth of sheeting. Install any seams in the longitudinal direction of the bridge and overlap seams a minimum of 12 inches. Provide certification from the manufacturer concerning the above material requirements.
- (c) **Concrete Curing.** Cure the approach slab in accordance with Section 1001.3(p), except Section 1001.3(p)3.a, and as follows:
Water cure bridge approach slabs for a minimum of 7 days. Use covers of a double thickness of burlap.

505.4 MEASUREMENT AND PAYMENT—

- (a) **Bridge Approach Slab.** Square Yard
The price includes excavation, subbase material, polyethylene sheeting, asphalt impregnated paper, cement concrete, and reinforcement bars.

SECTION 506—REINFORCED OR PLAIN CEMENT CONCRETE PAVEMENTS, RPS

506.1 DESCRIPTION—This work is construction of normal strength or high early-strength (HES) cement concrete pavement, plain or reinforced, on a prepared surface under restricted performance specifications (RPS).

506.2 MATERIAL—Section 501.2

506.3 CONSTRUCTION—Section 501.3, with the following modifications:

(o) **Surface Tolerance.** Test the surface of pavement as follows:

1. Mainline Paving. Test as specified in Section 507 and Section 501.3(o)1. These pavements include, but are not limited to any full width lane used for travel, passing, climbing, center turn, acceleration, deceleration, and ramps.

2. Other than Mainline Pavement. Test as specified in Section 501.3(o). These pavements include, but are not limited to approach slabs, bridge decks, tapers, shoulders, medians, or other pavement surfaces as directed.

(s) **Tests for Depth.** Replace with the following:

The Inspector will determine lots and sublots as specified in Section 506.3(u).

Complete all surface corrections or diamond grinding / grooving if specified by the contract, before testing for pavement depth. Test pavement depth by obtaining one core from each subplot. The Inspector will determine the location of each core using PTM No. 1.

Drill cores at each subplot location, according to PTM No. 606, in presence of the Inspector. Thoroughly clean the vertical surface of the core hole of laitance and loose and foreign material. Fill the holes with the mixture used to construct the course and consolidate. As an alternative, use a premixed, non-shrink grout.

Provide a measuring apparatus conforming to the requirements of PTM No. 614.

The Inspector will:

- determine the core length according to PTM No. 614,
- determine the average lot pavement thickness by averaging the individual subplot core thicknesses,
- accept concrete as specified in Section 506.3(u)1, and
- determine price adjustments as specified in Section 506.4(a).

Submit every tenth core, as an information sample, to the LTS where an evaluation will be made of the entrained air content according to PTM No. 623, and for 28-day compressive strength testing according to PTM No. 606. For a partial lot, the Inspector will randomly select one core, according to PTM No. 1, for testing. If the core strength is less than 3,500 pounds per square inch immediately perform an investigation of the concrete operations to determine the cause of the low strength. Provide a written evaluation of the problem and the proposed solution to the Department.

(t) **Defective Work.** Replace with the following:

Unless otherwise directed in writing, as specified in Section 110.10(d)1., by the District Executive, remove and replace defective pavement determined as follows:

1. Depth. The lot will be defective if the average core depth of the lot is less than the design thickness (D) minus 1/2 inch or more than one individual subplot core depth is less than the design thickness minus 1/2 inch.

2. Compressive Strength or Air Content. The lot is defective if the Percent Within Limits (PWL) for compressive strength or plastic air content is less than 55%, as specified in Section 506.3(u)2.

3. Other Conditions. The lot is defective if the pavement contains surface defects from rain, improper joint construction, improper curing procedures, improper final finish, cracking, or honeycombing that cannot be satisfactorily repaired as determined by the Representative.

4. Other Than Mainline Pavement Surface Tolerance. The lot is defective if the pavement contains depressions or high points as specified in Section 506.3(o) that cannot be satisfactorily corrected as determined by the Representative.

5. Edge Slumping. The pavement is defective if the requirements as specified in Section 501.3(g)5 are not met. Remove and replace a minimum of 10 feet of pavement between transverse joints of reinforced cement concrete pavements or an entire panel of plain cement concrete pavement. Longitudinal edge spall repairs are not considered satisfactory repairs for edge slumping or spalling between adjacent lanes or outside pavement edges.

Where replacement extends to an existing transverse joint, replace the joint in kind. Construct transverse joints at other locations resulting from removal of defective pavement using the methods for joining pavements as shown on the Standard Drawings.

(u) Acceptance. Add this section as follows:

Lots and sublots for the combined pavement characteristics of depth, strength, and air content will be determined based on the full width of pavement placement. Lots and sublots will begin at the starting point of paving and continue until 5,600 square yards are placed. Lots and sublots will be calculated as the work progresses and will include any pavement designated as RPS pavement. Do not combine various depth pavement into any lot or subplot.

A full lot is defined as 5,600 square yards of pavement, of the same constant depth, and consists of four equal sublots of 1,400 square yards each.

Combine partial lots with the last full lot or make a separate lot according to the following procedure:

- If less than 4,200 square yards remain, combine the remaining pavement with the last full lot.
- If the remaining pavement is equal to or greater than 4,200 square yards, consider the remaining pavement as a separate lot.
- Determine sublots for the last pavement lot by establishing a number of equal size sublots.
- Determine the number of sublots by dividing the area of the combined lot or partial lot by 1,400 square yards and then rounding to the nearest whole number.
- Determine the equal size of each subplot by dividing the combined lot or partial lot quantity by the number of whole sublots calculated.
- Determine lots and sublots based on the full width of pavement placement.

1. Depth. The Representative will accept each lot for compliance with the specifications, for depth if the average core depth of the lot is more than the design thickness (D) minus 0.5 inch and not more than one individual subplot core depth is less than the design thickness minus 0.5 inch.

2. Compressive Strength and Air Content. The Representative will accept concrete for compliance with the specification requirements, for compressive strength and air content, on a lot-by-lot basis, as specified in Section 105 and Section 106. The Representative will determine locations where samples of plastic concrete will be lifted according to PTM No. 1. Make one compressive strength test and one test for percentage of plastic air content on samples from each subplot. Sublot plastic air content acceptance test results outside specification limits will be included in the determination of the PWL.

Mold acceptance cylinders at the determined subplot location. The average of the test results from two cylinders, made from the same sample, tested according to PTM No. 604, will constitute the 28-day compressive strength. Cure test specimens according to Subsection 11.1 of PTM No. 611. The result of one sample of concrete obtained and tested according to AASHTO T 152 for stone and gravel, or AASHTO T 196 for slag coarse aggregate, will constitute the percentage of air content. The Representative will accept concrete based on the adequacy and uniformity of compressive strength at the age of 28 days, and, with respect to the air content, when the PWL is 55% or greater.

Calculate the value of Q by one of the following equations, where \bar{X}_4 is the average of the subplot test results. Q_L is the lower quality index and Q_U is the upper quality index. “s” is the Standard Deviation as specified in Section 106.03(a)3.a.4.

2.a For Class AA 28-day concrete compressive strength,

$$Q_L = \frac{\bar{X}_4 - 3,300\text{psi}}{s}$$

2.b For percentage of air content of Class AA concrete,

$$Q_L = \frac{\bar{X}_4 - 5.0\%}{s} \quad \text{and} \quad Q_U = \frac{8.5\% - \bar{X}_4}{s}$$

Determine the percentage of material within specification limits as specified in Section 106.03(a)3.

506.4 MEASUREMENT AND PAYMENT—Square Yard

The Department will pay on a lot-by-lot basis at the contract price, adjusted for pavement characteristics relative to depth, compressive strength, and air content. The lot payment will be determined according to the multiple characteristic formula as specified in Section 506.4(a)3.

(a) Adjustment for Pavement Characteristics.

1. Depth. The lot average core depth will be determined as specified in Section 506.3(s). The characteristic percentage for depth will be determined using Table A. The characteristic percentage for depth (Pd) will be placed in the multiple characteristic formula as specified in Section 506.4(a)3 to determine the lot payment.

2. Compressive Strength and Air Content. The PWL will be determined for the lot as specified in Section 506.3(u)2. The characteristic percentages for compressive strength and air content will be determined by using Table B. The characteristic percentage for compressive strength (Ps) and the characteristic percentage for air content (Pa) will be used in the multiple characteristic formula as specified in Section 506.4(a)3 to determine the lot payment.

3. Multiple Characteristic Formula. The lot payment will be determined according to the following formula:

$$L_p = C_p \left[\frac{(2Ps + 2Pd + Pa)}{500} \right]$$

where:

L_p	=	Lot Payment
C_p	=	Contract price per lot (contract price times lot size)
Ps	=	Characteristic Percentage of Compressive Strength—(Table B)
Pd	=	Characteristic Percentage for Depth—(Table A)
Pa	=	Characteristic Percentage for Air Content—(Table B)

(b) Defective Pavement Left in Place. Section 501.4(b)

(c) Concrete Pavement Cores. Each

The price includes measuring apparatus, which remains the Contractor's property upon completion of the project.

(d) Evaluation of Concrete Pavement Ride Quality and Payment of Incentive. Section 507.4.

SECTION 507—EVALUATION OF CONCRETE PAVEMENT RIDE QUALITY AND PAYMENT OF INCENTIVE

507.1 DESCRIPTION—This work is evaluating a concrete pavement surface profile and determining the ride-quality incentive associated with the pavement surface profile.

(a) General Requirements. Determine the ride quality of finished pavement surfaces, including approach slabs and pavement relief joints. In the presence of the Inspector, measure the pavement surface profile according to PTM No. 428. Provide the resultant International Roughness Index IRI data to the Representative. The Representative will determine payment for each ride-quality lot based on the IRI.

Measure the pavement surface of the following excluded areas separate from the pavement surface profile of ride-quality lots. The Representative will not include measurements from excluded areas to determine lot incentive payment.

- Bridge decks.
- Ramps less than 1,500 feet in length.
- Tapered pavements less than 12 feet wide.
- Shoulders, medians, and other pavement surfaces indicated.
- Partial lots less than 100 feet.

(b) Lot Size. A full lot is 528 feet of a single pavement lane with the same lot type. The lot types are Type 1 (posted speed limit greater than 45 miles per hour) and Type 2 (posted speed limit less than or equal to 45 miles per hour). The Representative will designate lots starting at the beginning limit of paving and continuing to the ending limit of paving for each pavement lane and ramp that is 12 feet or wider. Do not include the length of excluded areas in the 528 feet. If the lot type changes, end the lot and begin a new lot.

The Representative will designate a partial lot at the ending limit of paving, at a change in the lot type, and at an excluded area, when the lot length is less than 528 feet. The Representative will evaluate a partial lot as a percentage of a full lot.

507.3 CONSTRUCTION—

(a) Equipment and Operator. Provide pavement surface profile measuring equipment that has been verified by the Department according to PTM No. 428. In the presence of the Inspector, calibrate the distance sensor and check the profile system calibration before each day's testing.

Provide an operator that is Department certified according to PTM No. 428.

(b) Testing.

1. Lots. Provide the traffic control and station marking necessary to accommodate testing. Remove objects and equipment from the surface and sweep the surface as necessary to remove debris. In the presence of the Inspector, determine the pavement surface profile for each lot according to PTM No. 428. At the completion of testing, immediately submit the lot IRI data, as defined in PTM No. 428, to the Representative.

2. Excluded Areas. Provide traffic control necessary to accommodate testing. Test the entire surface of each excluded area in stages using a 10-foot straightedge. At each stage, hold the straightedge in contact with the surface and parallel to the road centerline and, in successive positions, test the pavement surface profile from one side of the excluded area to the other. Advance the test location to the next stage by moving the straightedge along the roadway centerline not more than 5 feet.

(c) Acceptance.

1. Lots. The Representative will compare the lot IRI to Table A in Section 507.4 to determine if the lot requires corrective action. Additionally, perform corrective action on any individual bump (must grind) where the irregularity is more than 1/4 inch when tested with a 10-foot straightedge.

2. Excluded Areas. Perform corrective action where irregularities are more than 1/4 inch when tested with a 10-foot straightedge. Correct longitudinal joints not conforming to the requirements specified in Section 501.3(o)1. To improve the ride quality and at the Department's expense, the Representative may require grinding of excluded areas that conform to the acceptable straightedge surface tolerances specified in Section 507.3(c).

(d) Corrective Action.

1. Do not produce a deviation, such as a ridge or valley with the adjacent pavement, of more than 1/8 inch when measured on the transverse profile. Correct a sufficient length of pavement to correct the pavement surface profile without producing additional high or low points. Retest the lots and excluded areas after completing corrective action. Perform additional measurements of the pavement surface profile, as necessary, for the Representative to determine which lots do not require additional corrective action. Correct surfaces to a uniform texture and cross section.

2. Perform all corrective action before testing for pavement depth. If protective coating was applied before grinding, reapply to ground area. Use one or more of the following methods:

2.a. Carbide Grinding. Use carbide grinding for correcting areas 15 feet in length or less. Use grinders of the walk-behind type that have cutting heads of carbide tipped shackles, stars, or blades and have a locking depth control to produce a uniform pavement surface texture.

Provide a pavement surface texture consisting of parallel grooves between 3/32 inch and 1/4 inch wide with a "land area" between grooves 1/16 inch and 3/16 inch. Operate the grinder by making multiple passes if necessary, with a maximum depth of any single pass of 1/8 inch. Grind longitudinally or transversely across the pavement surface.

2.b. Diamond Grinding. As specified in Section 514.3 and modified as follows:

(d) Tolerance. Delete this section.

Unless otherwise approved, grind the entire lane width.

2.c. Removal and Replacement. Remove and replace a minimum of 10 feet of pavement between transverse joints of reinforced cement concrete pavements or an entire panel of plain cement concrete pavement. Where replacement extends to an existing transverse joint, replace the joint in kind as directed. Construct transverse joints at other locations resulting from removal of defective pavement using the methods for joining pavements shown on the Standard Drawings.

(e) Defective Work. A ride-quality pavement lot is defective if:

- The IRI of the lot exceeds the maximum acceptable IRI specified in Table A of Section 507.4.
- Any individual bump (must grind) exists in the lot where the irregularity is more than 1/4 inch when tested with a 10-foot straightedge.
- The surface adjacent to another ride-quality lot contains a ridge or valley of more than 1/8 inch.
- The specifications for pavement construction require removal and replacement of pavement within the ride-quality lot.

Unless the Department and Contractor agree to leave a defective lot in place as specified in Section 507.4, remove and replace defective areas and retest the ride-quality lot.

507.4 MEASUREMENT AND PAYMENT—Dollar

The proposal will include an item and a predetermined amount of money for Evaluation Of Concrete Pavement Ride Quality And Payment Of Incentive. The contract item will have a unit of measure of DOLLAR, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the incentive or bonus status of the payment being made, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for, under the Evaluation Of Concrete Pavement Ride Quality And Payment Of Incentive item as follows:

If the lot is not defective, Table A and the IRI for each lot will be used to determine the incentive payment for ride quality.

The incentive payment for a lot subjected to corrective action will be determined using Table A and the IRI for the lot after the Contractor completes corrective action.

The incentive payment for a partial lot will be determined as a percentage of a full lot.

After corrective action, the Contractor may leave a defective lot in place if the District Executive provides written approval and the Contractor accepts a \$4,000 downward adjustment (rebate) of the amount paid for the lot.

Costs associated with evaluating pavement ride quality will not be paid for separately.

TABLE A
Payment Schedule for Ride Quality Incentive

Type 1 Lots	
IRI inches/mile/lot	Amount
≤ 35	\$1,500
≤ 50	\$1,000
≤ 60	\$500
≤ 70*	\$0
> 70	Corrective Action Required
* Maximum acceptable IRI	

Type 2 Lots	
IRI inches/mile/lot	Amount
≤ 45	\$1,500
≤ 55	\$1,000
≤ 70	\$500
≤ 90*	\$0
> 90	Corrective Action Required
* Maximum acceptable IRI	

SECTION 509—NEXT GENERATION CONCRETE SURFACE

509.1 DESCRIPTION—This work is the Next Generation Concrete Surface (NGCS) texture utilizing diamond grinding and grooving on new or existing cement concrete pavement as indicated or directed.

509.3 CONSTRUCTION—

(a) Equipment. Use a power driven, self-propelled machine utilizing diamond blades capable of grinding and grooving the concrete pavement. The grinding equipment must weigh a minimum of 40,000 pounds when equipped with a grinding head capable of making a single pass, a minimum of 4 feet in width. Do not use grinding equipment that causes spalls at joints or cracks, or fractures surface aggregates.

(b) Grinding /Grooving. NGCS can be attained in either a single pass or two-pass operation as determined by the capability of the contractor's equipment. Texture the entire pavement surface in the longitudinal direction parallel to the pavement centerline. Grinding shall be performed in a manner that eliminates faults at joints and cracks so there is a maximum 1/16-inch differential between adjacent sides of joints and cracks.

Perform a feather pass to ensure proper pavement drainage on the adjacent shoulders and ramps to maintain a consistent cross slope. Maintain the existing cross slope of the roadway. No depressions or misalignment of slope greater than 1/8 inch in 12-feet, when measured with a 12-foot straightedge placed perpendicular to the centerline will be allowed. Non-compliant areas will be reground. Straightedge requirements will not apply across longitudinal joints.

Provide proper drainage of the roadway, by making a feather pass a minimum of 2 feet into the adjacent shoulder, gore area, auxiliary lane, or ramp lane, using conventional diamond grinding. The minimum length of a feather pass will be 100 feet.

- **Single-pass operation.** – Provide a flush ground surface that contains longitudinal grooves constructed in one, single-pass. Stack the diamond blade with two types of diamond grinding blades arranged to provide a ground surface along with blades that produce longitudinal grooves. The diamond blade stack for texturing shall be mounted on a minimum 4-foot wide grinding head, stacked with 1/8 inch blades separated by 1/32 inch spacers. If mounted on the grinding head, all blades used to produce the ground surface will be flat across the contact surface and in the same plane with other flush grinding blades, excluding the grooving blades. Use a 4-foot straightedge to verify all blades on the grinding head are straight across the contact surface with no bowing if installed to grinding equipment.

The blades used to create the longitudinal grooves should be 1/4 inch to 3/8 inch taller in diameter than the grinding blades. The longitudinal grooves should be spaced among the grinding blades approximately 1/2-inch center to center and shall produce grooves 1/8 inch to 3/16 inch in depth.

The grinding equipment will be equipped with a guide to ensure NGCS is parallel to the roadway centerline. No unground surface area is allowed between passes. Do not overlap any pass of the grinding/grooving head by more than 1 inch.

- **Two-pass operation** – Provide a flush ground surface that contains longitudinal grooves constructed in two operations. The first operation will grind the pavement surface using a diamond blade stack mounted on a minimum 4-foot wide grinding head, stacked with 1/8 inch blades separated by 1/32 inch spacers. If mounted on the grinding head, all blades used to produce the ground surface will be flat across the contact surface and in the same plane with other flush grinding blades. Use a 4-foot straightedge to verify all blades on the grinding head are straight across with no bowing if installed to grinding equipment.

The second operation will provide the longitudinal grooves. The longitudinal grooves shall be 1/8 inch wide and 1/8 inch to 3/16 inch deep. The longitudinal grooves will be spaced approximately 1/2 inch center to center.

The grinding equipment will be equipped with a guide to ensure NGCS is parallel to the roadway centerline. No unground surface area is allowed between passes. Do not overlap any pass of the grinding/grooving head by more than 1 inch.

Remove slurry or residue resulting from the diamond grinding and grooving in a continuous operation. Do not allow slurry to flow across lanes occupied by traffic or to flow into gutters or other drainage facilities. Clean the pavement surface after diamond grinding and before opening to traffic.

(c) Test Section – Construct one 300-foot test section in a single lane to demonstrate the equipment and procedures will provide an acceptable surface. Do not proceed until the test section has been approved. The test section may be waived if approved in writing by the District Executive.

(d) Final Surface Finish – The NGCS shall produce a pavement surface true to grade with a longitudinal grooved texture. The ground surface shall be smooth and contain no ridges that exceed 1/8 inch. A minimum 98% of the pavement surface shall be textured utilizing NGCS. Depressed pavement areas due to subsidence, edge slump, or other localized causes will be excluded from this requirement if approved.

(e) Smoothness Requirements – After completion of the NGCS, determine the ride quality of the pavement as specified in Section 507.3(a) and Section 507.3(b). Provide a maximum IRI of 70 in/mile for facilities if posted speed limits are greater than 45 miles per hour, and a maximum IRI of 90 in/mile for facilities if posted speed limits are less than or equal to 45 miles per hour. To receive payment, all IRI lots must meet the requirements for the posted speed limits.

1. Lots. A full lot is 528 feet of a single lane. The Representative will designate lots starting at the beginning ride quality limit and continuing to the ending ride quality limit for each pavement lane and ramp that is 12 feet or wider. Do not include the length of excluded areas in the 528 feet. Excluded areas will consist of; bridge decks, ramps less than 1,500 feet in length, tapered pavements less than 12 feet wide, partial lots less than 100 feet in length, shoulders, medians, and other pavement surfaces as indicated.

509.4 MEASUREMENT AND PAYMENT—Square Yard

Payment will be for the entire textured surface completed as part of this work, whether the work is performed in a single-pass operation or a two-pass operation.

No ride quality incentive will be paid for NGCS texturing on concrete rehabilitation projects.

SECTION 510—LONGITUDINAL GROOVING OF EXISTING CONCRETE PAVEMENT

510.1 DESCRIPTION—This work is the cutting of longitudinal grooves in existing cement concrete pavement.

510.3 CONSTRUCTION—Groove the existing pavement surface longitudinally between the limiting stations indicated. Do not use flailing type equipment. Do not cut grooves on bridge decks. Cut 3/32-inch wide grooves, with a tolerance of plus 1/16 inch, a 3/4 inch center-to-center spacing, and a minimum depth of 3/16 inch. Do not cut grooves within 6 inches of the outside edge and centerline pavement joint. Do not overlap grooves. Remove slurry or residue resulting from the grooving in a continuous operation. Do not allow slurry to flow across lanes occupied by traffic or to flow into gutters or other drainage facilities. Clean the pavement surface after grooving and before opening to traffic.

510.4 MEASUREMENT AND PAYMENT—Square Yard
Measured on the finished grooved area.

SECTION 511—PRESSURE RELIEF JOINT

511.1 DESCRIPTION—This work is construction of a pavement pressure relief joint.

511.2 MATERIAL—

- (a) **Pressure Relief Material.** Section 705.4(e) or (f)
- (b) **Approved Sealant or Lubricant.** As recommended by the manufacturer of the pressure relief material.

511.3 CONSTRUCTION—Saw the joint opening 4 inches wide, full depth, and full width of the pavement. Remove the existing concrete material. Immediately before placing the sealing material, clean all vertical faces of the joint, and ensure the joint is free of oil, moisture, and other contaminants. Coat joint sides with either the sealant or lubricant adhesive according to the manufacturer's recommendations.

511.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 512—LONGITUDINAL JOINT CLEANING AND SEALING

512.1 DESCRIPTION—This work is cleaning and sealing longitudinal joints in existing cement concrete pavements.

512.2 MATERIAL—Section 705.4(b) or (c)

512.3 CONSTRUCTION—Thoroughly clean the longitudinal joints of all existing sealing material, asphalt material, and other foreign material. Clean original saw-cut joints to a minimum depth of 1 1/2 inches. Clean original formed construction joints to a minimum depth of 3/4 inch. If sawing is used, immediately flush the joint with water. If water blasting, use a waterblaster with a minimum operating capacity of 10 gallons per minute at 7,000 pounds per square inch.

Seal the joint, as specified in the applicable parts of Section 501.3(n), to a level 1/8 inch to 1/4 inch below the pavement surface.

512.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 513—JOINT REHABILITATION

513.1 DESCRIPTION—This work is construction of a sealant reservoir and sealing transverse contraction, construction, or expansion joints in existing Portland cement concrete pavements of the type indicated.

Joint Rehabilitation is classified into two types as follows:

- (a) **Type 1.** Joint Rehabilitation of existing saw-cut joints.
- (b) **Type 2.** Joint Rehabilitation of existing metal plate joints.

513.2 MATERIAL—

- (a) **Joint Sealing Material.** Section 705.4(b) or (c)
- (b) **Joint Backing Material.** Section 705.8
- (c) **Tape Bond Breaker.** Duct tape, the width of the sealant reservoir.

513.3 CONSTRUCTION—As shown on the Standard Drawings, and as follows:

(a) Type 1.

1. General. Perform this work after spall repairs at the joint are completed. Clean and seal any unrepaired spalls 2 inches or less in dimension. Construct the joint sealant reservoir by sawing to the width and depth indicated for the appropriate existing joint spacing. In general, center the sealant reservoir around the existing joint opening. Immediately after sawing, flush the joint with water.

Place tape bond breaker on bottom of joint reservoir immediately before sealing. Do not allow tape to extend up reservoir face more than 1/8 inch.

2. Existing Wide Joint. If the existing joint is as wide as or wider than the required width of sealant reservoir, thoroughly clean the joint to the depth required for the sealant reservoir. If water blasting, use a water blaster with a minimum operating capacity of 10 gallons per minute at 7,000 pounds per square inch. Place joint backing material to the depth required for the sealant reservoir, if necessary.

3. Sealing. Immediately before placing the sealing material, sandblast all vertical faces of the joint and clean, with a compressed air stream measuring 100 pounds per square inch at the source, free of oil, moisture, and other contaminants. Seal as specified in the applicable parts of Section 501.3(n).

(b) **Type 2.** Construct as specified for Joint Rehabilitation Type 1, except remove the portion of the existing steel plate that lies within the new sealant reservoir before sealing the joint. A maximum of 1/4 inch of the plate may protrude into the reservoir.

513.4 MEASUREMENT AND PAYMENT—Linear Foot

The unit price includes cleaning and sealing of small unrepaired spalls.

Repair any damage to the existing shoulders because of this work at no additional expense to the Department.

SECTION 514—DIAMOND GRINDING OF CONCRETE PAVEMENT

514.1 DESCRIPTION—This work is the diamond grinding of existing cement concrete surfaces as indicated or directed.

514.3 CONSTRUCTION—

(a) **Equipment.** Use a power driven, self-propelled machine having diamond blades and capable of grinding the surface of the pavement to the specified smoothness tolerances and texture. Do not use equipment that causes spalls at joints or cracks, or fractures the aggregate at the surface.

(b) **Grinding.** Grind the entire pavement surface in the longitudinal direction beginning and ending at lines normal to the pavement centerline, unless otherwise specified. Grind in either direction unless it is otherwise determined by the Representative traffic safety considerations mandate grinding with traffic flow. Provide a uniform finished surface and eliminate joint or crack faults. Operate the grinding machine parallel to centerline. Texture the entire pavement surface; however, do not perform extra depth grinding to eliminate minor depressions. Do not exceed 2 inches of overlap. Do not grind within 2 feet of existing curb, bridge barrier, and roadway barrier. Newly sealed longitudinal or transverse joints damaged due to the diamond grinding operation will be resealed as specified in Sections 512 and 521 at no additional cost to the Department. A newly sealed joint will be defined as a joint sealed under the current contract.

Remove slurry or residue resulting from the diamond grinding in a continuous operation. Do not allow slurry to flow across lanes occupied by traffic or to flow into gutters or other drainage facilities. Clean the pavement surface after diamond grinding and before opening to traffic.

(c) **Texture.** Provide a surface texture consisting of parallel grooves between 0.09 inch and 0.13 inch wide with a “land area” between grooves of 0.060 inch to 0.110 inch and a difference between the peaks of the ridges and the bottom of the grooves of approximately 1/16 inch.

(d) **Tolerance.**

1. Transverse Tolerance. Restore original pavement cross slope. Maintain a uniform cross slope. Check the uniformity of cross slope at 100-foot intervals longitudinally.

Correct all areas with deviations greater than 1/4 inch in 12 feet. Provide a positive cross slope so the pavement drains.

Provide the Representative with documentation recording each cross slope test location and the maximum depth of depression or slope misalignment at that location.

2. Longitudinal Tolerance. Supply and operate equipment as specified in Section 507.3(a), for all longitudinal roughness tests. Test the pavement surface roughness in the longitudinal direction and submit the record of the information to the Representative before beginning any diamond grinding work. Following grinding of the pavement surface, test the longitudinal roughness as specified in Section 507.3(c)1.

Regrind pavement segments as specified in Section 507.3(d).

(e) **Concrete Pavement Rehabilitation.** Concrete pavement repairs including concrete pavement patching, concrete spall repair, dowel retrofit, slab stabilization, and slab jacking must be completed before the start of any diamond grinding operations.

After completing the concrete rehabilitation operation, determine the ride quality of the existing pavement as specified in Sections 507.3(a) and 507.3(b), before performing any diamond grinding. After completing the diamond grinding operations, reevaluate the ride quality of the pavement surface as specified in Sections 507.3(a) and 507.3(b). Use the same pavement surface profile measuring equipment to perform all ride quality evaluations on the project.

After diamond grinding the pavement surface, provide a maximum IRI of 70 in/mile for facilities if posted speed limits are greater than 45 miles per hour, and a maximum IRI of 90 in/mile for facilities if posted speed limits are less than or equal to 45 miles per hour. Meet these requirements in all IRI lots where diamond grinding of the pavement was performed to receive payment.

1. Lots. A full lot is 528 feet of a single lane. The Representative will designate lots starting at the beginning ride quality limit and continuing to the ending ride quality limit for each pavement lane and ramp 12 feet or wider. Do not include the length of excluded areas in the 528 feet. Excluded areas will consist of: bridge decks, ramps less than 1,500 feet in length, tapered pavements less than 12 feet wide, partial lots less than 100 feet in length, shoulders, medians, and other pavement surfaces as indicated.

514.4 MEASUREMENT AND PAYMENT—Square Yard

The determination of longitudinal roughness and the determination of ride quality are incidental to this item.

No ride quality incentive will be paid for diamond grinding on concrete pavement rehabilitation projects.

SECTION 515—SAWING AND SEALING OF ASPHALT OVERLAYS

515.1 DESCRIPTION—This work is the saw cutting of new asphalt concrete courses directly above existing or constructed transverse joints in the underlying concrete pavement as directed, and sealing the reservoir.

515.2 MATERIAL—

(a) **Sealing Material.** Section 705.4(b), (c), or (g)

(b) **Tape Bond Breaker.** Section 513.2(c)

515.3 CONSTRUCTION—

(a) **General.** Locate and reference the location of each end of each existing transverse joint before placing any asphalt courses. For transverse joints across multiple lanes where traffic is diverted to an adjacent lane, locate and reference an additional point along the transverse joint to facilitate marking the location of the joint in one lane while traffic is traveling in the adjacent lane.

Prepare a QC plan outlining the control of locating and referencing transverse joints. Have the QC plan describe the personnel, equipment and methods necessary to accurately locate, reference and later mark for sawing all joint locations. Submit the QC plan to the Representative at least 21 days before the start of referencing operations. Do not begin joint referencing until the Representative reviews the QC plan.

Before or on the first day of joint referencing and before the placement of any asphalt courses, demonstrate the ability to accurately relocate the existing transverse joints using the reference data to the satisfaction of the Representative at no additional cost to the Department. If the joint referencing and relocating process does not yield consistent results within a ± 1 inch tolerance, stop all related operations and amend the QC plan to ensure accurate referencing.

(b) **Sawing.** Make all saw-cuts directly above the existing transverse joints within ± 1 inch. Saw-cuts which do not meet this tolerance will be declared defective as outlined in Section 105.12. Do not saw cut until the asphalt course has cooled below 140F. Perform saw cutting within 7 days after placing the wearing course. Perform this work on all finished overlay areas before discontinuing work due to seasonal paving limitations.

Make saw-cuts only in the lane in which the existing joint is located. Extend the saw-cuts through any existing widening. Provide separate saw-cuts in each lane if existing transverse joints are offset more than 1 inch.

Use the following table to determine saw-cut reservoir size:

Overlay Thickness inches	Reservoir inches
$\leq 1\frac{1}{2}$	$\frac{1}{2}$ deep by $\frac{1}{2}$ wide
$> 1\frac{1}{2}$	1 deep by $\frac{1}{2}$ wide

Additionally, if the total depth of overlay is $3\frac{1}{2}$ inches or greater, make an initial saw-cut $\frac{1}{8}$ inch wide to a depth of $1\frac{1}{2}$ inches or one-third of the total overlay thickness, whichever is greater. Indicated overlay depths do not include scratch or leveling courses less than 1 inch.

If not placing the wearing course within the same construction season, provide a $\frac{1}{8}$ -inch wide saw-cut in the last placed asphalt course to a minimum depth of 1 inch or one-third the thickness of the asphalt material placed, whichever is greater.

(c) **Sealing.** Do not place sealing material unless the reservoir faces are thoroughly clean and dry to the satisfaction of the Representative. Clean the reservoir immediately before placing sealing material. When using compressed air, use air free of oil, moisture, or any other substance that would prevent bonding of sealing material to the reservoir faces.

Do not place sealing material if the air temperature is less than 40F, or above 90F, unless otherwise allowed by the Representative.

Determine the safe heating temperature and recommended pouring temperature from the manufacturer's shipping container. Heat and maintain the material temperature within these recommended safe temperatures. Place the material as close as possible to the recommended pouring temperature. Do not maintain any single batch of material at the pouring temperature for more than 6 hours. Reheat according to the manufacturer's recommendations. Place tape bondbreaker on bottom of joint reservoir immediately before sealing. Do not allow tape to extend up the reservoir face more than 1/8 inch.

Fill the reservoir with sealing material to a level 1/8 inch to 1/4 inch below the pavement surface. Do not allow sealing material to spread over the pavement surface.

515.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 516—CONCRETE PAVEMENT PATCHING

516.1 DESCRIPTION—This work is the construction of single course, full depth, normal strength or accelerated strength, cement concrete pavement patches, and corner repairs. If diamond grinding is to be performed, test the pavement surface in the longitudinal direction as specified in Section 514.3(d)2.

(a) **Patching Joint.** Provide full depth saw-cuts at the existing pavement/patch interface, install load transfer dowels in the transverse faces of the existing pavement, construct a sealant reservoir, and seal the joint.

(b) **New Pavement Joint.** Provide load transfer unit, construct sealant reservoir, and seal the joint.

(c) **Normal and Accelerated Concrete Pavement Patching, Type A.** Construct patches between 6 feet and 20 feet long. Do not patch less than one lane width.

(d) **Normal and Accelerated Concrete Pavement Patching, Type B.** Construct patches between 20.1 feet and 65 feet long. Do not patch less than one lane width.

(e) **Normal and Accelerated Concrete Pavement Patching, Type C.** Construct patches between 65.1 feet and 500 feet long. Do not patch less than one lane width.

(f) **Full Depth Corner Repair.** Provide full depth corner repair as shown on the Standard Drawings.

516.2 MATERIAL— Section 501.2 with the following modifications:

(j) **Concrete Curing Material.** Revise to read as follows:

Sections 711.1 and 711.2

Section 501.2 Material. Add the following:

(u) **Subbase.** Section 350.2

(v) **Rapid Set Concrete Patching Material.** Section 525.2(c). Only allowed for Corner Repairs. Use within the shelf life and temperature limitations set by the manufacturer.

516.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in Section 501.3 and as follows:

(a) **General.** Prepare a QC Plan as specified in Section 106.03(a)2.a and submit it for review. The QC Plan must describe appropriate action points for all phases of construction, including concrete mixing and curing, joint sawing and sealing, and sampling and testing for opening to traffic. If patching adjacent lanes, construct concrete pavement patches one-lane at a time where two-lane width construction would interfere with traffic. The Representative will surface mark patch areas in advance of the sawing operations.

Protect traffic from drop off conditions as specified in Section 901.3(j). Do not allow excavated patch areas to remain un-patched for more than 48 hours or over weekends or holidays. If an excavated patch area is to remain open for longer than 48 hours and is adjacent to open traffic lanes, use temporary fill or other approved methods to protect traffic.

If it rains while the patch area is open, excavate an outlet through the shoulder at the lowest point of the patch as directed. Repair any damage to the existing shoulders as a result of this work, at no additional cost to the Department. After saw cutting the existing pavement, allow traffic on patch areas of existing pavement for a maximum of 72 hours. Do not allow saw cuts greater than 1/2 inch in width or less than full depth to be opened to traffic.

Before placing concrete, ensure adequate equipment and trained personnel are available, and sufficient hauling units scheduled, to maintain continuity in placement.

(b) Saw Cutting. Use a saw equipped with a diamond-tipped blade, a blade guard, alignment guides, water cooling system, and cut-depth controls for saw cutting the perimeter of the patch. Do not allow cooling water, slurry, and dust from the sawing operation to enter any lane opened to traffic. Make all required full depth longitudinal saw cuts along the perimeter of the patch before making any full depth transverse saw cuts.

Where only one lane is being patched, make a full depth saw-cut in the existing longitudinal joint for the full length of the patch. Where multiple lanes are being patched one lane at a time, perform one of the following:

- Make a full depth saw-cut within the adjacent lane to be patched. Make the saw-cut parallel and not more than 1 foot from the existing longitudinal joint. Form the patch joint in the same location as the existing longitudinal joint and backfill behind the forms with aggregate at no additional cost to the Department.
- Make a full depth saw-cut in the existing longitudinal joint for the length of the patch and insert a temporary rigid separator between the adjacent lane and the patch area. Do not use a temporary rigid separator greater than 1/8 inch thick.

Make full depth transverse saw-cuts at the locations marked on the pavement surface. Do not break back the underside of the existing pavement. If break back or spalling occurs, make a new full depth transverse saw-cut beyond the area of break back or spalling. Place the additional length of patch at no additional cost to the Department. If break back or spalling occurs in the adjacent lane, repair the damaged area at a minimum with a full depth Type A concrete patch at no additional cost to the Department. Full depth saw cuts at the patch limits will be allowed to extend transversely into the adjacent pavement up to full depth + 2 inches provided dowel bars in the adjacent lane are not damaged. Additional full depth transverse saw cuts will be allowed to facilitate slab removal but may not extend transversely into the adjacent pavement to remain in place.

For corner repairs, only saw 2 inches in depth and a minimum of 2 inches beyond the damaged area as shown on the Standard Drawings to establish the boundary of the repair. Full-depth cuts will be allowed along the existing joints to relieve restraints of a dowel or a tie bar. Cut and remove exposed sections of dowel and tie bars.

(c) Removal of Existing Pavement. Remove concrete between narrowly spaced saw-cuts at the end of a proposed patch area in a manner that does not damage any adjacent pavement that is to remain in place.

As an alternate, a wheel saw having carbide steel tips may be used before making the full depth transverse saw-cuts necessary for the patching joint. Limit penetration of the wheel to minimize disturbance to the subbase. Do not allow wheel saws with carbide steel tips to cut into pavement that is to remain in place. Discontinue using a wheel saw if unsatisfactory results are determined.

Remove the concrete in the patch area in one or more pieces minimizing disturbance to the subbase, subgrade, and the adjacent pavement to remain in place. Do not use drop hammers or hydro-hammers. If damage occurs to pavement to remain in place, repair as specified in Section 516.3(b) at no additional cost to the Department.

For full depth corner repairs, use a 35 pound maximum jackhammer to remove the unsound concrete. Operate the jackhammer at a 45-degree angle or less to taper the boundary and to minimize damage to the remaining sound concrete.

If the surface of the subbase is disturbed by the removal technique, recompact the surface using small vibratory compactors. If the disturbed material is deeper than 1 inch, remove the disturbed material with hand tools and replace with concrete during paving at no expense to the Department.

Correct all subbase surface irregularities exceeding 1 inch in depth by loosening the surface and removing or adding material as required. Compact the corrected area and surrounding surface by rolling to proper grade and slope.

(d) Removal of Existing Subbase. Remove unsuitable subbase material, as directed. Replace as specified in Section 350.3.

(e) Transverse Joints. Section 501.3(i) and as follows:

1. General. Delete Section 501.3(i)2, Table A. If a crack or spall occurs at any location and any time before final inspection and resolution of all issues regarding the condition of the pavement, remove and replace the pavement at no additional cost to the Department.

If any patch is replacing an existing expansion joint, and the existing expansion joint in the adjacent lane is remaining in place, install 3/4-inch expansion joint material in the joint nearest to the remaining expansion joint.

Apply bond breaker lubricant to at least one-half of the length of Type B coated dowel bars, unless a bond breaker lubricant has been applied in the shop. Stir the lubricant well and apply to the free end of dowels by spraying, or with a gloved hand, to produce a thorough coating. Do not use brushes for lubricant application. Apply the bond breaker lubricant, as specified, at least 1 hour before placing the concrete around the dowel. Provide a tube with a minimum 1-inch clearance packet, over the lubricated end of all coated dowel bars. Type A coated dowel bars do not need lubricant.

For corner repairs, install 1/2-inch expansion joint material to reestablish original transverse joint location. Drill 5/8-inch diameter holes and install tie bars as shown on the Standard Drawings.

2. Patching Joint. Drill holes into the face of the existing pavement that has been saw cut full depth. Provide holes a maximum of 1/8 inch larger in diameter than the coated dowel bars. Mount drilling machines in a frame that maintains the proper horizontal and vertical alignment during drilling.

Do not use hand held drills or drills that rest upon the subbase or subgrade. Drill holes to ensure the dowel alignment tolerances shown on the Standard Drawings and as specified in Section 501.3(i). Change location of drill holes ± 1 inch to avoid existing reinforcing steel.

Securely embed the coated dowel bars into place with an approved anchoring material. Inject all the mixed anchoring material into the rear of the hole before inserting the dowel bar. Rotate the dowel three to five complete rotations while inserting the dowel to purge air voids as completely as possible. Immediately trowel all excess anchoring material flush with the vertical face of the patch until the anchoring material reaches its initial set. Do not leave voids in the anchoring material. Use a plastic retainer washer to hold anchoring material in place, if directed, and remove before placement of concrete in the patch. Provide anchoring material formulated to reach an initial set within 5 minutes of application. Provide a material specification data sheet for the anchoring material used.

Render exposed portion of each coated dowel bar bondless as specified in Section 501.3(i).

2.a Dowel Bar Anchor Verification. On the first day of dowel bar anchoring operations, the Representative will randomly select three locations to evaluate proper anchoring of dowel bars to provide load transfer across the joint without deflection and to prevent intrusion of moisture. At each location, drill one 4-inch diameter core directly through the anchored dowel no closer than 3 inches from the joint face.

The Representative will determine if the anchoring of the dowels is acceptable. Acceptance will be the summation of voids around the perimeter of the dowel less than 0.50 inch. If the anchoring of the dowels is acceptable, continue production using the same anchoring operations. If the anchoring of the dowels is not acceptable, additional evaluations of dowel bar anchoring operations will be conducted. Construct a new patching joint offset 2 feet from each joint determined not acceptable at no additional cost to the Department.

Clean the vertical surface of any core hole of laitance, loose and foreign material. Fill the holes with the concrete mixture used to construct the pavement and consolidate. As an alternative, use a premixed, non-shrink grout.

3. New Pavement Joint. As indicated and when directed, provide load transfer units adjacent to existing joints. When patching all adjacent lanes, space joints as shown on the Standard Drawings.

Install load transfer units as specified in Section 501.3(i).

(f) Forms. Section 501.3(d). Form all patch sides not in contact with pavement remaining in place.

(g) Concrete. Design, mix, and place as specified in Section 501.3(a) through (h). Concrete will be accepted by lot as specified in Section 704.1(d)4.

For corner repairs, prepare the existing sound concrete surface to ensure proper bond according to manufacturer's recommendations immediately before placing patching material. Mix and place rapid set patching materials according to manufacturer's recommendations. Provide a copy of the manufacturer's recommendations for the epoxy bonding compound and the patching material to the Representative before installation.

(h) Final Strike-Off and Consolidation. Section 501.3(k).

(i) Final Finish for Pavements Not Being Overlaid. For Type A and B patches, finish the surface of the patch to match the existing pavement cross section. Include any existing wheel ruts. For Type C patches, taper the wheel ruts at both ends of the patch to a straight pavement cross slope, within the patch, with a minimum transition length of 20 feet.

Texture Type A and B patches to correspond with the texture of the surrounding pavement. Texture Type C patches as specified in Section 501.3(k)4.

Following the final finishing and before application of curing materials, scribe the date of the patch placement in the surface of the fresh concrete along the shoulder edge of the patch.

If the contract includes grinding of the pavement surface, then the matching of wheel ruts and the texturing of the patch surface is not necessary. Make the scribing of the patch dates deep enough that the grinding will not eliminate them.

(j) Curing of Concrete. Section 501.3(l) except, Type 2 white pigmented liquid membrane forming curing compound is allowed in lieu of white, poly-alpha-methylstyrene (PAMS) liquid membrane forming curing compound. Cure rapid set concrete patching material repairs according to manufacturer's recommendations

(k) Stabilizing Around Patches. After curing and before opening to traffic, grout around the patches. Use the hole pattern shown on the Standard Drawings. If directed, stabilize as specified in Section 679.

(l) Longitudinal Joints. Section 501.3(j) and as follows:

In two-lane width patching being performed at the same time, construct a Type L joint as shown on the Standard Drawings.

In two-lane patching being performed one lane at-a-time, or one-lane patching, provide a 1/4-inch, full depth, polystyrene board bond breaker in the longitudinal joint of Type A and B patches and corner repairs. Do not provide a bond breaker in the longitudinal joint of Type C patches. Provide tiebars in all Type C patches. For all patch types, saw cut the longitudinal joint 1/4 inch wide and 1 inch deep. Center the saw-cut over the joint.

(m) Sealing. Seal all longitudinal and transverse joints constructed as part of this work except, if the pavement is to be overlaid with asphalt pavement during the same construction season, then only expansion joint sealing is necessary. Seal the joints as specified in Section 501.3(n).

Seal all saw-cuts extending beyond the patch limits.

When the pavement will not be overlaid during the same construction season, construct a sealant reservoir and seal joints as specified in Section 501.3(n).

Longitudinal and transverse joints of accelerated strength concrete patches may be opened to traffic provided second stage sawing has not occurred, a backer rod is installed and maintained near the surface, initial concrete strength is attained, and curing requirements are met. Perform second stage sawing and seal the joints of accelerated strength concrete patches as specified in Section 501.3(n) within 24 hours.

(n) Surface Tolerance. Test the surface of the patch area, in the longitudinal direction, and across patch joints using a 12-foot straightedge. Correct, by grinding, any high points or depressions of 3/16 inch or more at no additional cost to the Department unless caused by surface deficiency in existing adjacent pavement. After grinding, retest the area with the straightedge. If the surface still exceeds the above limits, then the area is defective. Remove and replace the defective area at no additional cost to the Department.

(o) Protection of Pavement. Section 501.3(p).

(p) Protection Against Rain. Section 501.3(r).

(q) Opening to Traffic. Section 501.3(q). For rapid set concrete patching material repairs, cure the QC cylinders according to manufacturer's recommendations. The Representative will determine when pavement may be opened to traffic based on when the concrete attains the minimum required compressive strength of 1,000 pounds per square inch as measured by compressive strength testing of cylinders according to PTM No. 604.

(r) Defective Work. Section 501.3(t), except remove and replace cracked or spalled concrete pavement patches or corner repairs at no additional cost to the Department.

516.4 MEASUREMENT AND PAYMENT—

(a) Patching Joint. Linear Foot

Includes all costs associated with Dowel Bar Anchor Verification.

(b) New Pavement Joint. Linear Foot

(c) Concrete Pavement Patching. Square Yard

The Department will not pay for additional work required due to insufficient dowel bar anchoring.

For the type indicated. When longitudinal joint cleaning and sealing is part of the contract, the sealing of longitudinal joints is incidental to that item, not to concrete pavement patching.

The unit price includes removal of the existing pavement and all repairs or corrections specified in Section 516.3 that are needed as a result of patching operations.

(d) Full Depth Corner Repair. Square Foot

(e) Subbase Material. Cubic Yard

The unit price includes excavation.

(f) Slab Stabilization. Section 679.4(a)2 and (a)3, 679.4(b)2 and (b)3, and 679.4(c)2 and (c)3

SECTION 517—TRANSVERSE GROOVING OF CONCRETE PAVEMENT FOR RETEXTURING

517.1 DESCRIPTION—This work is the cutting of transverse grooves in existing cement concrete pavement after the original texture has been lost.

517.3 CONSTRUCTION—Groove the existing pavement surface transversely between the limiting stations indicated. Do not use flailing type equipment. Cut grooves $\frac{3}{32}$ inch in width, with a tolerance of plus $\frac{1}{16}$ inch, a $\frac{3}{4}$ -inch center-to-center spacing, and a minimum depth of $\frac{3}{16}$ inch. Do not cut grooves within 6 inches of the outside edge or centerline pavement joint. Do not overlap grooves. Remove slurry or residue resulting from the grooving in a continuous operation. Do not allow slurry to flow across lanes occupied by traffic or to flow into gutters or other drainage facilities. Clean the pavement surface after grooving and before opening to traffic.

517.4 MEASUREMENT AND PAYMENT—Square Yard
Measured on the finished grooved area.

SECTION 518—CONTINUOUSLY REINFORCED CONCRETE PAVEMENT PATCHING

518.1 DESCRIPTION—This work is the construction of one course, full-depth, continuously reinforced cement concrete pavement patches. Do not patch less than one lane width.

(a) **Patching Joint.** Provide partial depth saw-cuts at the existing pavement/patch interface, construct a sealant reservoir, and seal the joint.

(b) **Continuously Reinforced Concrete Pavement Patching, Type A.** Construct patches between 6 feet and 20 feet long if using tied splices and between 4 feet and 20 feet long if using welded splices.

(c) **Continuously Reinforced Concrete Pavement Patching, Type B.** Construct patches between 20.1 feet and 65 feet long.

(d) **Continuously Reinforced Concrete Pavement Patching, Type C.** Construct patches between 65.1 feet and 500 feet long.

518.2 MATERIAL—Section 516.2 with the following modifications:

Section 501.2 Material. Add the following:

(w) **Polyethylene Sheeting.** Section 711.1(a)

(x) **Welding Material.** Section 1105.02(t)

518.3 CONSTRUCTION—As specified in Section 516.3, modified as follows:

(b) **Saw Cutting.** Replace the third paragraph of Section 516.3(b) with the following:

No saw cuts will be allowed to extend into the adjacent pavement or shoulders that is to remain in place. Make initial, full-depth, transverse saw-cuts from the outside edge of the pavement toward the longitudinal saw-cut as shown on the Standard Drawings. Use methods that assure full depth vertical cuts to allow the interior portion of the patch to be removed as specified in Section 516.3(c). Make a second, 1-inch minimum depth, transverse saw-cut at each end of the patch area, parallel to and outside the initial saw-cut the distance shown on the Standard Drawings for the type of rebar splices to be used. Do not saw cut across an existing crack. Do not locate saw-cuts within 24 inches of an existing crack. Do not cut reinforcement bars when making the partial depth saw-cuts. If any of the reinforcement bars are cut, take corrective action by making the partial depth saw-cut a full-depth cut and making another partial depth (1-inch minimum) saw-cut located as specified above. Place the additional length of patch at no additional cost to the Department.

(c) **Removal of Existing Pavement.** Replace Section 516.3(c), with the following:

(c) **Removal of Existing Pavement.** Remove concrete between the two full-depth, transverse saw-cuts, before making the 1-inch minimum depth saw-cuts. A wheel saw having carbide steel tips may be used, while making the full-depth transverse saw-cuts, to provide a trench across the slab to relieve compression in pavement before lifting out failed area. Limit penetration of wheel into the subbase to a maximum of 1/2 inch. Do not allow the wheel to cut into pavement that is remaining in place. Discontinue use of the wheel saw if unsatisfactory results are obtained as determined by the Representative.

Install lifting devices and lift out the concrete in the area enclosed by the full-depth saw-cuts, in one or more pieces, without disturbing existing subbase.

Remove the concrete strips at each end of the patch area with jackhammers and hand tools. Limit jackhammer size to 30 pounds maximum. Do not damage existing reinforcement bars within the concrete strips. Do not break back the underside of the existing pavement. If break back greater than 2 inches or

damage to existing reinforcement bars occurs, make a new full-depth, transverse saw-cut beyond the area of break back. Saw cut a new outside edge, maintaining the appropriate bar length at the edge of patch. Place the additional length of patch at no additional cost to the Department.

If the existing pavement was constructed on top of a bond breaker, remove the bond breaker from the top of pavement base. Place two layers of 4.0 mil minimum polyethylene sheeting to be used as a new bond breaker before placing concrete. Cut the polyethylene sheeting to the surface dimensions of the patch.

If the surface of the subbase is disturbed by the removal procedure, recompact the surface using small vibratory compactors. If subbase material is disturbed to a depth greater than 1 inch, remove the disturbed material with hand tools and replace with concrete during paving at no additional cost to the Department.

(e) **Transverse Joints.** Replace Section 516.3(e), with the following:

(e) **Reinforcement.** Place reinforcement in the patch area as specified in Section 1002.3 and as shown on the Standard Drawings. Firmly support and tie bars at every intersection to re-establish the continuous reinforcing. Use tied or welded splices. Lap the new reinforcement bars with the existing bars as shown on the Standard Drawings for the type of rebar splices to be used. Weld splice as specified in Section 1105.03(m) and as shown on the Standard Drawings. When weld splicing, lap tie bars at the center of the patch, as shown on the Standard Drawings, to allow for expansion.

518.4 MEASUREMENT AND PAYMENT—

(a) **Patching Joint.** Linear Foot

(b) **Continuously Reinforced Concrete Pavement Patching.** Square Yard

For type indicated. The unit price includes removal of the existing pavement and repairs or corrections as specified in Section 516.3 that are needed as a result of patching operations.

(c) **Subbase Material.** Cubic Yard

The unit price includes excavation.

SECTION 519—FULL DEPTH LONGITUDINAL CONCRETE JOINT REPAIR

519.1 DESCRIPTION—This work is the full depth longitudinal repair of an existing concrete pavement. If diamond grinding is to be performed, test the pavement surface in the longitudinal direction as specified in Section 514.3(d)2.

519.2 MATERIAL—Section 501.2 with the following addition:

(a) **Subbase.** Section 350.2

519.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in Section 501.3 and as follows:

(a) **General.** At least 2 weeks before the start of repairs, submit a QC Plan as specified in Section 106.03(a)2.a and submit it for review. Describe the construction equipment, personnel, and methods necessary to construct and test concrete for all pavement repair operations. Include testing frequencies, and action points to initiate corrective measures. Do not establish action points at either the upper or lower specification limits.

If constructing full or partial depth patching adjacent to longitudinal joint repairs, construct all patches prior to performing longitudinal repairs. For any full depth repair adjacent to the longitudinal joint, the patch should be combined with the longitudinal repair along that portion of the joint repair. The Representative will surface mark repair areas in advance of the sawing operations.

After saw cutting the existing pavement, allow traffic on repair areas of existing pavement for a maximum of 72 hours. Do not allow saw cuts greater than 1/2 inch in width to be opened to traffic.

Do not allow excavated repair areas to remain un-patched for more than 48 hours or over weekends or holidays. Protect traffic from drop off conditions as specified in Section 901.3(j).

Before placing concrete, ensure adequate equipment and trained personnel are available, and sufficient hauling units scheduled, to maintain continuity in placement.

(b) **Saw Cutting.** Use a saw equipped with a diamond-tipped blade, a blade guard, alignment guides, water cooling system, and cut-depth controls for saw cutting the perimeter of the patch. Do not allow cooling water, slurry, and dust from the sawing operation to enter any lane opened to traffic. Make all required full depth longitudinal saw cuts along the perimeter of the repair prior to making any full depth transverse saw cuts.

Make the saw-cuts parallel to the existing longitudinal joint. Make full depth transverse saw-cuts at the locations marked on the pavement surface. Do not break back the underside of the existing pavement. If break back or spalling occurs, make a new full depth transverse saw-cut beyond the area of break back or spalling. Place the additional length of repair at no additional cost to the Department. Full depth saw cuts at the repair limits will be allowed to extend transversely into the adjacent pavement up to full depth + 2 inches provided dowel bars in the adjacent lane are not damaged. Additional full depth transverse saw cuts will be allowed to facilitate slab removal but may not extend transversely into the adjacent pavement to remain in place.

(c) **Removal of Existing Pavement.** Remove concrete between narrowly spaced saw-cuts at the end of a proposed repair area in a manner that does not damage any adjacent pavement that is to remain in place.

Remove the concrete in the repair area in one or more pieces minimizing disturbance to the subbase, subgrade, and the adjacent pavement to remain in place. Do not use drop hammers or hydro-hammers. If damage occurs to pavement to remain in place, repair as specified in Section 516.3(b) at no additional cost to the Department.

If the surface of the subbase is disturbed by the removal technique, recompact the surface using small vibratory compactors. If the disturbed material is deeper than 1 inch, remove the disturbed material with hand tools and replace with concrete during paving at no additional cost to the Department.

Correct all subbase surface irregularities exceeding 1 inch in depth by loosening the surface and removing or adding material as required. Compact the corrected area and surrounding surface by rolling to proper grade and slope.

(d) Removal of Existing Subbase. Remove unsuitable subbase material, as directed. Replace as specified in Section 350.3.

(e) Final Finish for Pavements Not Being Overlaid. Finish and texture the surface of the patch to match the existing pavement cross section.

(f) Sealing. Seal all longitudinal and transverse joints constructed as part of this work, as specified in Section 501.3(n).

Seal all saw-cuts extending beyond the patch limits.

519.4 MEASUREMENT AND PAYMENT—

(a) Patching Joint. Linear Foot

(b) Pavement Joint. Linear Foot

(c) Longitudinal Concrete Joint Repair. Square Yard

When longitudinal joint cleaning and sealing is part of the contract, the sealing of longitudinal joints is incidental to that item, not to longitudinal concrete joint repair.

The unit price includes removal of the existing pavement and all repairs or corrections as specified in Section 519.3 that are needed as a result of patching operations.

(d) Subbase Material. Cubic Yard or Ton

The unit price includes excavation.

SECTION 520—PERVIOUS CONCRETE PAVEMENT SYSTEM

520.1 DESCRIPTION—This work is the construction of plant-mixed pervious concrete pavement on a prepared surface designed to allow the infiltration of storm water into the subsoil. The pervious concrete surface layer is a horizontal plane that is permeable to water and air. The second layer of the storm water system is an open graded, angular stone layer used for temporary storm water detention.

520.2 MATERIAL—

(a) **Cement.** Section 701

(b) **Supplementary Cementitious Materials.** Section 724

(c) **Aggregate.** Section 703

1. Coarse Aggregate.

1.a For use in Concrete. AASHTO No. 8, Type A.

1.b For use in Detention Basin. Either AASHTO No. 3 as the primary detention coarse aggregate topped with AASHTO No. 57 as a choker and leveling course; or AASHTO No. 57 only, as designed and specified.

2. Fine Aggregate.

2.a For use in Concrete. Fine Aggregate, Type A.

2.b For use in Detention Basin. Fine Aggregate, Type A or Type B.

(d) **Water.** Section 720.1

(e) **Concrete Admixtures.** Section 711.3 with the following addition:

(i) **Hydration Stabilizing Admixture.** ASTM C494, Type D.

(f) **Geotextile, Class 4, Type A.** Section 735

(g) **Concrete Mix Design.** Design the pervious concrete mixture proportions according to ASTM C 1688. Design the mixture to have a plastic unit weight between 115 pounds to 130 pounds and water cement ratio of 0.36 ± 0.04 . Adjust the mix water, if necessary, during production if the mixture has a dull or dry appearance to produce a wet metallic sheen without causing the paste to flow from the aggregate. Additional mix water may be added at the project, if necessary, to achieve this condition provided the plastic unit weight is within 5 pounds per cubic foot of the target design unit weight.

If reactive aggregates are used in the mixture, remediate for Alkali-Silica Reaction as specified in Section 704.1(g).

Furnish the proposed mix design identifying all mixture components and weights or dosage amounts to the DME/DMM at least 3 weeks before the scheduled start of producing the mixture for the project. Include the target in-situ void content and 28 day unit weight values on the mix design form.

(h) **Concrete Curing Material.** Section 711.1(a) or 711.1(b)

(i) **QC Plan.** Prepare and submit a QC Plan, as specified in Section 106. Provide the QC plan to the Representative at the start of the project. Do not begin production until receiving approval of the QC Plan.

1. Cold Weather. Include provisions to protect pervious concrete from freezing throughout the 7 day curing period according to ACI 306.1.

2. Hot Weather. Include detailed plans indicating the amount of hydration stabilizing admixture to be added in 5F increments to provide time for placing and finishing the pervious concrete before initial set.

520.3 CONSTRUCTION—

(a) Test Sections. Produce two test sections using the approved mix design and placement and finishing operations to be used in production and construct at the project site on a prepared subgrade and base using the material and construction requirements used in production. Each section must have an area of at least 225 square feet. Perform infiltration on both test sections according to ASTM C 1701. The average of both infiltration values must exceed 200 inches per hour.

Submit the following information for each test section to the Representative:

- Test Section Thickness - Section 501.3(s). Thickness cannot be more than 1/4-inch less than the design thickness.
- Void Content - ASTM C 1754. Void structure of $20\% \pm 5\%$.
- Hardened Density - ASTM C 1754 (The average hardened densities of the two test sections will be the hardened density used as the basis of acceptance for the remainder of the project with a tolerance of ± 5 pounds per cubic foot and not to exceed 130 pounds per cubic foot.

Test sections may, with approval, be incorporated into the project.

(b) Equipment. Provide equipment to strike off pervious concrete that provides an acceptable final finish using either a form-riding paving machine, roller screed, vibrating screed, or an asphalt paver. The final surface finish may be applied with steel finishing equipment or a motorized pan finisher provided the surface voids are not sealed.

1. Rollers. Use smooth steel-wheeled rollers in the static mode seating with one to four passes. Do not use pneumatic tire rollers.

(c) Subgrade Preparation. Excavate subgrade to undisturbed soil without compaction allowing the subgrade to be left as permeable as possible. If erosion of subgrade has caused accumulation of fine materials or surface ponding or both, remove the accumulated material using light equipment and scarify the underlying soil to a minimum depth of 6 inches using a spring tooth rake or equivalent and a light tractor. Avoid driving concrete mixers or other equipment through the installation area. Correct and repair damaged or compacted areas to the satisfaction of the Representative. Notify the Representative upon completion of subgrade work for final inspection and acceptance before proceeding with basin and choker course installation.

(d) Detention Basin. Prevent sediment from washing into beds during site development. Cover the bottom of the detention base with a minimum of 2 inches of fine aggregate to prevent soils from migrating into the storm water storage area. Wrap basin sides with a non-woven geotextile fabric. Install detention basin coarse aggregate in 8 inch maximum lifts. Compact the course as specified in Section 360.3. Install aggregates to grades as indicated. Place the specified depth(s) of coarse aggregate on top of the fine aggregate and roll as specified in Section 520.3(b)1. Remove temporary sediment control materials when the site is fully stabilized.

(e) Setting Formwork. Set, align, and brace forms so the cured concrete meets the tolerances and specified elevations. Apply form-release agent to all formed faces in contact with the concrete immediately before placement. Undamaged vertical faces of previously placed concrete may be used for subsequent placement.

(f) Mixing and Hauling. Operate truck mixers at the speed designated by the manufacturer for a minimum of 70 to 100 revolutions of the drum. Unless otherwise approved, place pervious concrete within 90 minutes after final introduction of any mix water.

(g) Placing and Finishing Fixed Form Pavement. Wet the subgrade or subbase with water before concrete placement so the material is saturated but without standing water. Deposit the concrete either directly from the transporting equipment or by conveyor onto the subgrade. Do not place pervious concrete on frozen material. Deposit concrete between forms to an approximate uniform height. Spread the concrete using mechanized equipment or hand tools without segregation.

Where trucks or buses may access the concrete, utilize a paver equipped with compaction tampers.

For other areas, a roller screed or vibrating screed may be used.

(h) Final Surface Finish. Final finish for paver placed concrete is to be achieved with a maximum 2-ton roller to eliminate seams. Do not allow rollers to bridge previously placed and cured concrete for 7 days or before the Representative is satisfied the concrete has achieved sufficient strength to prevent damage.

Steel troweling may be used provided the surface voids remain open and the average density requirement and permeability values are met.

(i) Edging. Edge exterior formed surfaces to a radius of not less than 1/4-inch.

(j) Curing. Begin curing within 20 minutes of concrete discharge. Completely cover the pavement surface with polyethylene sheeting. Thoroughly secure the curing sheet at all exterior edges and interior laps to prevent removal from wind. Maintain curing for a minimum of 7 days.

(k) Construction Joints. Construct joints in the locations specified by either tooling into the pervious concrete immediately upon final finishing to approximately 1/4 slab thickness using a pervious concrete cross rolling tool or saw cut after the concrete has achieved sufficient compressive strength to prevent aggregate from being dislodged. If joints are saw cut, remove fines produced from the operation by vacuum to avoid clogging. If curing is interrupted, control the operation so the polyethylene sheeting and curing is reinstituted within 60 minutes of the initial removal.

(l) Weather. Do not place pervious concrete if air temperatures are projected to fall below 40F or lower any time during the 24-hour period following concrete placement or if rain is forecasted to occur before final finishing and curing. In the event a rainfall event occurs, immediately stop production, form a construction joint, and apply the polyethylene sheeting. With approval, a construction joint may be saw cut before resuming placement. Pervious concrete subjected to rainfall will be evaluated after curing for loss of mortar at the surface and repaired or removed and replaced at the discretion of the Representative.

(m) Testing and Acceptance.

1. Plastic Concrete. Perform unit weight testing on every truck according to ASTM C 1688.

2. In Place Hardened Concrete. Identify and remove three 4-inch diameter cores for each 5,000 square feet according to PTM No. 1. Transport the cores to the LTS for testing, indicating the required concrete thickness, density, and void content from the test sections.

2.a Project core lengths tested by LTS will be considered acceptable if meeting the following:

- Average core length: -3/8-inch + 3/4-inch
- Length of any individual -1/2-inch

2.b Oven dry density. ASTM C 1754.

2.c Core void content. Acceptance will be $\pm 5\%$ of the average voids in the cores of the accepted test section.

3. Infiltration Testing. Perform infiltration on three areas selected according to PTM No. 1 for every 10,000 square feet of pervious concrete placed according to ASTM C 1701. Remove and replace pervious concrete not meeting or exceeding a minimum average infiltration rate of 200 inches per hour. Document the average infiltration value from testing for use in future maintenance activities.

(n) Opening to Traffic. Do not open the pavement to vehicular traffic until the concrete has cured for at least 7 days during which the ambient temperature has exceeded 55F during any time of the day.

520.4 MEASUREMENT AND PAYMENT—Square Foot

SECTION 521—TRANSVERSE JOINT CLEANING AND SEALING

521.1 DESCRIPTION—This work is the cleaning and sealing existing transverse joints in cement concrete pavements and shoulders.

521.2 MATERIAL—

- Joint Sealing Material—Section 705.4(b) or (c)
- Joint Backing Material—Section 705.8

521.3 CONSTRUCTION—Completely remove all existing joint sealing material, neoprene compression seals, asphalt material, and other foreign material in a manner that provides a clean, newly exposed concrete surface. Clean to a minimum depth of 1 1/2 inches.

Immediately before placing backer rod, clean the joint faces. For air blasting, use a compressed air stream of at least 100 pounds per square inch measured at the source. Use air free of oil, moisture, and other contaminants.

Immediately before sealing the joint, place the backer rod to a depth where the top of the rod is one to two times the width of the joint opening plus 1/4 inch below the pavement surface to allow a recessed sealant depth to width ratio of 1:1 to 2:1. Use a backer rod 25 to 35 % larger in diameter than the joint opening.

Seal joint as specified in Section 501.3(n) and as follows:

- Do not place sealant unless joint is clean and dry.
- Do not place joint sealant unless the ambient air and the pavement temperatures are 40F or greater.
- Fill the joint reservoir to a level of 1/8 inch to 1/4 inch below the pavement surface.

521.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 523—ULTRA-THIN PORTLAND CEMENT CONCRETE OVERLAY

523.1 DESCRIPTION—This work is the construction of an accelerated strength ultra-thin Portland cement concrete overlay as indicated.

523.2 MATERIAL—

(a) **Accelerated Strength Portland Cement Concrete.** Section 704.1(b), modified as follows:

- Delete Table A.
- Use concrete reinforced with polypropylene fibers according to ASTM C 1116, Type III 4.13 and ASTM C 1116 (Ref: ASTM C 1018) Performance Level 1 outlined in Section 21, Note 17 and Residual Strength. Use 100% virgin polypropylene (PE) manufactured to an optimum gradation for use as concrete reinforcement.

(b) **Design Basis.** Section 704.1(c), modified as follows:

- Revise the first sentence of the first paragraph as follows:
Make trial mixtures and computations for accelerated strength Portland cement concrete including the molding and curing of test specimens.
- Revise the first sentence of the second paragraph and add a second sentence as follows:
Design a concrete mix for having a 28-day minimum compressive strength of 3,750 pounds per square inch for acceptance when tested according to PTM 604 and a 24-hour minimum compressive strength of 3,000 pounds per square inch. Measure concrete consistency in inches of slump as specified in Section 523.3(v).
- Add the following sentence to the third paragraph:
If the overlay depth is less than 3 inches, use No. 8 coarse aggregate instead of No. 57 coarse aggregate.
- Revise the fifth paragraph as follows:
Use a cement factor of 650 pounds minimum per cubic yard and a water-cement ratio of 0.42 maximum.
- Revise the sixth paragraph as follows:
The Contractor may substitute flyash for Portland cement at a maximum rate of 10% by weight for cement. Include flyash with cement when determining the water-cement ratio. Add PE fiber at the rate of 3.0 pounds minimum per cubic yard.

1. Air Content. Section 704.1(c)3. Revise the first sentence as follows:
Design cement concrete with an air content of 7.0% in the plastic state.

2. Class of Cement Concrete. Section 704.1(c)2. Revise the heading and first sentence as follows:

Accelerated Strength Portland Cement Concrete. The concrete design submitted for review is required to comply with the specified requirements, supported by air content and compressive strength test data according to ACI 211. Delete the last paragraph.

(c) **Concrete Admixtures.** Section 711.3 and as follows:

- If accelerating admixtures are used, provide accelerating admixtures that do not contain chlorides.

(d) **Concrete Curing Material.** Section 711.1 and Section 711.2(a), Type 2

523.3 CONSTRUCTION—Section 501.3, modified as follows:**(a) General.** Section 501.3(a), with the following additions:

Prepare a QC Plan, as specified in Section 106, detailing the timing and sequence of the work, including timing of mixing, hauling, placing, curing, monitoring of concrete temperature, joint sawing, and sampling and testing for compressive strength for opening to traffic. Indicate variations on timing in response to anticipated variations in the air temperature for the time of placement. Submit the QC Plan for review before the start of the project. Do not start work until the QC Plan has been approved.

(e) Preparation and Protection of Base Course. Replace Section 501.3(e) with the following:

(e) Asphalt Surface Preparation. Completely clean milled pavement surface. Limit cleaning to area that will be overlaid the same day. Protect the cleaned and prepared surface from oil or grease drippings from compressors, concrete trucks, spreaders, pavers, etc. by using protective covers. Remove all deleterious materials before overlaying. Sprinkle to thoroughly dampen the asphalt surface immediately before placement of cement concrete without causing pooled or puddle water.

(h) Handling and Placing Reinforcement. Delete Section 501.3(h).**(i) Transverse Joint.** Replace Section 501.3(i) with the following:

(i) Joints. Saw joints as soon as concrete has hardened sufficiently to permit sawing without excessive raveling resulting from the sawing operation. Space joints equidistant longitudinally and transversely. Determine spacing using formula of 1 foot of joint spacing per 1-inch of depth of cement concrete overlay. Saw joints with a green cut saw to a depth of $D/3$ and a minimum width of 1/8 inch. Do not seal joints. Clean joints of all deleterious material after sawing.

Saw soon enough after placement to prevent random cracking. If necessary, conduct sawing operations continuously, both day and night, regardless of weather conditions. Omit sawing if a crack occurs at or within 1.5 feet of a joint location, before the time of the sawing or during sawing. If a crack occurs before acceptance of pavement, remove and replace one full panel width and length.

Other than white curing compound, remove curing materials from overlay, at the location where a joint is to be cut. Remove only sufficient covering to provide space necessary for sawing joints. As soon as the joint is made, replace the covering. The maximum time period allowed for pavement curing covers to be removed is 1/2 hour. If white membrane curing compound is used, cure the joint area, as specified in the first six paragraphs in Section 501.3(l)1.c.

Do not displace coarse aggregate from the joint location using a vibrating T-bar, or using a filler strip at the joint.

(j) Longitudinal Joints. Delete Section 501.3(j).**(l) Curing Concrete.** Section 501.3(l), revised as follows:**1. Normal Curing.** Revise the first sentence as follows:

Allow curing materials to remain in place and maintain as specified, for a period of 24 hours or until the concrete has reached 3,000 pounds per square inch compressive strength.

Add the following paragraphs:

Provide adequate insulating blankets to prevent rapid heat loss if the air temperature is 65F or less. Remove any insulation when a minimum compressive strength of 3,000 pounds per square inch has been attained. Remove insulation at such a rate that the temperature change in the concrete does not exceed 40F within any 1-hour period. If a temperature change in the concrete in excess of 40F occurs within any 1-hour period, whether insulation is used or not, consider the work defective.

The application or removal of insulation covers may be controlled by the use of maturity concepts, provided the minimum degree-hours of curing has been achieved at the top of the slab.

(n) Sealing Joints and Cracks. Delete Section 501.3(n).

(r) Opening to Traffic. Replace Section 501.3(q) with the following:

(r) Opening to Traffic. Sample plastic concrete, for compressive strength testing (PTM No. 604) before opening to traffic, according to the approved QC Plan. The Representative will select sample locations according to PTM No. 1. The Representative will determine when pavement will be opened to traffic, but no sooner than 24 hours or when the concrete attains the minimum required compressive strength. If concrete pavement has not attained a minimum 24-hour compressive strength of 3,000 pounds per square inch at the time of opening to traffic, consider the work defective.

(t) Tests for Depth. Section 501.3(s), with the following exception:

- For projects at intersections and less than 3,000 square yards, drill two cores.

(u) Defective Work. Section 501.3(t), except revise the first paragraph as follows:

Unless otherwise directed in writing by the District Executive, remove and replace, at no expense to the Department, pavement that is; defective in surface tolerance, as specified in Section 501.3(o); defective in compressive strength as specified in Section 523.2(b); defective in depth, as specified in Section 523.3(t); defective in air content, as specified in Section 523.2(b)1; where the temperature change in concrete in excess of 40F occurs within a 1-hour period; or showing surface defects resulting from the effects of rain, hail, improper final finish, excessive raveling of joints during sawing, or honeycombing which, in the Representative's opinion, cannot be repaired.

(v) Test Slab. Construct an off-site slab 2 weeks before placement of accelerated concrete pavement on the project as follows:

Construct the test slab one lane width wide and 12 feet long. Use the concrete mix design specified in Section 523.2(a) and (b) in the test slab. Establish a target value for the consistency during placement of the test slab. The slump for production shall be the consistency of the test slab ± 1 inch. Submit any adjustments for review.

If maturity concept is being used, correlate degree-hours of cure to compressive strength breaks at 8, 12, 16, and 24 hours following placement of the test slab. Establish the minimum number of degree-hours of cure by correlation with compressive strength tests. Verify maturity curves with first 2 days production work, regardless of quantity placed, by recording compressive strength breaks at 8, 12, 16, and 24 hours following placement.

Appropriately time joint saw cut operations as they are proposed for the actual work. The results of this test slab will be used to adjust the timing of joint sawing during construction of the actual project.

Cure the test slab as proposed for the actual work and demonstrate by compressive cylinder breaks, and maturity data if maturity concepts are used, that the mix conforms to the opening to traffic requirement within 24 hours of placement.

523.4 MEASUREMENT AND PAYMENT—

(a) Surface Preparation. Square Yard

(b) Ultra-thin Portland Cement Concrete Overlay. Square Yard

This unit price includes saw cutting of transverse and longitudinal joints and construction of test slab.

(c) Concrete Pavement Cores. Each

The price includes the measuring apparatus, which remains the Contractor's property upon completion of the project. The Department will not pay for additional cores drilled if the depth is deficient by more than 1/4 inch.

SECTION 525—CONCRETE PAVEMENT PARTIAL-DEPTH REPAIR

525.1 DESCRIPTION—This work is the construction of a partial-depth repair of an existing concrete pavement. This type of repair is suitable for use on transverse or longitudinal joints, cracks, and interior slab spalls if the depth of the repair is no greater than half the slab thickness.

Areas requiring repair depths greater than half the slab thickness will be repaired with full-depth concrete pavement patches or corner repairs, as specified in Section 516.

Concrete pavement partial-depth repair is classified by two types as follows:

(a) Concrete Pavement Partial-Depth Repair, Type 1. Spot repairs of transverse or longitudinal joints, cracks, and interior slab surface spalling between 15 inches and 6 feet in length.

(b) Concrete Pavement Partial-Depth Repair, Type 2. Extended length repairs of transverse or longitudinal joints, cracks, and interior slab surface spalling in lengths greater than 6 feet.

525.2 MATERIAL—

(a) Class AA Cement Concrete, Modified. Class AA Cement Concrete as specified in Section 704, except as follows:

- Coarse Aggregate, Type A, No. 8—Section 703.2
- Maximum Water Cement Ratio (lbs/lbs) 0.42

(b) Class AA Cement Concrete, Accelerated. Class AA Cement Concrete as specified in Section 704, except as follows:

- Coarse Aggregate, Type A, No. 8—Section 703.2
- Maximum Water Cement Ratio (lbs/lbs) 0.42

Submit mix design having a minimum target value of 1,500 pounds per square inch compressive strength at 7 hours, when tested according to PTM No. 604.

(c) Rapid-Set Concrete Patching Material. From a manufacturer listed in Bulletin 15, meeting the requirements of ASTM C928.

The material must be tested and meet the minimum test results for the ASTM and AASHTO test methods outlined below:

- The material must have a minimum durability factor of 80% at 300 cycles when tested according to ASTM C666 (procedure B) with and without aggregate extenders.
- A minimum initial set time of 15 minutes at $75\text{ F} \pm 2\text{ F}$ as tested according to AASHTO T 131.

When the depth of the repair is greater than 2 inches, use aggregate extenders according to the manufacturer's recommendations. Use only aggregate extenders included with the prepackaged rapid-set concrete patching material. If aggregate extenders are not included as part of the prepackaged rapid-set concrete patching material, use AASHTO No. 8 coarse aggregate from a Bulletin 14 approved supplier with an expansion index less than 0.10, and only if allowed in writing by the material manufacturer. Use within the shelf life and temperature limitations set by the manufacturer.

(d) Grout. Use the following initial weight proportions:

<u>Cement</u>	<u>Water</u>	<u>Fine Aggregate</u>
2	1	1

Must be placed within 60 minutes of mix completion.

(e) Epoxy Bonding Compound. ASTM C881, Type II or Type V, Grade 2, as specified in Section 706.1 and as follows:

Provide a copy of the manufacturer's written installation instructions to the Representative. Use epoxy bonding compound within the shelf life established by the manufacturer. Apply the epoxy bonding compound within the application setting times (working or pot life) and temperature limitations established by the manufacturer.

(f) Concrete Curing Materials. Sections 711.1 and 711.2

(g) Preformed Cellular Polystyrene. ASTM C578

(h) Expansion Joint Filler. Section 705.1

(i) Joint Sealing Material. Section 705.4(a), (b) or (d)

(j) Tape Bond Breaker. An acceptable self-adhesive tape the width of the sealant reservoir.

525.3 CONSTRUCTION—

(a) General. Prepare and submit for approval a QC Plan specifically for concrete pavement partial-depth repair as specified in Section 106.03(a)2. Detail appropriate action points for all phases of construction including: removing unsound concrete, concrete mixing and curing, joint sawing and sealing, and sampling and testing for opening to traffic.

(b) Repair Area Preparation. In the presence of the Representative, sound the concrete to determine the extent of the concrete delamination using a steel bar, drag chains, or a hammer. Lay out rectangular repair limits to extend approximately 3 inches beyond the edges of the delaminated area. All repair areas will be rectangular, with minimum dimensions of 15 inches in length by 10 inches in width by 2 inches in depth. If partial-depth repair areas are less than 24 inches apart, combine them into one partial-depth repair area.

For areas where delamination extends through a pavement joint, the area should be repaired by maintaining the joint with two separate minimum repair areas unless a detailed procedure for reestablishing the joint and protecting the adjacent joint and crack from mortar intrusion is included in the QC Plan.

(c) Concrete Removal. Remove all unsound concrete in the designated repair area to a minimum depth of 2 inches and a maximum depth of half of the slab thickness.

For Type 1 partial-depth repairs only, saw cut the perimeter of the repair area to a minimum depth of 2 inches. Remove the existing concrete within the repair area to a minimum depth of 2 inches. Use a chipping hammer weighing not more than 35 pounds. Operate the chipping hammer at a 30 – 60 degree angle to remove damaged concrete without causing additional damage and to create a rough surface for proper bonding.

For Type 1 and Type 2 partial-depth repairs when using the milling machine, mill along the joint or crack. The head of the milling machine must be a “V” head, flat head, or a rounded head.

When using a milling machine, square the corners of the repair area by making a saw cut to a minimum depth of two inches. Remove the existing concrete in the corner of the repair area using a chipping hammer weighing not more than 35 pounds. Operate the chipping hammer at a 30 – 60 degree angle to remove the concrete in the corner of the repair area.

Cut and remove any reinforcement in jointed reinforced concrete pavement exposed after the removal of delaminated concrete. Do not cut or remove the reinforcement in continuously reinforced concrete pavement.

Do not disturb concrete outside the limits of the repair area. If the partial-depth repair area becomes a full-depth concrete pavement patch due to excessive, unnecessary removal of concrete or damage to the dowel bars during the concrete removal process, construct a full-depth concrete pavement patch as specified in Section 516 at no additional cost to the Department.

If dowel bars in the transverse joint are exposed and show little sign of corrosion or other damage, apply a bond breaking material to all exposed surfaces of these bars. If the Representative determines the dowel bars are unacceptable due to misalignment or extensive deterioration, construct a full-depth concrete pavement patch or corner repair as specified in Section 516. Resound the repair area in the presence of the Representative to ensure all delaminated concrete has been removed. Remove additional delaminated concrete within the repair area, but do not

exceed half the slab thickness. Produce a rough surface for material bond on all edges created by sawing.

Deploy the final cleaning method within 30 minutes before placing the partial-depth repair material. If using a compressed air stream, ensure it is free of oil, moisture, and other contaminants and has a minimum pressure of 100 pounds per square inch measured at the source. Re-clean areas not repaired within 30 minutes of the final cleaning.

(d) Mixing Equipment. Furnish mixing equipment for volumetrically mixed concrete as specified in Section 704.3 or prepare hand-batched mixtures using a power-driven revolving and tilting drum mixer or suitable revolving paddle mixer capable of thoroughly mixing the repair material. If using drum and paddle mixers, repair material batch sizes must be selected to fall within the minimum and maximum recommended batch size for the mixer.

(e) Transverse and Longitudinal Joints. If the partial-depth repair abuts an existing transverse joint, install 1/2" expansion joint material in the joint. If the partial-depth repair abuts an existing longitudinal joint, install 1/4" preformed cellular polystyrene in the joint. The expansion joint material and preformed cellular polystyrene should extend at least 1/2 inch below the bottom of the repair whenever possible. If the repair material can be sawed without damage, re-establish the joint by sawing through the full depth of the repair. Seal longitudinal joints as specified in Section 512.3 and seal transverse joints as specified in Section 521.3.

(f) Partial-Depth Repair.

1. Class AA Cement Concrete, Modified. Immediately after final cleaning, apply grout or epoxy bonding compound to all exposed surfaces within the repair area. Mechanically mix the grout and apply by brushing or scrubbing in a thin layer onto the concrete surface. Prepare and apply the epoxy bonding compound according to the manufacturer's recommendations. Do not allow the grout or epoxy bonding compound to run or puddle in low spots.

Place concrete in the repair area before grout begins to dry or while epoxy bonding compound is still tacky. Remove dried grout or hardened epoxy bonding compound. Re-clean the repair area as specified in Section 525.3(c) and recoat the repair area with fresh grout or epoxy bonding compound.

Place concrete if the ambient air and surface temperatures are 40 F and rising. Discontinue placement of the mixture if the ambient air and surface temperatures fall below 40 F. Protect repairs from freezing for a minimum of 24 hours.

Consolidate the concrete using a spud vibrator or other acceptable method. Work concrete into saw cuts extending beyond the corners of the repair area. Strike-off and shape concrete to match the surrounding pavement, including wheel ruts. Use expansion joint material and preformed cellular polystyrene temporary forms that extend to the pavement surface to keep the concrete out of existing joints.

2. Class AA Cement Concrete, Accelerated. Section 525.3(f)1

3. Rapid-Set Concrete Patching Material. Place the mixed material only within the manufacturer's recommended installation temperature range and when the ambient air and surface temperatures are 40 F or greater. Discontinue placement of the mixture when the ambient air and surface temperatures are outside of the manufacturer's recommended installation range or lower than 40 F. Protect repairs from freezing for a minimum of 24 hours.

Use vibration or tamping to consolidate the rapid-set concrete patching material. Work concrete into saw cuts extending beyond the corners of the repair area. Strike-off and shape concrete to match the surrounding pavement, including wheel ruts. Use expansion joint material and preformed cellular polystyrene temporary forms that extend to the pavement surface to keep the concrete out of existing joints.

The return-to-service time must be considered when placing the last partial-depth repair before opening to traffic.

(g) Curing.

1. Class AA Cement Concrete, Modified. Use white membrane forming curing compound as specified in Section 516.3(j), except use an atomizing type spray tank with an adjustable nozzle and agitate the solution before each application.

2. Class AA Cement Concrete, Accelerated. Apply white membrane forming curing compound as specified in Section 516.3(j). Cure test cylinders under the same conditions as the partial-depth repair. Provide insulation or heating of repair areas if the ambient air temperature drops below 80 F during the curing operation. Control the curing temperature and monitor at least hourly to ensure the repair area does not experience a curing temperature change in excess of 40 F within any 1-hour period during the curing operation. If a change in curing temperature in excess of 40

F occurs in the concrete pavement patch within any 1-hour period, the work will be considered defective.

3. Rapid-Set Concrete Patching Material. Cure according to the manufacturer's recommendations.

(h) Joint Sealing. Section 525.3(e)

(i) Resounding Repairs. Resound all completed repair areas in the presence of the Representative. Replace any completed repair areas that are delaminated, at no cost to the Department.

(j) Opening to Traffic.

1. Class AA Cement Concrete, Modified. Section 501.3(q), except use repair thickness and length according to Table D.

2. Class AA Cement Concrete, Accelerated. Section 501.3(q).

3. Rapid-Set Concrete Patching Material. Section 516.3(q).

(k) Defective Work. Section 501.3(t), except remove and replace cracked, spalled or delaminated repairs.

525.4 MEASUREMENT AND PAYMENT—

(a) Concrete Pavement Partial-Depth Repair. Square Foot

For the type indicated.

The unit price includes removal of existing pavement and repairs or corrections as specified in Section 525.3 that are needed as a result of partial-depth repair operations.

(b) Joint Sealing. Linear Foot

If transverse or longitudinal joint cleaning and sealing are part of the contract, sealing of joints at partial-depth repair areas are incidental to that item and will not be payable under concrete pavement partial-depth repair.

SECTION 526—RUBBLIZING OF CONCRETE PAVEMENTS

526.1 DESCRIPTION—This work is rubblizing and seating of existing concrete pavements before the placement of a pavement overlay.

Rubblizing is classified into two types as follows:

- (a) **Type 1.** Rubblizing pavement into pieces having a maximum horizontal dimension of 12 inches.
- (b) **Type 2.** Rubblizing pavement into pieces having a maximum horizontal dimension of 8 inches and with at least 50% of the pieces per square yard having a maximum horizontal dimension of 4 inches.

526.2 MATERIAL—

- (a) **Coarse Aggregate, Type A or Type B, No. 1.** Section 703.2
- (b) **Subbase, No. 2A.** Section 350.2

526.3 CONSTRUCTION—

(a) **Equipment.** Submit a pavement rubblizing plan and list of proposed equipment for Department approval before the start of construction. If, during rubblizing operations results are not being obtained, cease all rubblizing operations and submit an alternate plan and list of equipment capable of obtaining the specified results to the Representative. Resume rubblizing operations upon acceptance of the alternate plan.

(b) **Existing Asphalt Surfaces.** Remove any existing asphalt paving materials that are overlaying the concrete pavement, as specified in Section 490.3, before beginning rubblizing operations. Do not remove any existing full depth asphalt patches.

(c) **Rubblizing.** Use mechanical or sonic vibratory equipment capable of providing concrete pieces of the specified dimensions, throughout the full depth of the pavement, on a regular and continuous basis. Provide equipment suitable to the Representative.

For Type 2 rubblizing, ensure that pieces are free of bond with reinforcement to allow adequate seating.

Excavate two, 3-foot by 12-foot, full-depth sections of rubblized pavement, within the first 1/2 mile of rubblizing operations, to ensure that the pavement is being rubblized to the specific dimensions. Excavate additional areas, as directed, to ensure that the specified dimensions are being maintained. Repeat the initial two-section, full-depth pavement removal testing procedure whenever the equipment, rubblizing pattern, or breaking force is changed.

Use coarse aggregate to backfill all excavated areas. Place backfill in maximum 6-inch lifts and compact by rolling until nonmovement is achieved. Do not allow any shoving or wave motion under the roller.

Cut off and remove any reinforcement steel exposed at the surface of the rubblized pavement. If the transverse joints of the original pavement contained steel plates, remove any steel plates that are exposed.

Exercise care during rubblizing operations to prevent shattering pavement edges adjacent to asphalt base repairs.

Exercise extreme care during rubblizing operations to protect and prevent damage to underground utilities, drainage facilities, bridge approach slabs, and bridge decks. Repair any damage that occurs to these areas, at no cost to the Department.

(d) **Seating.** Following the rubblizing operation, use a 50-ton, pneumatic-tired roller, as specified in Section 108.05(c)3.e, to seat the rubblized pavement. Establish a rolling pattern that ensures all areas of rubblized pavement surface are directly contacted by the roller in no more than four passes. Do not use vibratory rollers.

Final seating of the rubblized pavement is satisfactory when vertical deflection under the roller is less than 3/4 inch. Undercut areas where this condition is not achieved. Remove all unsuitable or unstable material. Backfill to existing subgrade with suitable material, to the top of existing subbase with subbase material, and to the top of the rubblized pavement with coarse aggregate. Compact backfill as previously specified in Section 526.3(c).

Fifty-ton rollers may only cross bridges as approved by the Bridge Engineer. Repair any damage that occurs to bridge approach slabs and bridge decks during the seating operation, at no cost to the Department.

(e) Final Surface. After final seating, sweep and clean the surface of the rubblized and seated pavement to remove all loose material.

Prohibit traffic on the roadway after the pavement has been rubblized and seated.

Repair all rubblized and seated pavement areas disturbed by construction traffic, at no cost to the Department.

Complete all operations before construction of the leveling course. If an asphalt leveling course is indicated, apply a prime coat to the rubblized and seated surface, as specified in Section 461, before placing the leveling course.

Complete placement of the overlay within 60 calendar days after rubblizing and seating. Do not leave the rubblized and seated pavement exposed to freezing conditions.

526.4 MEASUREMENT AND PAYMENT—

(a) Rubblize and Seat Concrete Pavement. Square Yard

(b) Class 1A Excavation. Cubic Yard

(c) Class 1B Excavation. Cubic Yard

Measured to existing subgrade level.

(d) Coarse Aggregate. Cubic Yard

For the size indicated.

(e) Removal of Existing Asphalt Surface Course. Section 490.4

SECTION 527 - DOWEL RETROFIT

527.1 DESCRIPTION - This work is the installation of epoxy-coated, smooth dowel bars into existing concrete pavement across cracks or transverse joints without dowels.

527.2 MATERIAL -

- (a) **Load-Transfer Units.** Section 705.3(a), (b) and (g)
- (b) **Caulking Compound.** Section 705.8(b)
- (c) **Preformed Cellular Polystyrene.** ASTM C578
- (d) **Rapid-Set Concrete Patching Material.** Section 525.2(c). Use within the shelf life and temperature limitations set by the manufacturer.
- (e) **Concrete Curing Materials.** Section 711.1 and 711.2(b)
- (f) **Intermediate Curing Compound.** Section 711.2(d)
- (g) **Concrete Admixtures.** Section 711.3
If accelerating admixtures are used, provide only accelerating admixtures that contain no chlorides.
- (h) **Joint Sealing Material.** Section 705.4(a), (b) and (c)
- (i) **Bond Breaker Lubricant.** Provide a commercially available bond breaking lubricant with a flash point of not less than 149F, and recommended for contact with steel materials according to manufacturer's recommendations. Do not use graphite-based lubricants.
- (j) **Expansion Joint Filler.** Section 705.1

527.3 CONSTRUCTION – As shown on Standard Drawings and as follows:

- (a) **Equipment.** Provide a power driven, self propelled saw capable of making two parallel cuts per dowel bar slot. Do not use equipment that may cause pavement to spall or cause surface aggregates to fracture.
- (b) **Slot Preparation and Cleaning.** Saw cut pavement to place center of dowel at mid-depth of pavement slab. If repair area spans different pavement thicknesses, e.g. mainline to ramp transitions, place at the mid-depth of the thinner thickness. Align saw cuts parallel to roadway centerline. Cut three dowel slots (six saw cuts) per wheel path and centered over the crack or transverse joint. Provide three dowel bar slots in each wheel path.
Use a jackhammer weighing not more than 30 pounds to remove concrete between saw cuts. If pavement damage occurs from a 30 pound jackhammer, remove the damaged pavement and use a 15 pound jackhammer. Clean and backfill the damaged pavement area as specified in Sections 525.3(c) and 525.3(d). Create a level surface at bottom of slot parallel to roadway surface.
- (c) **Clean Slots.** Clean exposed surfaces of slots. Remove all loose and foreign material within 24 hours before concrete placement and remove all slurry to prevent debris from emerging once dried. Final cleaning must be completed within 30 minutes before concrete placement. Reclean areas not repaired within 30 minutes of final cleaning or if contamination occurs before concrete placement. When cleaning by air blasting, use a compressed air stream of at least 100 pounds per square inch measured at the source, free of oil, moisture, and other contaminants.
- (d) **Dowel Preparation and Placement.**

1. **Prepare Dowels.** Cut 1/4 inch thick preformed cellular polystyrene material to the cross-section

dimensions of the slot at the joint. Cut an opening in the polystyrene joint material to allow the dowel to fit without stretching and without gaps. Place the material centered on the dowel to form a temporary joint. Apply bond-breaker lubricant to Type B coated dowel bars, unless a bond breaker lubricant has been applied in the shop. Stir the lubricant and apply by daubing, mopping, or with a gloved hand, to produce a thorough coating. Do not use brushes for lubricant application. Apply the lubricant, as specified, at least 1 hour before placing the concrete around the dowel assembly. Type A coated dowel bars do not require lubricant as specified in Section 501.3(i). Place 1 1/2 inch non-metallic expansion caps with 1/4 inch clearance from the end of the dowel to the bottom of the cap. For crack or joint widths greater than 1/4 inch, use expansion joint material in lieu of the preformed cellular polystyrene material with a thickness matching the crack or joint width.

2. Place Dowels. Provide plastic or non-metallic chairs with a minimum 1/2 inch clearance between dowel bar cap and all slot surfaces, including end, both sides and bottom. Place chairs on the bottom of the slot. Place coated dowel bars parallel to roadway centerline and pavement surface not to exceed the following limits

- Vertical tilt or horizontal skew (relative to the plane of the grade and the centerline of the constructed pavement): 0.25 inch maximum displacement of each end of the dowel relative to the midpoint of the dowel.
- Longitudinal translation (relative to the intended crack or transverse joint location, along the direction of travel): 1 inch maximum
- Horizontal translation (relative to the intended location, across the crack or joint): 1 inch

Place dowels to align the temporary joint material with the existing joint or crack. Seal the temporary joint material at the sides and bottom of transverse joint or crack with caulking compound to prevent concrete patching material from entering into existing joint or crack.

3. Epoxy Bonding Compound. Apply according to the manufacturer's recommendations.

4. Fill Slot. Fill slot with concrete patching material. Vibrate to thoroughly consolidate the material in the slot and around dowel bar. Do not allow the dowel bar to move from the specified position.

(e) Final Finish for Pavements not being Overlaid or Diamond Ground. Finish the surface of the slots to match the existing pavement surface profile, including any existing wheel ruts.

(f) Curing of Concrete. Section 516.3(j).

(g) Saw and Seal Joint. Saw and seal transverse contraction joint sealant reservoirs for entire lane width as required

(h) Opening to Traffic. Section 516.3(q).

(i) Defective Work. Remove and replace dowel retrofits that are considered defective, at no additional cost to the Department.

527.4 MEASUREMENT AND PAYMENT – Each

For the existing joint or crack preparation, patching, curing and sealing operations. Includes six dowel bars per joint or crack.

SECTION 528—CONCRETE PAVEMENT CROSS-STITCHING

528.1 DESCRIPTION —This work consists of cross-stitching longitudinal cracks and may include cross-stitching longitudinal joints in plain cement concrete pavement by placing epoxy coated deformed tie bars, at an angle, across the longitudinal joint or crack.

528.2 MATERIAL—

- (a) **Reinforcement.** Section 705.2(a)
- (b) **Epoxy Bonding Compound.** Type I, Grade 3 Class B or C, as specified in Section 706.1, from a supplier listed in Bulletin 15. Follow the manufacturer's recommended procedures. Provide the Representative with the material data sheets before the start of work.
- (c) **Joint Sealing Material.** Section 705.4 (b) or (c)

528.3 CONSTRUCTION—

(a) **General.** Prepare a QC Plan as specified in Section 106.03 and submit it for review a minimum of 14 days before the start of work. Detail all of the construction procedures, equipment, and materials to be used. Demonstrate the cross-stitching operation to the Representative to receive final approval of operation procedures and an assessment of the capability of the equipment to be used. Perform the demonstration on a longitudinal crack or a longitudinal joint located within the project limits.

Do not perform work if either the ambient air temperature or the pavement surface temperature is below 40F. Do not move drifted slabs back into position against the adjacent slabs. Do not use cross-stitching on transverse joints or cracks.

Before cross-stitching longitudinal pavement joints make a full depth saw cut, in the existing longitudinal joint, along the entire length of the slab.

(b) **Equipment.** Use a hydraulic powered drill that minimizes damage to the concrete surface. Provide a drill rig to assure that the proper drill angle is maintained. The use of a gang mounted drill is allowed.

(c) **Drill Holes.** Drill holes no more than 3/8 inch larger in diameter than the tie bar on each side of the longitudinal joint or longitudinal crack at the required angle, offset distance, and spacing as shown on the Standard Drawing RC-26M. If spalling of the concrete pavement surface occurs, drill shallow vertical holes at each tie bar location. Drill angled holes to intersect the crack at approximately mid-depth of the pavement thickness. Do not allow the drilled hole to extend through the bottom of the slab. Thoroughly clean the drilled holes of all dust and debris. If using compressed air, use a stream measuring at least 100 pounds per square inch at the source, free of oil, moisture, and other contaminants.

When cross-stitching existing longitudinal joints, drill holes to the alignment shown on RC-26M. Change location of drill holes ± 1 inch to avoid existing longitudinal tie bars.

(d) **Installing Tie Bars.** Assure the drilled holes are dry and clean. Inject the epoxy bonding compound into the hole using a caulking gun or other approved method, leaving adequate space for the tie bar. Rotate the tie bar three to five complete rotations while inserting the tie bar to purge air voids as completely as possible. Provide 1 inch coverage for the tie bar at the surface of the pavement. Trowel the epoxy bonding compound flush with the pavement surface.

(e) **Sealing.** Route the longitudinal crack or longitudinal joint to a width of 3/4 inch wide and a depth of 1 inch. Immediately after routing, flush the entire longitudinal crack or longitudinal joint with water. Immediately before placing the sealant, clean the longitudinal crack or longitudinal joint. Do not place joint sealing material until the faces are thoroughly clean and dry to the satisfaction of the Representative.

Do not place sealing material if either the ambient air temperature or the pavement surface temperature is below 40F. Fill the longitudinal crack or longitudinal joint to a level of 1/8 inch to 1/4 inch below the pavement surface. Do not let sealing material spread over the pavement surface.

(f) Opening to Traffic. Do not open to traffic until the anchoring material has fully cured in accordance with the manufacturer's recommendations.

(g) Defective Work. Remove and replace any pavement slab where drilled holes have extended through the bottom of the slab with a full depth pavement patch at no additional cost to the Department.

528.4 MEASUREMENT AND PAYMENT— Each

Measurement of cross-stitching will be made per tie bar, at each individual location. Drilling holes, epoxy bonding compound, tie bar installation, crack sealing and all other items of work will be incidental to the payment for cross stitching.

SECTION 529—FULL DEPTH PRECAST/PRESTRESSED CONCRETE PAVEMENT SLABS

529.1 DESCRIPTION—

(a) **General.** This work consists of furnishing and installing Precast Concrete Pavement Slabs (PCPS) for intermittent patching and continuous applications with cast-in features for establishing load transfer, lane-to-lane ties and uniform support under the slabs and all activities and materials incidental to site preparation for same.

The work includes, but is not limited to, the following:

- Taking pavement cores of existing pavement in traffic lanes to verify the existing pavement thickness, a minimum of one per lane at each full depth repair location for a repair area of less than 100 feet in length. If length of repair is greater than 100 feet, perform coring at minimum 100-foot intervals. Additional cores may be required as directed by the Representative before the design of the precast concrete pavement slabs to verify existing pavement conditions.
- Engineering and design of the precast paving slabs
- Saw-cutting and removal of existing pavement
- Existing or new subbase preparation
- Furnishing and installing accepted bedding material, as required
- Fine grading of the subbase and bedding
- Installation of load transfer units (dowel bars) at transverse joints
- Installation of tie bars along the longitudinal joints
- Fabrication and furnishing precast paving slabs including all concrete, reinforcing steel, dowel bars, tie bars, and quality control
- Transportation and storage
- Placement of precast slabs including erection equipment
- Slab undersealing
- Patching of dowel bar and tie bar slots and other designated blockouts, ports, and embedments
- Temporary asphalt pavement wedge transition
- Diamond grinding
- Joint sawing, if applicable, and joint sealing
- All material certification(s) and testing of material(s)

529.2 MATERIAL—From a manufacturer listed in Bulletin 15. All materials must meet all requirements as specified in Section 106.

(a) Precast Concrete Structures. Section 714

- Epoxy Coated Tie Bars. Section 705.2
- Epoxy Coated Dowel Bars. Section 705.3
- High Performance Dowel Bars. Section 530
- Hot or cold applied joint sealer only. Section 705.4 (a), (b), (c), (g), (h). Backer rods (Joint Backing Material) will not be used.

(b) Prestressed Concrete Structures. Section 714

- Epoxy Coated Tie Bars. Section 705.2
- Epoxy Coated Dowel Bars. Section 705.3
- High Performance Dowel Bars. Section 530
- Hot or cold applied joint sealer only. Section 705.4 (a), (b), (c), (g), (h). Backer rods (Joint Backing Material) will not be used

(c) **Concrete.** Provide materials according to manufacturer's recommendations.

- Cement Concrete. Section 714.3
- Epoxy Grout. Section 1080.2(g)
- Curing Materials. Section 711.2(a)
- Class AA accelerated cement concrete for patching utility casting blockouts. Section 704

(d) **Reinforcement Steel.** Coat all reinforcement steel, dowel bars and longitudinal joint ties with epoxy according to ASTM A775 and as specified in Section 1002.1. If indicated on the Contract Drawings, dowel bars and other appurtenances of Load Transfer Units shall meet the requirements as specified in Section 530.

(e) **Fine-Grained Granular Bedding Material.** Use bedding material meeting the requirements as specified in Section 703.1 and the gradation according to manufacturer's recommendations. The bedding thickness will not exceed 1/2 inch.

(f) **Cement-Treated Bedding Material.** Use the mix design according to manufacturer's recommendations. The mixture consists of Portland cement and Cement Concrete Sand that meets the material requirements as specified in Section 703.1 Cement Concrete Sand, Type A. A minimum compressive strength of 500 pounds per square inch must be achieved at the time of opening to traffic. Do not exceed a bedding thickness of 2 inches.

At least 28 days before installation of the slabs, mix a minimum of one trial batch of the bedding material according to the recommendations of the manufacturer under the same time and temperature conditions expected during actual installation. Make and test cubes according to AASHTO T 106. Provide independent laboratory test results to the Representative that the required compressive strength can be achieved.

(g) **Grout Material for the Transverse Dowels, Longitudinal Tie Bar Slots, and Lifting Insert Ports.** Provide grout material according to manufacturer's recommendations. The final mix must be capable of being pumped into the slots and attain a minimum compressive strength of 2,500 pounds per square inch before the slabs are opened to traffic. Mix and use prepackaged grout material according to manufacturer's recommendations. Make and test grout cylinders according to PTM No. 521.

At least 28 days before installation of the pre-cast pavement, mix a minimum of one trial batch of the dowel grout according to manufacturer's recommendations under the same time and temperature conditions expected during actual installation. Provide independent laboratory test results to the Representative that the required compressive strength can be achieved. Use the same mix for actual installation as was used for the demonstration.

(h) **Cementitious Bedding Grout.** Provide grout material according to manufacturer's recommendations. Design, mix and use bedding grout material according to manufacturer's recommendations. The final mix must be capable of being pumped into the voids beneath the slabs and attain a minimum compressive strength of 1,000 pounds per square inch before the slabs are opened to traffic and 2,500 pounds per square inch in 12 hours. Submit the mix design and pump equipment to be used to the Representative for approval. Make and test grout cylinders as specified in PTM No. 521.

At least 28 days before installation of the slabs, mix a minimum of one trial batch of the bedding grout according to manufacturer's recommendations under the same time and temperature conditions expected during actual installation. Provide independent laboratory test results to the Representative that required flowability and compressive strength has been achieved. If Setting Bolts or Strongback Beam is used to set the slab to required elevation, test the grout cylinders for the required time for grout to attain a compressive strength of 50 pounds per square inch. Use the same mix for actual installation as was used for the demonstration.

(i) **Polyurethane Bedding Grout.** Provide grout material as specified in Section 679.2(c). Design, mix and use bedding grout material according to manufacturer's recommendations. The final mix must be capable of being pumped into the voids beneath the slabs.

At least 28 days before installation of the slabs, mix a minimum of one trial batch of the bedding grout according to manufacturer's recommendations under the same time and temperature conditions expected during actual installation. Provide independent laboratory test results to the Representative that required material conforms to requirements as specified in Section 679.2(c). Use the same mix for actual installation as was used for the demonstration.

(j) Foam Gasket Material. Use open-cell, 2 pound polyester foam gasket material according to ASTM D3574, and being capable of being fully compressed under the weight of the slab.

(k) Bond Breaker. Use a bond breaker to coat dowel bars according to manufacturer's recommendations.

(l) Rebar Coupling Device. Use a rebar coupling device that is listed in Bulletin 15 to splice reinforcement steel. Ensure the mechanical coupling device develops a minimum of 125 percent of the specified yield strength of the reinforcement steel. If the reinforcement steel has either galvanizing or an epoxy coating, use a mechanical coupling device with a matching coating system. Provide certification of compliance as specified in 106.03(b)3.

(m) Subbase (No. 2A). Section 350.

(n) Asphalt Tack Coat. Section 460.

(o) Temporary Asphalt Pavement Wedge Transition. Use Superpave Asphalt Mixture Design, Wearing Course (Scratch), PG 64S-22, 0.3 to < 3 Million ESALs, 9.5mm Mix, SRL-L – Section 413

529.3 CONSTRUCTION—As indicated on the contract drawings, and as shown on the accepted shop and working drawings, and as follows:

(a) Fabrication. Fabricate as required by the manufacturer.

1. Qualification of the Manufacturer. Manufacturer's PCPS system must be listed in Bulletin 15.

2. Concrete Mix Designs. At least 28 days before the commencement of precast slab production, provide any concrete mix designs to be used on the project to the Representative for acceptance. The mix designs must include trial batch test data demonstrating that each mix design will achieve the minimum required compressive and flexural strength. The representative may request flexural strength test results be obtained at any time thereafter; however, flexural strength tests are not required for acceptance of precast slabs. In the event that the contractor cannot provide flexural strength test results that meet or exceed the minimum values stated in Section 529.3(c), the Representative may request the contractor to direct the manufacturer to retrial batch the concrete mix design.

3. Fabrication Submittals. Fabricate the slabs as specified in Section 714 and the requirements herein. Provide Shop Drawings, Working Drawings, and Manufacturer's quality control plan, to the Representative at least 21 calendar days before the pre-production meeting. The Representative has 21 calendar days to review submission before providing notice to the Contractor of acceptance or rejection.

4. Thermal Expansion. For continuous prestressed precast paving systems, the mix design must account for ambient average daily temperatures and exposure conditions at the project site to determine correct panel size and expansion joint locations. Use standard values for the expansion coefficient found in the AASHTO Mechanistic-Empirical Pavement Design Guide for aggregate expansion.

5. Casting Concrete. Cast concrete pavement slabs with a maximum length of 15 feet (20 feet if prestressed) and a minimum length of 6 feet, and width based on the proposed longitudinal joints shown on the Shop Drawings. Adjust slab length to match transverse joints between slabs with existing, adjacent transverse joints as much as possible. Lay out precast slab transverse joint locations in a manner that will allow for expansion and contraction at the existing and proposed joints. Provide blockouts in the slabs for existing utility castings and proposed drainage structures.

6. Sacrificial Slab Thickness. Cast concrete pavement slabs 1/4 inch thicker than nominal design thickness.

7. Slab Surface Texture. Fabricate the bottom surface texture to be smooth; the top surface texture to be either broom, turf drag, or longitudinal or transverse tine finished as specified in Section 501.3 (k). Perform top surface texture before applying curing materials.

8. Load Transfer Dowels. Cast load transfer dowels and tie bars in the slab as indicated on Shop Drawings. Cast the dowels and bars square to the edge and parallel to the top surface of the slab within $\pm 1/8$ inch of the locations shown on the Shop Drawings.

9. Slots for Dowels and Tie Bars. Cast the slots for the transverse dowels and longitudinal tie bars in the slabs to accommodate dowels and tie bars to within $\pm 1/8$ inch of the locations shown on the Shop Drawings.

10. Grout Ports. Insert grout ports for dowel bar slots and undersealing/bedding grout in the slab as indicated on the Shop Drawings.

11. Lifting Devices. Lifting devices shall meet the requirements as specified in Section 1105 and be placed per accepted Shop Drawings. Recess each lifting device in the slab a minimum of 1 inch below the surface. After acceptance of each slab installed in the roadway, fill all exposed lifting device with an accepted cementitious grout.

12. Bond Breaker. Coat the portion of the dowels cast into the precast slab with bond breaker.

13. Foam Gasket. If required by the manufacturer, place on each slab a wide foam gasket attached to the underside edge of the slab to prevent grout leakage and to create discrete grout chambers between corresponding ports. Indicate the locations of all the gaskets clearly on the slab Shop Drawings.

14. Slab Setting Bolt Hardware. If required by the manufacturer, place slab setting bolt hardware. Indicate the locations of all the slab setting bolts clearly on the slab Shop Drawings.

15. Slab Dimensions and Tolerances. Construct slabs to the dimensions as indicated on the authorized Shop Drawings. Slabs are rejected if the fabricated dimensions are not within the tolerance shown in Table A:

TABLE A – Slab Fabrication Tolerances

Slab Feature	Tolerance
Length and width	$\pm 3/16$ inch
Thickness	$\pm 1/8$ inch
Difference in diagonals not to exceed	3/16 inch
Edge Squareness (in relation to top and bottom surfaces)	1/8 inch in 10 inches

(b) Working Drawings. Furnish working drawings as specified in Section 105.02(c). Include the following items in the working drawings:

- Locations of all cores to be taken from existing pavement.
- A slab layout drawing that shows the location of each slab in the finished pavement appropriately marked and numbered.
- Layout drawings that indicate the placement, spacing and diameter of any required grout reservoirs in the precast pavement.
- A work plan for grouting slabs and contingency plan if a slab cannot be grouted in time for opening to traffic.
- Installation drawings that indicate the placement of the slabs, any required bedding layer and the placement of any required supplemental aggregate material for subbase or subgrade soil remediation. These drawings will also indicate the required strength that any grout must obtain before slabs may be opened to traffic.

(c) Shop Drawings. Furnish shop drawings as specified in Section 105.02(d). Note on the shop drawings that the minimum concrete compressive strength will be 4,925 pounds per square inch and the minimum concrete flexural strength will be 650 pounds per square inch. Include the following items in the shop drawings:

- Reinforcing size and position.
- Detailed piece drawings showing the locations and sizes of dowels, tie bars, slots for the transverse dowels and longitudinal tie bars, utility casting blockouts, and all three-dimensional geometry related to widths,

lengths, thicknesses, and warps of each slab. Add 1/4 inch of sacrificial concrete to the top surface of each slab. The sacrificial concrete will not be included in the design calculations for any slab nor will it be considered as contributing to depth of cover over reinforcement. The sacrificial concrete may or may not be milled off the slab during construction at the discretion of the representative.

- Provide the following information for the precast slab leveling system if the setting bolt method is used:
 - Size and thickness of the steel bearing plates with supporting design documentation, including calculations and test data verifying that the plates can support the required loads without excessive settlement or vertical deflection. Calculations for the plates shall consider the possibility of ungrouted slabs if there is a potential for opening to traffic before bedding and dowel slot grout is placed and sufficiently hardened as specified in Sections 529.3(f)8 and 9.
 - Corrosion protection details of the steel bearing plates
 - Slab setting bolt and insert design and details
 - Name of fabricator listed in Bulletin 15
- A production note sheet indicating the source of materials, testing methods, weights of each slab, tolerances and all details relating to yard storage (including the size and position of required dunnage), shipping and handling.
- For prestressed, precast slabs, indicate the type of prestressing tendons to be used, layout of the prestressing tendons, the prestressing force to be applied, and the calculations that indicate the level of prestress available at the mid-slab location.

(d) Project Meetings. Provide a facility for the meetings as agreed upon by the Representative. The Representative will conduct the meeting.

1. Precast Pavement Planning Meeting. Before Shop and Working Drawing preparation, or any fabrication of the precast slabs, hold a precast pavement planning meeting with the Representative, inspection personnel, CQAS representative, SMS representative, project superintendent, project foreman, project surveyor, grout installers, sawcutters, the technical representative of the precast concrete slab system, precast slab fabricator, and all other subcontractors who will be involved in the precast pavement construction work. Submit Contractor's QC plan, repair plan, and emergency MPT plan at least 21 calendar days before the precast pavement planning meeting. The Representative has 21 calendar days to review the submission. As a minimum, the following items will be covered during this meeting:

- Review the process for accurately surveying to provide needed dimensions for the precast slabs
- Review the process for installing the precast slabs
- Determine the slab sizes necessary for the project
- Develop a Resource Loaded Schedule
- Determine when manufacturer must begin production in order to meet project schedule
- Review Contractor's QC Plan, repair plan, and emergency MPT plan
- Plan for gathering the field data necessary for the Shop and Working Drawing preparation
- Identify the equipment and materials necessary to complete the work
- Schedule of field measurements of existing repair locations for purposes of developing detailed Shop and Working Drawings

2. Pre-fabrication Meeting. Hold a pre-fabrication meeting at least fourteen 14 calendar days before the start of precast slab production at the fabricators facility with the Representative, SMS representative, inspection personnel, the technical representative of the precast concrete slab system, precast slab fabricator's production, quality control and engineering staff, and the project superintendent or their designee. As a minimum, the following items will be covered during this meeting:

- Review the fabricator's accepted Shop drawings
- Review the fabricator's production plan
- Review the fabricator's approved materials and approved mix design
- Review the fabricator's accepted QC plan
- Review QA procedures and roles and responsibilities
- Review slab marking and ID requirements

- Review storage requirements
- Review shipping and documentation requirements

3. Pre-placement meeting. Hold a pre-placement meeting 10 to 14 calendar days before the planned start of the slab installation with the Representative, CQAS representative, inspection personnel, project superintendent, project foreman, project surveyor, grout installers, the technical representative of the precast concrete slab system, precast slab fabricator, and all other subcontractors who will be involved in the precast pavement construction work. The technical representative of the precast concrete slab system will provide recommendations on the installation techniques and requirements of the precast concrete slab system. Aspects to be discussed during the meeting include, but are not limited to:

- Laying out saw cuts for the new slabs
- Sawing, cutting depth and width
- Removing existing pavement without damaging pavement to remain
- Lifting capacity of installation equipment and required footprint (available area within lane closure)
- Review contractor accepted repair procedure
- Setting up rails for grading
- Calibrating and using specialized equipment
- Installing and grading the bedding material
- Laying out slab point marks
- Placement of the new slabs
- Installing the dowel and grout material
- Review Contractor's accepted emergency MPT plan

The technical representative is required to be onsite for:

- The first 2 days of slab installation at a minimum
- If corrective work is necessary
- As directed

(e) Installation Plan. Prepare a detailed installation plan and present to the Representative, and the technical representative of the PCPS system at least 21 calendar days before the planned start of slab installation for acceptance. Ensure the plan indicates, at a minimum, the following information as required:

Instructions, methods, and equipment for lifting, moving, protecting, lowering, and adjusting the slabs into position. Provide size, weight, load distribution and lifting capacity of all installation cranes, excavators, and all other special lifting equipment. Provide evidence the equipment does not impose detrimental loads on any pavement, precast or otherwise, it occupies. As a minimum, the installation will also require the following:

- Rigging to be used for lifting the slabs
- Routes to be used by the delivery trucks
- Plans for maintenance and protection of traffic
- Proposed method and equipment used for fine grading, if required
- Method to level the slab
- Materials proposed for dowel and bedding grout
- Grout mix designs to be used for each grout
- Equipment to be used for mixing and installing the grouts
- Description and notes for saw cutting and method of removal of existing pavement that will minimize disturbance to the subbase

(f) Installation Processes. Install the PCPS according to the following requirements.

1. Authority of the Technical Representative. Obtain, maintain, and comply with directions and guidance provided by the Technical Representative throughout the installation process.

2. Surveying and Engineering. Before any slabs are fabricated and before existing pavement is removed, determine the theoretical surface elevations and dimensional sizes of the new slabs based on the proposed longitudinal joint locations. Survey and analyze elevations of the existing abutting pavement to remain, as required, to establish the surface elevations of the new slabs. Use these elevations for fabrication of the new slabs. Provide accurate survey layout of the proposed longitudinal joints before sawcutting.

3. Sawcut and Removal of Existing Pavement. As specified in Section 516.3(a), (b) and (c) with the following exceptions:

3.a Use a diamond saw to sawcut the full depth of the limits of the precast slabs and the proposed longitudinal joints.

3.b Do not use a wheel saw with carbide steel tips.

3.c Remove existing concrete or composite pavement using the lift out method. The lift out method consists of installing lifting devices and lift out the existing concrete or composite pavement in the area enclosed by the full-depth saw-cuts, in one or more pieces, without disturbing the existing subbase.

3.d Dispose or reuse removed pavement as specified in Section 104.06.

3.e The slab may be sawcut and the lift out holes may be drilled up to 5 calendar days before the concrete removal.

3.f Only remove concrete that can be replaced during the workday.

3.g Establish longitudinal joint between precast slabs and existing pavement by overcutting the existing longitudinal joint sufficient to provide a straight and smooth joint. Only sawcut and remove the existing pavement enough as required to establish a suitable joint.

4. Subbase Preparation. After the existing concrete has been removed, remove existing material to the required subgrade elevation for the PCPS installation method for the theoretical bottom of the new concrete slab. Before placing the slab, remove remaining existing OGS when present. Remove any soft, wet, or unsuitable subbase and subgrade material in the area of the slab replacement as directed. Place and compact No. 2A Coarse Aggregate, as specified in Section 703.2, as specified in Section 350. Shape the final surface of the subbase to a firm and even surface within a tolerance of plus or minus 1/2 inch of grade and contour.

5. Slab Leveling. Place each slab to the line and grade indicated on the Working Drawings, within the tolerances as specified in Section 529.3(f)6 and 7, and according to the manufacturer's recommendations. Place slabs using one of the methods described below or per the method designated for the accepted PCPS system.

5.a Placement and Fine Grading of Bedding Material. Perform all fine grading of the bedding material using a laser or otherwise mechanically controlled screeding device. Use screeding device capable of grading fully compacted bedding material and of being adjusted to the required cross slope and to the required tolerance of each pavement slab. Other grading devices and methods are allowed, if they are capable of grading fully compacted bedding material to the required tolerance.

Provide a pavement slab bed that serves as the grade control for the slabs placed upon it, such that slabs need not be adjusted for grade after they have been placed. Grade and check the surface to ensure it does not vary from the theoretical plane more than 1/8 inch over a length of each slab. Use personnel trained in use of the screeding device.

Examine the bedding surface using a straight-edge and depth gage accepted before placing the slabs. Provide a straight-edge not less than 10 feet long, and a depth gage not less than 6 feet long with the depth set equal to the thickness of the slab. Correct surface variations greater than the 1/8 inch in the bedding material before placement of the slab.

5.b Setting Bolts. Set the slab at the desired elevation using four symmetrically located threaded setting bolts to control the elevation of the slab. Preposition four steel plates, of a minimum size and thickness indicated on the

shop drawings on the prepared base before placing the slab at the designated location. Position plates to coincide with the location of the setting bolts in the slab. Use cementitious or polyurethane bedding material, as designated for the accepted PCPS system, to fill the gap between the compacted base and the slab bottom. Remove the setting bolts from the slab as soon as the cementitious bedding material has attained a compressive strength of 50 pounds per square inch or within 15 minutes after injection of the polyurethane material.

Slab placement technique requires fabricating threaded sleeves in the slab. Secure the sleeves in the concrete as detailed in the fabricator Shop Drawings to resist pop-out of the sleeves during the slab-setting operation.

5.c Polyurethane Leveling. Grade the compacted subbase about 0.5 to 1 inch below the design elevation of the slab bottom. Place slabs in the repair area and raise to the correct elevation by injecting polyurethane material under the slabs using grout holes. Ensure that there is no excessive uplift of the slab, that the slab is raised uniformly across the full slab, and that the polyurethane provides uniform support under the slab.

5.d Strongback Beams. Set the slabs at the desired elevation using the elevation of the existing pavement at each side of the repair area by fastening each slab to two strongback beams that extend about 2 feet beyond the repair area. Fasten beams to the slab using the lift inserts and long bolts with the lifting hooks while the slab is on the delivery truck. Use cementitious or polyurethane bedding material to fill the gap between the compacted base and the slab bottom. Remove the strongback beams from the slab as soon as the cementitious bedding material has attained a compressive strength of 50 pounds per square inch or within 15 minutes after injection of the polyurethane material.

6. Pavement Slab Placement. If a series of slabs are installed continuously, survey before the placement of any slabs, marking out the trailing ends and leading edges of all slabs to ensure proper placement and fit. Ensure the marks account for proper joint widths.

Install dowel bars and joint ties as indicated and as specified in Section 705.3. Coat the dowel bars and the vertical edges of the slab as per the accepted detailed installation plan, with bond breaker before setting any slabs to break the bond between the concrete slab and the dowel grout.

Do not exceed 1/4 inch finished vertical differential across any joint. Check the vertical differential before setting the next slab. Remove the slab and regrade the subbase or bedding material until the differential is 1/4 inch or less before setting the next slab. Alternatively, in the event that the finished vertical differential across any joint is greater than 1/4 inch and, not more than 1/2 inch, above the elevation of any adjacent slab or pavement, the precast slab may remain in place and be subject to diamond grinding to achieve the required tolerance at no additional cost to the Department, as accepted. The thickness of all precast slabs must include a sacrificial thickness of 1/4 inch when delivered to the project site to accommodate the diamond grinding to bring the precast slabs into tolerance. Diamond grinding the precast slab greater than 1/4 inch is not permitted. Remove any slab and regrade the subbase or bedding material if that slab presents a finished vertical differential greater than 1/2 inch above any adjacent slab or pavement.

Protect dowel and tie bars exposed at the end of a setting period. Remove and replace any slab if any exposed dowel or tie bars in that slab do not meet specifications at the time any adjacent slab is ready to be placed, as directed.

For repair areas that require more than one work shift to complete the entire repair, proceed with work in the direction of traffic flow. If a temporary vertical drop off condition from precast slab to the existing pavement is greater than 2 inches, provide temporary asphalt pavement wedge transition as specified in Section 901. Do not leave a permanent vertical differential between any repair section and any permanent pavement section of more than 1/4 inch.

7. Joint Gap. Place slabs so the width of any transverse joint between the slabs does not exceed 1/2 inch and is a minimum of 1/4 inch along its entire length. Any transverse joint that is less than 1/4 inch at any point along its length must be sawcut to obtain a minimum of 1/4 inch. The width of the longitudinal joints must not exceed 3/4 inch. If the slabs are opened to traffic before the dowel slots are grouted or patched, shim all open joints to prevent drift of the slabs in any direction under traffic.

7.a Load Transfer at Transverse Joints. Use the load transfer method at transverse joints provided for the accepted PCPS system or as indicated in the accepted fabricator Shop Drawings. The following methods may be used to provide load transfer at transverse joints:

7.a.1 Using slabs with dowel slots at the slab bottom at one transverse edge and embedded dowels at the other transverse edge, as indicated in the accepted fabricator Shop Drawings. For repair applications, drill and install dowels in the existing pavement.

7.a.2 Using slabs with conventional dowel slots at one transverse edge and embedded dowels at the other transverse edge, as indicated in the accepted fabricator Shop Drawings. In this method, the dowel slots have wider mouths, about 2 1/2 inches wide at the surface. Patch the surface slots during the same lane closure as used for placing the slabs using the details indicated in the accepted fabricator Shop Drawings.

7.a.3 Using slabs with narrow-mouth dowel slots at the surface, as indicated in the accepted fabricator Shop Drawings. Narrow-mouth dowel slots are approximately 1 inch wide at the slab surface and tapering out to approximately 3 inches wide about 1 inch below mid-slab depth. This technique allows the slabs fabricated with surface dowel slots to be left in place in the repair area without immediately patching the slots. Use the following installation steps:

- For repair applications, drill the dowel holes in the existing pavement before the placement of the slab.
- Position the dowels in the longer surface slots in the slab before slab placement.
- During the same or the next lane closure, slide the dowel bars into the corresponding narrow-mouth surface slots. The dowel bars are held in place, at proper alignment, using a magnetic clamp or a similar device.
- Patch the slots during the same lane closure as the slab placement or during a subsequent lane closure.

7.b Tie Bars Along Longitudinal Joints. Install tie bars along the longitudinal joints as indicated in the accepted fabricator Shop Drawings for precast slabs placed in continuous paving sections greater than 65 feet in length. Do not place tie bars in a manner that will reduce or prevent the movement of existing joints adjacent to the precast slabs. Use one of the following steps to install tie bars:

7.b.1 Drill and install tie bars in the existing pavement. Locate tie bars indicated in the accepted fabricator Shop Drawings. Use slabs with the tie bar slots at the slab bottom.

7.b.2 Use the cross-stitching technique as indicated in the accepted fabricator Shop Drawings. Seal all longitudinal and transverse joints as specified in Section 501.3(n).

8. Placing Dowel and Tie Bar Grout. Patch or grout the dowel and tie bar slots using one of the following methods, as designated for the accepted PCPS system:

8.a Dowel Slots at the Slab Bottom. Place the approved rapid-setting dowel slot grout through grout ports into each slot. Place the grout into the slab perimeter joint gap until the grout material is at the top of the joints. Use bond-breaking material on the joint faces of the existing pavement so the dowel grout material will not bond to the existing pavement.

Align the saw-cut along the existing pavement beside the joint during joint sawing for the sealant reservoir.

8.b Dowel Slots at the Surface (Conventional or Narrow-mouth). Patch the dowel slots as specified in the dowel retrofit method, Section 527.3(d). Ensure that no patch material flows into the joint gap.

8.c Finishing. Finish off the top of the grout ports, insert holes, and all surface damage repairs with the same finish as the rest of the slab surface. Do not allow traffic on the slab until the grout has reached a minimum compressive strength of 2,500 pounds per square inch.

9. Placement of Bedding Grout. Underseal all slabs placed directly over the granular or cementitious bedding material using the accepted cementitious or polyurethane undersealing grout material as demonstrated in the trial batching procedure. Distribute grout ports uniformly across the slab area as indicated in the accepted fabricator Shop Drawings. Use a minimum of four grout ports per slab.

Pump or pour the bedding grout into the grout port on the end of the slab until it comes out of the corresponding port at the other end of the slab, ensuring full bedding of the slab in that chamber. Fill all remaining

ports in the same manner. Monitor the grout level in previously filled ports and add grout as required to keep it level with the top of the slab. Minimize spillage and necessary cleanup of the slab surface.

After the bedding grout has taken initial set, and before it hardens completely, remove the bedding grout from the top 2 inches of each bedding grout port and replace with slot patching grout, patching material or other accepted higher-strength rapid-setting patching material. Ensure the grout reaches a minimum strength of 2,500 pounds per square inch before opening to traffic.

10. Opening Slabs to Traffic. Open repair areas to traffic only after the following applicable conditions are met:

10.a Dowel Slots at the Slab Bottom or Narrow-Mouth Surface Slots. If opening slabs to traffic before installation of dowel and bedding grouts, install a minimum of two incompressible shims in each transverse joint to prevent ungrouted slabs from hitting and spalling under traffic conditions. If ungrouted slabs settle or develop edge differentials under traffic conditions that are greater than 1/4 inch, remove the ungrouted slabs, regrade the bedding surface, and reset the slabs before grouting. If the settled slab cannot be removed because it is in the middle of a run of new slabs, diamond grind the surface of the pavement, as specified in Section 514, until the edge differential is less than the allowable 1/4 inch. Ungrouted slabs may be temporarily opened to traffic as specified in Section 529.3(f)10.c. Grouted slabs can be opened to traffic after the dowel and bedding grout have reached the minimum acceptable strength.

10.b Dowel Slots at the Conventional Surface. If conventional surface dowel slots are used, open slabs to traffic only after the grout for dowels and tie bars (if applicable) and the bedding grout have reached the minimum acceptable strength.

10.c Temporarily Opening to Traffic Before Grouting. Minimize the exposure of precast slabs to traffic before patching or grouting the dowel slots. Slabs without effective load transfer at transverse joints or without slab undersealing for slabs placed directly on the bedding will not be exposed to traffic for a period of more than 3 days.

11. Repairing Damaged or Cracked Slabs. Repair manufacturing imperfections, handling damage or construction damage to slabs as directed and at no additional cost to the Department. All damage is subject to inspection on a case-by-case basis. Of particular importance is damage to the top surface and edges that occurs before and during installation. Recurring damage or distress is cause for discontinuing installation until the cause of the recurring damage can be determined and the problem mitigated.

11.a Spalls. Repair all spalls as specified in Section 501.3(t).

11.b. Cracks. For cracks wider than 0.007 inches and greater than D/3, where D is the slab depth, replace the slab at no additional cost to the Department. For cracks, wider than 0.007 inches and a depth less than D/3, repair according to recommendations in the latest version of Control of Cracking in Concrete Structures (ACI 224R). Submit the appropriate procedure before performing the repair for acceptance. For cracks 0.007 inches wide or less, seal cracks using high molecular weight methacrylate. After cleaning the surface of the slab along the crack, mix the methacrylate according to the manufacturer's recommendations. Pour and squeegee sealer into the cracks. Approximately 20 minutes after the crack has been sealed, apply commercial quality, dry blast sand to the methacrylate before opening the slabs to traffic.

529.4 MEASUREMENT AND PAYMENT—

- (a) **Full Depth Concrete Pavement, Precast.** Square Yard
- (b) **Subbase.** Section 350.4 by Cubic Yard.
- (c) **Excavation of Unsuitable Materials as Indicated.** Section 203.4(a)
- (d) **Excavation of Unsuitable Materials Beyond Limits of Excavation Indicated.** Section 110.03.

SECTION 530—LONG-LIFE CONCRETE PAVEMENT (LLCP)

530.1 DESCRIPTION—This work is the construction of Long-Life Concrete Pavements (LLCP). LLCP is concrete pavement that is made with high quality materials and processes and is intended to provide a longer service life than conventional concrete pavement.

530.2 MATERIAL—Section 501.2 with the following modifications:

Limit thin and elongated coarse aggregate retained on the 3/8-inch sieve to 20% or less with a ratio of 3:1 according to 2010 ASTM D4791, Method B.

All concrete mixtures are limited to a Maximum Cement Factor of 611 pounds per cubic yard and a Maximum Water/Cement Ratio of 0.42.

(a) High Early Strength Cement Concrete. Do not use High Early Strength Concrete in LLCP.

(b) Load-Transfer Units (LTU). Section 705.3(f) and as follows:

1. Dowel Bar Acceptance. For High Performance Dowel Bars not listed in Bulletin 15, provide completed passing test reports for testing done according to PTM No. 642 (not executive summaries), shop drawings, and LTU samples to the Representative for verification testing at least 45 days before beginning paving operations. Provide one LTU sample that accommodates a minimum of six dowel bars with bond breaker lubricant pre-applied to the dowel bars. Do not begin concrete paving until the Representative approves the LTU documentation and verifies passing test results for the LTU.

For High Performance Dowel Bars listed in the Bulletin 15, provide one LTU sample that accommodates a minimum of three dowel bars with bond breaker lubricant pre-applied to the dowel bars at least 45 days before beginning paving operations for verification testing. Only one type of dowel bar can be used for Long Life Concrete Paving on a project unless approved. Do not begin concrete paving until the Representative verifies passing test results.

2. Storage, Handling and Placement. Do not store dowel bars at the jobsite for more than 30 days unless approved by the Representative. Store as specified in Section 1002.3(b) to allow air circulation. If field storage is expected to exceed 30 days, cover bars with opaque polyethylene or other protective material. Store stainless steel dowel bars as specified in Section 1002.3(i)3.

Provide dowel bars having uniform appearance. Do not use dowel bars with visible corrosion deposits, uncoated spots, or acid, flux or black spots. Do not place or store dowel bars in contact with uncoated reinforcement bars or other uncoated steel or stainless steel.

After placement, inspect the dowel bars and replace dowel bars damaged during placement.

3. Certification. Section 106.03(b)3

(c) Concrete Curing Material. Sections 711.1 and 711.2(b)

530.3 CONSTRUCTION—Section 501.3 with the following modifications:

(a) General. Add the following to Section 501.3(a).

The “Slip-form” method of construction is the standard construction method. Fixed forms may be used for pavement gaps and nonuniform areas with the approval of the Representative.

Use plant mixed concrete except for areas approved by the Representative. Areas that truck mixed concrete would be appropriate for include shoulders, closure pours, and projects with less than 15,000 square yards of mainline concrete paving.

Monitor aggregate gradations during concrete production by performing sieve analysis using plant stockpiled aggregate before beginning daily production and when restocking bins, but no more than daily. From the results of

the sieve analysis generate the cumulative percent retained chart. Verify that the daily production plots within the limits defined by the cumulative percent retained chart in PTM No. 529.

If necessary, adjust aggregate proportions during production to maintain the combined percent retained gradation within limits in PTM No. 529. Adjustments to aggregate proportions that also require adjustments to cementitious material or water content will require the development of new mix designs, including trial concrete batches. The DME/DMM may allow combined gradations during production that are less than 5% outside of the required percent retained gradation in PTM No. 529. The DME/DMM will immediately report acceptance of production gradations outside of the limits in PTM No. 529 to CMD QA personnel in writing.

1. Field Operation QC Plan. Section 501.3(a)1. Add the following:

Include a concrete temperature control plan that outlines the actions that will be taken to control concrete temperatures if they exceed 80F at the point of placement.

Provide a written QC Plan for Department approval that specifies a method for keeping the LTU assemblies anchored to the foundation. The LTU Quality Control Plan includes the following minimum requirements:

- Proposed type, number, and installation locations of fasteners.
- LTU assembly anchoring plan.
- A method for measuring proper alignment of LTU before concrete placement as specified in Section 501.3(i).
- Within 18 hours after ending each day's concrete pavement placement and finishing for quantities greater than 700 SY, verify the LTU vertical and horizontal alignment by a nondestructive verification method acceptable to the Representative. Verify a minimum of the first five transverse joint locations across the full width of the pavement placed and one joint location for each 2,640 LF (1/2 mile) of pavement placed each day.
- An action plan to address dowel bars not meeting the requirements as specified in Section 501.3(i) before or after concrete placement.

The QC Plan must require that the first truck in each lot be sampled for plastic air and state that trucks that do not meet the requirement of 7.0%, plus or minus 1.5%, will not be incorporated. Each truck after any failing plastic air test will be tested until three consecutive passing test results are obtained.

The QC plan must include the method proposed to be used to cure and protect joints during the curing period, to prevent moisture loss from concrete in and adjacent to joints during and following joint sawing.

Submit an organizational chart listing names and telephone numbers of individuals and alternates responsible for mix design, process control administration, and quality control. Post the organizational chart in the Contractor's on-site field office.

Assign a QC Supervisor to manage all testing and plant operations. The QC Supervisor must be on site at all times during LLCP placement or have a mobile device in their possession and must be able to arrive at the project or plant site within 1 hour.

(g) Slip-form Paving Method.

1. Equipment. Section 501.3(g)1 and the following.

Provide a slip-form paver with the following characteristics:

- Automatic controls to control line and grade.
- A positive interlock system to stop all vibration and tamping elements when forward motion of the machine stops.
- A mechanical device that accurately spaces and positions the required tie bar reinforcement that allows satisfactory mechanical or manual tie bar insertion, and a non-oscillating extrusion plate with an adjustable angle of entry.

Provide an electronic monitoring device meeting the following characteristics and requirements to display the operating frequency of each individual internal vibrator for concrete pavement placed by the slip-form method:

- Contains a readout display near the operator's controls, visible to the operator and the Representative.

- Operates continuously as the paving machine operates.
- Displays all the vibrator frequencies with manual and automatic sequencing for each of the individual vibrators.
- Records the following at least every 25 feet of paving or at least every 5 minutes:
 - Clock time
 - Station location
 - Paver track speed
 - Operating frequency of individual vibrators

Do not operate equipment, other than sawing equipment or a lightweight profiler, on the new pavement slab as specified in Section 530.3(q). Do not operate equipment wheels or tracks within 4 inches of the slab edge.

(j) Longitudinal Joints. Section 501.3(j) and add the following:

When tie bars are mechanically inserted, verify location of tie bars every 500 feet in tangent sections and 100 feet through horizontal curves to confirm that ties bars are inserted no closer than 24 inches from the transverse joint.

(k) Final Strike-Off, Consolidation and Finishing. Section 501.3(k) revised as follows:

4. Final Finish. Add the following:

Finish the surface of all travel and passing lane pavements with a longitudinal texture as specified in Section 501.3(k)4.a. Finish all other pavement surfaces as specified in Section 501.3(k)4.a or Section 501.3(k)4.b.

(o) Surface Tolerance. Test the surface of pavement as follows:

1. Mainline Paving. Test as specified in Section 507 and Section 501.3(o)1. These pavements include, but are not limited to any full width lane used for travel, passing, climbing, center turn, acceleration, deceleration, and ramps.

2. Other than Mainline Pavement. Test as specified in Section 501.3(o). These pavements include, but are not limited to approach slabs, bridge decks, tapers, shoulders, medians, or other pavement surfaces as directed.

(q) Opening to Traffic. Replace Section 501.3(q) with the following:

The Representative will determine when pavement may be opened to traffic. Do not open pavement to traffic or operate heavy equipment on it for a minimum of 96 hours, and until the concrete has reached a minimum compressive strength of 3,000 pounds per square inch. Estimating concrete compressive strength by the maturity method according to PTM No. 640 may be used as an alternate method of determining the compressive strength of the finished pavement.

Perform operations on new pavement as approved by the Representative and according to the following:

- When moving on and off the pavement, construct a ramp to prevent damage to the pavement slab.
- Take positive action to prevent damage to the pavement surface and joints.
- Before placing the protective mats, sweep the pavement surface free of debris.
- Operate equipment on a slab without causing damage. If damage results, suspend operations and take corrective action as approved.
- New pavement will not be opened to any traffic until all joints have been sealed unless an acceptable method to protect joints from damage and keep non-compressible materials from entering the joint is approved.

(s) Tests for Depth. Revise Section 501.3(s) with the following:

The Representative will determine lots and sublots as specified in Section 530.3(u).

Complete any surface corrective work before testing for pavement depth. Test pavement depth by obtaining one core or one Non-Destructive test in each subplot. The Representative will determine the location of each depth test according to PTM No. 1.

If the drilled core measurement method is used for depth measurement submit the first subplot core and every tenth core thereafter, as an information core, immediately to the Representative. If the non-destructive depth measurement

method is used, drill one information core in the first subplot placed and one information core for every tenth subplot thereafter. Verify the depth of all drilled cores as specified in Section 530.3(s)1. The Representative will determine subplot and core locations according to PTM No. 1. For a partial lot the Representative will randomly select one core or core location according to PTM No. 1. The Representative will immediately submit the information cores to the LTS for an evaluation of entrained air content according to PTM No. 623. If the entrained air content is below 3.5% or above 8.5% provide a written evaluation of the problem and proposed solution to the Department within 5 days. If positive action is not taken to address hardened entrained air results below 3.5% or above 8.5% within 5 days, the District Executive may require that paving operations be stopped until an acceptable solution is agreed upon.

1. Measurement of Drilled Cores. Add the following:

Drill cores at each subplot location, according to PTM No. 606, in presence of the Representative. Thoroughly clean the vertical surface of the core hole of laitance and loose and foreign material. Fill the holes with the mixture used to construct the course and consolidate. As an alternative, use a premixed, nonshrink grout.

Provide a measuring apparatus according to PTM No. 614.

The Representative will:

- determine the core length according to PTM No. 614,
- determine the average lot pavement thickness by averaging the individual subplot core thicknesses,
- accept concrete as specified in Section 530.3(u), and
- determine price adjustments as specified in Section 530.4(a).

2. Measurement by Non-Destructive Testing. Add this section as follows:

When indicated or when requested in writing and approved by the District Executive test the depth of the finished pavement as specified in Section 501.3(s)2.

(t) Defective Work. Replace Section 501.3(t) with the following:

Unless otherwise directed in writing, as specified in Section 110.10(d)1., by the District Executive, remove and replace pavement determined defective as follows:

1. Depth. The lot will be defective if the average core depth of the lot is less than the design thickness (D) minus 0.5 inch or more than one individual subplot core depth is less than the design thickness minus 0.5 inch.

2. Compressive Strength. The lot is defective if PWL for compressive strength is less than 55%, as specified in Section 530.3(u)2.

3. Other Conditions. The lot is defective if the pavement contains surface defects from rain, improper joint construction, improper curing procedures, improper final finish, cracking, or honeycombing that cannot be satisfactorily repaired as determined by the Representative.

4. Other Than Mainline Pavement Surface Tolerance. The lot is defective if the pavement contains depressions or high points as specified in Section 506.3(o) that cannot be satisfactorily corrected as determined by the Representative.

5. Edge Slumping. The pavement is defective if the requirements specified in Section 501.3(g)5 are not met.

Remove and replace a minimum of an entire panel of LLCPC pavement as shown on the Standard Drawings. Longitudinal edge spall repairs are not considered satisfactory repairs for edge slumping or spalling between adjacent lanes or outside pavement edges.

(u) Acceptance. Add this section as follows:

Lots and sublots for the combined pavement characteristics of depth and compressive strength will be determined based on the full width of pavement placement. Lots and sublots will begin at the starting point of paving and continue until 5,600 square yards are placed. Lots and sublots will be calculated as the work progresses and will

include any pavement designated as LLCP pavement. Do not combine pavement with different depths into any lot or subplot.

A full lot is defined as 5,600 square yards of pavement, of the same constant depth, and consists of four equal sublots of 1,400 square yards each.

Combine partial lots with the last full lot or make a separate lot according to the following procedure:

- If less than 4,200 square yards remain, combine the remaining pavement with the last full lot.
- If the remaining pavement is equal to or greater than 4,200 square yards, consider the remaining pavement as a separate lot.
- Determine sublots for the last pavement lot by establishing a number of equal size sublots.
- Determine the number of sublots by dividing the area of the combined lot or partial lot by 1,400 square yards and then rounding to the nearest whole number.
- Determine the equal size of each subplot by dividing the combined lot or partial lot quantity by the number of whole sublots calculated.
- Determine lots and sublots based on the full width of pavement placement.

1. Depth. The Representative will accept each lot for compliance with the specifications, for depth if the average core depth of the lot is more than the design thickness (D) minus 0.5 inch and not more than one individual subplot core depth is less than the design thickness minus 0.5 inch.

2. Compressive Strength and Plastic Air Content. The Representative will accept concrete for compliance with the specification requirements, for compressive strength, on a lot-by-lot basis, as specified in Section 105 and Section 106. The Representative will determine locations where acceptance samples of plastic concrete will be taken, according to PTM No. 1. Make one set of compressive strength specimens and one test for percentage of plastic air content on samples from each subplot. All sampling and testing must take place before trucks being placed on grade.

Trucks selected for acceptance testing with plastic air results that are outside specification limits will not be placed. If a truck is discarded because of low plastic air content, test consecutive trucks as specified in Section 704.1(d)4.a. Discard all concrete with failing plastic air results. Provide a testing station within 1 mile of the final concrete placement location unless an alternate location is approved by the Representative.

Mold acceptance cylinders at the determined subplot location. The average of the test results from two cylinders, made from the same sample, tested according to PTM No. 604, will constitute the 28-day compressive strength. Cure test specimens according to Subsection 11.1 of PTM No. 611.

The Representative will accept concrete based on the adequacy and uniformity of compressive strength at the age of 28 days, when the PWL is 55% or greater.

For compressive strength, calculate the value of Q_L by the following equation, where \bar{X}_4 is the average of the subplot test results, Q_L is the lower quality index, and “s” is the Standard Deviation as specified in Section 106.03(a)3.a.4.

2.a For Class AA 28-day concrete compressive strength,

$$Q_L = \frac{\bar{X}_4 - 3,300\text{psi}}{s}$$

Determine the percentage of material within specification limits as specified in Section 106.03(a)3

(v) Water/Cementitious Ratio Incentive (W/C ratio). Add this section as follows:

Provide and place concrete with a W/C ratio between 0.37 and 0.42.

Do not add water or finishing aids to the surface of the concrete to aid in finishing.

The Department will determine the W/C ratio for concrete hauled in dump or agitator trucks according to the following (concrete hauled in truck mixers is not eligible for W/C ratio incentives):

1. W/C Ratio Incentive Lots and Sublots. The Representative will determine the sample location for each subplot as specified in Section 530.3(u)2. The Representative will compute the average W/C ratio for each lot of material established as specified in Section 530.3(u) as follows:

1.a Water Content Determination. For plant mixed cement concrete, use a Representative approved electronic meter that is capable of recording and printing on the batch ticket the total amount of water added to the mix including temper water. The amount of temper water may be hand written on the delivery ticket if the District provides inspection personnel to certify the hand written information. All temper water must be from a metered and calibrated source.

The Representative will determine the water content for calculating the water/cement ratio for each subplot and lot.

1.b Cementitious Content Determination. The Representative will use the sum of all cementitious material weights printed on the plant delivery slip for each subplot to determine the cementitious content of each subplot.

1.c Water Content Verification. Provide the microwave oven and the ancillary equipment required by the Representative to perform this test.

The Representative will use PTM No.1 to select a minimum of 1 subplot in each lot placed. Take verification samples from the same truck load of concrete as specified in Section 530.3(v)1. Plastic concrete samples will be taken at the same site as the compressive strength and plastic air content as approved by the Representative. The Representative will determine the water content of the plastic concrete mixture according to AASHTO T 318. The Representative will begin the test within 45 minutes after the water has contacted the cement.

The representative will compare the W/C ratio from the AASHTO T 318 verification testing results to the W/C ratio results computed from the plant delivery tickets. If more than one subplot within a lot is tested according to AASHTO T 318, the average of the tested sublots will be compared to the average of the corresponding W/C ratios computed from plant delivery tickets.

If the W/C ratio computed from the delivery tickets is not within ± 0.03 of the W/C ratio from the AASHTO T 318 verification testing results, the lot is not considered verified and no incentive will be paid for the lot.

530.4 MEASUREMENT AND PAYMENT—Square Yard

The Department will pay on a lot-by-lot basis at the contract price, adjusted for pavement characteristics relative to depth, and compressive strength.

The lot payment will be determined according to the multiple characteristic formula specified in Section 530.4(a)3.

(a) Adjustment for Pavement Characteristics.

1. Depth. The lot average pavement depth will be determined as specified in Section 530.3(s). The characteristic percentage for depth will be determined using Table A. The characteristic percentage for depth will be placed in the multiple characteristic formula as P_d specified in Section 530.4(a)3 to determine the lot payment.

2. Compressive Strength. The PWL will be determined for the lot as specified in Section 530.3(u)2. The characteristic percentages for compressive strength will be determined by using Table B. The characteristic percentage for compressive strength will be used as P_s in the multiple characteristic formula specified in Section 530.4(a)3 to determine the lot payment.

3. Multiple Characteristic Formula. The lot payment will be determined according to the following formula:

Multiple Characteristic Formula
No Incentive / Disincentive

$$L_p = C_p \left[\frac{2P_s + 2P_d}{400} \right]$$

Multiple Characteristic Formula
With Incentive

$$L_p = C_p \left[\frac{2P_s + 2P_d}{400} \right] WC$$

L_p	=	Lot Payment
C_p	=	Contract price per lot (contract price times lot size)
P_s	=	Characteristic Percentage of Compressive Strength—(Table B)
P_d	=	Characteristic Percentage for Depth—(Table A)
WC	=	Incentive Pay Factor (Table C)

TABLE A
Characteristic Percentages for Concrete Pavement Depth (Pd)
Relative to Specification Limits

15-inch Design Thickness		14.5-inch Design Thickness	
Average Thickness, inches	Characteristic Percentage Pd	Average Thickness, inches	Characteristic Percentage Pd
15.00 or greater	100.0	14.50 or greater	100.0

Average Thickness, inches	Characteristic Percentage Pd
8.50 or greater	100.0
8.40 - 8.49	94.0
8.30 - 8.39	88.7
8.20 - 8.29	83.5
8.10 - 8.19	78.5
8.00 - 8.09	73.8
Less than 8.00	*

8-inch Design Thickness	
Average Thickness, inches	Characteristic Percentage Pd
8.00 or greater	100.0
7.90 - 7.99	93.9
7.80 - 7.89	88.1
7.70 - 7.79	82.6
7.60 - 7.69	77.3
7.50 - 7.59	72.4

Less than 7.50

*

* Defective work, as specified in Section 530.3(t).

TABLE B Characteristic Percentages for Concrete Pavement Compressive Strength (Ps) Relative to Specification Limits	
Percent Within Specification Limits	Characteristic Percentage
90 - 100	100
85 - 89	99
75 - 84	94
65 - 74	83
55 - 64	66
Below 55	*

* Defective work, as specified in Section 530.3(t).

4. Adjustment for W/C Ratio Incentive. The lot average W/C Ratio will be determined as specified in Section 530.3(v). The Incentive Pay Factor will be determined using Table C. The Incentive Pay Factor will be placed in the W/C Ratio formula as WC as specified in Section 530.4(a)3 to determine the lot payment.

TABLE C Adjustment for W/C Ratio Incentive	
W/C Test Result	Incentive Pay Factor
0.38 to ≥ 0.37	+0.04
0.39 to > 0.38	+0.03
0.40 to > 0.39	+0.02
0.41 to > 0.40	+0.01
≤ 0.42 to > 0.41	0.00

If a water/cementitious ratio greater than 0.42 is approved no incentive pay will be paid.

(b) Defective Pavement Left in Place. The Department will not pay for defective pavement left in place, unless otherwise directed in writing by the District Executive. When the District Executive directs that defective pavement be left in place, final payment for this pavement will be at 5% of the contract unit price.

(c) Concrete Pavement Cores. Each

The contract unit price includes measuring apparatus, which remains the Contractor's property upon completion of the project.

(d) Evaluation of Concrete Pavement Ride Quality and Payment of Incentive. Section 507.4.

SECTION 540—BONDED CONCRETE OVERLAY OF ASPHALT-SURFACED PAVEMENT

540.1 DESCRIPTION—This work is the construction of a Portland cement concrete overlay with a thickness of 4 to 8 inches, and is bonded to an existing asphalt-surfaced pavement. It includes asphalt surface preparation, overlay construction, construction of transitions, joint sawing and sealing, and other construction details, as indicated.

540.2 MATERIAL—

- Class AA Cement Concrete—Section 704 except, revise the Table A Maximum Water Cement Ratio by weight to 0.42. If the maturity method is intended to be used, correlate the degree-hours of cure to compressive strengths in accordance with PTM No. 640 except, at time intervals of 8 hours, 1, 7, 28 and 56 days.
- Expansion Joint Filler—Section 705.1
- Tape Bond Breaker—An acceptable self-adhesive tape with width matching that of the sealant reservoir.
- Joint Backing Material—Section 705.8
- Longitudinal Joint Material—Section 705.2, for use in transition areas only
- Load Transfer Units—Sections 705.3(a) and (b), for use in transition areas only
- Joint Sealing Material—Section 705.4(a) – Self-leveling, Section 705.4(b), or (c)
- Concrete Curing Material—Section 711.1 and 711.2(a), ASTM C 309 Type 2
- Concrete Covering Material—Section 711.1
- Concrete Admixtures—Section 711.3
- Class 4 Geotextile, Non-woven—Section 735, for use in transition areas only
- Epoxy Bonding Compound—Section 706.1 Type V
- Pre-Mixed Nonshrink Grout—An approved type as listed in Bulletin 15.

540.3 CONSTRUCTION—Section 501.3, modified as follows:

(a) General. Section 501.3(a) with the following modifications:

1. Field Operation QC Plan. Replace with the following:

1. Comprehensive QC Plan. Prepare a comprehensive QC Plan detailing all operations related to this work, including, but not limited to, surface preparation, the timing and sequence of the work, including timing of mixing, hauling, placing, curing, monitoring of concrete temperature, joint sawing, and sampling and strength testing or evaluation for opening to traffic. Indicate variations in timing of activities in response to anticipated variations in air temperature at the time of placement. Submit the QC Plan for the Representative's review before the start of the project. Do not begin construction-related work until the QC Plan has been accepted.

(e) Preparation and Protection of Base Course. Replace with the following:

(e) Asphalt Surface Preparation. Profile mill the existing asphalt pavement surface to the depth indicated in the plans as specified in Section 492. In lieu of replacing unsound pavement as specified in Section 492.3(c) with asphalt

materials, replace with Class AA Cement Concrete in conjunction with the placement of the concrete overlay. Saw cutting and chipping with pneumatic hammers may be used to remove areas inaccessible by a milling machine. Clean and fill in cracks greater than 3/4 inches with non-shrink grout or other material approved by the Department which will enable bond to the concrete overlay prior to pavement surface cleaning. No standing water should remain on the surface after the milling operation. If standing water occurs, immediately provide measures, acceptable to the Department, to drain the water from the milled surface. Completely clean the milled pavement surface to completely remove all loose debris. Protect the cleaned and prepared surface from oil or grease drippings from compressors, concrete trucks, spreaders, pavers, etc. Remove all deleterious materials before overlaying.

Conduct final cleaning of the surface no more than 30 minutes before the placement of the concrete overlay to remove loose material and debris. If using a compressed air stream, ensure that it is free of oil, moisture, and other potential contaminants, and that has a minimum pressure of 100 pounds per square inch measured at the source.

Immediately before placing the concrete overlay, ensure the asphalt surface is less than 120F. Fog-misting, protective covers or blankets will be allowed to achieve the proper condition of the surface, however, do not allow any standing water or moisture to remain on the pavement surface.

(h) Handling and Placing Reinforcement. Delete Section 501.3(h).

(i) Transverse Joints. Replace with the following:

(i) Joints. Space joints as indicated on the project plans and special provisions. If no joint spacing is indicated, develop a joint layout plan to be accepted by the Department and lay out joints before placement of concrete. Avoid placing longitudinal joints in the wheel paths. In general, maximum panel dimensions should not exceed 18 times the concrete overlay thickness, and the length of the longer panel dimension divided by the shorter panel dimension should not exceed 1.5. The Representative may allow or require slight deviations from nominal panel dimensions in order to match joints in adjacent pavement or structures, or to avoid the construction of panels with dimensions or shapes that would otherwise be subject to premature cracking.

Sawing is the only acceptable technique for creating concrete overlay joints. Saw joints as soon as concrete has sufficiently hardened to permit sawing without excessive raveling resulting from the sawing operation and to prevent random cracking. The use of “early entry” saws is recommended. FHWA’s HIPERPAV or similar software approved by the Department may be used in determining a project-specific sawing window. If necessary, conduct sawing operations continuously, both day and night, regardless of weather conditions. Saw joints with a green cut saw to a depth of D/3 and a minimum width of 1/8 inch. If initial saw cuts do not extend through the slab edge to avoid “blowouts” or edge damage of green concrete, extend these cuts through the edge as soon as it can be done without causing damage. Omit sawing if a crack occurs at or within 1.5 feet of a joint location, before or during sawing, and address as specified in Section 590. Do not seal joints at this time. Clean joints of all deleterious material after sawing.

If pavement is cured by means other than white-pigmented, liquid membrane-forming curing compound, remove curing materials from overlay, at the location where a joint is to be cut. Remove only sufficient covering to provide space necessary for sawing joints. As soon as the joint is made, replace the covering. The maximum time period allowed for pavement curing covers to be removed is 1/2 hour. If white-pigmented, liquid membrane-forming curing compound is used, cure the joint area, as specified in Section 501.3(l)1.c.

(j) Longitudinal Joints. Replace with the following:

(j) Concrete Overlay Transitions. Construct transitions at the limits of the concrete overlay as indicated. In areas where transitions contain existing treated base course or concrete pavement directly below the overlay, place geotextile as a debonding layer as specified in Section 212.

(l) Curing Concrete. Section 501.3(l) with the following modifications:

- Replace the first sentence of Section 501.3(l)1 with the following:

Apply curing materials after finishing and texturing, and within 30 minutes of the dissipation of bleed water. Maintain the curing materials until the pavement has achieved sufficient strength for opening to traffic as specified in Section 540.3(q).

- Add the following paragraphs at the end of Section 501.3(l)1:

Provide adequate insulating blankets to prevent rapid heat loss if the air temperature is 45F or less. Insulation may be removed when the air temperature exceeds 45F or when the average compressive strength of the concrete

exceeds 3,000 pounds per square inch. Remove insulation in a manner such that the rate of temperature change at the concrete surface does not exceed 40F within any 1-hour period. Concrete that experiences a higher rate of temperature change will be considered defective.

The application or removal of insulation covers may be controlled by the use of maturity method as specified in Section 540.3(q), with full removal of insulation allowed after the minimum required degree-hours of curing has been accumulated at the top of the slab.

- Replace the second sentence of the second paragraph of Section 501.3(l)1.c with the following:

Apply curing compound homogeneously to provide a uniform, solid white opaque coverage on all exposed concrete surfaces. Apply at a minimum rate of 1 gallon (± 0.1 gallon) per 125 square feet or as specified by the manufacturer's recommendations, whichever is greater. If conditions warrant, the curing compound can be applied in two equal rates of application, with the first applied as stated previously and the second applied immediately after sawing operations have been completed. Joint faces must be protected from exposure to curing compound or cleaned thoroughly prior to sealant installation.

(n) Sealing Joints and Cracks. Replace with the following:

(n) Sealing Joints. Seal all transverse and longitudinal joints with an approved hot-pour or silicone sealant material in accordance with the manufacturer's recommendations and as specified in Section 501.3(n).

(o) Surface Tolerance. Replace with the following:
Section 506.3(o)

(q) Opening to Traffic. Replace with the following:

The Representative will determine when pavement will be opened to traffic based on when the concrete attains the minimum required compressive strength of 3,000 pounds per square inch as measured either by compressive strength testing of cylinders in accordance with PTM No. 604 or by the maturity method in accordance with PTM No. 640.

(s) Tests for Depth. Replace with the following:

Before final acceptance of each phase of the project, proceed as follows:

- The Department will divide the concrete overlay pavement into lots representing not more than 3,000 square yards of pavement in each traffic lane. Include ramps in a separate lot(s). The Inspector will select one coring location at random within each lot according to PTM No. 1. Drill cores according to PTM No. 606 and in the presence of the Inspector. For projects at intersections or less than 3,000 square yards, drill two cores. Thoroughly clean the vertical surface of the core hole of laitance and loose and foreign material. Fill the holes with the mixture used to construct the course and consolidate. As an alternative, use a premixed, nonshrink grout.
- Provide a measuring apparatus conforming to PTM No. 614. The Inspector will determine the core depth according to PTM No. 614.
- If any core measurement is deficient by more than 1/4 inch in required depth, drill additional cores in the presence of and for measurement by the Inspector. Drill the additional cores at 100-foot intervals in both directions longitudinally from each deficient core, in the same traffic lane, until the depth is no more than 1/4 inch deficient. Each core will represent the condition in the same traffic lane for a distance of 50 feet in both directions longitudinally.
- The Inspector will consider the pavement to be defective if any core measurement is deficient in required depth as indicated in Table B.

(t) Defective Work. Replace with the following:

Unless otherwise directed in writing by the District Executive, remove and replace, at no expense to the Department, pavement that is: defective in construction or sawing of joints as specified in Section 540.3(i); defective in curing requirements as specified in Section 540.3(l); defective in surface tolerance, as specified in Section 501.3(o); defective in depth, as specified in Section 540.3(s); defective in air content, as specified in Section 704.1(c)3; defective in

compressive strength as specified in Section 704.1(d), or showing surface defects resulting from the effects of freezing and thawing, rain, hail, improper final finish, or honeycombing.

The minimum pavement removal and replacement will be one panel in length and width. Where deficiencies are exhibited in successive panels of pavement, remove and replace entire panels. After removal of defective pavement, reestablish replaced joints.

If removing and replacing pavement defective in depth, start at the determined point of deficiency as determined by the Representative. Remove and replace defective work transversely for the full-lane width and longitudinally, until the pavement is not more than 1/4 inch deficient in depth, as specified in Section 540.3(s).

540.4 MEASUREMENT AND PAYMENT—

(a) Profile Milling of Asphalt Pavement Surfaces. Section 492.4

Ownership of the milled material will be indicated by the selected item of work. The transition areas will be excluded.

(b) Bonded Concrete Overlay of Asphalt Pavement. Square Yard

This unit price includes all work associated with the construction of the concrete overlay with the exception of the cement concrete material and the profile milling. The price also excludes the concrete overlay transitions and the concrete pavement cores.

(c) Cement Concrete, Class AA. Cubic Yard

For producing the cement concrete needed for the overlay and delivering it to the jobsite. Pay quantity for the overlay will be computed based on the indicated depth and the placement area. An additional quantity, not to exceed 2% of the computed overlay quantity, may be paid as compensation for the cost of cement concrete material needed to replace unsound pavement material removed as part of the profile milling operation. Excludes cement concrete material used in transition areas. Submit written request for additional compensation with justification. The justification should indicate the cubic yardage of concrete delivered to the job site from delivery tickets, and show a deduction for the volume of the overlay and the quantity of concrete wasted.

(d) Concrete Overlay Transition. Each

This unit price includes all associated items of work within the limits of the transitions.

(e) Concrete Pavement Cores. Each

The price includes the measuring apparatus, which remains the Contractor's property upon completion of the project. The Department will not pay for additional cores drilled when the depth is deficient by more than 1/4 inch.

(f) Adjustment for Deficient Pavement Thickness Depth. Where a deficiency exists, as determined by cores, lot payment for both the bonded concrete overlay and the cement concrete material will be adjusted as specified in Table B.

TABLE B
Adjustment for Depth

Deficient in Depth Determined by Cores (inches)	Payment Percent of Contract Unit Price, by Lot, Based on Nominal Overlay Depth (%)		
	≤ 4.00 inches	4.25 to ≤ 6.00 inches	> 6.00 inches
-0.25 to 0.00	100	100	100
-0.30 to -0.26	95	97	99
-0.35 to -0.31	85	90	95
-0.40 to -0.36	75	80	90
-0.45 to -0.41	65	70	85
-0.50 to -0.46	50	60	75
-0.60 to -0.51	Defective Work	50	65
-0.75 to -0.61	Defective Work	Defective Work	50
> -0.75	Defective Work	Defective Work	Defective Work

(g) Defective Pavement Left in Place. The Department will not pay for defective pavement left in place, unless otherwise directed in writing by the District Executive. When the District Executive directs that defective pavement be left in place, final payment for this pavement will be at 5% of the contract unit prices of the concrete overlay and the cement concrete.

(h) Evaluation of Concrete Pavement Ride Quality and Payment of Incentive. Section 507.4

SECTION 545—BONDED CONCRETE OVERLAY OF CONCRETE-SURFACED PAVEMENTS

545.1 DESCRIPTION—This work is the construction of a bonded concrete overlay, or inlay, of concrete pavements including surface preparation and joint sawing and sealing.

545.2 MATERIAL—

(a) Cement Concrete, Class AA. Section 704, modified as follows:

(b) Material. Section 704.1(b), modified as follows:

- Coarse Aggregate, Type A, No. 57, No. 67, or No. 8 (Stone, gravel, or Slag)--Section 703.2, modified as follows:

(a) General. Section 703.2, modified as follows:

1. Stone. Provide durable stone, free from slate texture or cleavage planes. For use in cement concrete, wash thoroughly during production.

2. Gravel. Provide durable gravel particles. For use in cement concrete, wash thoroughly during production.

3. Blast Furnace Slag Aggregate. Blast furnace slag aggregate is not allowed for use in cement concrete paving applications.

- Section 704.1(b) TABLE A modified as follows:

1. Minimum Cement Factor for AA Slip Form Paving, Paving, and Accelerated Patching: 530 lbs/cu. yd.
2. Maximum Cement Factor for AA Slip Form Paving, and Paving (but not Accelerated Patching): 600 lbs/cu. yd.
3. Maximum Water-Cement Ratio: 0.42 lbs/lbs for all Class AA concrete.
4. Delete note 7 and replace with "The target Water-Cement Ratio is 0.40 lbs/lbs and will not fall below 0.38 lbs/lbs for all Class AA concrete."

(c) Design Basis. Section 704.1(c), revised as follows:

- Add the following paragraph to the end of Section 704.1(c)2.

For Class AA Paving, Portland cement may be replaced with supplementary cementitious material (flyash or slag cement) weighing as much or more than Portland cement replaced provided that at least 400 pounds per cubic yard of Portland cement is used and the total cementitious (cement plus supplementary cementitious material) content does not exceed the limits in Table A. The maximum slag cement content, if used, is not to exceed 30% of the total cementitious material, by weight.

- Replace the first sentence of Section 704.1(c)3 with the following:

For Class AA Slip-Form Paving, and AA Accelerated Patching concrete, design cement concrete to have an air content of 7.0%, within a tolerance of $\pm 1.5\%$, at the time and point of placement.

(d) Testing and Acceptance. Section 704.1(d), add the following:

4.c Verify Water-Cement Ratio. Verify water-cement ratio in the field using batch tickets (for cementitious content determination) and AASHTO T 318-02 "Standard Method for Test for Water Content of Freshly Mixed Concrete Using Microwave Oven Drying (for water content determination)."

(g) Mix Designs Using Potentially Reactive Aggregate. Section 704.1(g) revised as follows:

- Replace the first sentence of the second paragraph in Section 704.1(g)2 with the following:

Use aggregates that are deemed reactive or potentially reactive with 14-day expansion between 0.10% and 0.30% only with an approved cement-supplementary cementitious material combination that is sufficient to mitigate the 14-day expansion to a value less than 0.1% and as specified in Section 704.1(g)3. Reject aggregate with 14-day expansion greater than 0.30%. This requirement applies to all paving concrete on this project. For other applications, use any of the cements or cement-supplementary cementitious material combinations specified in Section 704.1(g)3.

- Revise Section 704.1(g)3.b with the following:

3.b Blended Hydraulic Cement. Type IS or IP, ASTM C 595, from a manufacturer listed in Bulletin 15. If any blended cement is used for any paving and patching concrete, the maximum allowable mortar expansion at 14 days and 8 weeks are 0.02% and 0.06%, respectively.

(b) Concrete Admixtures. Section 711.3

(c) Concrete Covering Material. Section 711.1(a)

(d) Concrete Curing Materials. Section 711.1 or 711.2(a), Type 2

(e) Joint Backing Material. Section 705.8

(f) Joint Sealing Material. Section 705.4(a), (b), or (c)

(g) Tape Bond Breaker. An acceptable self-adhesive tape the width of the sealant reservoir.

545.3 CONSTRUCTION—Section 501.3, and as follows:

(a) Weather Restrictions. Section 501.3(b) with the following modifications:

1. Cold Weather. Replace the fourth sentence with the following:
Place concrete when the concrete temperature is between 65F and 90F.

(b) Surface Preparation. Prepare the existing concrete surface as follows:

1. Equipment.

1.a Scarifying Equipment. Provide a self-propelled mechanical scarifier capable of uniformly removing the old surface across the entire cutting path, to the depth indicated, as specified in Section 591.3.

1.b Shot Blasting, Sand Blasting, or Water Blasting Equipment. Provide equipment capable of removing any loose concrete and rust from exposed reinforcement.

2. Scarification of the Existing Pavement Surface. When used to lower the pavement elevation, scarify the existing pavement surface to the depth indicated. Cut off and remove any reinforcement that is exposed and loose. After scarifying, remove any deteriorated concrete or asphalt materials that extend below the level of the scarification, as indicated or directed. Remove all full-depth asphalt patches and replace with concrete as specified in Section 516.

Remove all loose material from the pavement surface before cleaning. Minimal minor repairs of surface defects can be replaced with overlay.

3. Steel Plates. If inlaying and the existing transverse pavement joints have steel plates, remove exposed steel plates.

4. Final Preparation. Shot blast or water blast to produce a roughened surface, following the milling. Provide measures, acceptable to the Department, to drain or remove standing water from the prepared surface as directed by the Department. Completely clean the prepared surface to remove all loose debris. Protect the cleaned and prepared surface from oil or grease drippings from compressors, concrete trucks, spreaders, pavers, etc. Remove all deleterious materials before overlaying.

Conduct final cleaning of the surface in front of the paver no more than 30 minutes prior to the placement of the concrete overlay/inlay. If using a compressed air stream, ensure that it is free of oil, moisture, and other potential contaminants, and that has a minimum pressure of 100 pounds per square inch measured at the source.

Install joint backing or other approved joint filling material to within $\pm 1/4$ inch of the pavement surface in all existing transverse joints (including those associated with full-depth repairs) prior to placement of the overlay. Ensure that the joint backing or filling material cannot be dislodged by the paving operation.

Immediately prior to placing the concrete overlay/inlay, ensure the surface is less than 120F. Fog-misting, protective covers or blankets will be allowed to achieve and maintain proper temperature and moisture conditions of the surface. Completely blow off standing water with compressed air from the pavement surface.

(c) Overlay Transition. Construct paving notches, as indicated.

(d) Transverse Joint Location. Accurately mark the location of all transverse joints with the use of guide nails, tacks or other Representative-approved devices to accurately mark the locations of the centers of all transverse joints prior to placing the concrete overlay so that they can be located after the overlay has been placed. Submit the proposed method of location marking for approval 20 days before the start of construction. Do not begin paving without approval.

(e) Bond Strength. After the surface preparation has been completed and before placement of the overlay, test the prepared surface in the presence of the Inspector. Bond strength testing will be performed at 7 days, according to ASTM C 1583. Provide the test equipment.

1. Lot Testing. For each area represented by each day's placement of not more than 3,000 square yards, the Inspector will select five test locations at random, according to PTM No. 1, and test according to ASTM C 1583.

If the average of the test results on the three tests is below 175 pounds per square inch and each individual test has a minimum strength of 160 pounds per square inch, the area represented will be considered defective. If defective, obtain additional tests at 100-foot intervals in both directions longitudinally from the defective locations to determine the limits of defective work. Each set of three defective tests will represent the condition in the same traffic lane for a distance of 50 feet in both directions longitudinally.

(f) Final Finish. Section 501.3(k)4

(g) Curing Concrete. Section 501.3(l) with the following modifications:

- Replace the first sentence of Section 501.3(l)1 with the following:

Apply curing materials after finishing and texturing operations, and within 30 minutes of the dissipation of bleed water and maintain them in place until the pavement has reached sufficient strength as specified in 545.3(l) for opening to traffic.

- Add the following paragraph to the end of Section 501.3(l)1:

Provide adequate insulating blankets to prevent rapid heat loss if the air temperature is forecasted to be 45F or less. Insulation may be removed when the air temperature exceeds 45F or when the average compressive strength of the concrete exceeds 3,600 pounds per square inch. Remove insulation in a manner such that the rate

of temperature change at the concrete surface does not exceed 40F within any 1-hour period. Concrete that experiences a higher rate of temperature change will be considered defective.

- Replace the second sentence of the second paragraph of Section 501.3(l)1.c with the following:

Apply curing compound homogeneously to provide a uniform, solid white opaque coverage on all exposed concrete surfaces. Apply at a minimum rate of 1 gallon (\pm 0.1 gallon) per 125 square feet or as specified by the manufacturer's recommendations, whichever is greater. If conditions warrant, the curing compound can be applied in two equal rates of application, with the first applied as stated previously and the second applied immediately after sawing operations have been completed. Joint faces must be protected from exposure to curing compound or cleaned thoroughly prior to sealant installation.

(h) Transverse Joints. As soon as the concrete is strong enough for cutting the joints without significant raveling or chipping, saw cut transverse joints directly over all existing transverse joints, including those produced by pre-overlay repairs. Saw cut depth must be equal to the full thickness of the overlay (including any additional thickness used for grade corrections) plus 1/2 inch, but must not result in damage to dowel load transfer devices in the original pavement. To prevent debonding, saw cut width should be at least the width of the underlying joint or crack in the existing pavement or greater. Measure joint widths immediately prior to placement of the overlay/inlay.

When inlaying, saw cut transverse joints to the full depth of the inlay, including any extra depth concrete placed at the joint, directly over the existing transverse joint and a minimum of 1/2 inch wide.

Construct a sealant reservoir as shown on the Standard Drawing for Cement Concrete Pavement Joints. The overlay may be sawed in a second operation, or make the initial saw cut equal to the required reservoir width. After sawing, immediately flush the joint with water to remove sawing slurry that might otherwise prevent proper sealant installation.

Place backing material to the proper depth and seal the joints, as specified in Section 501.3(n).

In the case of overlaying an existing Continuously Reinforced Concrete Pavement (CRCP), only match the terminal joints and joints created from full-depth repairs.

(i) Intermediate Transverse Joints. Cut intermediate transverse joints between existing transverse joints such that the overlay panel length does not exceed 15 feet. Saw cut depth must be equal to the full thickness of the overlay (including any additional thickness used for grade corrections) plus 1/2 inch.

(j) Longitudinal Joints. Accurately reference the location of existing longitudinal joints within the overlay area and between the adjacent lane and the overlay area, so that they can be accurately located after paving. After paving, saw cut a sealant reservoir, 1/4 inch wide, and the full depth of the overlay plus 1/2 inch, directly over the existing longitudinal joint.

Seal joints as specified in Section 501.3(n).

Provide a neat vertical edge face, free of honeycomb and segregation, longitudinally along both sides of the overlaid pavement.

(k) Edge Slump. Maximum edge slump allowed in the outside 6 inches next to the shoulder is 1/4 inch. Maximum edge slump allowed in the outside 6 inches next to an adjacent lane is 1/8 inch.

(l) Opening to Traffic. The Representative can determine when pavement will be open to traffic based on when the concrete attains the minimum required compressive strength of 3,600 pounds per square inch as measured by compressive strength testing of cylinders in accordance with PTM No. 604, and the minimum acceptable bond strength as specified in Section 545.3(e).

(m) Surface Tolerance. Section 506.3(o)

(n) Defective Work. Unless otherwise directed in writing from the District Executive, remove and replace pavement overlay that is defective in depth, as specified in Section 545.4(c) Table A; defective in air content, as specified in Section 704.1(c)3 (modified as specified in Section 545.2(a)); defective in bond strength, as specified in Section 545.3(e); or showing surface defects resulting from the effects of rain, improper final finish, or honeycombing which, in the Representative's opinion, cannot be repaired.

Replace defective pavement overlay as specified in Section 501.3(t); except, provide a minimum pavement removal and replacement length between transverse joints of 6 feet.

545.4 MEASUREMENT AND PAYMENT—**(a) Surface Preparation.** Square Yard**(b) Cement Concrete, Class AA.** Cubic Yard

For producing the cement concrete needed for the overlay and delivering it to the jobsite. Pay quantity for the overlay will be computed based on the indicated depth and the placement area. An additional quantity, not to exceed 2% of the computed overlay quantity, will be paid as compensation for the cost of cement concrete material needed to replace unsound pavement material removed as part of the surface preparation operation. Excludes cement concrete material used in transition areas.

(c) Bonded Concrete Overlay of Concrete Pavements. Square Yard

The unit price includes all work associated with construction of the concrete overlay with the exception of the cement concrete material and the surface preparation. Also excludes concrete overlay transitions and concrete pavement cores.

1. Adjustment for Depth. The Inspector will determine lots and sublots as specified in Section 506.3(u). Where a deficiency exists, as determined by cores, lot payment for bonded concrete overlay will be adjusted as specified in Table A.

TABLE A
Adjustment in Contract Price for Depth

Deficient in Depth Determined by Cores (inches)	Payment Percent of Contract Unit Price, by Lot, Based on Nominal Overlay Depth
-0.25 to 0.00	100%
-0.30 to -0.26	95%
-0.35 to -0.31	85%
-0.40 to -0.36	75%
-0.45 to -0.41	65%
-0.50 to -0.46	50%
> -0.50	Defective Work

2. Defective Pavement Left in Place. The Department will not pay for defective pavement left in place, unless otherwise directed in writing by the District Executive. When the District Executive directs that defective pavement be left in place, final payment for this pavement will be at 5% of the contract unit prices of the concrete overlay/inlay and the cement concrete.

(d) Concrete Overlay Transition. Each

This unit price includes all associated items of work within the limits of the transitions.

(e) Evaluation of Concrete Pavement Ride Quality and Payment of Incentive. Section 507.4**(f) Concrete Pavement Cores.** Each

The price includes the measuring apparatus, which remains the Contractor's property upon completion of the project. The Department will not pay for additional cores drilled when the depth is deficient by more than 1/4 inch.

SECTION 548—UNBONDED CONCRETE OVERLAY OF CONCRETE-SURFACED PAVEMENTS

548.1 DESCRIPTION—This work is the construction of an unbonded concrete overlay of concrete pavements including surface preparation and joint sawing and sealing.

548.2 MATERIAL—Section 501.2 with the following modification:

(a) **Non-Woven Geotextile Interlayer.** Section 735 Class 4 Separation, Type A modified as follows:

Mechanical Properties	Test Method	Average Roll Value
Color	Visual Inspection	Uniform (all same color fibers)
Geotextile Type	EN 13249, Annex F (Certification)	Nonwoven, needle-punched, no thermal treatment to include calendaring
Weight per unit area	ASTM D5261	14.0 oz/sq.yd minimum
Thickness under load (pressure) 0.29 psi 2.9 psi 29 psi	ASTM D5199	≥ 0.12 inches ≥ 0.10 inches ≥ 0.04 inches
Wide Width Tensile Strength	ASTM D4595	≥685 lb/ft s
Wide Width maximum Elongation	ASTM D4595	≤ 130%
Water permeability in normal direction under 2.9 psi load	ASTM D5493	0.02 ft/min
In-plane Water Permeability (transmissivity) under load (pressure) 2.9 psi 29 psi	ASTM D4716	0.10 ft/min 0.04 ft/min
Alkali Resistance	EN 13249, Annex B (Certification)	≥96% Polypropylene/Polyethylene
UV Resistance at 500 hours	ASTM D4355	retained strength 70% average with no value less than 60%

(b) **Geotextile-Securing Devices, Materials, or Techniques.** Anchoring devices, materials, or techniques approved by the selected geotextile manufacturer for project-specific use.

(c) **Superpave Mixture Design, Standard Construction of Plant-Mixed HMA Fine-Graded Courses.** Section 410 and Bulletin 27.

(d) **Class AA Cement Concrete.** Section 704 except for overlays with depth less than 7 inches use concrete reinforced with polypropylene fibers according to ASTM C1116, Type III 4.13 and ASTM C1116 (Ref: ASTM C1018) Performance Level 1 outlined in Section 21, Note 17 and Residual Strength. Use 100% virgin polypropylene (PE) manufactured to an optimum gradation for use as concrete reinforcement. Use a synthetic fiber that is a monofilament or bundled monofilament with a minimum length of 1.0 inches and a maximum length of 2 1/2 inches and has a maximum aspect ratio (length divided by the equivalent diameter of the fiber) of 150. Add a sufficient quantity of synthetic fiber(s) to the concrete mixture to have a residual strength ratio (R150,3) of 20.0 percent according to Illinois Modified ASTM C1609. Do not exceed the maximum dosage rate of 5.0 pounds per cubic yard, unless the manufacturer can demonstrate, through a field demonstration, that the concrete mixture will be workable and fiber clumping is not a problem.

Add the synthetic fibers to the concrete and mix in accordance with the manufacturer's recommendation.

548.3 CONSTRUCTION—Section 501.3 modified as follows:

(e) **Preparation and Protection of Base Course.** Replace with the following:

(e) Surface Preparation.**1. Pre-overlay Repairs.**

1.a General. Areas with unstable slabs and slab fragments (e.g. slabs or fragments that move or rock visibly under normal traffic loads) that would otherwise result in non-uniform support of the overlay must be stabilized or repaired before placement of the interlayer material.

1.b Concrete Pavement Patching. Section 516, except delete Section 516.3(p)

1.c Slab Stabilization. Section 679 except delete Sections 679.3(b), (d)4, and (e).

1.d Slabjacking. Section 681

1.e Flexible Base Replacement. Section 316.

1.f Shallow Repairs. Repair surface defects with a patching material that consists of an asphalt material, a cementitious material, or a similar pavement repair material meeting the approval of the Representative before placing the overlay. When using a geotextile interlayer, fill all surface defects measuring greater than 4 square inches and 1 inch deep in the surface of the traffic lanes, with a patching material and compact to a flat, tight surface. When using an asphalt interlayer, shallow defects can be filled with an asphalt interlayer material as the interlayer is placed provided that the material in the defect can be properly compacted along with the interlayer; otherwise the defects must be filled with repair material before placement of the interlayer.

2. Sweeping. Sweep pavement to remove any loose debris by either using a power broom, vacuum truck, or other approved means before applying pavement interlayer.

3. Separation Layer.

3.a Geotextile Interlayer Placement. Mill joints with greater than 1/4 inch faulting.

Place geotextile flat on the repaired and cleaned existing pavement surface. Overlap edges of geotextile by 8 inches \pm 2 inches. Do not allow more than three layers of the geotextile to overlay in any location. Sequence rolling out geotextile to ensure good lapping practice and prevent folding or tearing by construction traffic.

Extend free edge of geotextile interlayer a minimum of 4 inches beyond edge of pavement. Terminate interlayer in a drainable layer or at a daylighted location (e.g. ditch foreslope). Do not impair free drainage of the geotextile.

Secure geotextile in accordance with the geotextile manufacturer's instructions.

Avoid allowing construction traffic on the geotextile whenever possible. Delay geotextile installation on areas subject to potentially damaging traffic, such as crossovers, until immediately before concrete placement. Minimize sharp turns and braking on geotextiles

Keep geotextile clean and free of loose debris before overlay placement. Dampen geotextile but do not saturate, before overlay placement. Do not allow the surface temperature of the fabric to exceed 120F before the overlay placement.

3.b Asphalt Interlayer. Place a nominal depth of 1 inch of Superpave Mix Design as specified in Section 410.3. If joint faulting exceeds 1/2 inch, place a scratch course at the joint or mill/grind joints to reduce faulting. Use a rubber tire roller. Do not allow the surface temperature of the pavement to exceed 120F before the overlay placement. Control the asphalt surface temperature by misting the surface, using white-pigmented curing compound, whitewashing with lime water, or other method approved by the Representative.

(g) Slip-Form Paving Method. Modified as follows:**3. Placing Concrete.** Add the following:

If dowel baskets are moving during the paving operation, suspend paving operations until a plan for securely anchoring the baskets is approved by the Representative and implemented.

4. Joints. Add the following:

Leave shipping wires intact, unless a Magnetic Tomography-Based Device is to be used for dowel placement verification. Secure dowel bar assemblies with anchors to hold the dowel bars in the correct position and alignment while preventing movement during concrete placement in accordance with the following:

- Provide a QC Plan for anchoring dowel basket assemblies.
- Fasten the baskets to the substrate surface so that they do not move vertically or horizontally more than 1/4 inch.
- Type, location, number, and length of anchors are dependent upon field conditions.
- Before starting concrete pavement placement and before each day of concrete pavement placement, demonstrate the fastening method to the Representative for approval.

(i) **Transverse.** Modified as follows:

3. Expansion Joints. Add the following:

Identify and mark any transverse expansion joints in the existing pavement. To allow for slab movement before sawing, precut the expansion joints in the plastic concrete. As soon as sawing is possible, saw two full-depth cuts on each side of the precut joint following the edges of the underlying expansion joint and remove the concrete between the saw joints.

4. Location. New transverse and longitudinal joints are not required to match existing joint locations, nor are they required to be offset by any minimum distance.

5. Panel Size. Determine the dimensions of the unbonded concrete overlay panels using lane geometry, concrete placement width and the following guidance:

Unbonded Overlay Thickness	Maximum Nominal Panel Dimensions
≤ 6 inches to < 8 inches	6 ft × 6 ft
≥ 8 inches to ≤ 10 inches	12 ft × 12 ft
> 10 inches	12 ft × 15 ft

The aspect ratio (longer dimension/shorter dimension) of any panel should be as close to 1.0 as is feasible and should not exceed 1.5.

6. Saw Cut Depth. The saw cut depth must be no less than D/3 within 12 inches of the pavement edges and must be no less than D/4 anywhere. Clean joint of all deleterious material after sawing. Seal all transverse and longitudinal joints. Consider concrete panels with cracking outside of the sawed joints defective.

7. Joint Spacing. Space joints as indicated on the project plans and special provisions. If no joint spacing is indicated, develop a joint layout plan to be accepted by the Department and lay out joints before placement of concrete. Avoid placing longitudinal joints in the wheel paths. In general, maximum panel dimensions should not exceed 18 times the concrete overlay thickness, and the length of the longer panel dimension divided by the shorter panel dimension should not exceed 1.5. The Representative may allow slight deviations from nominal panel dimensions in order to match joints in adjacent pavement or structures, or to avoid the construction of panels with dimensions or shapes that would otherwise be subject to premature cracking.

8. Sawing for Creating Concrete Overlay Joints. Sawing is the only acceptable technique for creating concrete overlay joints. Saw joints as soon as concrete has sufficiently hardened to allow sawing without excessive raveling resulting from the sawing operation and to prevent random cracking. The use of “early entry” saws is recommended. FHWA’s HIPERPAV or similar software approved by the Department may be used in determining a project-specific sawing window. If necessary, conduct sawing operations continuously, both day and night, regardless of weather conditions. Saw joints with a green cut saw to a depth of D/3 and a minimum width of 1/4 inch. If initial saw cuts do not extend through the slab edge to avoid “blowouts” or edge damage of green concrete, extend these cuts through the edge as soon as it can be done without causing damage. Omit sawing if a crack occurs at or within 1.5 feet of a joint location, before or during sawing, and address as specified in Section 590. Clean joints of all deleterious material after sawing.

9. Curing. If pavement is cured by means other than white-pigmented, liquid membrane-forming curing compound, remove curing materials from overlay, at the location where a joint is to be cut. Remove only sufficient covering to provide space necessary for sawing joints. As soon as the joint is sawed, replace the covering. The maximum time period allowed for pavement curing covers to be removed is 1/2 hour. If white-pigmented, liquid membrane-forming curing compound is used, cure the joint area, as specified in Section 501.3(1)1.c.

(j) Longitudinal Joints. Add the following:

Additional longitudinal joint requirements are as specified in Sections 548.3(i)4, 3(i)5, 3(i)6, 3(i)7, 3(i)8, and 3(i)9.

(k) Final Strike-Off, Consolidation, and Finishing. Modified as follows:

2. Floating. Add the following:

Do not use steel or Fresno Floats.

(l) Curing Concrete. Modified as follows:

1. Normal Curing. Replace the first sentence with the following:

Apply curing materials after finishing and texturing, and within 30 minutes of the dissipation of bleed water. Maintain the curing materials until the pavement has achieved sufficient strength for opening to traffic as specified in Section 548.3(q).

Add the following paragraph:

Provide adequate insulating blankets to prevent rapid heat loss if the air temperature is 40F or less. Insulation may be removed when the air temperature exceeds 40F or when the average compressive strength of the concrete exceeds 3,600 pounds per square inch. Remove insulation in a manner such that the rate of temperature change at the concrete surface does not exceed 40F within any 1-hour period. Take temperature readings of the concrete surface during insulation removal. Concrete that experiences a higher rate of temperature change may be considered defective.

1.c White Membrane Forming Curing Compound. Replace the second sentence of the second paragraph with the following:

Apply curing compound evenly to provide a uniform, solid white opaque coverage on all exposed concrete surfaces. Apply at a minimum rate of 1 gallon (\pm 0.1 gallon) per 150 square feet for pavements > 6 inches and per 125 square feet for pavements \leq 6 inches or according to the manufacturer's recommendations, whichever is greater. If conditions warrant, the curing compound can be applied in two equal rates of application, with the first applied as stated previously and the second applied immediately after sawing operations have been completed. Joint faces must be protected from exposure to curing compound or cleaned thoroughly prior to sealant installation.

(o) Surface Tolerance. Replace with the following:
Section 506.3(o)

(q) Opening to Traffic. Replace with the following:
The Representative will determine when pavement will be open to traffic based on when the concrete attains the minimum required compressive strength according to Table A as measured either by compressive strength testing of cylinders in accordance with PTM No. 604 or by concrete maturity specifications in accordance with PTM 640.

Table A

Slab Thick, inches	Strength for Opening to Traffic, psi			
	Length < 10 ft		Length \geq 10 ft	
	f'c	MR (3rd)	f'c	MR (3rd)
6.0	3000	490	3600	540
7.0	2400	370	2700	410
8.0	2150	340	2150	340
9.0	2000	275	2000	300
10.0 +	2000	250	2000	300

(u) Concrete Overlay Transitions. Add this section as follows:

Construct transitions at the limits of the concrete overlay as indicated. In areas where transitions contain existing treated base course or concrete pavement directly below the overlay, place geotextile as a debonding layer as specified in Section 548.3(e)3.a.

548.4 MEASUREMENT AND PAYMENT—

(a) Concrete Pavement Patching. Section 516.4(c)

(b) Slab Stabilization. Section 679.4(b) and (c)

(c) Slabjacking. Section 679.4(b) and (c)

(d) Flexible Base Replacement. Section 316.4

(e) Shallow Repairs. Square Foot

(f) Cement Concrete, Class AA. Cubic Yard

For producing the cement concrete needed for the overlay and delivering it to the jobsite. Computed based on the indicated depth of the overlay and the placement area. Includes all work associated with the construction of the concrete overlay with the exception of pre-overlay repairs. Excludes cement concrete material used in transition areas.

(g) Separation Layer – Geotextile. Square Yard

The unit price includes all required materials and placement/installation including sweeping.

(h) Separation Layer – Asphalt. Tons

The unit price includes all required materials and placement/installation including sweeping. The cost of necessary joint fault reduction efforts will be considered incidental to this item of work.

(i) Adjustment for Deficiencies. Section 501.4(a)

(j) Defective Pavement Left in Place. Section 501.4(b)

(k) Concrete Overlay Transition. Cubic Yard.

The unit price includes all associated items of work within the limits of the transitions.

(l) Evaluation of Concrete Pavement Ride Quality and Payment of Incentive. Section 507.4.

(m) Test for Depth. Section 501.4(c)

SECTION 590—CRACK CLEANING AND SEALING

590.1 DESCRIPTION—This work is cleaning and sealing of cracks in existing cement concrete pavements having an opening of 1/16 inch and wider.

590.2 MATERIAL—

(a) **Joint Sealing Material.** Section 705.4(b) or (c)

590.3 CONSTRUCTION—Saw or grind cracks to a width of 3/4 inch wide by 1 inch depth. Immediately after sawing and grinding, flush with water. If original crack is between 3/4 inch and 1 inch wide, saw or grind to a width of 1 inch and a depth of 1 1/4 inches.

Immediately before placing the sealant, thoroughly clean the crack. If using a compressed air stream, it should be at least 100 pounds per square inch measured at the source. Do not place sealing material until the faces are thoroughly clean and dry to the satisfaction of the Representative.

Seal cracks as specified in the applicable requirements in Section 501.3(n) and as specified here.

Do not place joint sealant unless the ambient air temperature is 40F or greater, and the pavement temperature is 40F or greater.

Fill the sealant reservoir to a level of 1/8 inch to 1/4 inch below the pavement surface.

590.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 591—MILLING OF CEMENT CONCRETE PAVEMENT SURFACE

591.1 DESCRIPTION— This work is milling of an existing cement concrete pavement surface to the indicated depth.

591.3 CONSTRUCTION—

(a) **Equipment.** Provide a milling machine designed and built for milling existing cement concrete pavements.

(b) **Milling Operation.** Mill to provide a finished surface that is free from gouges, grooves and ridges and that conforms to the surface tolerance requirements of Section 501.3(o). Immediately after milling, remove milled material. Carefully remove the existing cement concrete material around utility facilities within work areas. Repair or replace utility facilities that are damaged by the milling operation to the satisfaction of the utility owner. Control the rate of milling to avoid tearing of the mat, or chunky and non-uniformly milled material. If directed, separate oversized and chunky milled material. Maintain the milled pavement surface free of all loose materials and dust before placing a proposed asphalt overlay.

(c) **Disposition of Milled Material.** Satisfactorily dispose of the milled material or dispose as indicated.

591.4 MEASUREMENT AND PAYMENT—Square Yard

SECTION 600 INCIDENTAL CONSTRUCTION

SECTION 601—PIPE CULVERTS

601.1 DESCRIPTION—This work is construction or reconstruction, inspection, and cleaning of pipe culverts; including subsurface utility facilities, sewers, and storm drains. This work also includes the direct design, manufacturing and testing of reinforced concrete pipes.

601.2 MATERIAL—

(a) **Pipes.** Comply with the following:

1. **Certification.** Section 106.03(b)3
2. **Size and Type of Pipe.** As indicated.
3. **Reinforced Concrete (RC) Pipe.**

3.a Round and Elliptical Reinforced Concrete Pipe. Publication 280. Provide RC pipe conforming to BD-636M, PennDOT Design Manual Part 4, Appendix H, and the Pennsylvania Installation Direct Design (PAIDD) computer program or other Department accepted software program. Manufacture and test according to Publication 280.

3.b Plant Acceptance.

3.b.1 General. Do not begin fabrication before the Structural Materials Engineer's inspection and acceptance of the plant. Provide a permanent building offered for the Department's acceptance.

Material, equipment, test procedures, methods of fabrication, handling, storage, and transportation are subject to inspection. Through wall lift holes are permitted only if formed during the manufacturing process or cored after the pipe is cured on pipe diameters 42 inches (or elliptical equivalent) and larger. Punch through methods are prohibited on all pipe diameters. Through wall lift holes are prohibited on pipe diameters 36 inches (or elliptical equivalent) and smaller.

Register and certify the plant under either the American Concrete Pipe Association (ACPA) or National Precast Concrete Association (NPCA) plant certification program. Submit an annual endorsed copy to the Structural Materials Engineer for continued qualification.

3.c QC.

3.c.1 General. Establish a level of QC based on uniform production practices. Submit the plant's QC Plan and mix design(s) to the Structural Materials Engineer, BD TD, for review and approval. Include with the QC Plan a company organizational chart indicating a separate chain of command from the QC Manager to the Owner/Plant Manager independent of the Production Manager. Resubmit the QC Plan, mix design, and/or organizational chart, when required, due to changes in processes, materials, or personnel.

3.c.2 QC Manager. Provide a QC Manager who has the overall responsibility for the adequacy of production facilities, QC, sampling, and testing, and fabrication of the product, and who will ensure that items are fabricated as designed and specified. QC Managers are required to maintain an active ACI Grade I Field Technician Certification.

3.d Testing and Inspection.

3.d.1 Testing. Publication 280.

3.d.2 Inspection. Publications 145 and 280. Provide the necessary pipe inspection equipment and leaf gauges. Before installation, pipes may have non-through wall cracks of less than 0.003 inch in width. Any pipe having both an unloaded surface crack width of 0.003 inch or greater and extending 12 inches or longer, will be rejected. To determine whether rejection or remediation is required, measure crack widths with leaf gauges conforming to AASHTO T 280. Use gauges having a thickness of 0.003 inches to determine pipe acceptability before installation.

4. Metal Pipes.

4.a Ductile Iron Pipe. ASTM A716

4.b Corrugated Steel Pipe, Metallic Coated. AASHTO M 36, Types I and IR; AASHTO M 218; AASHTO M 274; and AASHTO M 289

4.c Corrugated Aluminum Alloy Pipe. AASHTO M 196, Types I and IR

4.d Coated Corrugated Galvanized Steel Pipe. AASHTO M 245, Type I; AASHTO M 246; and AASHTO M 218. Fabricate pipes with coatings as follows:

- Grade 10/10 — 10 mil coating on all surfaces.

5. Half-Circle Pipe. Conforming to the requirements of the type indicated, except modified to meet the half-circle configuration.

6. Thermoplastic Pipes. Provide cell class of material (actual and minimum), minimum pipe stiffness, and the dimension ratio, when applicable, if not included in pipe markings. Thermoplastic connection for T-Y-K sections that meet the requirements of this section are allowed on pipe runs.

6.a Group I. 15-foot maximum fill—1.5-foot minimum fill height.

6.a.1 Polyethylene.

- ASTM F714, Type S, SDR<21, cell class 335434C, 48-inch diameter maximum
- ASTM F714, Type S, SDR=26, cell class 335434C, 21-inch diameter—48-inch diameter only
- ASTM F894, Type S, RSC=100, cell class 335434C, 36-inch maximum diameter
- ASTM F894, Type S, RSC=160, cell class 335434C, 18-inch diameter—42-inch diameter only

6.a.2 Polyvinyl Chloride.

- ASTM F794, Type S, PS=46, cell class 12454C or 12364C, 48-inch diameter maximum
- AASHTO M 304, Type S, cell class 12454C, 48-inch maximum diameter
- AASHTO M 304, Type S, cell class 12364C, 18-inch to 48-inch diameter
- ASTM F679, Types S, T1, or T2, PS=46, cell class 12364C or 12454C, 36-inch maximum diameter
- AASHTO M 278, Type S, cell class 12454B, 12-inch diameter and 15-inch diameter only

6.b Group II. 12-foot maximum fill—1.5-foot minimum cover. Section 601.2(a)6.a and as follows:

6.b.1 Polyethylene. ASTM F894, Type S, RSC=100, cell class 335434C, 42-inch diameter

6.c Group III. 8-foot maximum fill—2-foot minimum cover. Section 601.2(a)6.a and as follows:

6.c.1 Polyethylene.

- AASHTO M 294, Types D and S, cell class 435400C, 30-inch maximum diameter; PennDOT Design Manual Parts 2 and 4, and 2014 AASHTO LRFD Bridge Design Specifications Chapter 12.

6.c.2 Polyvinyl Chloride.

- AASHTO M 304, cell class 12364C, 12-inch diameter and 15-inch diameter

6.d Group IV. 7-foot maximum fill—2.5-foot minimum cover.

6.d.1 Polyethylene.

- AASHTO M 294, Types D and S, cell class 435400C, 36-inch, 42-inch, 48-inch; PennDOT Design Manual Parts 2 and 4, and 2014 AASHTO LRFD Bridge Design Specifications Chapter 12.
- AASHTO M 294, Type S, cell class 435400C, 54-inch and 60-inch diameters; PennDOT Design Manual Parts 2 and 4, and 2014 AASHTO LRFD Bridge Design Specification Chapter 12.

6.e Group V. 7-foot maximum fill—2.5-foot minimum cover

6.e.1 Polyethylene.

- AASHTO M 294, Type C, cell class 435400C, 24-inch maximum diameter

6.f Group VI. 15-foot maximum fill—2.0-foot minimum cover

6.f.1 Polyethylene.

- AASHTO M 294, Types D and S, cell class 435400C; PennDOT Design Manual Parts 2 and 4, and 2014 AASHTO LRFD Bridge Design Specifications Chapter 12.

6.f.2 Polypropylene.

- AASHTO M 330, Types D and S, 12-inch to 60-inch diameter; PennDOT Design Manual Parts 2 and 4, and 2014 AASHTO LRFD Bridge Design Specifications Chapter 12.

6.g Group VII. 12-foot maximum fill—2.0-foot minimum cover

6.g.1 Polyethylene (High Density Polyethylene (HDPE) 100-year pipe).

- AASHTO M 294, Type S, cell class 435400C, 18-inch, 21-inch, 24-inch, 30-inch, 36-inch, 42-inch, 48-inch, and 60-inch diameters; PennDOT Design Manual Parts 2 and 4, and 2014 AASHTO LRFD Bridge Design Specifications Chapter 12 with:

$$F_u \text{ min} = 0.5 \text{ ksi}$$

$$E \text{ min} = 20 \text{ ksi}$$

- Comply with the requirements of Table 1 for initial product approval testing. Comply with the requirements of Table 2 for production quality control sampling and testing in addition to the requirements of AASHTO M 294. Provide watertight joints according to AASHTO M 294 using a bell and spigot design. Except: as noted below in Bulletin 15 Product Approval and Approved Product Changes, Resubmittal, and Approval.

TABLE 1			
6.g.1(a) Stress or Crack Resistance (SCR) of Pipes			
Pipe Location	Test Method	Test Conditions	Test Requirements
1. Pipe Liner	FM 5-572, Procedure A	10% Igepal solution at 122F and 600 psi applied stress; 5 replicates	average failure time of the pipe liner \geq 18 hours, no single value $<$ 13 hours
2. Pipe Corrugation ¹ , (molded plaque)	ASTM F2136	10% Igepal solution at 122F and 600 psi applied stress; 5 replicates	average failure time \geq 24 hours, no single value $<$ 17 hours
3.b Junction	FM 5-572, Procedure B and FM 5-573	Full Test ² : Test temperature 176F and applied stress of 650 psi and 450 psi. Also, test temperature 158F and applied stress of 650 psi; 5 replicates at each of three test conditions.	Determine failure time at 500 psi at 73.4F \geq 100 years (95% lower confidence) using 15 failure time values ³ . The tests for each condition can be terminated at duration equal to or greater than the following criteria: 110 hours at 176F: 650 psi 430 hours at 176F: 450 psi 500 hours at 158F: 650 psi
3.b Junction		Single Test ⁴ : Test temperature 176F and applied stress of 650 psi; 5 replicates.	average failure time \geq 110 hours
4.a Longitudinal Profiles ⁵	FM 5-572, Procedure C and FM 5-573	Full Test ² : Test temperature 176F and applied stress of 650 psi and 450 psi. Also, test temperature 158F and applied stress of 650 psi; 5 replicates at each of three test conditions.	Determine failure time at 500 psi at 73.4F \geq 100 years (95% lower confidence) using 15 failure time values ³ . The tests for each condition can be terminated at duration equal to or greater than the following criteria: 110 hours at 176F: 650 psi 430 hours at 176F: 450 psi 500 hours at 158F: 650 psi
4.b Longitudinal Profiles ⁵		Single Test ⁴ :	average failure time \geq 110 hours

		Test temperature 176F and applied stress of 650 psi; 5 replicates.	
6.g.1(b) Oxidation Resistance of Pipes			
Pipe Location	Test Method	Test Conditions	Test Requirements
1. Liner and/or Crown ⁶	OIT test (ASTM D3895)	2 replicates (to determine initial OIT value) on the as manufactured (not incubated) pipe	25 minutes, minimum
2. Liner and/or Crown ⁶	Incubation test FM 5-574 and OIT test (ASTM D3895)	Three samples for incubation of 265 days at 176F ⁷ and applied stress of 250 psi. One OIT test per each sample.	average of 3 minutes ^{8, 9} (no values < 2 minutes)
3. Liner and/or Crown ⁶	MI test (ASTM D1238 at 374F/4.762 lb	2 replicates on the as manufactured (not incubated) pipe	< 0.4 g/10 minutes
4. Liner and/or Crown ⁶	Incubation test FM 5-574 and MI test (ASTM D1238 at 374F/4.762 lb	2 replicates (total) on the three aged samples after incubation of 265 days at 176F ⁷ and applied stress of 250 psi	MI Retained Value ^{9, 10, 11} > 80% and < 120%
6.g.1(c) Long Term Tensile Properties			
Pipe Location	Test Method	Test Conditions	Test Requirements
1. Liner	FM 5-577	2 replicates at applied stress of 500 psi	Determine creep modulus at 100-year at 73.4F ≥ 20,000 psi (95% lower confidence).
2. Junction ¹¹	FM 5-577, Procedure B	Test at 3 temperature/stress combinations: 176F at 650 psi 176F at 450 psi 158F at 650 psi; 5 replicates at each test condition.	Determine tensile strength at 100-year at 73.4F ≥800 psi (95% lower confidence) using 15 failure time values ^{3,12} . The tests for each condition can be terminated at duration equal to or greater than the following criteria: 110 hours at 176F: 650 psi 430 hours at 176F: 450 psi 500 hours at 158F: 650 psi
6.g.1(d) Antioxidant Index			
Pipe Location	Test Method		Test Requirements
Liner, Crown, Junction Corrugation	ASTM D6953-03		QA Index All pipe sizes
Note:			
FM = Florida Method of Test MI = Melt Index OIT = Oxidative Induction Time			
1. Required only when the resin used in the corrugation is different than that of the liner.			
2. Perform full test on alternative (redesign) pipe diameter of pipe based on wall profile design. raw			

material cell classification, and manufacturing process. Full test must be performed on maximum and minimum pipe diameters within a manufacturing process.

3. Provide documentation to predict the 100-year stress crack resistance with a 95% lower confidence.
4. Single test for the junction and longitudinal profile may be used on alternate (redesign) pipe sizes within a manufacturing process. Single point tests may not be used on maximum and minimum pipe sizes within a manufacturing process except by approval of LTS, Engineer of Tests. Single point tests may be used for quality assurance testing purposes.
5. Longitudinal profiles include vent hole(s), molded lines and circumferential weld seam.
6. OIT and MI tests on the crown are required when resin used in the corrugation is different than that of the liner.
7. The incubation duration and temperature can also be 187 days at 185F.
8. Within each replicate set of tests, the discrepancy range is to be within 6%. If an out-of-range discrepancy occurs, repeat the three OIT tests.
9. Perform the tests for incubated and "as-manufactured" pipe samples by the same lab, same operator, the same testing device, and in the same day.
10. Within each replicate set of tests, the discrepancy range is to be within 9%. If an out-of-range discrepancy occurs, repeat the two MI tests on the same pipe sample. If insufficient material is available, a repeat of one test is acceptable.
11. The MI retained value is determined using the average MI value of incubated sample divided by the average MI value of as-manufactured pipe sample.
12. The junction test results from the SCR test may be used to establish the minimum 100-year tensile strength of 800 psi.

- Florida Department of Transportation (FDOT) Method of Test: FM 5-572, Determining Stress Crack Resistance of HDPE Corrugated Pipes; FM 5-573, Predicting the Crack Free Service Life of HDPE Corrugated Pipes; FM 5-574, Predicting the Oxidation Resistance of HDPE Corrugated Pipes; FM 5-577, Predicting Long-Term Modulus of HDPE Corrugated Pipes. The laboratory performing these tests must be certified by the Geosynthetic Accreditation Institute (GAI).
- Provisional approval can be granted for all current Bulletin 15 approved products as well as products currently pending approval. Final approval will only be granted to systems which meet all requirements as currently outlined.
- **Bulletin 15 Product Approval (initial Bulletin 15 listing)**
Initial testing of all 100 year HDPE pipes will include:

Third party independent testing of all sizes, profiles, and manufacturing locations for all:

1. AASHTO M 294 requirements (*except: ASTM D3212—testing for joint integrity)
2. All Table 1 testing requirements (Note: only footnotes 1,3, and 5-12 apply)
3. Fingerprint of antioxidant package according to ASTM D6953-03 "Determination of Antioxidants and Erucamide Slip Additives in Polyethylene Using Liquid Chromatography" to be used to index the antioxidant package for future confirmatory testing.

*The capability to provide watertight joints according to ASTM D3212 can be demonstrated by testing representative samples in the presence of the Representative in lieu of providing third party data.

4. Manufacturers must submit to BOPD, information pertaining to materials identity, antioxidant variation, carbon black variation, and QC/QA plans for review and approval before use. Any change in resin or antioxidant raw materials from the initial product approval must be resubmitted to the Department for reevaluation and approval.

- **Bulletin 15 Approved Product Changes, Resubmittal and Approval**

The following instances/changes trigger resubmittal:

- Design
- Antioxidant package
- Additional sizes
- Manufacturing location

Full retest includes:

1. AASHTO M 294 requirements (*except: ASTM D3212—testing for joint integrity)
2. All Table 1 testing requirements (Note: all footnotes apply)
3. ASTM D6953 antioxidant fingerprint

*The capability to provide watertight joints according to ASTM D3212 can be demonstrated by testing representative samples in the presence of the Representative in lieu of providing third party data.

Exceptions include:

1. If no change in antioxidant package can be confirmed to be the same by ASTM D6953 antioxidant fingerprint then the Table 1 Oxidation Resistance tests 6.g.1(b)2 and 6.g.1(b)4 can be omitted.
2. If solely a Design (longitudinal profile) change; than the Table 1 single point testing of SCR 6.g.1(a)4.b; full testing can be omitted. Take sample on the circumferential weld seam.

TABLE 2			
Pipe Location	Test Method	Test Requirements	Minimum Test Frequency
Pipe Liner	FM 5-572, Procedure A	Greater than or equal to the value of the initial approval test (within the statistical precision and bias of the test method).	Monthly ²
Liner and/or Crown ¹	OIT test (ASTM D3895)	25 minutes, minimum	Quarterly ²
1. OIT test on the crown is required when resin used in the corrugation is different than that of the liner. 2. The test is applicable for each pipe diameter manufactured within the stated time period.			

6.g.2 Polypropylene.

- AASHTO M 330, Types D and S, 12-inch to 60-inch diameter; PennDOT Design Manual Parts 2 and 4, and 2014 AASHTO LRFD Bridge Design Specifications Chapter 12 with:

$$F_u \text{ min} = 0.5\text{ksi}$$

$$E \text{ min} = 20 \text{ ksi}$$

- Comply with the requirements of Table 3 for initial product approval testing.

TABLE 3			
Stress Crack Resistance (SCR) of Pipes			
Pipe Location	Test Method	Test Conditions	Test Requirements

Pipe Liner	FM 5-572, Procedure A	10% Igepal solution at 122F and 600 psi applied stress; 5 replicates	average failure time of the pipe liner ≥ 100 hours, no single value < 71 hours ¹
Oxidation Resistance of Pipes			
Pipe Location	Test Method	Test Conditions	Test Requirements
Liner and/or Crown ²	OIT Test (ASTM D3895)	2 replicates (to determine initial OIT value) on the as manufactured (not incubated) pipe	25 minutes, minimum
Liner and/or Crown ²	Incubation test FM 5-574 and OIT test (ASTM D3895)	Three samples for incubation of 264 days at 185F ³ . One OIT test per each sample.	average of 3 minutes ⁴ (no values < 2 minutes)
Liner and/or Crown ²	MI test (ASTM D1238 at 446F/4.762 lb	2 replicates on the as manufactured (not incubated) pipe	< 1.5 g/10 minutes
Liner and/or Crown ²	Incubation test FM 5-574 and MI test (ASTM D1238 at 446F/4.762 lb	2 replicates (total) on the three aged samples after incubation of 264 days at 185F ³	MI Retained Value ^{4, 5, 6} > 80% and < 120%
Antioxidant Index			
Pipe Location	Test Method	Test Requirements	
Liner, Crown, Junction Corrugation	ASTM D6953-03	QA Index All pipe sizes	
Note:			
FM = Florida Method of Test MI = Melt Index OIT = Oxidative Induction Time			
1. If, due to sample size, this test cannot be completed on the liner, then conduct testing on a molded plaque sample. Samples can be removed if test time exceeds 100 hours without failure.			
2. OIT and MI tests on the crown are required when resin used in the corrugation is different than that of the liner.			
3. The incubation duration and temperature can also be 192 days at 194F or 140 days at 203F.			
4. Perform the tests for incubated and "as-manufactured" pipe samples by the same lab, same operator, the same testing device, and in the same day.			
5. Within each replicate set of tests, the discrepancy range is to be within 9%. If an out-of-range discrepancy occurs, repeat the two MI tests on the same pipe sample. If insufficient material is available, a repeat of one test is acceptable.			
6. The MI retained value is determined using the average MI value of incubated sample divided by the average MI value of as-manufactured pipe sample.			

(b) Other Material.

- Premolded Expansion Joint Filler—Section 705.1
- Mortar—Section 705.7(a)
- Caulking Compound—Section 705.8(a)
- Preformed Pipe Joint Gaskets—Section 705.5(b)
- Cement Concrete for Miscellaneous Drainage—Section 704
- Reinforcement Steel—Section 709

- Coarse Aggregate—Type C or better, Section 703.2
- Curing Compound—Section 711.2
- Curing and Protecting Covers—Section 711.1
- Asphalt Paint—Federal Specification TT-V-51F. Certify as specified in Section 106.03(b)3.
- Zinc Chromate Primer—Federal Specification TT-P-645. Certify as specified in Section 106.03(b)3.
- Flowable Backfill—Section 220.1(a)
- Geotextile, Class 4, Type A—Section 735
- Geotextile, Class 1 – Section 735
- Watertight Joint Gasket. ASTM F477

(c) **Grout.** Mix one part cement and two parts fine aggregate with the minimum amount of water necessary to obtain grout of the required consistency containing 3% to 7% entrained air. Air entraining cement may be used in place of the plain cement and air entraining admixture. Use materials conforming to the following requirements:

- Cement—Section 701
- Fine Aggregate—Type A or C, Section 703.1
- Water—Section 720.1
- Admixtures—Section 711.3

601.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) **General.** Provide 12-inch minimum cover from the bottom of base course to the top of pipe barrel. Construct the embankment to 4 feet above the top of pipe elevation or to subgrade, whichever is less, before excavating for the pipe. Do not haul over pipe with less than 4 feet of cover over the top of pipe barrel. Maintain a minimum pipe slope of 0.35% on drainage pipes unless otherwise specified.

If running water is encountered and cannot be diverted, provide an acceptable temporary pipe or other structure before placing embankment, or as otherwise directed.

Before placing pipe, inspect pipe for any defects such as cracks, dents, spalls, and/or coating according to Publication 280.

In advance of installation, submit to the Representative a detailed list of lifting equipment and hardware, including their rated capacity from the manufacturers for each size of pipe being installed. In addition, perform a visual review of the lifting equipment and hardware each day before installation for signs of damage or wear. Replace damaged or worn lifting equipment and hardware before use.

(b) **Trench and Bedding.** Excavate trench and construct bedding as shown on the Standard Drawings. Compact and proof roll the bottom of the trench as specified in Section 601.3(f)1 before placement of bedding material. Place appropriate bedding material for the type of pipe being placed. Do not compact pipe bedding materials. If, following compaction, the trench bottom is unable to withstand the force of the compaction equipment and provide adequate bearing for the bedding and pipe, discontinue work and immediately notify the Representative. Provide a proposed means to remediate the condition to provide adequate bearing to the Representative for review and acceptance before starting construction. Document the insufficient bearing location and the remediation technique on Form CS-6 for future reference. If flowable backfill material is used, provide support for pipe as specified in Section 220.3(b)2.

(c) **Laying Pipe.** Lay pipe as shown on the Standard Drawings before constructing base course or pavement. Lay

pipe with bells or grooves up grade in shaped recesses when required, spigot ends fully entered into the hubs. Begin placement of the pipe at the outlet end with a full length of pipe and continue towards the inlet end, unless otherwise directed. Fill lift holes with a manufactured lift hole plug that is soil-tight.

Control the pipe alignment and grade with suitable string lines, with an electronic laser beam system, or by other acceptable methods.

Camber the grade line to offset anticipated settlement due to the height of embankment and bedding used, if directed.

On straight-line pipe placements, join pipe sections according to the joint requirements specified in Section 601.3(n). Verify joint gaps during progressive pipe installation. If joint gaps cannot be maintained within the tolerance as specified in Section 601.3(n), stop work and investigate the cause. Commence construction after resolving any joint fitup problem. Join pipes placed on a radius to within these tolerances as measured at a point halfway up the pipe, springline, along the interior of the curve. For pipe runs placed on curves with a radius less than 765 yards (greater than 2 degrees, 30 minutes) use shorter lengths of precast pipe to minimize the joint gap.

If pipes are protected by endwalls or connected with drainage structures, place exposed pipe end within cast-in-place wall or cut off flush with precast structure face and finish with mortar, as directed. Provide satisfactory connections to existing drainage structures.

Coat all aluminum surfaces that will be embedded into concrete with one coat of zinc chromate primer, or a coat of asphalt paint. Allow coating to dry completely before placement of concrete.

If an existing utility facility or other obstruction is encountered which will prohibit the proper installation and backfill of the pipe, cease installation and notify the Representative immediately. Carefully excavate by hand if necessary to determine the nature and extent of conflict. Submit to the Representative a sketch or plan sheet showing the extent and nature of conflict. The Representative will provide direction to arrange for relocation of the utility facility, remove the obstruction(s), or complete the installation in a modified manner. Document the location of the obstruction and the remediation technique on Form CS-6 for future reference.

(d) Joints. Lay pipe, except interlocking style and pipe joined with bands, with pipe joint caulk or preformed pipe joint gaskets or elliptical concrete pipe as follows:

1. Pipe Joint Caulk. Before placing succeeding pipe sections, place the caulk on the inside of the bell end of the pipe, such that a sufficient layer of material is placed around the entire circumference of the pipe. After the joint is assembled, remove excess caulk on the inside of the pipe, such that the flow of water is not obstructed and seal the outside circumference of the joint.

2. Preformed Pipe Joint Gaskets. Before placing succeeding pipe sections, place preformed pipe joint gaskets according to manufacturer's recommendation.

3. Elliptical Concrete Pipe. Wrap the joint of the pipes with two layers of Geotextile, Class 1, as shown on Standard Drawings, RC-30M.

4. Metal Pipe. Minimum metal pipe connecting band width of 12 inches. Use two layers of Geotextile, Class 1, as shown on Standard Drawings, RC-30M, if the connecting partial and fully corrugated band dimples do not properly index into each corrugation valley at the pipe end. Verify the corrugation indexing as part of joint inspection.

(e) Elongation of Metal Pipes. When indicated, elongate metal pipe vertically 5%, using acceptable shop methods. Elongate coated pipe by acceptable shop methods only. Satisfactorily repair coating damaged by elongation procedures.

(f) Backfilling Trench. After the pipe is laid, backfill the trench as shown on the Standard Drawings with suitable material above the coarse aggregate layer as approved. Place material as shown on the Standard Drawings and as specified for the portion of the trench where the backfill is being placed and the placement condition. Compact backfill material for the full trench width, as specified in Section 206.3(b) for the specific material type placed. Use equipment with a consistent application force that will not damage the pipe. Test as specified in Section 206.3(a). If flowable backfill material is used, backfill the trench as shown in the Flowable Backfill Detail on the Standard Drawings, and as specified in Section 220.3.

1. Bottom of Trench. Compact and proof roll the bottom of the trench with the equipment, as specified in Sections 108.05(c)3.d, 3.g, 3.i, or 108.05(c)4, that will be used to compact the backfill before placing the pipe bedding

material. The use of an excavator-mounted hydraulic plate compactor (hoe pac) for proof rolling is not allowed. Compact trench bottom as specified in Section 206.3(b) for the specific material type present. Perform proof rolling only in the presence of the Representative who will assess and approve or disapprove the stability of the area being investigated. In wet areas or unstable areas, the Representative may waive this requirement if other stabilization or treatment measures are indicated and/or required. Any areas displaying permanent deformation greater than 1/2 inch are considered unstable. Treat unstable areas by excavating material in the area to a depth of 1 foot. Dry the material and recompact or replace with compacted suitable material of the same type or other material, including Soil, Type 1 granular material, and Type 2 granular material, as specified in Section 206.2(a)1, except having particles no greater than 2 inches in size, as approved by the Representative or as indicated.

2. Sides of Trench. Place No. 2A Coarse Aggregate backfill in compacted 4-inch layers to the height shown on the Standard Drawings. Compact with equipment, as specified in Section 108.05(c)4. Do not compact the backfill directly over the crown of the pipe as shown on the Standard Drawings.

3. Above Pipe or Conduit. Backfill from the top of the required No. 2A Coarse Aggregate, as shown on the Standard Drawings, to the finished grade elevation with suitable material or other material, including Soil, Type 1 granular material, and Type 2 granular material, as specified in Section 206.2(a)1, except having particles no greater than 2 inches in size, when the trench is located beyond the roadway footprint, including the shoulders. For pipes constructed in new embankments, backfill to the pavement subgrade elevation (bottom of the pavement subbase layer) with No. 2A Coarse Aggregate when the trench is located within the roadway footprint, including the shoulders, and the distance from the top of pipe elevation to the pavement subgrade elevation is less than or equal to 4 feet. When the distance is greater than 4 feet, suitable material or other material, including Soil, Type 1 granular material, and Type 2 granular material, as specified in Section 206.2(a)1, except having particles no greater than 2 inches in size, may be placed from the top of the required No. 2A Coarse Aggregate to the pavement subgrade elevation. For reconstruction or replacement of pipes/utilities under existing pavements, backfill the entire trench with No. 2A Coarse Aggregate regardless of the distance from the top of pipe to the pavement subgrade elevation.

Place in 5-inch loose layers when using equipment, as specified in Sections 108.05(c)3.d and 108.05(c)4. Up to 10-inch loose layers are acceptable if using a vibratory roller, as specified in Section 108.05(c)3.i. If using a backhoe-mounted hydraulic plate compactor, up to 12-inch loose layers are acceptable.

(g) Shored or Trench Box Installation. Construct shored or trench box installation where indicated and as specified in Section 107.08. Construct shored or trench box installation as required for reinforced concrete pipe.

Construct shored or trench box installations for thermoplastic or metal pipe as follows:

- Leave trench sheeting in place to prevent loss of foundation support and backfill materials unless otherwise directed by the Chief Bridge Engineer. When the top of trench sheeting is to be cut off, make the cut 18 inches or more above the crown of the pipe. Leave rangers, walers, and braces in place as required to support the cut off sheeting and trench wall in the vicinity of the pipe zone. Leave timber sheeting in place. Treat timber sheeting against biological degradation and decay if placed above the ground water table.
- Do not disturb the installed pipe and its embedment when using movable trench boxes and shields. Do not use movable supports below the top of the pipe backfill pay limit zone unless methods for maintaining the integrity and level of compaction of the backfill material are submitted to and approved by the Chief Bridge Engineer. Before moving supports, place and compact embedment to sufficient depths to ensure protection of the pipe. Finish placing and compacting the backfill material as supports are moved.
- If the use of sheeting or other trench wall supports is permitted below the pipe backfill pay limit zone, ensure that pipe, bedding, and backfill materials are not disturbed by support removal. Fill voids left upon removal of supports and compact all material to required densities.

(h) Jacked Pipe. Jack pipe by means of conventional tunneling or boring methods, when indicated. Before commencement of this work, submit a complete plan and schedule for pipe installation. Include complete details of sheeting, shoring, and bracing for the protection of facilities above the pipe, as well as materials and equipment pertinent to the jacking operation. Do not proceed with pipe installation until the plan and schedule are accepted.

Do not disturb facilities or cause settlement of the ground above the pipe. Provide free and unobstructed use of

facilities above the pipe, without delay or danger to life, equipment, or property.

Install pipe immediately following the heading or tunneling excavation. After completion of the jacking operation, fill voids around the pipe with grout placed under pressure. Properly protect the grout for at least 3 days.

Place joint sealant material on concrete pipe in front of the jacking frame. Replace or repair pipe damaged during the jacking operations as directed. If steel casing pipe is used, butt-weld the joints as installation progresses. Make joints watertight.

Where 100-year service life pipe is installed using a steel pipe casing, the joint gap tolerances do not apply provided the annular space between the liner pipe and the jacked pipe is filled with grout and where no visible grout leakage is observed during the post installation inspection.

If it is determined that the pipe installation is being conducted in an unsatisfactory manner, stop this work and place a bulkhead at the heading until an alternate procedure is proposed and accepted.

(i) Extension of Existing Pipe. If extensions of pipe culverts or drains are indicated or required, remove the existing endwalls as directed. Cut the existing pipe to a true edge, as required, to make a satisfactory joint. Join the new pipe to the existing pipe or endwalls, using acceptable collars constructed of Class A Concrete or acceptable metal connecting bands. Clean the existing pipe, as specified in Section 601.3(j). Repair or replace existing pipe damaged during construction.

As an alternate to removing the endwall, if permitted, extend the pipe using a concrete collar for pipe extension, as specified in Section 618.

(j) Cleaning Existing Pipes. Clean existing pipe culverts, as indicated and as directed, before the start of roadway paving operations. Clean inlets, bridge scuppers and piping, manholes, endwalls, and other drainage appurtenances connected to the pipes, as directed. Clean in an acceptable manner and repair damage resulting from the cleaning operation. Remove any material deposited in inlets during paving operations. Prevent material cleaned from the drainage system from entering streams or other bodies of water, and dispose of this material in a satisfactory manner.

(k) Relaid Pipe. Remove and clean existing pipes as indicated, and have them inspected by the Representative. Transport and relay accepted existing pipes at the indicated locations, in the same manner specified for new pipes.

(m) Removal and Replacement. Remove and replace pipe that is not true to alignment, shows settlement after installation, or is broken or damaged.

(n) Final Inspection of Pipes Except 100 Year Design Life Pipes. Before final acceptance, inspect all of the following types of installed pipe with total backfill/embankment load applied. Perform inspection on pipes at least 30 days after backfill/embankment is completed. If the final wearing course is placed more than 30 days after the pipe backfill/embankment is completed, the inspection must be performed before placing final wearing course. Provide pipe inspection equipment and inspect all pipes over 30 inches in diameter from inside the pipe. Inspect 18-inch to 30-inch diameter pipes from access points. Provide written documentation on Form CS-601 of all inspections to the Representative following each inspection. Locations of pipe installation documented as having been modified due to obstructions or insufficient bearing will be excluded from the acceptance criteria of this section.

1. Concrete Pipes. Provide pipe gauges, as specified in Section 601.2(a)3.d.2. and inspect concrete pipes for signs of damage. Inspection criteria for the pipe are as follows:

1.a Joints.

- If joint separation is greater than the joint gap installation allowance but less than the maximum joint gap allowance according to Tables A or B and soil tight, then the pipe joint will be accepted with reduced payment. Note all joint gaps that are greater than the installation allowance in the inspection report.
- If joint separation is greater than the maximum joint gap allowance according to Tables A or B and soil tight, then submit a remediation plan for repair or replacement as specified in Section 601.3(p). Note all joint gaps that are greater than the installation allowance in the inspection report.
- If any soil infiltration is identified at the pipe joint during inspection a pipe analysis and a remediation plan for repair or replacement as specified in Section 601.3(p) is required. Note all joints with soil infiltration in the inspection report.

TABLE A ROUND PIPE**		
Diameter (inches)	Joint Gap Installation Allowance (inches)	Maximum Joint Gap Allowance (inches)
12-36	0.700	1.000
42-54	0.800	1.200
60-72	0.850	1.275
78-90	0.900	1.350
96	1.000	1.500

TABLE B ELLIPTICAL PIPE**		
Equivalent Diameter (inches)	Joint Gap Installation Allowance (inches)	Maximum Joint Gap Allowance (inches)
18-36	0.750	1.125
42-48	0.850	1.275
54-60	0.900	1.350
66-72	1.200	1.500

**Special design joints will be subject to manufacturer submittal and individual review and approval. If the bell depth is greater than the tongue depth, include the difference between these depths to the joint gap table allowances.

1.b Cracks. Cracks with a width less than or equal to 0.007 inches are considered hairline and minor. Note these cracks in the inspection report; however, no remedial action is necessary.

Cracks identified during inspection having a width greater than 0.007 inches and a length greater than 12 inches require a pipe analysis and a remediation plan for repair or replacement as specified in Section 601.3(p). Note these cracks in the inspection report.

1.c Spalls/Chips. Check spalling area for exposed reinforcement.

- If spalling area has no exposed reinforcement, then repair according to Publication 145, Non-Structural Repair Section. Note these spalls in the inspection report.
- If spalling area has exposed reinforcement with a single spall area less than or equal to 150 square inches, then repair according to Publication 145, Structural Repair Section. Note these spalls in the inspection report.
- If spalling area has exposed reinforcement with a single spall area greater than 150 square inch, prepare and submit a pipe analysis and a remediation plan for repair or replacement as specified in Section 601.3(p). Note these spalls in the inspection report.

2. Metal Pipes. Inspect metal pipes for damage. Perform deflection testing using either electronic deflectometers, calibrated television or video cameras, properly sized, 9-leg (minimum) “go, no-go” mandrel, direct measurement by extension rulers or tape measures in pipes that allow safe entry, or other acceptable devices. At a minimum, perform deflection testing if pipe cannot be physically inspected. Inspection criteria for the pipe are as follows:

2.a Joints.

- If joint separation is greater than the joint gap installation allowance but less than the maximum joint allowance noted in Table C and soil tight, then the pipe joint will be accepted with reduced payment. Note all joint gaps that are greater than the installation allowance in the inspection report.
- If joint separation is greater than the maximum joint allowance noted in Table C and soil tight, then submit a remediation plan for repair or replacement as specified in Section 601.3(p). Note all joint gaps that are greater than the installation allowance in the inspection report.
- If any soil infiltration is identified at the pipe joint during inspection a pipe analysis and a

remediation plan for repair or replacement as specified in Section 601.3(p) is required. Note all joint with soil infiltration in the inspection report.

TABLE C METAL PIPE AND PLATE CULVERT		
Material	Joint Gap Installation Allowance (inches)	Maximum Joint Gap Allowance (inches)
Corrugated Metal Pipe, Type I (Round)	1.500	2.000
Corrugated Metal Pipe, Type II (Pipe- Arch)	2.000	2.500
Metal Plate Culvert	N/A ¹	N/A ¹
Iron Ductile Pipe (All Diameters)	1.000	1.500

Note:

1. Structural plates have lap joints.

2.b Coating. Repair damaged coatings according to AASHTO M 36 and AASHTO M 245 where the original coating has pinholes, blisters, cracks in the coating, lack of coating bond to surface, or loss of galvanizing. Note coating damage in the inspection report. Perform repairs at no expense to the Department.

2.c Deflection/Buckle. Note all deflections in the inspection report. Prepare and submit a pipe analysis and a remediation plan for repair or replacement as specified in Section 601.3(p) if deflection is greater than 7.5% of a round pipe nominal diameter plus a manufacturing tolerance of 1% or 1/2-inch undersize, whichever is greater.

For pipe arch, prepare and submit a pipe analysis and a remediation plan for repair or replacement as specified in Section 601.3(p) if the deflection limits of 7.5% decrease in rise and a 7.5% increase in span from the nominal dimension with no allowance for manufacturing tolerance are exceeded. Note all deflections in the inspection report.

2.d Dents. Note all dents in the inspection report. If any of the following criteria are identified in the report, then prepare and submit a pipe analysis and a remediation plan for repair or replacement as specified in Section 601.3(p).

- Dents greater than 5 % deflection of diameter
- Dents with an area greater than 1.0 square feet
- Dents with a length or width greater than 10 % of the circumference

2.e Holes. Note all holes in the inspection report.

- Holes with a diameter less than 1/2 inch without water leakage or soil infiltration will be accepted.
- Pipes with diameters greater than 30 inches having holes with a diameter less than 1/2 inch which exhibit either water leakage or soil infiltration require an internal repair patch as shown in Project Office Manual (POM) C.6.11.
- Pipes 30 inches and less in diameter having holes with a diameter less than 1/2 inch which exhibit either water leakage or soil infiltration require a remediation plan for repair as specified in Section 601.3(p).
- Pipes with diameters greater than 30 inches having holes with a diameter greater than or equal to 1/2 inch but less than 1.5 times the corrugation width require an internal repair patch as shown in POM C.6.11.
- Pipes 30 inches and less in diameter having holes with a diameter greater than or equal to 1/2 inch but less than 1.5 times the corrugation width require a remediation plan for repair or replacement as specified in Section 601.3(p).
- Holes with a diameter greater than 1.5 times the corrugation width require a pipe analysis and a remediation plan for repair or replacement as specified in Section 601.3(p).

3. Thermoplastic Pipes. Inspect thermoplastic pipes for damage. If the pipe run is 40 feet or less in length, not under the roadway, and the initial visual inspection does not indicate any deflection or other deficiencies, additional testing will be waived. In all other cases, perform the deflection testing using either electronic deflectometers, calibrated television or video cameras, properly sized “go, no-go” mandrel, direct measurement by extension rulers or tape measures in pipes that allow safe entry, or other acceptable devices. Perform deflection testing at a minimum if pipe cannot be physically inspected. Provide the unloaded inside diameter pipe size from the manufacturer for each pipe type and size delivered to the project. Inspection criteria for the pipe are as follows:

3.a Joints.

- If joint separation is greater than the joint gap installation allowance of 3/4 inch but less than the maximum joint gap allowance of 1 inch without water leakage or soil infiltration, then the pipe joint will be accepted with reduced payment. Note all joint gaps that are greater than the installation allowance in the inspection report.
- If joint separation is greater than the maximum joint gap allowance of 1 inch without water leakage or soil infiltration, then submit a remediation plan for repair or replacement as specified in Section 601.3(p). Note all joint gaps that are greater than the installation allowance in the inspection report.
- If any water leakage or soil infiltration is identified at the pipe joint during inspection a pipe analysis and a remediation plan for repair or replacement as specified in Section 601.3(p) is required. Note all joints with soil or water infiltration in the inspection report.

3.b Cracks. Note all cracks identified during inspection of the interior wall of the pipe in the inspection report:

- Cracks less than 1/8 inch in width and less than 6 inches in length without water leakage or soil infiltration will be accepted.
- Cracks less than 1/8 inch in width and less than 6 inches in length with water leakage or soil infiltration require a remediation plan for repair or replacement as specified in Section 601.3(p).
- Cracks greater than or equal to 1/8 inch in width and greater than or equal to 6 inches in length require a pipe analysis and a remediation plan for repair or replacement as specified in Section 601.3(p).

3.c Holes. Note all holes in the inspection report.

- Holes with a diameter less than 1/2 inch without water leakage or soil infiltration will be accepted.
- Pipes with diameters greater than 30 inches having holes with a diameter less than 1/2 inch which exhibit either water leakage or soil infiltration require an internal repair patch as shown in POM C.6.11.
- Pipes 30 inches and less in diameter having holes with a diameter less than 1/2 inch which exhibit either water leakage or soil infiltration require a remediation plan for repair as specified in Section 601.3(p).
- Pipes with diameters greater than 30 inches having holes with a diameter greater than or equal to 1/2 inch but less than 1.5 times the corrugation width require an internal repair patch as shown in POM C.6.11.
- Pipes 30 inches and less in diameter having holes with a diameter greater than or equal to 1/2 inch but less than 1.5 times the corrugation width require a remediation plan for repair or replacement as specified in Section 601.3(p).
- Holes with a diameter greater than 1.5 times the corrugation width require a pipe analysis and a remediation plan for repair or replacement as specified in Section 601.3(p).

3.d Deflection/Buckling. Note all deflections in the inspection report. Prepare and submit a pipe analysis and a plan for repair or replacement as specified in Section 601.3(p) if deflection is greater than 5 % of the unloaded inside diameter of the pipe. If the pipe analysis provides a remediation method that will provide a structurally adequate pipe, then the pipe may remain at the elevated deflection, otherwise remove and replace.

(o) Final Inspection of 100 Year Design Life Pipes. For 100 year design life pipe installations ≤20 feet in length

at each location, perform final inspection as specified in Section 601.3(n). For all other 100 year design life pipe installations, perform final inspection as follows:

Before final acceptance, inspect the entire length of all installed pipe types according to Table D with total backfill/embankment load applied. Perform inspection on pipes at least 30 days after backfill/embankment is completed. If the final wearing course is placed more than 30 days after the pipe backfill/embankment is completed, the inspection must be performed before placing the final wearing course. Provide the measurement equipment according to Table D to document the required items. Provide the required documentation of all inspections directly from the inspection service provider and/or data processor to the Representative following each inspection.

Locations of pipe installation documented as having been modified due to obstructions or insufficient bearing will be excluded from the acceptance criteria of this section. Deficiencies of the pipe that remain in-place which do not meet specification will be documented on Form CS-601.

TABLE D REQUIREMENTS FOR PIPE CULVERT INSPECTION BY TYPE OF PIPE		
Pipe Type	Measurement Equipment	Items Required for Documentation
Ductile Iron Pipe	Crawler-Mounted Camera with Laser Profiler*	Joint Separation, Crack Widths and Lengths, Deflection, Evidence of Soil Intrusion**, Vertical Alignment (i.e. ponded water)
Reinforced Concrete Pipe	Crawler-Mounted Camera *	Joint Separation, Crack Widths and Lengths, Spalls, Offset Joints, Bell/Spigot Shear Failure, Evidence of Soil Intrusion**, Vertical Alignment (i.e. ponded water)
Corrugated Steel Pipe (Aluminized, Galvanized, or Polymer Coated)	Crawler-Mounted Camera with Laser Profiler*	Joint Separation, Crack/Gouge Widths and Lengths, Dents, Buckling, Seam Separations, Deflection and Ovality, Evidence of Soil Intrusion**, Loss of Aluminized Coating, Oxidation, Vertical Alignment (i.e. ponded water)
Corrugated Aluminum Alloy Pipe	Crawler-Mounted Camera with Laser Profiler*	Joint Separation, Crack/Gouge Widths and Lengths, Dents, Buckling, Seam Separations, Deflection and Ovality, Evidence of Soil Intrusion**, Oxidation, Vertical Alignment (i.e. ponded water)
Thermoplastic Pipe	Crawler-Mounted Camera with Laser Profiler*	Joint Separation, Crack Widths and Lengths, Buckling, Deflection and Ovality, Evidence of Leakage or Soil Intrusion**, Vertical Alignment (i.e. ponded water)

*Manual tools as measurement equipment for pipes with manual inspection procedures as specified in Section 601.3(o)2.

**Leakage or Soil Intrusion will be in conformance with AASHTO R 82.

1. Remote Inspection. Perform a remote inspection according to PTM No. 450, Section 3, in the presence of the Representative for all 100 year design life pipe installations 48 inch in diameter and smaller. When defects or irregularities are observed with closed circuit television but cannot be measured within acceptable tolerances on pipes greater than 30-inch, inspect and report in accordance with manual inspection procedures including man-entry, as indicated in PTM No. 450, Section 4. Develop a remediation plan as specified in Section 601.3(p) to address all joint separation, cracks, deflections, and other irregularities exceeding the specification limits as specified in Section 601.3(c) and Sections 601.3(n)1, 2, or 3.

2. Manual Inspection. Perform a manual inspection according to PTM No. 450, Section 4, in the presence of the Representative for all 100 year design life pipe installations larger than 48 inch in diameter. Develop a remediation plan as specified in Section 601.3(p) to address all joint separation, cracks, deflections, and other irregularities exceeding the specification limits as specified in Section 601.3(c) and Sections 601.3(n)1, 2, or 3.

(p) Remediation. Remedial action may include but is not limited to removal and replacement or an accepted repair procedure with a reduced payment. Reference POM C.6.11 for pipe remediation and reduced payment (rebate) guidance. Submit all pipe remediation plans to the Representative for approval. All pipe remediation plans that require pipe analysis must be prepared and sealed by a Professional Engineer registered in the State. Include in the pipe analysis the structural integrity, hydraulic capacity, and service life.

(q) Inspection During Installation. For pipe installations under the roadway, sidewalk, or shoulder, perform trench backfill work only in the presence of an authorized Inspector. The Inspector will complete Form CS-6 for each run of the conduit or pipe. Certify the work by signing the completed form and submit the signed form to the Representative.

601.4 MEASUREMENT AND PAYMENT—

(a) Pipe Culverts and Relaid Pipe Culverts. Linear Foot

Measured along the length of pipe to the centerline of “T,” “Y,” “K”, and other connections. If pipes are protected by endwalls or connected with drainage structures, include payment for the width of the structure wall. The unit price includes the excavation, the removal and disposal of existing pipe, the bedding material, the pipe, connecting bands, and the backfill as shown on the Standard Drawings or as indicated. Furnishing personnel and equipment for dewatering operations, inspection of pipes, and all remedial measures are incidental to the pipe items.

If the pipe item for shore/trench box is indicated or required; the unit price includes placement and removal or keeping in place of shoring, supports, shield systems and trench boxes as specified in Section 601.3(g).

Payment for remediation of the trench bottom or for obstructions encountered including changes to or the addition of trench support methods, as directed by the Representative, will be made as specified in Section 110.03(c).

(b) Half-Circle Pipe. Linear Foot

(c) Cement Concrete for Miscellaneous Drainage. Cubic Yard

As indicated, for the class specified, for the item indicated.

The unit price includes reinforcement when required.

(d) Class 2 Excavation. Section 204.4

For Half-Circle Pipe including bedding and anchors.

(e) Cleaning Existing Pipe Culverts. Linear Foot

Measured from inlets, manholes, endwalls, and other drainage appurtenances along the pipe centerline.

Pay items will establish a break point based on the sizes of pipes to be cleaned. The Department will pay for cleaning of pipe culverts having diameters up to and including 36 inches under one pay item, and cleaning of pipe culverts having diameters over 36 inches under a separate pay item.

(f) Jacked Pipe. Linear Foot

The unit price includes excavation.

(g) Flowable Backfill Material. As indicated, for all pipe installations, flowable backfill and geotextile are incidental to linear foot of pipe payment.

SECTION 602—CORRUGATED METAL PIPE-ARCH CULVERTS

602.1 DESCRIPTION—This work is construction or reconstruction of pipe-arch culverts.

602.2 MATERIAL—Sections 601.2(a)1 and 2; 601.2(b) and (c); and as follows:

(a) **Corrugated Steel Pipe-Arch, Metallic Coated.** AASHTO M 36, Types II and IIR; AASHTO M 218; AASHTO M 274; and AASHTO M 289.

(b) **Corrugated Aluminum Alloy Pipe-Arch.** AASHTO M 196, Types II and IIR.

(c) **Coated Corrugated Galvanized Steel Pipe-Arch.** AASHTO M 245, Type II; AASHTO M 218; and AASHTO M 246. Fabricate pipe-arch with coating as follows:

- Grade 10/10—10 mil coating on all surfaces.

602.3 CONSTRUCTION—As specified in Section 601.3, according to the requirements applicable to metal pipes.

602.4 MEASUREMENT AND PAYMENT—As specified in Sections 601.4(a), (c), and (f).

SECTION 603—METAL PLATE CULVERTS

603.1 DESCRIPTION—This work is construction of metal plate pipes, metal plate pipe-arches, and metal plate arch culverts.

603.2 MATERIAL—

(a) **Metal Plate Pipes, Metal Plate Pipe-Arches, and Metal Plate Arches.** Certify as specified in Section 106.03(b)3. Comply with the requirements of AASHTO M 167/M 167M (Steel) and AASHTO M 219/M 219M (Aluminum Alloy), except modify as follows:

1. AASHTO M 167/M 167M. Modified as follows:

1.a Section 11, Fabrication. Except:

- Space bolt holes 9.4 inches apart along plate edges that are to form circumferential seams.
- For bolt hole diameters, do not exceed the bolt diameter by more than 1/8 inch for longitudinal bolt holes or 1/4 inch for circumferential bolt holes.
- Form corrugations at right angles to the structure's longitudinal axis, having a depth of not less than 1 7/8 inches but not greater than 2 1/8 inches, unless otherwise accepted.
- Where necessary, to secure additional seam strength for pipe assembled with lap joints, increase the number of bolts per foot of longitudinal seam to six or eight.

In addition:

- Furnish plates in sizes that will allow length increments of 2 feet for square-ended structures.
- Provide a lap joint capable of transmitting the design thrust through the joint.
- Fabricate plates so not more than three plates come together at a point.
- In the two bottom segments of an arch, plates may be punched with one row of holes adjacent to the longitudinal plate edge that is to rest on the pier or abutment.

1.b Section 14, Dimensions and Tolerances. Determine the thickness of plates by weight of flat plates before corrugating. Comply with the following theoretical weights and tolerances.

THEORETICAL WEIGHTS AND TOLERANCES

Gage	Theoretical Weight Before Galvanizing (lbs. per sq. ft.)	Theoretical Weight After Galvanizing (lbs. per sq. ft.)	Permissible Variation of Average Weight of Lots* (percent)	
			Over	Under
1	11.25	11.406	5.5	3
3	10.00	10.156	5.5	3
5	8.75	8.906	5.5	5
7	7.50	7.656	5.5	5
8	6.875	7.031	5	5
10	5.625	5.781	5	5
12	4.375	4.531	5	5

* The term “lot” means all the plates of one gage in the shipment, for thicknesses gage 7 and heavier and not less than 6,000 pounds, for thicknesses gage 8 and lighter, with all individual plates not below the theoretical weights by more than 10%.

1.c Section 17.1, Inspection. Inspect mill and factory base metal when required, according to AASHTO M 36. Test the weight of the spelter coating, according to AASHTO T 65.

2. AASHTO M 219/M 219M. Include fabrication details on the shop drawings.

3. Field Inspection and Acceptance of Plates. A field inspection will be made at the job site. Furnish an itemized statement showing the number, size, and certified chemical analysis of the plates in each shipment.

A plate will be rejected if it:

- fails to meet specifications,
- shows defective workmanship, or
- has a bruised or broken spelter coat.

(b) Other Materials.

- Class A Cement Concrete—Section 704
- Cement Concrete for Miscellaneous Drainage—Section 704
- Reinforcement—Section 709.3
- Coarse Aggregate—Section 703.2
- Selected Borrow Excavation—Structure Backfill. As shown on the Standard Drawings.
- Structural Steel—Section 1105.02(a)2
- Emulsified Asphalt Class RS-1(E-1A) or CRS-1(E-1C) (Mop Coat on Concrete Paving)—Section 702
- Asphalt Coating—AASHTO M 243. Certify as specified in Section 106.03(b)3.
- Asphalt Material—(For sealing the groove, metal bearing channel or angle or arches, as required.) Class BF-1 Asphalt Cement, Section 702.

- Hook Bolts—Section 1105.02(d). Certify as specified in Section 106.03(b)3.
- Metal Bearing Materials—AASHTO M 183/M 183M, galvanized as specified in Section 1105.02(s) (AASHTO M 232). Certify as specified in Section 106.03(b)3.
- Curing and Protective Covers—Section 711.1

603.3 CONSTRUCTION—

(a) General. Provide shop drawings for review and acceptance. Show physical properties of plates and the proposed joint design on the drawings.

Inspect metal plate culverts as specified in Section 601.3(n) and provide remediation as specified in Section 601.3(o).

(b) Placing and Erecting. Excavate, as shown on the Standard Drawings. Place and erect as follows, unless an alternate method from the manufacturer is accepted:

1. Metal Plate Pipes and Pipe-Arches. Form the bed and trench, as shown on the Standard Drawings. Place plates “shingle-wise” to allow water to flow over, not against, the edges of plates, except for haunch plates for pipe-arches. Haunch plates may require placement inside or outside of adjacent haunch plates. When indicated, place washers under nuts. Use sufficient bolts to hold plates of the pipe or pipe-arch in position until the structure is completed. Place the bottom two rows of bolts with the threaded end inside the structure to facilitate tightening. Place bolts on other seams alternately, so nuts are always on the crests of corrugations, first inside, then outside, the culvert. Do not draw bolts and nuts tight until the structure is finished. Draw bolts and nuts tight before backfilling.

1.a Elongation. Elongate round pipes vertically 5%, using acceptable shop methods, or 3%, using timber strutting in the field, unless otherwise indicated.

Submit a plan for review before placing timber strutting, showing strut sizes, spacing, and jacking methods. A tolerance of $\pm 25\%$ of the specified amount of elongation will be permitted. Complete the field strut before backfilling around the pipe.

Place struts for pipe-arches when directed, to retain the size.

Uniformly strut from end to end of pipes and pipe-arches without endwalls. If endwalls are used, do not elongate the ends of pipes or pipe-arches. Leave struts in place until the roadway embankment is complete and compacted, unless otherwise directed.

1.b Asphalt Coating. Clean and dry plates and field apply an asphalt coating, if indicated, at the proper temperature. Provide a coating with a minimum thickness of 0.05 inch, measured on the crest of corrugations, to the lower inside one-half of the pipe or pipe-arch.

1.c Concrete Paving. If indicated, pave inverts of pipes and pipe arches with Class A cement concrete, reinforced with 6 inches by 6 inches, 10 gage, steel wire fabric (WWR 152 x 152 - MW9 x MW9 and/or WWF 6 x 6 - W 1.4 x W 1.4). Anchor reinforcement to the structure. Cover 25% of the periphery of pipes and 40% of the periphery of pipe-arches to a thickness of 2 inches above the crests of corrugations. If asphalt coating and concrete paving are both indicated, pave with concrete first. Do not apply asphalt coating on the paved portion. Tamp the concrete to the required thickness and contour. After initial set, cover concrete with a heavy spray or mop coat of emulsified asphalt, Class E-1.

2. Metal Plate Arches. Construct the concrete foundation, as indicated and as specified in the applicable parts of Section 1001.3. Place the metal channels or angles in the concrete foundation, as indicated.

Erect metal plates one course at a time and hold in place temporarily, beginning at the sides, with lower plates fitted into their channels. Progress to the top or center of the arch. Portions of the arch may be assembled and lifted into place, if directed.

Place downstream plates outside adjoining upstream plates, with each rise plate outside the adjoining lower plate and all placed “shingle-wise”, or as recommended by the manufacturer. When indicated, place washers under

each nut. Use enough bolts to hold arch plates in position until the structure is formed. Then, place and tighten the remaining bolts. Place nuts on the crests of corrugations, alternately inside and outside of the arch. Draw all bolts tight before backfilling.

After the arch has been completely placed, but before backfilling, fill the groove or channel used for the bearing area of the arch with asphalt material. If an angle is used for the bearing area, seal the intersection of the arch and angle with asphalt material.

(c) Backfilling.

1. Metal Plate Pipes and Pipe-Arches. After plates are satisfactorily erected, place fill material around the pipe or pipe-arch, as specified in Section 601.3(f).

2. Metal Plate Arches. Carefully place selected borrow excavation-structure backfill, as shown on the Standard Drawings and as specified in Section 1001.3(q)2.b when the substructure concrete has attained the required strength and plates have been erected, unless otherwise directed.

Place backfill in layers not exceeding 4 inches in depth, alternately on each side of the arch, or on each side of each arch in the case of a multiple installation. Compact with mechanical tampers until a power roller may be used, then place the remainder of the embankment, as specified in Section 206.3.

When filling around and over arches, before endwalls are constructed, place the first fill material midway between the arch ends, forming as narrow a ramp as possible until the top is reached. Build the ramp evenly from both sides, compacting fill material while placing it. After the ramps have been built to the arch top, deposit the remainder of fill material from the top, in both directions, from the center to the ends, as evenly as possible on both sides.

If endwalls are built before any fill material is placed around and over the arch, place fill material adjacent to one endwall until the arch top is reached, then dump fill material from the top toward the other endwall, using care to deposit material evenly on both sides of the arch.

For a multiple installation, follow the procedure specified above, but bring material up evenly on each side of each arch, avoiding unequal pressure.

Tamp the fill material thoroughly, but not excessively. Do not puddle the material with water.

Remove fill material causing excessive distortion of plates. Brace plates into correct position, then replace fill material. Remove bracing, as directed.

Conform to additional requirements from the manufacturers.

603.4 MEASUREMENT AND PAYMENT—

(a) Metal Plate Pipes and Pipe Arches. Linear Foot

Measured along the centerline of culverts with square or skewed vertical ends; the average length along the centerline of culvert with square or skewed beveled ends.

Bedding, backfill, concrete paving, if indicated, and inspection of culverts, including personnel and equipment, is incidental.

(b) Metal Plate Arches. Linear Foot

Measured along the centerline of culverts with square or skewed vertical end; the average length along the centerline of culverts with square or skewed beveled ends.

(c) Excavation. Cubic Yard

For the class indicated.

(d) Cement Concrete for Miscellaneous Drainage. Section 601.4(c)

The unit price does not include concrete paving, if indicated.

(e) Selected Borrow Excavation-Structure Backfill. Section 1001.4(g)

SECTION 604—COMBINATION STORM SEWER AND UNDERDRAIN

604.1 DESCRIPTION—This work is construction of combination storm sewer and underdrain.

604.2 MATERIAL—

(a) **Pipes.** Section 601.2(a)1 and (a)2 and as follows:

1. Nonmetal Pipes.

1.a General. When indicated provide a minimum water inlet area of 1.4 square inches per linear foot of pipe.

1.b Reinforced Concrete (RC) Pipe. Section 601.2(a)3. Where specified, provide RC pipe with specified water inlet area according to Pennsylvania Installation Direct Design (PAIDD) computer program, other Department accepted software program, and Publication 280.

1.c Group IP. Section 601.2(a)6.a

1.d Group IIP. Section 601.2(a)6.b

1.e Group IIIP. Section 601.2(a)6.c, and as follows:

1.e.1 Polyethylene. Add the following:

- AASHTO M 294, Type S, Class 1 perforations, provide specified water inlet area.

1.e.2 Polyvinyl Chloride. Add the following:

- AASHTO M 304, Class 1 perforations, provide specified water inlet area.

1.f Group IVP. Section 601.2(a)6.d, and as follows:

1.f.1 Polyethylene. Add the following:

- AASHTO M 294, Type S, Class 1 perforations, provide specified water inlet area.

1.g Group VP. Section 601.2(a)6.e, and as follows:

1.g.1 Polyethylene. Add the following:

- AASHTO M 294, Class 1 perforations, provide specified water inlet area.

1.h Group VIP. Section 601.2(a)6.f, and as follows:

1.h.1 Polyethylene. Add the following:

- AASHTO M 294, Class 1 perforations, provide specified water inlet area.

1.h.2 Polypropylene. Add the following:

- AASHTO M 330, Class 1 perforations, provide specified water inlet area.

2. Metal Pipes.

2.a General. Perforate pipe with Class 1 perforations, according to AASHTO M 36, M 196, or M 245, except provide a minimum water inlet area of 1.4 square inches per linear foot of pipe.

2.b Corrugated Steel Pipe, Metallic Coated. AASHTO M 36, Types I and IR; AASHTO M 218; AASHTO M 274; and AASHTO M 289

2.c Corrugated Steel Pipe-Arch, Metallic Coated. Section 602.2(a)

2.d Corrugated Aluminum Alloy Pipe. AASHTO M 196, Types I and IR

2.e Corrugated Aluminum Alloy Pipe-Arch. AASHTO M 196, Types II and IIR

2.f Coated Corrugated Galvanized Steel Pipe. Section 601.2(a)4.d

2.g Coated Corrugated Galvanized Steel Pipe-Arch. Section 602.2(c)

(b) Other Material.

- Coarse Aggregate—Type C or better, No. 57, Section 703.2.
- Geotextile—Class 1, Section 735.

604.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) Laying Pipe. Section 601.3(c), except as follows:

Lay pipe with perforations facing upwards. Place rigid non-metal pipe, keeping the portions of the joints in contact with the coarse aggregate clean, and providing a minimum water inlet area of 1.4 square inches per linear foot by either blocking open, furnishing pipe manufactured with the required water inlet area provided, or by other acceptable means. For Reinforced Concrete Open Joint Pipe, provide joint openings as noted in Table A. Fill the remainder of the joint, as specified in Section 601.3(d).

TABLE A		
Joint Tolerances for Reinforced Concrete Open Joint Pipe**		
Pipe Diameter Or Equivalent (inches)	Minimum Joint Opening (inches)	Maximum Joint Opening (inches)
18-24	0.625	1.000
27-36	0.500	1.000
≥ 42	0.375	1.275

**Special design joints will be subject to manufacturer submittal and individual review and approval. If the bell depth is greater than the tongue depth, include the difference between these depths to the maximum joint opening.

(b) Geotextiles, Class 1. Section 212.3(b)

(c) Backfilling Trench. After the pipe is satisfactorily laid, backfill as shown on the Standard Drawings and as specified in Section 601.3(f) for the portion of the trench where the backfill is being placed and the placement condition. Obtain suitable impervious material, as required.

(d) Pipe Inspections. Inspect pipes as specified in Section 601.3(n) and Section 601.3(o).

604.4 MEASUREMENT AND PAYMENT—

(a) Pipe. Linear Foot

Measured along the length of pipe to the centerline of "T," "Y," "K," and other connections. If pipes are protected by endwalls or connected with drainage structures, include payment for the width of the structure wall. The unit price includes the excavation, the removal and disposal of existing pipe, the impervious material, the pipe, connecting bands, geotextile, and the coarse aggregates for backfill as shown on the Standard Drawings or as indicated. Furnishing personnel and equipment for dewatering operations, inspection of pipes, and all remedial measures are incidental to the pipe items.

If the pipe item for shore/trench box is indicated or required; the unit price includes placement and removal or keeping in place of shoring, supports, shield systems and trench boxes as specified in Section 601.3(g).

Payment for remediation of trench bottom or for obstructions encountered including changes to or the addition of trench support methods, as directed by the Representative, will be made as specified in Section 110.03(c).

SECTION 605—ENDWALLS, INLETS, MANHOLES, AND SPRING BOXES

605.1 DESCRIPTION—This work is construction and/or cleaning of endwall, inlet, manhole, and spring box structures of the type indicated.

605.2 MATERIAL—

(a) Inlet Grates and Frames. As shown on the Standard Drawings, either structural steel, as specified in Section 1105.02(a)3.c, or gray, malleable, or ductile iron as specified in Section 1105.02(h). For Type M Frames, provide either structural steel as specified in Section 1105.02(a)2 or gray, malleable, or ductile iron as specified in Section 1105.02(h). Certify as specified in Section 106.03(b)3.

Coat structural steel grates with asphalt paint in the shop or in the field, before placement. Coat structural steel frames with asphalt paint when placing in the concrete inlet top. Cover frames and grates completely with no pin holes or voids. As an alternative to asphalt paint, hot dip galvanize structural steel grates and frames as specified in Section 1105.02(s).

(b) Manhole Frames and Covers. As shown on the Standard Drawings, either gray, malleable, or ductile iron, as specified in Section 1105.02(h). Machine-grind the metal-bearing contact areas to fit in pairs. Matchmark each pair with notches to ensure satisfactory seating.

(c) Manhole Steps. Certify as specified in Section 106.03(b)3. As shown on the Standard Drawings, conforming to the vertical design load and the horizontal pull out design load requirements of ASTM C478; and made of one of the following materials:

- Corrosion-resistant steel alloy bars containing 1.65% to 1.85% nickel and 0.8% to 0.9% copper, having a minimum tensile strength of 50,000 pounds per square inch and a minimum yield strength of 37,000 pounds per square inch, with a minimum elongation of 30% over a 2-inch gage length.
- Deformed Wire, according to ASTM A1064, Epoxy-Coated according to ASTM A934, encased in a copolymer polypropylene shell that conforms to ASTM D4101, Table PP, Group 03, Class 4, Table B Designation B44744.
- Deformed reinforcement bars, according to AASHTO M 31, Grade 40, galvanized after bending, according to ASTM A787.
- Deformed reinforcement bars, according to ASTM A615, Grade 60, coated with copolymer polypropylene plastic that conforms to ASTM D4101; Table PP; Group 03 Copolymer or Impact Modified; Class 2, 3, or 4; any of grades 1 through 9.
- Gray, malleable or ductile cast iron, as specified in Section 1105.02(h).
- Aluminum alloy according to ASTM B221, 6061-T6, 6005-T5, or 6351-T6, with a protective coat applied to the portion to be embedded in the concrete.
- Fiberglass-reinforced polyester, according to ASTM D2444 and D635.
- Fabricate manhole steps free from sharp edges, burrs, and hazardous projections.

(d) Precast Concrete Top Units for Inlet Boxes, Inlet Boxes, Manholes, Grade Adjustment Rings, Top Slabs, and Transition Slabs.

- Class AA Cement Concrete Modified – Provide cement concrete as specified in Section 704; except, with a minimum 28-day compressive strength of 4,000 pounds per square inch.

(e) Concrete Top Units for Inlet Boxes.

- Structural Steel Angles and Plates – Section 1105.02(a)2 galvanized after fabrication as specified in Section 1105.02(s)
- Welded Studs – Section 1105.02(e)1

(f) Other Material.

- No. 2A Coarse Aggregate – Section 703.2
- Class A Cement Concrete—Section 704
- Epoxy Bonding Compound – Section 706.1
- Reinforcement—Section 709
- Gaskets – Section 705.5
- Mortar—Section 705.6
- Caulking Compound – Section 705.7
- Precast Concrete Units—Section 714
- Concrete Curing Compounds—Section 711.2(a)
- Curing and Protecting Covers—Section 711.1
- Non-Shrink Grout – Section 1080.2(c)
- Asphalt Paint—According to AASHTO M140 (emulsified asphalt) meeting the requirements listed in Bulletin 25 and from a supplier listed in Bulletin 15, Section 702-EM. Certify as specified in Section 106.03(b)3.
- Zinc Chromate Primer—Federal Specification TT-P-645. Certify as specified in Section 106.03(b)3.

605.3 CONSTRUCTION—Before construction or fabrication, obtain acceptance of shop drawings, if required.

(a) Construction of Drainage Structures. Construct as indicated, as shown on the Standard Drawings, as shown on the accepted shop drawings, and as follows:

- Cement Concrete Structures—As specified in Section 1001.3.

Excavate for the structure as required.

Place No. 2A Coarse Aggregate and compact as specified in Section 350.3(e), if specified.

Place concrete foundations and walls monolithically, except if otherwise allowed.

Carefully remove existing castings that are to be reused. Clean and transport to the new location.

Construct new inlet or manhole walls and bottoms to accommodate the dimensions of the existing castings.

Set frames, concrete top units, and grade adjustment rings (if required for inlets and manholes) on a bed of non-shrink grout to provide full bearing on the supporting surface.

Set pipes in inlets and manholes, flush with the inside structure face. For pipes protected by end walls, set flush with the exposed structure face.

If constructing structures in conjunction with existing pipe culverts and drains, provide for satisfactory connections, as specified for new construction of a similar type.

Backfill excavated spaces around the structure, with acceptable embankment material, as specified in Section 206.3(b)4. Satisfactorily dispose of unsuitable and surplus materials.

Brick and Brick and Mortar are not allowed for grade adjustments.

Coat all aluminum surfaces to be embedded in concrete with one coat of zinc chromate primer, or a coat of asphalt paint. Allow to dry completely before placing concrete.

(b) Cleaning of Drainage Structures. Clean drainage structures, as indicated, including inlets, manholes, end walls, spring boxes, grates, and scuppers. Repair any damage resulting from the cleaning operations. Prevent material cleaned from structures from entering streams or other bodies of waters and dispose of this material in a satisfactory manner.

605.4 MEASUREMENT AND PAYMENT—

(a) Manhole. Each

The price for the manhole includes excavation, compacted No. 2A coarse aggregate, manhole, concrete for channel, transition slab, if required, top slab, if required, backfill, and any other miscellaneous items required for the construction of the manhole. The height is measured from the Finished Grade Elevation to the bottom of the bottom slab elevation.

(b) Manhole Frame and Cover. Set

The price includes frame, cover, and grade adjustment rings, if required.

(c) Reuse Existing Manhole Frame and Cover. Set

The price includes removing the existing frame and cover and installing the frame and cover on a new structure. Also includes grade adjustment rings, if required.

(d) Spring Boxes. Each

The price includes excavation, spring box, reinforcement, if required, backfill, and any other miscellaneous items required for the construction of the spring box.

(e) End Walls. Each

For the type indicated.

(f) End Wall Excavation. Cubic Yard

For the Class of excavation, as indicated.

(g) Grates. Each

(h) Concrete Top Units and Grates. Set

The price includes top unit, grate, and grade adjustment rings, if required.

(i) Concrete Top Units Using Existing Grates. Set

The price includes top unit and grade adjustment rings, if required.

(j) Frames and Grates. Set

The price includes frame, grate, and grade adjustment rings, if required.

(k) Frames Using Existing Grates. Set

The price includes frames and grade adjustment rings, if required.

(l) Inlet Boxes. Each

The price for the inlet box includes excavation, compacted No. 2A coarse aggregate, inlet box, concrete for channel, transition slab, if required, top slab, if required, backfill and any other miscellaneous items required for the construction of the inlet box. The height is measured from the Finished Grade Elevation to the bottom of the bottom slab elevation.

(m) Concrete for Miscellaneous Drainage. Section 601.4(c)

(n) Cleaning of Drainage Structures. Each
For the type indicated.

(o) Stormwater Basin Outfall Structure. Each
For the type indicated.

(p) Inlet Cap. Each

SECTION 606—GRADE ADJUSTMENT OF EXISTING MISCELLANEOUS STRUCTURES

606.1 DESCRIPTION—This work is the grade adjustment of existing inlets, manholes, or utility boxes for a vertical height of 6 inches or less.

606.2 MATERIAL—

(a) **Manhole and Inlet Extensions.** From a manufacturer listed in Bulletin 15 or have the type of extension accepted by the LTS before use.

Use extensions composed of gray, malleable, or ductile iron conforming to the requirements of Section 1105.02(h); structural steel, Section 1105.02(a)2; or merchant quality steel conforming to ASTM A 575.

Fabricate the extensions to conform to the shape of the original manhole or inlet castings. They may be either welded in place or secured by a swedge fit. Weld according to the manufacturer's recommendations. Provide a locking device to ensure the swedge fit is permanent. Coat steel extensions with an asphalt paint, as specified in Section 605.2(a).

(b) **Additional Material.** Conforming to the requirements specified for new structures.

(c) **Certification.** Section 106.03(b)3

606.3 CONSTRUCTION—

(a) **General.** Excavate as necessary. Carefully remove and clean existing castings. Construct the structure walls to the required elevation, as specified in Section 605.3, conforming to the type of construction and dimensions of the existing structure.

Replace castings on a full mortar bed, as required.

Remove existing walls if the existing structure elevation is higher than the proposed elevation or if directed because the walls are in an unsatisfactory condition. Rebuild as specified.

Backfill as required. Repair or replace existing pavement, curb, and sidewalk damaged due to rebuilding. Satisfactorily dispose of unsuitable and surplus materials.

Upon completion, clean each structure of accumulations of debris, mortar, or foreign matter, including existing material, and keep clean until final acceptance.

(b) **Adjustable Extensions.** Before placing pavement material, set the adjustable extension unit in the existing inlet or manhole frame with the section resting on the flange. Secure the unit in place, according to the manufacturer's recommendations. Set the manhole cover or inlet grate in the flange formed by the adjustable extension unit.

606.4 MEASUREMENT AND PAYMENT—Set

SECTION 607—REBUILT MISCELLANEOUS STRUCTURES

607.1 DESCRIPTION—This work is rebuilding of existing inlets, manholes, or utility boxes of the types indicated for vertical heights in excess of 6 inches.

607.2 MATERIAL—Section 605.2

607.3 CONSTRUCTION—Section 606.3(a). Install necessary additional manhole steps as required.

For inlets and manholes, reset the existing top unit, castings, frames, covers and grates at each location. If the top unit or grate is damaged during removal, replace the top unit or grate at no additional cost to the Department.

607.4 MEASUREMENT AND PAYMENT—Vertical Foot

The Department will measure and pay to the nearest 0.1 foot, except that heights less than 1 foot will be paid for as 1 foot vertical.

SECTION 608—MOBILIZATION

608.1 DESCRIPTION—This work is the assembly and set-up of the general plant required to comply with the contract and with local and State laws and regulations. General plant includes Contractor's offices, shops, plants, storage areas, and sanitary or other facilities. This work includes obtaining the required permits, insurance, bonds, and any other initial items required for the start of the work.

When developing agreements with DBE subcontractors, include an opportunity for the DBE to identify an item for their mobilization. List the agreed to amount for each DBE subcontractor on the DBE Participation for Federal Projects form specified in the "Disadvantage Business Enterprise Requirements" Designated Special Provision in Appendix C of Publication 408.

608.2 MATERIAL—Furnish adequate material and furnishings required. These material and furnishings will not be considered a part of the other completed contract items.

608.3 CONSTRUCTION—Construct the required facilities.

608.4 MEASUREMENT AND PAYMENT—Lump Sum

The Department will pay for mobilization, as specified in Section 110.05, and according to the following schedule:

(a) Final Payment Calculation. Final Payment will be based on 0.2% of the contract amount capped at a minimum of \$10,000 and no greater than \$25,000. In addition, if the contract lump sum amount bid for mobilization exceeds 6% of the sum of the total amounts bid for all other items, excluding mobilization in the bid proposal, the excess will be paid on completion of the project.

(b) Payment Schedule. The Department will pay for mobilization, as specified in Section 110.05, and according to the following schedule.

1. One half (50%) of the contract lump sum amount bid for mobilization excluding the final payment amount will be released with the first estimate payable.

2. An additional 50% of the contract lump sum amount bid for mobilization excluding the final payment amount will be released after 10% of the original total contract amount, including payments for delivered materials but excluding mobilization, is earned.

3. When all physical work has been satisfactorily completed and the following certificates and documents, as required, have been properly furnished, the final payment will be made as specified in Section 608.4(a):

- Certified Payroll Records;
- Final DBE/DB payment amounts and, if necessary, shortfall justification;
- Material Certifications;
- Form CS-4225H, Highway Lighting In-Service Guarantee Notification;
- As built drawings for Design/Build projects;
- Form RW-397A, Right to Enter (a property) and Release Form from property owner, if applicable;
- Form CS-4345, Borrow And/Or Waste Management;
- Contractor Evaluations of the design of the project; and
- Work Order Information (i.e. Force Account documentation).

(c) DBE Payment Schedule. Within the Schedule submitted as specified in Section 108.03, indicate the starting date of work subcontracted to DBEs. One month before the scheduled start of subcontracted DBE work, but not earlier than the Notice to Proceed, pay 25 percent of the amount shown for mobilization on the applicable DBE

Participation for Federal Projects form. Pay the remaining 75 percent of the amount shown for mobilization on the applicable DBE Participation for Federal Projects form, in three equal payments, when subcontracted DBE work is 25 percent, 50 percent, and 75 percent complete. Pay the affected DBE within 7 days of its reaching the specified milestones for percentage of work completed.

SECTION 609—INSPECTOR'S FIELD OFFICE AND INSPECTION FACILITIES

609.1 DESCRIPTION—This work is furnishing, setting up, maintaining, and removing a field office of the type indicated and, if indicated, a field laboratory, proportioning plant office, and/or equipment package for the exclusive use of Department personnel. If Section 609 is excluded or waived from the contract, the requirement for providing sanitary facilities, as specified in Section 107.06, are not waived.

609.2 MATERIAL—

(a) General. Provide offices and laboratories having the minimum floor space specified, along with all required furnishings, equipment, and materials. Furnish office and laboratory facilities conforming to applicable occupational safety and health regulations, including, but not limited to, those governing sanitation, illumination, ventilation, means of egress, medical services and first aid, and fire protection. Ensure that offices and laboratories have at least 7-foot ceilings, locking windows, adequate electric lighting, an adequate number of storage cupboards and closets, a mail slot or drop box, and a private entrance secured with lock and key. Ensure that stairway systems installed for access to offices and laboratories include a handrail and non-skid treads. Provide systems to heat and cool interior spaces, as necessary, to maintain an ambient temperature between 65F and 75F. Maintain acceptable sanitary toilet facilities, for exclusive use by Department personnel, near or within offices and laboratories. Ensure that the number of sanitary toilet facilities furnished is sufficient based on the size of the Department inspection staff that will likely be stationed in the indicated office or laboratory. Maintain acceptable lavatory (wash-up) facilities near or within sanitary toilet facilities. If the field office is located in an existing building ensure that lavatory facilities are equipped with hot and cold (or tepid) running water: hand soap or similar cleansing agents; and clean, sanitary, cloth or paper hand towels or warm air blowers. If a construction trailer is used as a field office, ensure that a sanitary toilet facility is located near the field office, for quick access, and ensure that it is equipped with waterless hand soap or hand sanitizer. Provide a clean electrical power source (not derived from a portable generator) with sufficient capacity to allow unrestricted operation of all indicated electronic systems, appliances, and equipment. Furnish documentation certifying that indicated equipment requiring calibration has been calibrated within the last 12 months, and continue to have such equipment recalibrated annually for the duration of the project. If required furnishings and/or equipment being provided have been previously used, ensure that such items are in satisfactory condition and fully functional as of the scheduled start of work. Whenever practical, obtain maintenance agreements for communications, electronic, and/or specialized equipment that provide for on-site repair service. If malfunctioning equipment cannot be repaired on site, provide a replacement within a 24 hour time frame based on the relative importance of the piece to the timely performance of required project management functions as determined by the Representative.

1. Inspector's Field Office. Set up the indicated field office in an acceptable weatherproof building or trailer. Situate the field office in an acceptable location on or in the immediate vicinity of the project, separate from other construction offices. For field offices where multiple individual partitioned rooms are indicated, submit a floor plan showing the layout of the interior space for approval. Equip the field office according to Table A.

2. Proportioning Plant Office. If indicated, provide an office at the proportioning plant. Set up the indicated plant office in an acceptable weatherproof building or trailer. Equip the office according to Table A.

3. Field Laboratory. If indicated, provide a laboratory for materials and soils testing. Set up the indicated field laboratory in an acceptable weatherproof building or trailer situated in an acceptable location. Supply a gravity or pressure potable water system having at least a 100-gallon capacity and connected to a service sink with a faucet and acceptable outside drain. Do not drain or discharge wastewater into the surrounding environment; use a container of sufficient size to collect all drained or discharged wastewater and transport and dispose of wastewater at an approved site for handling such wastewater. Equip the field laboratory according to Table A.

4. Nuclear Gauge Temporary Storage. If indicated, provide a temporary storage location within the Inspector's Field Office or Field Laboratory for temporary storage of moisture density nuclear gauges by a Department Representative. Provide a temporary storage location consisting of an enclosed closet with a minimum area of 9 square feet and secured with two independent locks and keys. Provide all keys to only the licensed Department nuclear gauge operator. Do not provide keys to any other persons. Where possible, locate the closet at least 20 feet from a

permanent workstation (i.e., desk area). Where a 20 feet minimum distance from a permanent work station is not reasonably possible, the Department licensed nuclear gauge operator will temporarily store the nuclear gauge within the storage location following current Department policy and procedures to prevent radiation exposure to the public.

(b) Testing Equipment. On projects where a Field Laboratory is indicated, furnish and maintain the following equipment for required testing of soil or aggregates:

Number of Each	Equipment
1	C.A. Mechanical Sieve Shaker with Timer
1	F.A. Mechanical Sieve Shaker with Timer
1	Set Standard Sieves for C.A.
1	Set Standard Sieves for F.A. and Soils
1	Unit Mass (Weight) Metal Container 1 cubic foot
1	Unit Mass (Weight) Metal Container 1/2 cubic foot
1	Platform Scale, 200-pound capacity, sensitive to 0.01 pound
1	Balance, 70.5-ounce capacity, sensitive to 3.5×10^3 ounce, with one complete set of Masses (Weights).
1	Exhaust Fan (for venting Mechanical Shakers)
1	Density Sample Extruder
1	Proctor Mold and Rammer
1	12-inch Steel Straightedge
2	Mixing/Drying Pans
1	Mixing Spoon
1	Broom & Dust Pan

In addition, on projects where a Field Laboratory is indicated and cement concrete, asphalt concrete, and/or construction aggregates are to be used; furnish and maintain the equipment specified in Section 704.2(a), in the plant requirements of Bulletin 27, and/or in Sections 703.1(b) and 703.2(b), respectively.

When specified, provide an on-site cylinder breaking testing machine conforming to PTM No. 604 for use by Contractor's certified technicians and Department personnel to determine the compressive strength of molded concrete cylinders. The testing machine is to be calibrated annually, every time it is moved to a new location, immediately after making repairs or adjustments which may affect the operation of the system, and whenever there is any reason to doubt the accuracy of the testing machine.

(c) Communications Equipment. When indicated, provide the communications equipment specified in the proposal. Furnish communications equipment in the quantity indicated and meeting the following requirements:

1. High Capacity Multifunctional Device (MFD): Copier, Scanner, Fax, and Printer. A Windows 10 compatible network enabled digital color laser copier, with automatic document feeder, having reduction/enlargement functions capable of accepting maximum 11-inch by 17-inch size originals and producing 11-inch by 17-inch size copies at a minimum rate of 45 letter size copies per minute. Device will have three paper drawers to accommodate letter, legal, and tabloid paper sizes. Include sufficient imaging cartridges (toner/drum/developer) to yield a minimum of 5,000 copied pages, as well as printer driver software to install on the computer devices. Device will have air print (wireless) capability.

2. Low Capacity Multifunctional Device (MFD): Copier, Scanner, Fax, and Printer. A Windows 10 compatible network enabled digital color inkjet copier, with automatic document feeder, having reduction/enlargement functions capable of accepting maximum 11-inch by 17-inch size originals and producing 11-inch by 17-inch size copies at a minimum rate of 35 letter size copies per minute. Device will have two paper drawers to accommodate letter, legal, and tabloid paper sizes. Include sufficient imaging cartridges (toner/drum/developer) to yield a minimum of 5,000 copied pages, as well as printer driver software to install on the computer devices. Device will have air print (wireless) capability.

(d) Specialized Equipment. When indicated, provide the specialized equipment specified in the proposal. Furnish specialized equipment in the quantity indicated and meeting the following requirements:

1. Surveyor's Level and Measuring Rod. A standard, waterproof, surveyor's leveling instrument having, as a minimum, 20x magnification and a sighting range of up to 200 feet; with a job accuracy range within 1/4 inch at 75 feet. Include a 25-foot minimum, fiberglass measuring rod, folding leg tripod, rain cover, and carrying case.

2. Electronic Digitizer. A stationary or portable, high performance digitizer system capable of electronically measuring the exact, net area and perimeter of linear shapes on plan drawings at any scale, and converting those measurements to areas and volumes. Furnish electronic digitizer having a tablet with a minimum 22-inch by 36-inch active area. Include necessary cabling, carrying case, and all other operating essentials.

3. Digital Display Level. A durable level with automatic calibration function, that reads angles with precision and digitally displays readings in degrees, percent slope, and pitch to within 1/10 degree accuracy. Include battery(ies).

4. Infrared Thermometer. A hand-held, portable, non-contact thermometer capable of measuring temperatures between - 4F and 482F and with a field of view (i.e., spot ratio) of at least 6:1. Include protective case, battery(ies) and all other operating essentials.

5. Laser Range Finder. A self-contained, light-weight, hand-held instrument that measures and records distances in feet, yards, or meters; having a maximum range of 750 feet to an uncooperative, non-reflective target; Liquid Crystal Display (LCD); and shock/water resistant housing. Include battery(ies), cabling, carrying case, and all other operating essentials.

6. Paper Shredder. Lightweight, crosscut shredder capable of shredding 10 sheets at one time.

(e) Internet Service. For each type field office indicated, purchase a subscription to a wired broadband Internet Service, for exclusive use by Department personnel, for the duration of the project. Provide high-speed wired broadband internet access, with a minimum connection of 10 Megabits per second (Mbps), by means of a Fiber, Cable or Digital Subscriber Line (DSL). Provide a wireless broadband router, with a minimum security setting of Wifi Protected Access II (WPA2), to connect to the provided wired broadband, to be managed by Department IT. Based on the specific type of high-speed connection provided, furnish a compatible modem with built-in hardware firewall protection. Purchase a separate internet service subscription for the Proportioning Plant Office, if indicated, as specified in Section 609.2(e).

If such high-speed wired broadband connection is not attainable within the area where the project office is located alternate internet connectivity with a minimum connection of 10Mbps options must be submitted to the District IT Administrator for review and acceptance.

Demonstrate connectivity with the internet service provider at the time of or immediately following microcomputer system installation.

(f) Miscellaneous Materials. For each microcomputer system that will be used on the project, as indicated in the proposal, at a minimum provide the following:

- Two (minimum), Memory Flash Drives 32 Gigabites (GB) (minimum), encrypted to meet 2048-bit (minimum).
- 8 1/2 -inch by 11-inch and 8 1/2-inch by 14-inch, and 11-inch by 17-inch 20# white bond paper for copiers and printers, as specified, sufficient for the life of the project. Providing only one ream of paper at a time is unacceptable.

All miscellaneous material become Department property.

609.3 CONSTRUCTION—Install the indicated facilities no later than 5 working days after the Notice to Proceed Date or 5 days before the scheduled start of work. Anchor the facilities to withstand high winds. Maintain the facilities

from installation until 30 days after physical work (including completion of punch list items identified during the final inspection) has been completed, unless released earlier by the Representative. Clean or arrange for the indicated facilities to be cleaned at least once per week. Arrange for the weekly pick up and disposal of trash and recyclables including, but not limited to, paper, plastic, and ink/toner cartridges. Provide an adequate number of accessible parking spaces immediately adjacent or in close proximity to the offices or laboratory for exclusive use by Department personnel. Provide proper maintenance of parking areas. Ensure that there is sufficient lighting to illuminate the exterior of offices or laboratory and all parking areas. Designate a specific individual to serve as the contact person for service-related problems. After physical work has been completed, but before release by the Representative, arrange to meet with the Inspector-in-Charge to examine and determine the condition of all specialized equipment that is contractor-owned. Report all unresolved disputes over the condition of such equipment to the Representative. Failure to meet with the Inspector-in-Charge or to report problems with the condition of specialized equipment will create a presumption that, except for expected wear resulting from normal usage, the equipment is in good condition and remains fully functional. Specialized equipment that is lost or determined to be damaged beyond repair will be replaced or reimbursement will be made as specified in Section 110.03, provided such loss or damage is not the result of carelessness or negligence on the part of the Contractor or any other responsible third party.

The Representative may direct that the office or laboratory facilities and equipment package be maintained for more than 30 days after the date of physical work completion due to the Contractor's failure to submit, complete, and/or correct required certificates or documents, as established during the final inspection.

609.4 MEASUREMENT AND PAYMENT—Lump Sum

The proposal will include separate pay items for the Inspector's Field Office and Inspection Facilities, Field Laboratory, Proportioning Plant Office, and Equipment Package, as applicable.

Each contract item will be paid, as specified in Section 110.05, in two equal payments, according to the following schedule:

- When work is completed in an amount equivalent to at least 10% of the original contract amount, excluding the bid price for the applicable item, the first payment will be made.
- When work is completed in an amount equivalent to at least 60% of the original contract amount, excluding the bid price for the applicable item, the second payment will be made.

(a) Price Adjustments. Adjustments to the lump sum prices bid for the indicated office or laboratory facilities and equipment package, as applicable, will be made as follows:

1. Time Extensions and Reductions. In the event the time for completion of all work on the project is extended or reduced, as specified in Section 108.06, an appropriate adjustment (payment to the Contractor or rebate to the Department) will be made to the lump sum prices bid for the indicated office or laboratory facilities and equipment package, as applicable, for the days in excess of (payment) or less than (rebate) the original contract time, at the following daily rate:

$$\text{Daily Price Adjustment Rate} = \frac{75\% \times \text{Contract Lump Sum Price}}{\text{Original Contract Time in Days}}$$

2. Facilities Maintained for More than 30 Days After Physical Work Completion. In the event the Representative directs that the office or laboratory facilities and equipment package be maintained for more than 30 days after the date of physical work completion, as specified in Section 609.3, an appropriate adjustment (payment to the Contractor) will be made to the lump sum prices bid for the indicated office or laboratory facilities and equipment package, as applicable, for the days in excess of 30 until released by the Representative, at the Daily Price Adjustment Rate specified in Section 609.4(a)1.

No adjustment will be made if the Representative directs that the office or laboratory facilities and equipment package be maintained for more than 30 days after the date of physical work completion due to the Contractor's failure to submit, complete, and/or correct required certificates or documents, as established during the final inspection.

TABLE A

Office/Laboratory and Standard Equipment					
	Type A Field Office	Type B Field Office	Type C Field Office	Proportioning Plant Office	Field Laboratory
Floor Space square foot, out to out	1,300	650	240	150	150
Individual Partitioned Rooms	6	3	2	1	1
Conference Table & Chairs	1				
Desk(s) & Chair(s)	6	3	2	1	1
Office Chairs	15	9	6		
Plan Rack(s)	2	2	2		1
Work Table(s) ⁽¹⁾	5	3	2	1	1
Printer Stand(s) ⁽²⁾	5	3	1		
4-Drawer File Cabinet ⁽³⁾	4	3	2	1	1
2-Drawer File Cabinet ⁽³⁾	2	1	1		
Sample Splitter ⁽⁴⁾					1
Range ⁽⁵⁾					1
Sanitary Electric Water Cooler	1	1	1	1	1
Individual Access Phone Line(s) ⁽⁶⁾	4	4	4	3	
Surge Protectors ⁽⁷⁾	6	4	4		
Telephone(s) w/ Answering Machine(s) or Voice Mail	2	2	2	1	

- (1) Work Table. Minimum size: 2 1/2 feet by 7 feet by 2 1/2 feet high.
- (2) Printer Stand. Specifically designed to accommodate laser and color printers, with paper storage/feeder tray. Minimum size: 18 inches by 18 inches by 2 1/2 feet high.
- (3) File Cabinets. Fire resistant (D-Label), lockable, metal file cabinet.
- (4) Sample Splitter. For coarse and fine aggregate, with adjustable chute opening.
- (5) Range. Standard, 36-inch range, gas or electric, new or used, with oven capable of operating at 230F ± 9F.
- (6) Individual Access Phone Line(s). The number indicated includes the phone line(s) needed for microcomputer system operation and Internet service.
- (7) Surge Protector. A minimum of six AC outlets and one telephone outlet, with a 6 foot minimum length cord, having a line voltage regulator/conditioner that protects against chronic high voltage, voltage spikes, and radio frequency interference.

**Appendix
TABLE A**

EQUIPMENT PACKAGE	
Equipment	Quantity*
Communications Equipment	
High Capacity MFD ⁽¹⁾	
Low Capacity MFD ⁽¹⁾	
Specialized Equipment	
Surveyor's Level & Measuring Rod	
Electronic Digitizer	
Digital Display Level	
Infrared Thermometer	
Laser Range Finder	
Paper Shredder	
Internet Service	
Internet Service Provider	Yes/No
Wireless Internet Broadband Router ⁽²⁾	Yes/No
Miscellaneous Items	
Computer Media	Yes/No
High Yield MFD Ink/Toners Cartridges	Yes/No
Laboratory Equipment	
Concrete Cylinder Testing Machine	

* The special provision will be included in the proposal indicating the quantity of each type of communications, electronic, and/or specialized equipment to be furnished.

1. Unless otherwise approved, furnish a multifunction device in lieu of a separate copier, laser printer, color printer, scanner, and fax.
2. Provide compatible, powered internet hardware with firewall protection capable of wireless WPA2 security internet service and eight hardwired network ports, and pre-shared key. All cabling needed to interconnect network hardware and all microcomputer systems are required.

Microcomputer Systems. This information is being provided to assist Bidders in meeting the requirements as specified in Section 609.2(c), Communications Equipment, Section 609.2(e), Internet Service, and Section 609.2(f), Miscellaneous Materials. The special provision in the proposal will indicate the total number of microcomputer systems that will be used on the project.

Microcomputer systems may be furnished by the Department. If microcomputer systems are to be furnished by the Contractor, as part of the construction Contract, the bid will include applicable, 0688-XXXX bid items. When indicated, furnish microcomputer systems meeting the requirements as specified in Section 688.

SECTION 610—PIPE UNDERDRAIN AND PAVEMENT BASE DRAIN

610.1 DESCRIPTION—This work is construction of pipe underdrains, of the type and size indicated, and pavement base drains.

610.2 MATERIAL—

(a) **Pipes.** Section 601.2(a)1 and as follows:

1. General.

1.a Type. Use the type indicated. If not indicated, use any one of the types listed below.

1.b Size. For circular pipe, unless otherwise indicated, use pipe with a minimum inside diameter of 4 inches and sized in not less than 1-inch increments. For semi-circular pipe, unless otherwise indicated, use pipe with a smooth-walled bottom section and an average inside diameter of 4 5/8 inches.

1.c Perforations. Perforate a pipe to provide a minimum water inlet area of 1.4 square inches per linear foot of pipe and, unless otherwise specified, as follows:

- Cut perforations cleanly so as not to restrict the flow of water.
- Provide either circular or slotted perforations, except do not use slotted perforations in smooth walled pipe.
- For circular perforations, provide holes with a nominal diameter not less than 3/16 inch or greater than 3/8 inch. Also, provide similar rows of perforations on both sides of the pipe's vertical centerline, with the lower most rows separated by an arc of 60 degrees minimum.
- For slotted perforations, provide slots not exceeding 1/8 inch wide and a length not more than 10% of the average inside circumference for 4-inch to 8-inch diameter pipe and not exceeding 2 1/2 inches for pipes larger than 8 inches. Additionally, center the slots in the corrugation valleys and at maximum 120 degree intervals about the pipe circumference.

1.d Strength Test. As specified, except for plastic pipe test using the parallel plate load test, according to ASTM D2412.

1.e Infiltration Rate. For perforated or porous pipe, provide a minimum infiltration rate of 10 (gallons per minute) per linear feet of pipe, as determined according to AASHTO M 176M.

1.f Pipe Length. Flexible plastic pipe, 6 inches or less in diameter, may be supplied in specified coiled lengths or standard increments agreeable to the Department. The use of long coils, 3,000 feet to 4,000 feet in length, is allowed, provided placement is by equipment recommended by the manufacturer and the pipe is not stretched or damaged during handling or placement. Furnish flexible plastic pipe, larger than 6 inches in diameter, and all sizes of rigid pipe in maximum lengths of 20 feet. Furnish lengths not less than 99% of the stated quantity. Measure with any suitable device accurate to 1/4 inch in 10 feet (0.2%) while the pipe is stress-free and at rest on a flat surface in a straight line.

1.g Plastic Pipe. Furnish extruded or molded plastic pipe made of high density, flexible plastic.

Furnish pipe that is permanently marked, stenciled, or labeled with manufacturer's name, pipe trade name, or type, average size the specification designates, the plant designation code, and the date of manufacture all at intervals of no more than 10 feet.

2. Porous Concrete Pipe. AASHTO M 176M

3. Corrugated Polyethylene (PE) Pipe. AASHTO M 252 (pipes 4 inches through 10 inches) and AASHTO M

294 (pipes 12 inches through 15 inches), modified as follows:

- The Department will determine the lot size for acceptance.
- Minimum pipe stiffness for pipes 4 inches through 10 inches to be 30 pounds per square inch at 10% deflection, when tested according to ASTM D2412. Minimum pipe stiffness for pipes 12 inches through 15 inches to be 45 pounds per square inch at 5% deflection and 40 pounds per square inch at 10% deflection, when tested according to ASTM D2412.

4. Polyvinyl Chloride (PVC) Pipe. ASTM D3034, ASTM F758, Type PS46 or ASTM F949 modified as follows:

- Minimum pipe stiffness for pipes 4 inches through 10 inches, 35 pounds per square inch at 5% deflection, when tested according to ASTM D2412. Minimum pipe stiffness for pipes 12 inches through 15 inches, 45 pounds per square inch at 5% deflection, when tested according to ASTM D2412.
- Capable of being flattened to 40% of the original pipe O.D. without splitting, cracking, or breaking.

5. Acrylonitrile-Butadiene Styrene (ABS) Pipe. ASTM D2751, modified as follows:

- Minimum pipe stiffness for pipes 4 inches through 10 inches, 35 pounds per square inch at 5% deflection, when tested according to ASTM D2412. Minimum pipe stiffness for 12 inch pipe, 45 pounds per square inch at 5% deflection, when tested according to ASTM D412.
- Capable of being flattened to 60% of the original pipe O.D. without splitting, cracking, or breaking.

6. Perforated Plastic Semicircular Pipe. AASHTO M 278 or ASTM D2680, modified as follows:

- Smooth or corrugated top and a smooth semicircular bottom.
- Minimum pipe stiffness (PS), 35 pounds per square inch at 5% deflection, when tested according to ASTM D2412.
- Capable of being flattened to 40% of the original pipe outside-to-outside height for PVC or 60% for ABS without splitting, cracking, or breaking.

7. Corrugated Steel Pipe, Metallic Coated. AASHTO M 36, Type III with Class 1 perforations or Type IIIA; AASHTO M 218; AASHTO M 274; and AASHTO M 289.

8. Corrugated Aluminum Alloy Pipe. AASHTO M 196, Type III with Class 1 perforations or Type IIIA.

9. Prefabricated Pavement Base Drains.

9.a General. Use prefabricated pavement base drains consisting of an inert, plastic core, designed to carry water flow, wrapped in geotextile fabric for filtering purposes. Select from a manufacturer listed in Bulletin 15.

9.b Backfill. As indicated, fine aggregate, Type A, except limestone sand, Section 703.1.

9.c Core Materials. An inert, plastic material resistant to commonly encountered chemicals and substances, having the following properties:

- Tensile strength, ASTM D638—1,200 pounds per square inch, minimum

- Water absorption, ASTM D570—0.01% after 24 hours
- Fungus resistance, ASTM G21—no growth
- Crush strength, *GRI-GC4—40 pounds per square inch, minimum
- Flow rate, ASTM D4716—15 gallons per minute per foot of width, minimum
- Provide a minimum of 6% open core area on the pavement side face of the base drain and a minimum of 3% on the shoulder side face.
- Provide unobstructed inflow through a minimum of 50% of the geotextile area on the pavement side face of the base drain and 12% of the geotextile area on the shoulder side face, when stretched across the face of the core.

* Geosynthetic Research Institute, Drexel University.

9.d Geotextile Fabric. Provide geotextile, non-woven, needle punched, conforming to Table A. Resins are to be virgin materials, unless otherwise approved, and identified as such in the certification statement.

TABLE A
Prefabricated Pavement Base Drain - Geotextile Physical Requirements

Fabric Properties	Test Method	Required Value ⁽¹⁾
1. Grab Tensile Strength, lbs.	ASTM D4632	158
2. Grab Tensile Elongation, %	ASTM D4632	50
3. Puncture, lbs. (2-inch flat-end rod)	ASTM D6241	400
4. Trapezoid Tear Strength, lbs.	ASTM D4533	56
5. Apparent Opening Size (AOS), Sieve No.	ASTM D4751	100 to 50
7. Permittivity, sec ⁻¹	ASTM D4491	1.1
9. Ultraviolet Resistance Strength Retention, %	ASTM D4355	70 @ 500 hrs.

(1) The numerical values indicate average minimum roll value or minimum to maximum range, except as noted.

9.e Approval. Approval will be based on certified test data submitted by the manufacturer or testing by LTS, or both, before being listed in Bulletin 15.

9.f Certification and Shipment to Project. Certify each shipment as specified in Section 106.03(b)3.

Clearly identify each roll of pavement base drain by affixing a tag or sticker containing the following information:

- Lot number
- Manufacturer's name and address
- Product type and designation
- Product identification including thickness, height, roll length, and roll weight
- Geotextile designation

9.g Wrapping of the Core. Wrap the geotextile completely around the drainage core with the seam along the length of the drain, on the shoulder side face, and preferably near the midpoint. Fabricate the seam using a non water-soluble adhesive, if adhesive is used. Firmly attach geotextile to the protrusions on the pavement side face of the drainage core and spot-bond on the shoulder side face, or submit results of flow tests on the drain under loading with the geotextile unattached, to ensure that the geotextile will not deform under continuous loading to the point where flow capacity is diminished and the specified minimum flow rate is not achieved.

9.h Splice Connections and Fittings. Provide standard fittings and splice connections along the pavement base drain, as indicated or as directed, of sufficient strength to withstand construction handling and permanent loading. Obtain approval for any nonstandard fittings and connections.

9.i Outlets. Section 615.2

(b) Aggregates.

1. Fine Aggregate. Type II backfill, natural or manufactured Type A sand, Section 703.1; rock, gravel, or blast furnace slag sand prepared from Type C, or better, coarse aggregate as specified in Section 703.2; except conform to the size and grading requirements for Type A sand, Section 703.1, with a maximum loss in soundness test not exceeding 20%.

2. Coarse Aggregate. Type C or better, Section 703.2, except that the percentage of crushed fragments for gravel is not required. Use No. 57 for Type I backfill and No. 8 for Type II backfill.

(c) Mortar. Section 705.7(a)

(d) Geotextiles, Class 1. Section 735

(e) Open Graded Subbase. Section 350

610.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) Pipe, Trench, and Backfill. Place pipe underdrain after fine grading is completed.

Place pavement base drain after the adjacent roadway pavement is constructed, except when it is placed under curb sections or other special locations. Excavate pavement base drain trench without disturbing subbase under the roadway pavement.

Join underdrain or base drain to new or existing drainage structures with satisfactory connections. Use fittings with deflection angles of 45 degrees or less.

After completing the trench and the lower 2 inches of compacted backfill, lay the pipe and make the joints according to the manufacturer's recommendations.

For perforated pipe, place the perforations down, unless otherwise directed. Lay semicircular pipe with the smooth, circular portion at the bottom.

Do not leave trenches open during periods of precipitation or overnight.

Seal the upgrade end of pipe underdrain or base drain to prevent entry of foreign material.

Complete backfilling after having the pipe inspected by the Inspector-in-Charge.

(b) Geotextiles, Class 1. Use Class 1 geotextile, as specified in Section 212.3(b), for all pavement base drain construction and if indicated for pipe underdrain construction.

(c) Prefabricated Pavement Base Drains.

1. General. At least 2 weeks before beginning installation, submit the proposed installation method to the Representative, in writing, and note any deviation from the plans or from the manufacturer's approved drawings. Upon request by the Representative, have a technical representative from the manufacturer present during installation.

2. Shipping and Storage. Ship drainage materials with protective covering and store in a manner so as not to damage or contaminate them. Visually inspect all materials, before placement, to ensure they are free from damage. Damaged drainage material will not be accepted. Store drainage material on an elevated platform and protect from weather and ultraviolet exposure. Do not remove material from the manufacturer's protective covering until ready to be installed. If material is rerolled and stored, use an approved protective covering equivalent to the manufacturer's original wrapping.

3. Excavation. Place prefabricated pavement base drain in a trench constructed adjacent to the roadway pavement edge as shown on the Standard Drawings. Construct trench without disturbing the pavement structure or subbase. Unless otherwise indicated or directed, provide trench having a width as shown on the Standard Drawings and a depth extending at least 2 inches into the subgrade.

4. Placement and Backfilling. Place prefabricated pavement base drain vertically in the trench as shown on the Standard Drawings. Place the first lift of backfill material simultaneously with drain install to ensure complete contact with the geotextile and the trench wall. Repair any tears in the geotextile according to the manufacturer's recommendation. If raised core projections protrude from only one side of the drain, place the projections toward the pavement side of the trench.

Backfill the trench with fine aggregate, Type A using 9-inch (maximum) hydraulically compacted lifts. Spray each lift with water at 1.0 gallon per linear foot.

Ensure that excavation, drain placement, and backfill operations are performed in sequence, with a minimum amount of trench open at all times. Do not leave trenches greater than 2 inches in depth open overnight. Barricade trenches at all times according to the requirements of 67 PA Code, Chapter 203.

If shoulder restoration is indicated, follow applicable specifications and standards to reconstruct the existing shoulder as specified in the contract documents.

5. Connections, Fittings, and Outlets. Fit splice connectors into the drainage core so that they do not restrict flow. Follow the manufacturer's approved connection details. Do not allow backfill material to enter the connector at any point. For drainage cores that splice using male-to-female overlapping, roll back the geotextile onto the in-place drainage core, make the splice, and rewrap the geotextile over the completed joint. Provide a minimum of 6 inches of geotextile overlap from one section to the next.

Install subsurface drain outlet pipe and fittings as specified in Section 615.3, concurrently with the pavement base drain, to establish positive drainage within 24 hours of the beginning of trenching for the installation of a given section of base drain. The Representative may restrict installation of additional sections of base drain until acceptable outlet installations are completed. Ensure transitions are smooth and nonrestricting to flow. Do not use "home-made" connections.

Install all fittings and connections to preclude soil intrusion into the drainage core or outlet piping and to provide continuity of drainage flow. Install fittings for positive, gravity flow, and outlet the drainage system as indicated or as directed. Furnish outlet pipes with galvanized wire mesh shields as shown on the Standard Drawings. If the drain is terminated without an outlet, provide a fitting to prevent soil intrusion into the end of the drainage core. Protect all joints and fittings from damage during construction.

610.4 MEASUREMENT AND PAYMENT—

(a) **Pipe Underdrain, Types I and II Backfill.** Linear Foot

(b) **Pipe Underdrain, Types I and II Backfill, Including Shoulder Restoration.** Linear Foot.

(c) **Pavement Base Drain.** Linear Foot

(d) **Pavement Base Drain, Including Shoulder Restoration.** Linear Foot

(e) **Class 4 Excavation.** Cubic Yard

For extra-depth pipe underdrain and extra-depth pavement base drain excavation in excess of that shown on the Standard Drawings.

(f) **Fine Aggregate for Extra-Depth Pipe Underdrain.** Cubic Yard

(g) **Additional Coarse Aggregate for Extra-Depth Pipe Underdrain.** Cubic Yard

(h) **Additional Coarse Aggregate for Extra-Depth Pavement Base Drain.** Cubic Yard

(i) **Geotextiles, Class 1.** Section 212.4(a)

610.4(j)

610.4(k)

(j) Prefabricated Pavement Base Drains. Linear Foot

(k) Subsurface Drain Outlets. Section 615.4

SECTION 612—SUBGRADE DRAINS

612.1 DESCRIPTION—This work is construction of subgrade drains.

612.2 MATERIAL—

- Asphalt Impregnated Paper—Section 727
- Coarse Aggregate, Type C or better (no steel slag), No. 57—Section 703.2, except that the soundness test is not required and the percentage of crushed fragments for gravel does not apply.
- Geotextiles, Class 1—Section 735

612.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) **Trench and Backfill.** Excavate the trench, backfill, and adequately tamp the backfill.

Keep outlet ends of subgrade drains open during construction and until final acceptance of shoulders.

Extend subgrade drains a length sufficient to adequately drain the wet area. Construct subgrade drains under subbase after the subgrade has been completed but before the subbase is placed. Construct subgrade drains at right angles to the roadway centerline, or skew, as directed. Extend subgrade drains along the roadway, if necessary, to achieve a suitable outlet. Maintain a minimum slope of 1/4 inch per foot on the trench bottom through pavement and shoulder areas.

(b) **Geotextiles, Class 1.** Section 212.3(b), if indicated.

(c) **Shoulder Restoration.** If shoulder restoration is indicated, follow applicable specifications and standards to reconstruct the existing shoulder as specified in the contract documents.

612.4 MEASUREMENT AND PAYMENT—

(a) **Subgrade Drains.** Linear Foot

(b) **Subgrade Drains, Including Shoulder Restoration.** Linear Foot

(c) **Geotextiles, Class 1.** Section 212.4(a)

SECTION 613—STONE BACKFILL FOR MISCELLANEOUS DRAINAGE

613.1 DESCRIPTION—This work is the furnishing and placing of stone backfill for miscellaneous drainage.

613.2 MATERIAL—

- Coarse Aggregate, Type C or better (no steel slag), No. 1 and No. 57—Section 703.2
- Local Stone—If allowed, acceptable, clean, sound, hard, and durable slabs of stone, sharply broken, if required, and not more than 6 inches in any dimension.
- Geotextiles, Class 1—Section 735

613.3 CONSTRUCTION—Place No. 1 Coarse Aggregate or local stone backfill for miscellaneous drainage in sumps, springs, wells, sink holes, and other places, where indicated or directed. Place geotextiles, Class 1, as specified in Section 212.3(b).

If local stone is used, place a 6-inch layer of No. 57 coarse aggregate as the stone backfill top layer.

613.4 MEASUREMENT AND PAYMENT—Cubic Yard

SECTION 615—SUBSURFACE DRAIN OUTLETS

615.1 DESCRIPTION—This work is construction of subsurface drain outlets.

615.2 MATERIAL—

- Pipe—Section 610.2(a); except, without perforations. Unless otherwise directed, use outlet pipe of the same materials as the underdrain or pavement base drain. Provide smooth walled PE or PVC outlet pipe, for use with PE, PVC, or ABS underdrain or pavement base drain, conforming to the above requirements and having a minimum stiffness of 70 pounds per square inch at 5% deflection at all pipe diameters.
- Class A Cement Concrete—Section 704
- Red Subsurface Drain Outlet Marker—From a manufacturer listed in Bulletin 15. Reflective sheeting material is not required.

615.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

Excavate the trench, leaving the bottom uniformly firm and smooth, ensuring positive gravity flow in outlet. Lay pipe on top of 2 inches of satisfactorily tamped embankment material. Join pipe with connecting bands or with split couplings. After the outlet pipe has been laid and accepted, backfill the trench in 4-inch layers, using satisfactory embankment material, then thoroughly tamp. Compact the portion of the outlet under pavement or shoulder, as specified in Section 601.3(f). Provide outlet opening protection as shown on the Standard Drawings.

Connect to the pipe underdrain or pavement base drain using suitable couplings and fittings or special connectors; connect with a maximum 45-degree bend or series of 45-degree bends. If indicated or directed, provide satisfactory connections to join outlets to existing drainage structures.

If indicated, construct concrete endwalls to protect outlets not connected to new or existing drainage structures. If plastic pipe is used, protect ends from exposure to the deteriorating effects of sunlight, using satisfactory endwalls and trench backfill material.

Mark subsurface drain outlet using a red subsurface drain outlet marker on the side of opening facing approaching traffic. Embed the markers a minimum of 18 inches or as recommended by the manufacturer.

615.4 MEASUREMENT AND PAYMENT—

(a) **Subsurface Drain Outlets.** Linear Foot

(b) **Class 4 Excavation.** Cubic Yard

For subsurface drain outlet excavation in excess of that shown on the Standard Drawings.

(c) **Subsurface Drain Outlet Endwall.** Each

(d) **Red Subsurface Drain Outlet Marker.** Each

SECTION 616—END SECTIONS AND SLOPE PIPE FITTINGS

616.1 DESCRIPTION—This work is construction of end sections and slope pipe fittings.

616.2 MATERIAL—Manufactured or fabricated as specified in applicable portions of Section 601, as shown on the Standard Drawings, and as follows:

(a) **Concrete End Sections.** Section 601.2(a)3 except as follows:

Provide reinforcement per linear foot of end section, equal to the minimum steel requirements for circular reinforcement in a Type A Standard Installation Concrete Pipe having the internal diameter of the end section portion, withstanding a fill height greater than or equal to 36 inches and less than 82 inches.

(b) **Steel End Sections, Metallic Coated.** Section 601.2(a)4.b

(c) **Aluminum Alloy End Sections.** Section 601.2(a)4.c

(d) **Steel Slope Pipe Fittings.** Fabricated from sheet steel of the thickness indicated, as specified in Section 601.2(a)4.b for steel sheets, except that minor variations may be acceptable to allow use of the manufacturer's standard methods of fabrication.

(e) **Coarse Aggregate.** Section 703.2

(f) **Thermoplastic End Sections—outlet ends only.** Section 601.2(a)6

616.3 CONSTRUCTION—Install end sections as specified in the applicable requirements of Section 601.3 and as indicated.

Only use thermoplastic end sections on the outlet end of any thermoplastic pipe run.

Install slope pipe fittings as shown on the Standard Drawings.

616.4 MEASUREMENT AND PAYMENT—

(a) **End Sections.** Each

The price includes excavation and all backfill as indicated.

(b) **Slope Pipe Fittings.** Each

The price includes excavation and all backfill as indicated.

SECTION 617—SLOTTED DRAINS

617.1 DESCRIPTION—This work is construction of drains with continuous slotted openings.

617.2 MATERIAL—

- Slotted Drain—Fabricated from metallic-coated steel pipes specified in Section 601.2(a)4.b and structural steel conforming to the requirements specified in Section 1105.02(a)2 or precast polymer concrete troughs as listed in Bulletin 15 and certified as specified in Section 106.03(b)3.
- Coarse Aggregate—Section 350.2

617.3 CONSTRUCTION—Excavate the trench, as shown on the Standard Drawings for pipe and for precast polymer concrete sections according to the manufacturer's recommendations.

Install the drains according to the manufacturer's instructions or by another accepted method.

Place the drain to the line and grade indicated, adequately supported until adjacent construction is completed.

Provide temporary covers, as required, to prevent foreign material from entering the drain during construction. Before placing cement concrete or asphalt concrete adjacent to the drain, place adequate covers in or over the slot or grate to prevent entry of the paving material. If directed, remove and dispose of the temporary covers.

Backfill metal pipe as specified in Section 601.3(f) and precast polymer concrete sections according to the manufacturer's recommendations.

617.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 618—CONCRETE COLLAR FOR PIPE EXTENSION

618.1 DESCRIPTION—This work is the construction of a concrete pipe collar for extending existing pipe(s) from an endwall or other structure.

618.2 MATERIAL—

- Class A Cement Concrete—Section 704
- Mortar—Section 1001.2(e)
- Reinforcement Bars—Section 709.1(a)1

618.3 CONSTRUCTION—As shown on the Standard Drawings for pipe diameters up to 33 inches, as indicated for larger diameter pipe, and as follows:

(a) **General.** Remove a portion of the endwall footer, if required to obtain proper pipe alignment, using acceptable equipment and methods.

Obtain acceptance for drilling equipment and methods before drilling. Drill 1-inch holes in the existing structure with equipment that does not damage the existing structure. Clean material from the full depth of the holes before placing the reinforcement and grout. Grout the reinforcement in place, using non-shrinking mortar placed to ensure complete bonding of the reinforcement to the grout and the existing structure. Completely fill all holes with mortar, and after placing the reinforcement remove excess mortar protruding from the structure. Obtain acceptance for adjustments required to obtain final horizontal and concentric alignment.

(b) **Cement Concrete.** Construct the collar, as specified in Section 1001.3, after placing the pipe extension, as specified in Section 601.3(i).

(c) **Excavation and Backfill.** Excavate as required. Backfill excavated spaces around the collar, as specified in Section 206.3(b)4, using acceptable embankment material. Satisfactorily dispose of unsuitable and surplus material.

618.4 MEASUREMENT AND PAYMENT—Each

SECTION 619—PERMANENT IMPACT ATTENUATING DEVICES

619.1 DESCRIPTION—This work is furnishing and installing of permanent impact attenuating devices, including all appurtenances and hardware, as indicated.

619.2 MATERIAL—

- Permanent impact attenuating device as listed in Bulletin 15 that is crashworthy according to the 2016 AASHTO Manual for Assessing Safety Hardware (MASH) with either an FHWA eligibility letter or determination by an accredited testing laboratory stating that the product has passed all critical tests. Certify as specified in Section 106.03(b)3.
- Reflective sheeting from a manufacturer listed in Bulletin 15, as shown on the Standard Drawings, and as specified in Section 1103.05.
- Flat sheet signs from a manufacturer listed in Bulletin 15, as shown on the Standard Drawings, and as specified in Section 1103.04(a).

619.3 CONSTRUCTION—

(a) General. Submit shop drawings as specified in Section 105.02(d).

(b) Installation. Install according to the manufacturer's specifications and installation instructions for full depth embedment only, and as follows:

Drive posts mechanically, unless otherwise directed by the Representative. Do not cut, batter, burr, separate galvanizing from steel, or distort the post. Driven post must be plumb. As directed, remove and replace posts bent or otherwise damaged.

In areas where random boulders, hardpan, or bedrock are encountered and the post cannot be driven to grade, remove the post, then drill or excavate a hole as per manufacturer's recommendation for full depth embedment. Reset the post and backfill to the ground line, using No. 57 Coarse Aggregate and an acceptable embankment material thoroughly compacted in maximum 6-inch layers.

Type B flowable backfill as specified in Section 220 Table A can be used to backfill the hole after resetting the post in place.

Apply reflective sheeting onto the space provided on the manufacturer's impact head for delineation.

Apply reflective sheeting onto flat sheet signs for a left clearance marker (OM-3L) and/or right clearance marker (OM-3R) to delineate a sand barrel array system. Attach the left clearance marker (OM-3L) and/or right clearance marker (OM-3R) securely to the front of the sand barrel array system, according to the manufacturer's recommendations, where traffic is required to pass to the left and/or right.

(c) Training. Provide at least one trained installer as specified in Section 620.3(g)2.

619.4 MEASUREMENT AND PAYMENT—Each

(a) Permanent Impact Attenuating Device. Each

For the type indicated. The price includes tail end treatment when required. Reflective sheeting as specified in Section 1103.05 is incidental. Flat sheet signs as specified in Section 1103.04(a) are incidental.

(b) Flowable Backfill, Type B. Section 220.4(a)

SECTION 620—GUIDE RAIL

620.1 DESCRIPTION—This work is construction of new guide rail of the type indicated, re-setting of existing guide rail, removal of a concrete end anchor, and removal of existing guide rail, including all appurtenances and hardware.

620.2 MATERIAL—

(a) Guide Rail. Section 1109 and Section 1119

(b) Other Material.

- Class A Cement Concrete—Section 704
- Reinforcement Bars—Section 709.1
- Delineators—Section 937.2(b)
- Reflective Sheeting—From a manufacturer listed in Bulletin 15, as shown on the Standard Drawings, and as specified in Section 1103.05.

(c) Certification. Section 106.03(b)3

620.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) New Guide Rail.

1. General. Set posts plumb at the spacing shown. Minor adjustments in spacing may be allowed to clear objects or to fit between fixed ends.

Use bolts that are long enough to extend at least 1/4 inch beyond the nuts. Draw bolts tight, except if required for expansion.

Before installation, apply acceptable galvanizing paint to repair portions of posts to be placed underground. After installation, apply two coats of the galvanizing paint to guide rail or related appurtenances, including threaded portions of fittings, fasteners, and the cut end of bolts, that have been abraded or cut, exposing the base metal.

If guide rail is installed under traffic conditions, conform to the following requirements:

- Perform work only within those areas protected by temporary traffic control devices.
- Attach guide rail on posts driven during the day, before the end of that day.
- Provide satisfactory protection at exposed, unfinished ends of guide rail.

Join new and existing guide rail, if required, as indicated or directed.

Construct concrete parts of guide rail, if required, as specified in the applicable parts of Section 1001.3.

2. Posts and Offset Brackets. Install posts as shown on the Standard Drawings or as indicated. Do not batter, burr, separate galvanizing from steel, or distort the post. As directed, remove and replace posts bent or otherwise damaged. Install offset brackets, if required.

In areas where random boulders are encountered and the post cannot be driven to grade, remove the post, then drill or excavate a hole of suitable dimensions and depth to place the post at grade. Reset the post and backfill to the ground line, using No. 57 Coarse Aggregate and an acceptable embankment material, thoroughly compacted in 6-inch layers as shown on the Standard Drawings.

In areas where bedrock is encountered, and the post cannot be driven to grade, remove the post, then drill or excavate a hole of suitable dimensions to the required depth. Reset the post and backfill to the ground line, using No.

57 Coarse Aggregate and an acceptable embankment material, thoroughly compacted in 6-inch layers as shown on the Standard Drawings. If an underground feature, such as a low-fill culvert or underground utility line, prevents post(s) from being driven, posts may be skipped up to a 25-foot span as shown on the Standard Drawings.

3. Rail Elements. Do not allow the free end of Types 2-W and 2-WC rail elements to swing free and cantilever from the 5/16-inch mounting bolt. Rest the free end on temporary 1/2-inch support bolts and nuts or temporary drift pins until the 5/16-inch mounting bolts are torqued.

Splice by lapping in the direction of traffic. Provide full contact between the rail elements in the overlap, between the center and both edges of the element, and between the bracket or post, as the case may be.

Use suitable shop-formed guide rail or rubbing rails on curves having a radius of less than 150 feet.

4. Delineators. Install as specified in Section 937.3(a) and 937.3(c) for all W-beam guide rail and transition types. Do not install on strong post connection bolts.

5. Terminal Sections, Terminal Connectors, Strong Post Anchor Terminals, Strong Post In-Line Anchors, and End Treatments. Install, where indicated.

6. Over Underground Structures. Install, where indicated, using Class A Cement Concrete, reinforcement bars, anchor bolts, nuts, and washers.

(b) Guide Rail to Bridge Barrier Transition.

1. Thrie-Beam Guide Rail to Concrete Bridge Barrier Transition. Install approach end and trailing end guide rail transition at structure barrier, without curb, with curb and inlet or with curb and inlet near bridge barrier as indicated, and as shown on the Standard Drawings.

2. Thrie-Beam Guide Rail to PA Bridge Barrier Transition. Install approach end and trailing end guide rail transition at structure barrier, without curb, with curb and inlet or with curb and inlet near bridge barrier as indicated, and as shown on the Standard Drawings.

3. Thrie-Beam Guide Rail to PA Type 10M Bridge Barrier Transition. Install approach end and trailing end guide rail transition at structure barrier, without curb, with curb and inlet or with curb and inlet near bridge barrier as indicated, and as shown on the Standard Drawings.

(c) Reset Guide Rail. Carefully remove existing guide rail and reset at locations indicated, as shown on the Standard Drawings. Do not reset posts in same locations. The Department must approve the condition of the in-situ barrier components to determine if they are able to be reused. Ensure guide rail conforms to the Standard Drawings, including guide rail height and splice locations.

Replace steel offset brackets and backing plates with routed wood, plastic, or composite offset brackets from a supplier listed in Bulletin 15. Properly dispose of steel offset brackets and backing plates.

Repair or replace rail element, posts, hardware, or other materials damaged during this operation.

When resetting posts for Type 2 Weak Post guide rail, replace posts that are less than 65 inches in length.

(d) Remove Existing Guide Rail. Dispose of all excess material created by the removal, reset, or repair work, except for the material that the Representative determines salvageable for Department use. Satisfactorily backfill holes in preparation of driving new posts, as required.

1. Remove Existing Guide Rail (Contractor Property). Remove existing guide rail from locations indicated, and then dispose of the material outside the right of way.

2. Remove Existing Guide Rail (Department Property). When indicated, the guide rail will be retained by the Department. Carefully remove the existing guide rail from locations indicated. Completely dismantle, unbolt, and remove guide rail in a manner that permits reuse of the components from locations indicated. Do not disassemble by burning or cutting. Neatly bundle the galvanized steel posts, offset brackets, and galvanized rail elements. Separate the individual elements, (rail elements, posts, offset blocks) as directed. Bundle and deliver to designated stockpile. The proposal/contract will include a special provision that identifies where the guide rail is to be stockpiled, as well as the approximate distance (miles) from project site to designated stockpile location. Advance notification of a

scheduled delivery of guide rail to designated stockpile is to be provided to the individual whose name and telephone number are listed in the special provision.

(e) Structure Mounted Guide Rail. Install as indicated.

(f) Remove Concrete Anchorage. Remove and satisfactorily dispose of concrete end anchor from the locations indicated. Backfill anchorage area with suitable material.

(g) Training.

1. Generic Systems.

1.a Provide at least one trained guide rail installer present at each location within the project to be an active participant during the installation, replacement, and repair of guide rail system or elements of a guide rail system. The trained installer must be a foreman or crew chief overseeing the installation by field crew.

1.b The trained installer(s) must attend the Department's Guide Rail Installation, Replacement, and Maintenance Course and receive a Training Certificate by passing the final examination. Alternatively, installers can attend the American Traffic Safety Services Association (ATSSA) Guardrail Installation Training course and acquire a training certificate with a valid expiration date.

1.c The trained installer must provide an unexpired Training Certificate to the Representative before starting physical work.

2. Proprietary Systems.

2.a Provide at least one trained installer present at each location within the project to be an active participant during the installation, replacement, and repair of a proprietary roadside safety hardware system. The trained installer must be a foreman or crew chief overseeing the installation by field crew.

2.b The trained installer(s) must attend the Department's Proprietary Traffic Barrier & End Treatment Course, or any respective manufacturer's training course, and receive a Training Certificate from the manufacturer for the installation, replacement, and repair of the proprietary product(s) by completing the manufacturer's requirements. Certificate must identify the specific device for which it is issued and the expiration date.

2.c The trained installer(s) must provide an unexpired proprietary product(s) Training Certificate to the Representative before starting physical work. A certificate issued for one product will not be accepted for the installation, replacement, or repair of another product.

620.4 MEASUREMENT AND PAYMENT—

(a) Guide Rail. Linear Foot

For the type indicated. Includes nested guide rail as indicated.

(b) Terminal Section, Single. Each

Reflective sheeting as specified in Section 1103.05 is incidental.

(c) Type 31 Strong Post Anchor Terminal. Each

The price includes steel foundation tubes, short breakaway timber posts, ground strut, terminal rail element, soil plate, anchor cable bearing plate, post sleeve, anchor plate, swaged cable assemblage, hex bolts, washers, nuts, and terminal section, single.

(d) Type 31 Strong Post End Treatment. Each

(e) Type 2 Weak Post End Treatment. Each

(f) Type 2 Weak Post, Driveways and Openings. Each

(g) Reset Guide Rail. Linear Foot

The price includes height adjustment, W-beam splice location adjustments, new offset brackets and backing plates.

(h) Structure Mounted Guide Rail. Linear Foot

(i) Delineators. Section 937.4. For the type and color indicated.

(j) Remove Existing Guide Rail. Linear Foot

If guide rail is retained by the Department, the unit price includes the cost of delivering guide rail material to the designated stockpile.

(k) Guide Rail to Bridge Barrier Transition. Each

For the type indicated.

(l) Inlet. Section 605.4

(m) Remove Concrete Anchorage. Each

(n) Guide Rail Post. Each

(o) Offset Bracket. Each

(p) Type 31 Strong Post In-Line Anchor. Each

The price includes steel foundation tubes, short breakaway timber posts, ground strut, terminal rail element, soil plate, anchor cable bearing plate, post sleeve, anchor plate, swaged cable assemblage, hex bolts, washers, and nuts.

(q) Curved W-Beam Guide Rail at Intersections. Linear Foot

The price includes W-beam rail elements, long breakaway timber posts, hex bolts, washers, and nuts.

(r) Terminal Connector. Each

The price includes connection plates, square washer plates, filler plates, bolts, washers, and nuts.

(s) Guide Rail Element. Each

The price includes bolts and nuts.

(t) Buried-in-Backslope Terminal. Each

The price includes W-beam rail element, posts, steel plates, square washers, bolts, and nuts.

SECTION 621—METAL MEDIAN BARRIER

621.1 DESCRIPTION—This work is construction of new metal median barrier of the type indicated, resetting of existing metal median barrier, and removal of existing metal median barrier.

621.2 MATERIAL—

(a) **Metal Median Barrier.** Section 1109

(b) **Other Material.**

- Class A Cement Concrete—Section 704
- Joint Sealing Material—Section 705.4(b) or (c)
- Asphalt Wearing Course—Section 413.2 (Not RPS)
- Reinforcement Bars—Section 709.1
- Asphalt Cement—Class PG 64S-22 or PG 58S-28

(c) **Certification.** Section 106.03(b)3.

621.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) **Metal Median Barrier.**

1. General. Section 620.3(a)1, except substitute median barrier for guide rail.

2. Posts. Drill or punch holes.

Drive posts, as specified in Section 620.3(a)2, or set manually.

As directed, either form holes before placing concrete, or cut or drill holes in existing or newly placed concrete to accommodate the installation. Do not make holes any larger than necessary to install the post. Drive the post to grade after the hole is cut or drilled; backfill the hole with either hot or cold asphalt wearing course material and fill the void around the post with Asphalt Cement, Class PG 64S-22 or PG 58S-28.

In areas where random boulders are encountered and the post cannot be driven to grade, remove the post, then drill or excavate a hole of suitable dimensions and depth to place the post at grade. Reset the post and backfill to the ground line, using an acceptable material, thoroughly compacted in 4-inch layers. If a hole has been cut or drilled in paved areas, backfill the hole for the full paved depth, using hot or cold asphalt wearing course material, finish to a flush elevation, then seal the top with joint sealing material.

In areas where bedrock is encountered and the post cannot be driven to grade, remove the post, then drill or excavate a hole of sufficient dimensions to the required depth. Fill the hole with Class A Cement Concrete, set the post to grade, then plumb and secure until the concrete has set.

3. Rail Elements. Support rail elements and splice, as specified in Section 620.3(a)3. Use suitable shop-formed rail on curves having a radius of less than 150 feet. Do not punch, drill, cut, or weld in the field, except if directed for special conditions.

4. Cement Concrete Anchor Blocks. Section 620.3(a)4

(b) **Reset Metal Median Barrier.** Section 620.3(c), except substitute median barrier for guide rail.

(c) **Remove Existing Median Barrier.** Section 620.3(d), except substitute median barrier for guide rail.

621.4 MEASUREMENT AND PAYMENT—

- (a) **Metal Median Barrier.** Linear Foot
- (b) **Metal Median Barrier End Treatment.** Each
- (c) **Metal Median Barrier End Treatment, Driveways and Openings.** Each
- (d) **Metal Median Barrier, Structure Mounted.** Linear Foot
- (e) **Reset Metal Median Barrier.** Linear Foot
- (f) **Remove Existing Metal Median Barrier.** Lump Sum or Linear Foot

SECTION 622—CONCRETE GLARE SCREEN

622.1 DESCRIPTION—This work is construction of cement concrete glare screen of the type indicated.

622.2 MATERIAL—

- Class AA Cement Concrete—Section 704, except use Class AAA Cement Concrete as specified in Section 704, for pre-cast barrier.
- Class AA Cement Concrete (Slip-Forming)—Section 704, except:
The slump criteria for acceptance specified in Table A, Section 704.1 does not apply. Establish a target slump value to control the consistency of the concrete and action points and rejection points and include in the QC Plan. Perform slump testing at the frequency established in the QC Plan.
- Premolded Expansion Joint Filler—Section 705.1
- Reinforcement—Section 709.1, 709.3, or 709.4
- Curing and Protecting Covers—Sections 711.1 and 711.2(a)
- Joint Sealing Material (Longitudinal Joints)—Section 705.4(b) or (c)
- Mortar—Section 1001.2(d)
- Coarse Aggregate—Section 703.2
- Precast Concrete Barrier—Section 714
- Protective Coating for Concrete—Section 503.2
- Dowel Holes—Section 1003
- Nonshrink Mortar—Section 1001.2(e)
- Subbase Material—Section 350.2
- Structural Steel (Plates for Joints)—Section 1105.02(a)2. Galvanized as specified in Section 1105.02(s) or coated as specified in Section 605.2(a).
- Intermediate Curing Compound—Section 711.2(c)
- Caulking Compound (Vertical Joints)—Section 705.8(b)

622.3 CONSTRUCTION—As shown on the Standard Drawings and as specified in the applicable parts of Sections 623.3 and 1001.3.

622.4 MEASUREMENT AND PAYMENT—

- (a) **Concrete Glare Screen.** Linear Foot
- (b) **End Transition.** Each
- (c) **Concrete Glare Screen, Structure Mounted.** Linear Foot

SECTION 623—CONCRETE MEDIAN BARRIER

623.1 DESCRIPTION—This work is construction of cement concrete median barrier.

623.2 MATERIAL—

(a) Preformed Fabric Filter Drain.

1. General. Use prefabricated pavement base drains consisting of an inert, plastic core, designed to carry water flow, wrapped in geotextile fabric for filtering purposes.

2. Geotextile Fabric. Non-woven, clog resistant, geotextile that does not reduce core flow capacity by creeping or deforming. Has the equivalent life of the core material.

3. Approval. Approval will be based on certified test data submitted by the manufacturer, or testing by LTS, or both.

4. Certification and Shipment to Project. Certify each shipment as specified in Section 106.03(b)3.

(b) Other Material.

- Class AA Cement Concrete—Section 704, except use Class AAA Cement Concrete, as specified in Section 704, for pre-cast barrier.
- Class AA Cement Concrete (Slip-Forming)—Section 704, except:
The slump criteria for acceptance specified in Table A, Section 704.1 does not apply. Establish a target slump value to control the consistency of the concrete and action points and rejection points and include in the QC Plan. Perform slump testing at the frequency established in the QC Plan.
- Premolded Expansion Joint Filler—Section 705.1
- Reinforcement, Epoxy Coated or Galvanized—Section 709.1, 709.3, or 709.4
- Curing and Protecting Covers—Sections 711.1 and 711.2(a)
- Joint Sealing Material (Longitudinal Joints)—Section 705.4(b) or (c)
- Mortar—Section 1001.2(d)
- Coarse Aggregate—Section 703.2
- Subbase Material—Section 350.2
- Precast Concrete Barrier—Section 714
- Structural Steel (Plates for Joints)—Section 1105.02(a)2. Galvanized as specified in Section 1105.02(s).
- Protective Coating for Concrete—Section 503.2
- Intermediate Curing Compound—Section 711.2(c)
- Caulking Compound (Vertical Joints)—Section 705.8(b)

623.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in the applicable parts of Section 1001.3, as follows:

(a) **General.** Submit proposed standard design modifications to the District Executive for review and acceptance before starting work.

Fill surface blemishes larger than 1/2 inch with mortar, as directed.

Install barrier mount delineation devices, as directed or according to the manufacturer's recommendations.

For sections of barrier indicated as removable sections, install a bond breaker, such as asphalt impregnated paper or polyethylene, to facilitate removal. Provide suitable lifting methods for handling, installing, and removing the barrier units. If not in use, plug lifting devices with removable plastic or other acceptable plugs.

Join new concrete median barrier and existing barrier, where indicated and as directed.

If required, construct structure mounted median barrier, as indicated.

Precast concrete median barrier used in temporary installations, as specified in Section 627, may later be placed in a permanent installation, as specified here, provided barrier sections are not identified as being for temporary use only, are free from damage, and are otherwise acceptable.

Construct cast-in-place barrier and slip-form barrier according to the weather restrictions specified in Section 501.3(b).

Cure cast-in-place barrier and slip-form barrier as specified in Section 1001.3(p)3.a or Section 501.3(l) except white membrane curing compound may be used to cure barrier subject to the application of protective coatings and the first paragraph specified in Section 501.3(l)1.c does not apply.

Apply a protective coating to barriers, a minimum of 28 days after concrete placement, as specified in Section 503.3(b). Before application, thoroughly dry and clean concrete surfaces of dirt, debris, oil, grease, and foreign matter that would prevent protective coating penetration, adhesion, or drying.

Do not apply protective coating to precast barrier units produced specified in Section 714.

(b) **Slip-Form Method.** If the barrier is cured by a method other than a liquid membrane curing compound, apply an intermediate monomolecular film curing agent as specified in Section 516.3(j) immediately after the extruded concrete surface leaves the slip form machine or immediately after necessary offsets and fins are removed by light troweling.

Do not touch the barrier extruded concrete surface as it leaves the slip-form machine, except to immediately remove offsets and fins by light troweling.

Make adjustments in the operation to correct any condition causing surface blemishes larger than 1/2 inch. If the adjustments do not correct the condition within 30 linear feet, halt the operation until the condition is corrected, either by adjustments to the operation or by adjustments to the concrete mix.

Do not use an intermediate curing compound or water on the completed barrier to correct imperfections.

(c) **Joints.** Form contraction joints, by hand or saw, 3/16 inch wide and 2 inches deep, at 20-foot intervals. Saw as soon as possible after the concrete sets sufficiently to preclude raveling during the sawing, before any shrinkage cracking occurs in the concrete. The depth of saw cut may be decreased at the edge adjacent to the pavement to obtain a maximum depth without pavement damage.

Tool the construction joint edges.

Place 3/4-inch premolded, expansion-joint material, cut to conform to the cross sectional area, at structures and at the end of the workday.

Construct longitudinal joints a maximum of 1/4 inch wide on both sides of the barrier, as indicated. For precast units on curved sections, the Representative will allow a maximum 1/2-inch longitudinal joint. For curves with radii less than 765.5 yards (For curves greater than 2 degrees 30 minutes), use shorter precast barrier lengths to maintain longitudinal joint tolerances.

Seal the longitudinal joint as specified in Section 501.3(n). Seal all vertical contraction and construction joints with an approved caulking compound. Trim 3/4-inch premolded expansion-joint material at construction joints to create a notch for caulking compound. Do not seal the joints between precast barrier sections. Place precast barrier sections so that transverse joints are reasonably tight, but do not result in damage to barrier edges during placement.

(d) **Removal of Forms.** Do not remove forms until at least 12 hours after placing the concrete. Do not rub to correct irregularities until the full curing period has elapsed. Correct any irregular surface by rubbing with a carborundum stone. Do not brush finish or plaster. After removing the forms, fill minor defects with mortar. Promptly remove and replace rejected barrier.

(e) **Testing and Acceptance.** Have the finished barrier conform to the dimensions of the design template within 1/4 inch in all directions and across the joints. Test the top and side surfaces using a 10-foot straightedge. Hold the straightedge in successive positions for the entire length of the barrier and advance in stages of not more than 5 feet. Remove and replace barrier with deviations in excess of 1/4 inch as measured from the testing edge of the straightedge.

(f) **Single Face Concrete Barrier.** If single face concrete barrier is specified for use as a retaining wall, and drainage treatment is necessary, construct a preformed fabric filter drain as indicated.

623.4 MEASUREMENT AND PAYMENT—

(a) **Concrete Median Barrier.** Linear Foot

(b) **End Transition.** Each

(c) **Concrete Median Barrier, Structure Mounted.** Linear Foot

(d) **Single Face Concrete Barrier.** Linear Foot

(e) **Flared End Transition.** Each

SECTION 624—RIGHT-OF-WAY FENCE

624.1 DESCRIPTION—This work is construction of right-of-way fence of the type indicated.

624.2 MATERIAL—

(a) **Right-of-Way Fence.** Section 1110

(b) **Packaged Dry Concrete.** ASTM C 387, normal strength concrete; Type IA, IIA, or IIIA cement; 28-day compressive strength of 3,000 pounds per square inch.

(c) **Other Material.**

- Class A Cement Concrete—Section 704
- Mortar—Section 1001.2(e)
- Ground Rod—Acceptable 1-inch by 10-foot copper clad rod with suitable clamps
- Ground Wire—No. 4 AWG solid copper

(d) **Certification.** Section 106.03(b)3

624.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) **General.** Clear and grub to construct the right-of-way fence and to provide a reasonably smooth ground profile at the fence line, unless otherwise directed. Cut, trim, and remove vegetation, as specified in Section 810, as required for right-of-way fence installation.

Excavate or construct compacted embankment a maximum depth of 6 inches and a minimum width of 18 inches, with 2:1 side slopes, unless otherwise directed to obtain the desired elevations. Fill minor ground depressions that are not water courses.

Restore areas disturbed by grading operations as specified in Section 105.14.

Join new and existing right-of-way fence as indicated or directed.

Complete the fence true to line, plumb, taut, rigid, and erected in conformance with established practices for the type specified.

(b) **Posts.** Orient posts with sections that have a major and a minor bending axis, with the major axis parallel to the fence line. Place corner posts with the major axis parallel to one of the lines of the fence.

Drive line posts, except when concrete footings are required. Obtain acceptance for the method of driving and of protecting the post. Remove and replace posts with battered heads, bent, or otherwise damaged posts as directed.

Furnish and place longer line posts where indicated to suit field conditions.

If rock is encountered, drill a hole with a diameter that is 1/2 inch larger than the post's maximum dimension, at least 12 inches into the rock, and then grout the post in place with mortar.

(c) **Anchorage.** Construct concrete footings or install acceptable drive anchors. Construct concrete footings, using Class A Concrete or packaged dry concrete. Concrete footings do not require forming. Finish the footing tops to drain water away from the posts. Do not place the fabric until the concrete has cured for a minimum of 72 hours.

(d) **Fabric.** Firmly fasten wire fabric to the posts using aluminum or galvanized bands or clamps, or by other acceptable methods.

Splice fabric using an acceptable method that develops the full fabric strength.

Place fabric on the side of the fence toward the highway unless otherwise indicated or directed. At corner posts and on curves, place the fabric so it pulls against the post.

If supplied with both knuckled and barbed selvages, install fabric with the barbed selvaqe on the fence top edge.

(e) **Gates.** Install gates where indicated or directed.

(f) **Electrical Grounds.** Install an electrical ground directly under areas where electrical transmission, distribution, or secondary lines cross over the right-of-way fence. Drive a 10-foot copper clad rod, a minimum of 1 inch in diameter, vertically until the top is approximately 6 inches below the ground elevation. Bronze clamp a No. 4 AWG solid-copper conductor to the rod and to the fence so each fence element is grounded.

624.4 MEASUREMENT AND PAYMENT—

(a) **Right-of-Way Fence.** Linear Foot

(b) **End Post, Corner Post, Pull Post and Line Post.** Each

(c) **Gate.** Each

(d) **Class 2 Excavation.** Cubic Yard

Excavation and embankment within the specified depth of 6 inches is incidental to this work. If the Representative directs additional excavation and/or embankment beyond the 6-inch depth indicated, the Department will pay for additional quantities as Class 2 Excavation.

(e) **Fabric.** Linear Foot

SECTION 625—CRIBBING

625.1 DESCRIPTION—This work is constructing precast reinforced concrete or metal cribbing as indicated.

625.2 MATERIAL—

(a) Reinforced Concrete Cribbing.

1. Material.

- Class A Cement Concrete—Section 704
- Reinforcement Bars—Section 709.1
- Steel Welded Wire Fabric—Section 709.3
- Premolded Expansion Joint Filler—Section 705.1
- Asphalt Material—Asphalt Cement RC-1, Section 702
- Drift Bolts—3/4-inch diameter, galvanized steel, of the required length. Certify as specified in Section 106.03(b)3.
- Casings for Drift Bolts—1 1/4 inch inside diameter, galvanized steel pipe. Certify as specified in Section 106.03(b)3.
- Rock—Rock or rock spalls not exceeding 8 inches in their greatest dimension, or stone backfill, as specified in Section 613.2. Obtain backfill from available excavation if possible, otherwise provide foreign borrow material. Provide backfill of acceptable quality, sound, free from structural defects and foreign substances. Unless backfill is from an approved Type A source, submit samples to the LTS.

2. Fabrication. Submit a concrete design (based upon compressive strengths) and shop drawings of the cribbing members to the Department for review and acceptance. Use a concrete design mix which when molded, cured, and tested in accordance with Department procedures, has a minimum 28-day compression cylinder strength of 5,000 psi.

Fabricate and cure sufficient test cylinders, for design verification and for production control of members, in the same manner as the cribbing members. Do not ship cribbing until it has attained the minimum 28-day compressive strength. One day's production will represent a lot. Lot acceptance will be based upon average strength of at least one set of cylinders.

Mix concrete with an air content of 5.5% (\pm 1.5%), a minimum cement factor of 7.0 bags per cubic yard of concrete, and a slump between 1 1/2 inches and 2 1/2 inches. Use a minimum quantity of water per bag of cement to obtain workable concrete of the specified minimum strength. Do not exceed 5 gallon of water per bag of cement. Mix and proportion concrete, as specified in Section 704. Place concrete and cure, in accordance with AASHTO M 170.

Embed the casings for drift bolts and lift hooks in the members where required. Do not place more than two handling lift hooks in each member. Use members true to form, free from depressions, spalls, patched or plastered surface edges. Cracked or otherwise defective crib members will be rejected. Fully enclose the equipment and facilities for manufacture of the members in a building available for Department inspection. Crib members will be inspected for acceptance before being placed in the work.

Mark each member with the following information:

- Date of Manufacture.
- Name or trademark of the manufacturer.
- Letter "F" on face of each stretcher.

625.2(a)**625.4(b)**

Certify each project shipment of concrete cribbing, as specified in Section 106.03(b)3.

(b) Metal Cribbing.

1. Material. Certify as specified in Section 106.03(b)3.

- Galvanized Metal Sheets and Base Plates. AASHTO M 218, U.S. Standard or thicknesses (gages) as required, but not thinner than No.16 gage, except for base plates do not use thinner than No. 1 gage.
- Galvanized Bolts and Nuts. 5/8-inch diameter and 1 3/4 inch minimum length, bolts, furnished by the manufacturer.

2. Fabrication. Units of the same nominal size are to be fully interchangeable. Replace units with improper holes or otherwise defective. Maintain a minimum forming radius of 3/4-inch. However, for units formed with less than 3/4-inch radius, galvanize after forming.

Completely fabricate individual members before shipment.

(c) Other Types of Cribbing. Submit shop drawings and methods to the Department for review. Do not start work until written acceptance is received.

(d) Footings.

Class A Cement Concrete - Section 704

625.3 CONSTRUCTION—

(a) Reinforced Concrete Cribbing. Cushion bearing surfaces between crib members and their supports with 1/4-inch expansion joint filler over the full bearing area. Satisfactorily and firmly compact the cribbing foundation. Do not place the cribbing members until the foundation is accepted.

Handle and place crib members carefully. Remove and replace cracked or damaged members.

Fill the interior of the bins and the space behind the cribbing with rock.

Thoroughly compact the rock in layers having a maximum depth of 12 inches. Erect the units and place and compact the backfill simultaneously.

(b) Metal Cribbing. Excavate the foundation area to the finished ground line elevation at the cribbing face. Below this elevation, excavate trenches 18 inches in width, to the depth required, for all bin sides. Provide acceptable bearings at the bin corners, firm and to grade, before the crib erection.

Place metal base plates, if required, and erect the units. Do not drill, punch, or use drift pins to correct manufacturing defects. Handle members carefully. Hold members securely in place using bolts and nuts provided. Remove and replace members that become deformed or damaged.

Field coat metal cribbing with asphalt material, when indicated.

Satisfactorily backfill the bins and the space behind the cribbing.

(c) Other Types. In accordance with the reviewed shop drawings and methods.

(d) Footings. Provide concrete footings as required. Mix, place, and cure the concrete, as specified in the applicable parts of Section 1001.3.

625.4 MEASUREMENT AND PAYMENT—

(a) Reinforced Concrete Cribbing. Square Foot
Measured on the completed cribbing face.

(b) Metal Cribbing. Square Foot
Measured on the completed cribbing face.

625.4(c)

625.4(e)

(c) Class A Concrete. Cubic Yard

(d) Excavation. Cubic Yard
For the class indicated.

(e) Borrow Excavation. Cubic Yard
For the type indicated and if required for backfilling.

SECTION 626—GABIONS

626.1 DESCRIPTION—This work is the furnishing, assembling, filling, and placing of open mesh wire baskets with aggregate, forming gabions of the type indicated.

626.2 MATERIAL—

(a) **Aggregate.** Type A, Section 703.2 and as follows:

Gabion Height	Minimum Aggregate Size*	Maximum Aggregate Size*
Less than 1 foot	3 inches	5 inches
1 foot or over	4 inches	8 inches

* Measure longest side.

(b) **Geotextiles.** Class 4, Type A. Section 735

(c) **Gabion Baskets.** Provide materials as shown on the Standard Drawings and fabricated from one of the following:

1. Galvanized. Use Galvanized Gabions and Gabion (Revet) Mattresses conforming to the following:

- ASTM A974, Standard Specification for Welded Wire Mesh Fabric Gabions and Gabion Mattresses (Metallic-Coated or Polyvinyl Chloride (PVC) Coated), Zinc Coated

OR

- ASTM A975, Standard Specification for Double-Twisted Hexagonal Mesh Gabions and Revet Mattresses (Metallic-Coated Steel Wire or Metallic-Coated Steel Wire with Polyvinyl Chloride (PVC) Coating), Zinc Coated

2. Corrosion Resistant. Use Corrosion Resistant Gabions and Gabion (Revet) Mattresses conforming to the following:

- ASTM A974, Standard Specification for Welded Wire Mesh Fabric Gabions and Gabion Mattresses (Metallic-Coated or Polyvinyl Chloride (PVC) Coated), Zinc Coated and overcoated with PVC

OR

- ASTM A975, Standard Specification for Double-Twisted Hexagonal Mesh Gabions and Revet Mattresses (Metallic-Coated Steel Wire or Metallic-Coated Steel Wire with Polyvinyl Chloride (PVC) Coating), Zinc Coated and overcoated with PVC.

3. Certification. Section 106.03(b)3. Certify each shipment delivered to the job site. A shipment consists of material arriving at the job site at approximately the same time.

(d) **Hardwood Stakes.** Section 808.2(i)1

(e) **Steel Pins.** Section 212.2

626.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated, and as follows:

(a) **Excavation.** Excavate as required to place gabion baskets. Undercut areas of unsuitable material and replace with acceptable material. Scarify depressions and add acceptable material. Thoroughly compact entire gabion area and finish to a firm, even surface, free of vegetation, large stones, and other debris. Dispose of unsuitable or excess material.

(b) **Geotextile.** For channel lining or slope wall, place Class 4, Type A geotextile as specified in Section 212. For retaining walls, drape Class 4, Type A geotextile over surface of gabions to receive backfill without stretching as indicated.

(c) **Gabions.**

1. Assembly.

1.a Woven Wire Gabion. Unfold and assemble woven wire gabion basket using interlocking fasteners or continuous tie wire lacing. Overlap ends of tie wire lacing equal to two loop coils to start next length of tie wire.

1.b Welded Wire Gabion. Unfold and assemble welded wire gabion basket using temporary or spiral fasteners. Place spiral fasteners and secure as indicated.

2. Placement of Gabions. Place assembled gabion baskets to the line and grade as indicated. Join assembled gabion baskets using the type and number of fasteners or tie wire lacing indicated. Maintain shape and alignment of gabion baskets using standard fence stretcher, chain fall, or iron bar. Place cross ties as shown on Standard Drawings. Do not damage corrosion resistant wire mesh or fixtures. Fill Type A gabions by hand with coarse aggregate along all exposed faces for a uniform appearance. Fill Type B gabions by hand placement or use small power equipment to place coarse aggregate. Overfill gabion baskets approximately 1 1/2 inches and fasten lid to diaphragms, sides, and ends of gabion basket using tie wire lacing. When stacking of gabions is indicated, offset ends of individual gabion baskets from ends of gabion baskets on underlying course. Adjust size of gabion basket to provide offset.

3. Backfill. Backfill excavated areas around gabions with acceptable backfill material to the limits shown on the plans. Place backfill material for each course of gabion baskets and compact before starting succeeding course. In areas inaccessible to self-propelled compaction equipment, place material in uniform loose layers of 4 inches maximum depth and compact using mechanical vibration tampers.

4. Acceptance. Correct any damage to gabions during construction at no cost to the Department, as directed by the Representative. This includes broken wires, missing or damaged coatings, broken or cracked welds, or other damage resulting from installation of the gabions. Construct gabions so that faces have a smooth, uniform appearance and are positioned at the proper lines, grades, and batter. Remove and replace gabions deemed unacceptable by the Representative.

626.4 MEASUREMENT AND PAYMENT—Cubic Yard

SECTION 627—TEMPORARY BARRIER

627.1 DESCRIPTION—This work is the furnishing, placing, maintaining, and removing of temporary barrier or glare screen, as indicated, for maintenance and protection of traffic during construction.

627.2 MATERIAL—

- **Precast Concrete Barrier or Glare Screen**—Fabricate barrier as shown on the Standard Drawings or as listed in Bulletin 15, and as specified in Section 714. Barrier must be crashworthy according to the 2016 AASHTO Manual for Assessing Safety Hardware (MASH). Proprietary Products must have either an FHWA eligibility letter or determination by an accredited testing laboratory stating that the product has passed all critical tests. Temporary barrier manufactured on or before December 31, 2019, and successfully tested to NCHRP 350 or the 2009 edition of MASH, may continue to be used throughout their normal service lives.
 - Mortar—Section 1001.2(d)
 - Structural Steel—Section 1105.02(a)2
- **Steel Barrier**—As listed in Bulletin 15 and crashworthy according to MASH 2016 with either an FHWA eligibility letter or determination by an accredited testing laboratory stating that the product has passed all critical tests. Temporary barrier manufactured on or before December 31, 2019, and successfully tested to NCHRP 350 or the 2009 edition of MASH, may continue to be used throughout their normal service lives.
- **Water Filled Barrier**—As listed in Bulletin 15 and crashworthy according to MASH 2016 with either an FHWA eligibility letter or determination by an accredited testing laboratory stating that the product has passed all critical tests. Temporary barrier manufactured on or before December 31, 2019, and successfully tested to NCHRP 350 or the 2009 edition of MASH, may continue to be used throughout their normal service lives.
- **Warning Lights**—67 PA Code, Chapter 213 and from a manufacturer listed in Section 901.2 of Bulletin 15.
- **Barrier Mount Delineation Devices**—Section 937.2(a)
- **Waterborne Pavement Markings**—Section 962

627.3 CONSTRUCTION—

(a) General. Do not reuse or place precast concrete barrier or glare screen that display the discrepancies for temporary concrete barrier according to Publication 213, Appendix C.

Replace or repair structural components of steel barrier or water filled barrier that do not conform to the manufacturer's drawings, instructions, and recommendations. Provide the manufacturer's drawings, instructions, and recommendations to the Representative before installation that identify the structural components of the barrier.

Place clean barriers on a stable base. Then, properly join and align the barriers at the required locations. If indicated, bury approach blunt ends of the temporary barrier into an existing backslope 3:1 or steeper. Install top and side delineators as shown on the Standard Drawings. Install warning lights as directed and according to the manufacturer's recommendations. Maintain alignment, delineation, warning lights, and condition of the barriers as necessary, for the duration of the project. Remove the barriers from the project upon project completion, or when directed. Clean and remove conflicting pavement markings.

To minimize eradication of paint lines within the work zones, paint continuous white or yellow 6-inch wide pavement marking on the barrier as shown on the Standard Drawings. Water blast the temporary barrier with a minimum of 3,000 pounds per square inch before painting.

Immediately replace or repair barriers showing signs of damage that would hinder its performance, as determined by the Representative.

627.4 MEASUREMENT AND PAYMENT—

- (a) Temporary Barrier.** Linear Foot
Delineation as specified in Section 937 is incidental.
- (b) Temporary End Transition.** Each
Delineation as specified in Section 937 is incidental.

SECTION 628—RESET TEMPORARY BARRIER

628.1 DESCRIPTION—This work is the resetting of a temporary barrier from one construction area to another within the project limits.

628.2 MATERIAL—Section 627.2

628.3 CONSTRUCTION—Section 627.3

Reset barrier if construction operations require a change in protection of traffic or as directed. Store or transport the barrier, as required.

628.4 MEASUREMENT AND PAYMENT—

- (a) **Reset Temporary Barrier.** Linear Foot
Delineation as specified in Section 937 is incidental.
- (b) **Reset Temporary End Transition.** Each
Delineation as specified in Section 937 is incidental.

SECTION 630—PLAIN CEMENT CONCRETE CURB

630.1 DESCRIPTION—This work is construction of plain cement concrete curb, plain cement concrete depressed curb for curb ramps, and reinforced cement concrete depressed curb for driveways.

630.2 MATERIAL—

- Class A Cement Concrete—Section 704
- Class A Cement Concrete (Slip-Forming)—Section 704, except with a maximum slump of 1 1/2 inches.
- Premolded Expansion Joint Filler—Section 705.1
- Covers for Curing and Protection—Section 711.1
- Curing Compound—Section 711.2(a)
- Mortar—Section 1001.2(d)
- Caulking Compound—Section 705.7
- Reinforcement Bars—Section 709.1(a)

630.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in Section 501.3, and as follows:

(a) Excavation. Saw cut and excavate as required. Remove existing curb, pavement, and sidewalk to neat lines if indicated. Then, compact the material, upon which the curb is to be constructed, to a firm even surface.

(b) Forms. Use acceptable metal forms as specified in Section 501.3(d). Use wood forms on sharp curves and short tangent sections. Use forms that will not discolor the concrete.

(c) Placing, Finishing, and Curing Concrete. Conform to weather restrictions for concrete placement as specified in Section 501.3(b). Place the concrete in the forms in layers not exceeding 5 inches in depth if spading, or layers not exceeding 15 inches in depth if using a vibrator to eliminate voids. Provide drainage openings through the curb, at the elevation and of the size required, where indicated or directed. Smoothly and evenly finish the top surface of the curb using a wood float. Round the edges of the face and back of the curb top while the concrete is still plastic. Place depressed curbs for drives or curb ramps, where indicated or directed. Place bars as indicated for depressed curb at drives as specified in Section 1002.3. Cure concrete as specified in Section 501.3(l)

(d) Curb Machine. The concrete curb may be placed with an acceptable, self-propelled machine. Uniformly feed the concrete to the machine so it maintains the shape of the section without slumping after extrusion.

The Representative will not allow voids or honeycomb on the surface of the finished curb. Immediately after extrusion, perform any additional surface finishing.

(e) Joints. Form or saw contraction joints to dimensions as shown on the Standard Drawings and as specified in Section 501.3(i)2. Place 3/4-inch premolded expansion joint material conforming to the cross-sectional area of the curb where indicated and at the end of the workday.

Prepare and caulk joints according to caulking manufacturer's recommendations.

(f) Removal of Forms. Do not remove forms until such time that it will not be detrimental to the concrete. Correct irregular surfaces by rubbing with a carborundum stone. Do not brush finish or plaster. Fill minor defects with mortar.

(g) Backfilling and Embankment. As soon as possible after the removal of forms, backfill the voids in front and back of the curb, using acceptable embankment material, as specified in Section 206.3(b)4.

Complete embankments in back of raised curbs, as indicated, and as specified in Section 206.3, except carefully compact the embankment by means of mechanical tampers, or rollers, if allowed, not exceeding 8 tons.

Replace existing pavement and sidewalk damaged or removed during construction.

Dispose of unsuitable and surplus material.

(h) Curb Modification. Modify curb construction within existing pavement limits and existing structures, where indicated or directed. Drill holes and insert dowel bars with non-shrink mortar, as required.

(i) Depressed Curb. Construct depressed curb with sloped sides as shown on the Standard Drawings.

1. Driveways. Construct reinforced cement concrete depressed curb as indicated or directed. Place reinforcement bars to extend the entire length of the depressed curb and sloped sides.

2. Curb Ramps. Construct plain cement concrete depressed curb with a level surface that extends across the curb width as indicated or directed. Construct the depressed curb flush with the adjacent roadway surface elevation.

Install depressed curb for all curb ramps and at median or traffic refuge island access openings where the opening meets adjacent roadway pavement.

The contractor may place cement concrete for depressed curb monolithically with curb ramps, side flares or both. Do not place cement concrete curb monolithically with other cement concrete sidewalk.

630.4 MEASUREMENT AND PAYMENT—Depressed curb will be measured and paid for as full depth curb of the type indicated. If depressed curb is placed monolithically with curb ramps, side-flairs or both, the depressed curb will be measured and paid separately from the curb ramps and side flairs.

(a) Plain Cement Concrete Curb. Linear Foot

(b) Plain Cement Concrete Curb, Including Removal of Existing Curb. Linear Foot

(c) Class I Excavation. Section 203.4

SECTION 633—PLAIN CONCRETE MOUNTABLE CURB

633.1 DESCRIPTION—This work is construction of plain concrete mountable curb of the type indicated.

633.2 MATERIAL—As specified in Section 630.2 and as follows:

- Subbase—Section 350
- **Joint Sealing Material.** Section 705.4(a), (b), or (c)

Preformed Cellular Polystyrene. ASTM C 578

633.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in Section 501.3, and as follows:

- (a) **Excavation.** Excavate, if necessary, as specified in Section 630.3(a).
- (b) **Forms.** Use forms as specified in Section 630.3(b).
- (c) **Placing, Finishing, and Curing Concrete.** Place, finish, and cure concrete as specified in Section 630.3(c).
- (d) **Curb Machine.** Use a curb machine as specified in Section 630.3(d).
- (e) **Joints.** As specified in Section 630.3(e), except use ½-inch premolded expansion joint material as shown on the Standard Drawings. Seal joints as specified in Section 705.4.
- (f) **Removal of Forms.** As specified in Section 630.3(f).
- (g) **Backfilling and Embankment.** As specified in Section 630.3(g).
- (h) **Curb Modification.** Modify curb construction within existing pavement limits and existing structures, where indicated or directed. Drill holes and insert dowel bars with nonshrink mortar, as required.
- (i) **Premolded Expansion Joint Filler**—Section 705.1. Place premolded expansion joint filler material ½-inch thick or polystyrene bond breaker ¼-inch thick adjacent to new or existing curbs, plain cement concrete pavements or islands, concrete, sidewalks and other structures and at the end of the work day as shown on Standard Drawings.

633.4 MEASUREMENT AND PAYMENT—

- (a) **Plain Concrete Mountable Curb.** Linear Foot
- (b) **Class 1 Excavation.** Section 203.4
- (c) **Plain Cement Concrete Pavement.** Section 501.4

SECTION 636—ASPHALT CONCRETE CURB

636.1 DESCRIPTION—This work is construction of a hot-mixed, hot-laid, asphalt concrete curb on a completed asphalt surface.

636.2 MATERIAL— Section 413.2, except that the mixture design controls do not apply.

(a) **Asphalt Material.** Asphalt Cement, Class PG 64S-22 or PG 58S-28.

(b) **Aggregate.** Fine Aggregate, Section 703.1.

(c) **Filler (Drawn Polyester Fibers).** Provide a supplier certification with each shipment as specified in Section 106.03(b)3. The supplier shall certify that the filler conforms to the following requirements:

Average Length	0.25 inch \pm 0.06 inch
Average Diameter	0.0004 inch minimum
Specific Gravity	1.34 to 1.40
Melting Temperature	480F minimum
Tensile Strength	70,000 pounds per square inch minimum

(d) **Composition of Mixture.** Combine fine aggregate, asphalt, and fiber in proportions that produce a mixture conforming to composition by weight percentages within the limits of Table A and as directed. Add approximately 0.3% asphalt cement per 0.12% by weight of polyester fibers.

TABLE A
Asphalt Concrete Curb
(Percentages by Weight Passing Square Opening Sieves)

Passing Sieve	Required Composition of Mixture
3/8-inch	100
No. 4	90 - 100
No. 8	70 - 100
No. 16	50 - 80
No. 30	35 - 60
No. 50	20 - 45
No. 100	10 - 30
No. 200	5 - 20
Asphalt Cement, % by Weight	6 - 13
Drawn Polyester Fiber, % by Weight of Total Mix	0.12 - 0.38

(e) **Asphalt Tack Coat.** Section 460.2

636.3 CONSTRUCTION—

(a) **Asphalt Mixing Plant.** Obtain the asphalt mixture from a plant conforming to Chapter 1, Bulletin 27, except that three bins are not required.

(b) **Hauling Equipment.** Section 413.3(d)

(c) **Asphalt Paver.** Use an acceptable, self-propelled, extruding curb-paver.

(d) **Preparation of Surface.** Before placing curb, clean the asphalt surface and apply a tack coat, as specified in Section 460.3.

(e) **Placing and Compacting.** Place the curb in a continuous operation. The Representative will determine the mixture temperature from within the range of 290F to 315F based on weather conditions and workability requirements at the time of placement. Maintain the mixture temperature within a tolerance of 15F of the mixture temperature.

Place the hot asphalt mixture in the hopper of the curb-paver without segregation and then extrude the mixture through the mold to provide the proper compaction and surface texture.

Properly support and mass-load the curb-paver during operation along the edge of pavement. Guide the paver along string or chalk lines to maintain proper alignment and grade of the completed curb.

Where indicated or directed, make drainage openings through the curb.

Remove and replace completed curbs that show signs of sagging, cracking, or distortion; do not conform to lines, grades, or cross sections; and that cannot be satisfactorily repaired.

(f) **Joints.** If placing of curb is interrupted and the mixture cools below 275F cut a vertical joint in the curb. Just before placing the curb resumes, paint the joint with a thin, uniform coat of hot Asphalt Cement, Class PG 64S-22 or PG 58S-28.

(g) **Curing.** Protect newly completed curb from traffic or any other disturbance for at least 12 hours.

(h) **Backfilling.** Immediately after the curing period and where necessary, backfill and compact acceptable material behind the curb up to the required elevation and cross section.

636.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 640—PLAIN CEMENT CONCRETE GUTTER

640.1 DESCRIPTION—This work is construction of plain cement concrete gutter.

640.2 MATERIAL—

- Class AA Cement Concrete—Section 704
- Asphalt Cement—Class PG 64S-22 or PG 58S-28
- Joint Sealing Material—Sections 705.4(b) or (c)
- Caulking Compound—Section 705.7
- Covers for Curing and Protection—Section 711.1
- Curing Compound—Section 711.2(a)

640.3 CONSTRUCTION—As shown on the Standard Drawing, as specified in the applicable parts of Section 501.3, and as follows:

(a) Foundation. Form the foundation for the gutter bottom at the required depth below the finished surface as indicated. Remove unsuitable materials, replace with acceptable embankment material, as specified in Section 206.2(a), and then compact thoroughly to a firm, even surface.

(b) Forms. Use acceptable forms of wood or metal.

(c) Placing and Finishing Concrete. Place the concrete on a moist foundation between the forms, consolidate, and then strike off to the required shape. Finish smoothly and evenly with a wood float. Where the gutter joins other structures, seal the adjacent edges with an approved Asphalt Cement. Tool the gutter edge to the radius indicated.

(d) Joints. Form or saw contraction joints to dimensions as shown on the Standard Drawing and as specified in Section 501.3(i).

Place 3/4-inch premolded expansion joint material that is cut to the cross section of the gutter at structures and where gutter placement ends each workday.

Prepare and seal or caulk joints, according to manufacturer's recommendations.

(e) Backfilling. After the concrete has hardened sufficiently, backfill the spaces adjacent to the gutter with acceptable embankment material, as specified in Section 206.3(b)4.

640.4 MEASUREMENT AND PAYMENT—

(a) Plain Cement Concrete Gutter. Square Yard

(b) Class 1 Excavation. Cubic Yard

SECTION 641—PLAIN CEMENT CONCRETE CURB GUTTER

641.1 DESCRIPTION—This work is construction of plain cement concrete curb gutter.

641.2 MATERIAL—

- Mortar—Section 1001.2(d)
- Class AA Cement Concrete—Section 704
- Asphalt Cement—Class PG 64S-22 or PG 58S-28
- Joint Sealing Material—Sections 705.4(b) or (c)
- Caulking Compound—Section 705.7
- Covers for Curing and Protection—Section 711.1
- Curing Compound—Section 711.2(a)

641.3 CONSTRUCTION—As specified in Section 640.3 and as follows:

Do not rub forms to correct irregularities until they have been removed and the full curing period has elapsed. Correct irregular surfaces by rubbing with a carborundum stone. Do not brush finish or plaster. Fill minor defects with mortar. Place depressed curb gutter where indicated or directed.

Prepare and seal or caulk joints according to manufacturer's recommendations.

641.4 MEASUREMENT AND PAYMENT—Square Yard

The Department will not adjust the area for depressing the curb portion.

SECTION 643—TEMPORARY CONCRETE BARRIER, STRUCTURE MOUNTED

643.1 DESCRIPTION—This work is the furnishing, placing, maintaining, and removing of precast temporary concrete barrier, structure mounted; temporary concrete median barrier, structure mounted; or temporary concrete glare screen median barrier, structure mounted, as indicated, for maintenance and protection of traffic during construction using bolt through anchors, adhesive anchors, or pin connected drop-pin anchors, as shown on the Standard Drawings, to attach the barrier to existing hardened concrete structure(s). Temporary concrete barrier applies to bridge construction projects that extend continuously for a maximum of three construction seasons.

643.2 MATERIAL—

(a) **Barrier.** Section 714

(b) **Bolt Through Anchor.**

1. Anchor. ASTM F1554-99 Grade 105, 105 kips per square inch or ASTM A193/A193M - 01b Grade B7, 105 kips per square inch anchor bolt - 1 inch diameter; hot-dipped galvanized according to the requirements of Class C of ASTM A153. Additional requirements for both ASTM F1554-99 and ASTM A193/A193M includes ASTM F1554 supplement S5 Grade 105, 105 kips per square inch Charpy Impact Requirements at -20F.

2. Nuts. Heavy hex nuts as specified in Section 1105.02(c)3.a or according to ASTM A194/A194 Grade 7, Supplement S3 at -20F; hot-dipped galvanized according to the requirements of Class C of ASTM A153. Provide zinc coating, overlapping of the nut, and lubrication requirements according to ASTM A563.

3. Washers. 3 inch diameter by 1/4 inch thick Grade 250 (Grade 36) Plate Washer with a 1 1/8 inch diameter hole in the middle. All other washers are according to ASTM F436/F436M Type 1. Washers are to be hot-dipped galvanized according to the requirements of Class C of ASTM A153.

4. Structural Steel. Section 1105.02(a)2

5. Grout. Section 1080.2(c)

(c) **Adhesive Anchor.**

1. Anchor. Provide the results of testing performed by an independent testing facility for review and approval of a bolt equivalent to an ASTM A193/A193M - 01b Grade B7, 105 kips per square inch anchor bolt - 1 inch diameter; hot dipped galvanized according to the requirements of Class C of ASTM A153. Additional requirement for ASTM A193/A193M includes ASTM F1554 supplement S5 Grade 105, 105 kips per square inch Charpy Impact Requirements at -20F. If using bolts treated for future removal, provide manufacturer recommendations to the Representative and include manufacturer's test data to ensure this operation will not affect the physical properties of the anchor/adhesive combination.

2. Nuts. Heavy hex nuts as specified in Section 1105.02(c)3.a or according to ASTM A194/A194 Grade 7, Supplement S3 at -20F; hot-dipped galvanized according to the requirements of Class C of ASTM A153. Provide zinc coating, overlapping of the nut, and lubrication requirements according to ASTM A563.

3. Washers. 3 inch diameter by 1/4 inch thick Grade 36 Plate Washer with a 1 1/8 inch diameter hole in the middle. All other washers are according to ASTM F436/F436M Type 1. Washers are to be hot-dipped galvanized according to the requirements of Class C of ASTM A153.

4. Structural Steel. Section 1105.02(a)2

5. Grout. Section 1080.2(c)

6. Adhesive. Use adhesive bonding material systems specified herein and as listed in Bulletin 15 specifically

for this application. Use material designed for installation type, spacing and minimum temperature considerations. Provide a bonding material that is either a glass/soft-skin capsule or two-component system contained in pre-packed injection (coaxial or side by side) cartridges and that is inserted into the hole using a manufacturer approved dispensing gun and replaceable mixing nozzle.

6.a Performance Requirements. Provide independent test results from the adhesive bolt manufacturer, of the following properties, for review and approval by LTS.

6.b Physical Properties. Determine physical properties in 3000 ± 500 pounds per square inch concrete (cured for 28 days minimum) at a maximum depth of 6.5 inches with a 1 inch diameter anchor bolt of equal or greater tensile strength to an ASTM A193/A193M - 01b Grade B7 anchor bolt. Meet the minimum acceptance criterion of one or more of the following categories as shown in the Standard Drawings.

6.b.1 Tension. ASTM E1512, Procedure - Static Tests, modified for testing at the following temperatures: $32F \pm 1.8F$, $73.5F \pm 3.5F$, and $125F \pm 5F$, and to meet and be classified as per the tension minimums as shown in the Standard Drawings. Apply test loads to confined specimens to preclude concrete failure but allow bond failure. Concrete specimen size may be modified if necessary.

6.b.2 Shear (Continuous Load Application). ASTM E488, Shear Test; to meet and be classified as per the shear minimums in.

6.b.3 Shock. ASTM E488, Modified for testing as follows:

Number of samples: $n=5$

Number of shocks of test sample: 3

Shock duration: 0.1 seconds

Conduct the shock test at the following temperatures: $32F \pm 1.8F$, $73.5F \pm 3.5F$, and $125F \pm 5F$, to meet and be classified as per the tension minimums in. Apply test loads to confined specimens to preclude concrete failure but allow bond failure.

6.b.4 Short Term Cure. Perform static tension testing 24 hours after installation as per the procedure for tension testing in ASTM E1512, modified for testing at the following temperatures: $32F \pm 1.8F$, $73.5F \pm 3.5F$, and $125F \pm 5F$, and to meet and be classified as per the tension minimums in. Apply test loads to confined specimens to preclude concrete failure but allow bond failure.

6.b.5 Freeze Thaw. ASTM E1512, to meet and be classified as per the tension minimums in. Apply test loads to confined specimens to preclude concrete failure but allow bond failure.

6.b.6 Damp Hole Installation. ASTM E1512, to meet and be classified as per the tension minimums in. Before testing blow out the hole with dry compressed air for 1 to 1 1/2 minutes. Apply test loads to confined specimens to preclude concrete failure but allow bond failure.

6.b.7 Test on Effect of Reduced Temperature on Curing. ASTM E1512 modified as follows: Conduct installation/application at the lowest temperature of use specified to meet and be classified as per the tension minimums in. Perform test loads at $75F \pm 10F$ before application of the loading and at the specified minimum installation/application temperature. Apply test loads to confined specimens to preclude concrete failure but allow bond failure.

6.c Chemical/Compositional Properties. Provide manufacturer's data indicating the adhesive system is resistant to gasoline, diesel oil, acids, and caustics. Perform testing according to ASTM D543.

The following materials requirements are:

- Concrete Temperature at time of installation:

Minimum	41F*
Maximum	109F

*Adhesives designed for installation below 41F may be submitted and evaluated for approval if the lowest temperature of use specified is the installation/application temperature for physical properties testing.

- Installation time at 75F±10F:

Minimum Set time of	0.1 hrs
Maximum Set time of	6.0 hrs
Maximum Cure time of	24.0 hrs

Provide the following testing information for the tests listed below to the LTS. The information requested will be used to identify, characterize, and classify the material for proper use and to verify composition:

- ASTM D1875 - "Standard Test Method for Density for Adhesives in Fluid Form." Provide production ranges for each component of the system in terms of weight per gallon or specific gravity.
- ASTM D1252 - "Standard Practice for General Techniques for Qualitative Infrared Analysis." Provide an infrared analysis of each of the components, and of representative specimen of the cured final product of the adhesive system.
- ASTM D482 - "Ash Filler Content." Provide a value in terms of percent.
- ASTM D570 - "Water Absorption." Provide a value in terms of percent.
- ASTM D1084 - "Viscosity of Adhesives"
- The LTS must approve this information before the product is used.

6.d Storage of Materials. Store materials delivered to the job-site in the original unopened containers within a facility capable of maintaining storage conditions consistent with the manufacturer's recommendations.

6.e Certification, Shipment to Project, Packaging, and Marking. Certify each shipment as specified in Section 106.03(b) 3.

Deliver the adhesive bonding material system to the project site in original unopened containers with the manufacturer's label identifying the product. Clearly mark each package with the following information:

- Manufacturer's name and address
- Product name
- Manufacturer Expiration Date
- LOT Identification Number
- Storage and Handling Requirements

Include in each package a copy of the manufacturer's instructions for anchor and installation. Provide instructions that include at least the following information:

- Diameters of drilled holes for applicable anchor and anchor sizes.
- Cleaning procedure for drilled holes, including a description of permitted and prohibited equipment and techniques.
- Allowable temperature ranges for storage, installation, curing, and in-place performance.
- Identification of acceptable mixing/dispensing nozzles.
- Fabrication requirements for anchors.
- Description of tools permitted or required for installation.
- Method of identifying properly proportioned and mixed adhesive materials.
- Time and temperature schedule for initial and set and full-strength cure.
- Special requirements for special installation conditions such as damp holes, or low temperatures, etc.
- Release agents, if used.

(d) Pin Connected Drop-Pin Anchor.

1. Drop-Pin Anchor. ASTM A36/A36M, Grade 250 (36 kips per square inch) – 1 1/2 inch diameter rod; head plate: 1/2 inch thick; hot-dipped or mechanically galvanize as specified in Section 1105.02(s) after head plate is welded to drop-pin anchor.

2. Connection Pin. ASTM A449-07b, Type 1, unthreaded rod (straight) - 1 inch diameter; hot-dipped or mechanically galvanize as specified in Section 1105.02(s) after plate washer is welded to rod.

3. Plate Washers. ASTM A36/A36M, Grade 250 (36 kips per square inch), plate - 1/4 inch thick; hot-dipped or mechanically galvanize as specified in Section 1105.02(s) after plate washer is welded to connection pin rod.

(e) **Waterborne Pavement Markings**—Section 962.2

(f) **Barrier Mount Delineation Devices**—Section 937.2

643.3 CONSTRUCTION—

Install top and side delineators as shown on the Standard Drawings. Install warning lights as directed and according to the manufacturer's recommendations. Maintain alignment, delineation, warning lights, and condition of the barriers as necessary, for the duration of the project. Remove the barriers from the project upon project completion, or when directed.

To minimize eradication of paint lines within the work zones, paint continuous white or yellow 6" wide pavement marking on the barrier as shown on the Standard Drawings. Water blast the temporary barrier with a minimum of 3,000 psi before painting and if applicable, remove the existing contrasting paint color.

(a) **Bolt Through Anchor.** Prepare and install bolt through anchors in hardened concrete as indicated in BC-719M and as directed by the Representative.

1. Placement of Temporary Concrete Barrier. Ensure the concrete deck receiving bolt through anchors is structurally sound and free of cracks in the vicinity of the anchor to be installed. During the initial barrier layout, use a metal detector specifically designed for locating steel in concrete to minimize conflicts with existing steel reinforcement. Move the barrier parallel to the direction of traffic up to 2 inch and perpendicular to traffic up to 1 inch if conflicts with the existing steel reinforcement occur.

Maintain a smooth barrier face to traffic along the entire barrier length. Use a rotary drill and bit for drilling the hole for a 1 inch diameter bolt. Drill into the deck using the holes in the temporary barrier as a template. The drill may be located anywhere within the 2 inch slot, but must be maintained vertically ($\pm 1^\circ$) and at a 5° cant $\pm 1^\circ$ to the vertical from the front face to rear face of the barrier.

Drill into the deck using methods that will not shatter/damage the concrete surface adjacent to the holes or result in concrete spalling at the underside of the deck. Notify the Representative if spalling occurs. Patch areas of spalling immediately. If reinforcement is encountered during drilling, before the specified depth is attained, notify the Representative immediately. The hole may be repositioned within the slot in the barrier to avoid damaging the deck reinforcement during drilling; however, the hole must remain vertical. Patch unused or partially drilled holes as specified in Section 643.3(b)7.

2. Installing Anchors. Install the anchors in the hole with plate washers and channels if required. Snug tighten heavy hex nuts.

(b) **Adhesive Anchor.** Prepare and install adhesive anchors in hardened concrete as shown on the Standard Drawings, as directed by the Representative, according to manufacturer's instructions, and as specified herein.

1. Equipment. Use equipment meeting the manufacturer's recommendations for installation of adhesive anchors.

2. Placement of Temporary Concrete Barrier. Ensure concrete deck receiving adhesive anchors is structurally sound and free of cracks in the vicinity of the anchor to be installed. During the initial barrier layout, use a metal detector specifically designed for locating steel in concrete to minimize conflicts with existing steel reinforcement whenever placement tolerances and edge clearances allow. Move the barrier parallel to the direction

of traffic up to 2 inch and perpendicular to traffic up to 1 inch if conflicts with the existing steel reinforcement occur. Maintain a smooth barrier face to traffic along the entire barrier length.

Unless otherwise specified, use the depth of hole and the installation procedure recommended by the manufacturer to conform to BC-719M and the depth of the deck. Provide a copy of the manufacturer's recommended installation procedure, including depth, to the Representative at least 2 days before the start of work. Use rotary drill and bit as recommended by the adhesive manufacturer. Drill holes to the manufacturer's recommendation for a 1 inch diameter bolt. Drill into the deck using the holes in the temporary barrier as a template. The drill may be located anywhere within the 2 inch slot, but must be maintained vertically ($\pm 1^\circ$) and at a 5° cant $\pm 1^\circ$ to the vertical from the front face to rear face of the barrier.

Drill into the deck using methods that will not shatter/damage the concrete surface adjacent to the holes or penetrate the bottom of the bridge deck resulting in concrete spalling at the underside of the deck. Notify the Representative if spalling occurs. Patch areas of spalling immediately; use a bolt through connection for that hole location. If reinforcement is encountered during drilling, before the specified depth is attained, notify the Representative immediately. The hole may be repositioned within the slot in the barrier to avoid damaging the deck reinforcement during drilling; however, the hole must remain vertical. Patch unused or partially drilled holes as specified in Section 643.3(b)7.

Dry the drilled holes completely before cleaning and installing the anchors. Ensure drilled holes are cleaned in according to the manufacturer's instructions and are completely dry at the time of placing the adhesive bonding material and anchors. As a minimum, remove loose particles from drilling, brush inside surface to free loose particles trapped in pores, then remove the remaining loose particles to avoid contamination of the adhesive bonding material. Use a non-metallic bristle brush and avoid over-brushing to prevent polishing the inside surface of the drilled hole. Protect holes from contamination and moisture.

3. Installing of Anchors. Immediately before installation of anchors, dry the drilled holes completely by blowing out the drilled hole with dry compressed air. Ensure the drilled holes are cleaned in according to the manufacturer's instructions and are completely dry at the time of placing the adhesive bonding materials and anchors.

Install anchors as shown on the Standard Drawings, the structure drawings, and the manufacturer's instructions with particular attention to requirements and limitations due to anchor position, dampness, ambient temperature, and curing. Do not install anchors below 41F or above 109F unless manufacturer data can be provided and LTS has approved and listed the material in Bulletin 15 in advance.

Use adequate quantities of the adhesive bonding material to fill the drilled hole to within 1/4 inch of the concrete surface, measured after placement of the anchor.

For encapsulated systems, mix materials inside the drilled hole as the capsule and its contents are crushed by the anchor rod, driven by a rotating drill as directed by manufacturer's technical/application data sheets.

For pre-packed injection cartridge systems, fill hole completely (without gaps, air bubbles, etc.) from bottom as directed by manufacturer's technical/application data sheets. Insert anchor by hand, turning clockwise to coat threads and remove air bubbles.

Support the anchor as necessary to maintain alignment/orientation and prevent movement during curing. Maintain undisturbed until the adhesive has cured the minimum time specified by the manufacturer.

Anchors that are improperly bonded, as determined by the Representative, will be rejected. If removal of adhesive anchors is required, perform under the direction of the Representative, and provide manufacturer test data to support that this operation will not damage the surrounding concrete. If possible (>1 foot anchor spacing), drill new anchor holes in both adjacent barrier anchor locations to account for rejected anchors. Otherwise, re-drill holes to remove adhesive bonding material residue and clean as specified in Section 643.3(b)2. Do not reuse failed anchors. Perform all work necessary to correct improperly bonded anchors at no additional cost to the Department.

If adhesive anchors cannot be used, use bolt through anchors as specified in Section 643.3(a).

4. Field Testing of Anchors. Perform field testing of the installed anchors in according to ASTM E488 and ASTM E1512, in the presence of the Representative. In addition, orient the field test load equipment to provide a field load at the same angle and orientation as the anchor being tested.

If electing to use another type of field testing equipment, submit details to the BOPD for review and conceptual approval with field verification by the Contractor. Provide documentation that all field test equipment has been calibrated to the requirements of ASTM E488 and E 4. Perform restrained static tension tests to prevent damage to the surrounding concrete. Test individual anchors to the values shown in BC-719M, Table 2; values in Table 2 are based on 85% of the adhesive anchor tensile capacity.

The anchors will be divided into lots for testing and acceptance. Each lot will contain a maximum of 100 anchors, of the same embedment length and adhesive bonding material system. Ten percent of the anchors in each lot will be

randomly selected for testing, according to PTM No.1, with a minimum of five tests per lot, unless otherwise directed by the Representative. Submit test results to the Representative for each lot. Acceptability of the field tests will be determined according to ASTM E488 and the tension requirements of Table 1. For every failed field test, perform two additional field tests on adjacent untested anchors within the lot. Continue additional field tests until no additional test failures occur, or all anchors within the lot are tested. Remove and replace failed anchors as specified in Section 643.3(b)5.

Provisionally approved adhesive anchor systems will be evaluated randomly, for specification compliance, at job completion by secondary field proof load testing immediately before barrier removal.

5. Removal and Replacement of Failed Test Specimens. Remove all anchors failing the field test, without damage to the surrounding concrete. If possible, installing new replacement anchors, use adjacent barrier anchor slots as specified in Section 643.3(b)2. Otherwise, re-drill holes to remove adhesive bonding material residue and clean as specified in Section 643.3(b) 2. Reinstall new anchors as specified in Section 643.3(b)3. Do not reuse the failed anchors. Install anchors utilizing a new lot of adhesive bonding material, at the same embedment and field test as specified in Section 643.3(b)4.

If adhesive anchors cannot be used, use bolt through anchors as specified in Section 643.3(a).

6. Opening of Work Zone to Traffic. If removal operations of the structure have commenced or safety barriers have been removed on the inactive side of the newly placed temporary concrete barrier, do not open the work zone to traffic until all adhesive anchors have been successfully tested. Otherwise, the opening of the work zone to traffic will be allowed by the Representative before field-testing of the adhesive bonded anchors. Note cure time will be significantly modified by environmental conditions such as surface temperature, humidity, etc. In these cases, conduct field-testing after the required cure time of the adhesive.

7. Removal, Replacement, and Repair of Temporary Concrete Barrier, Structure Mounted. Immediately replace or repair barriers showing the following signs of damage:

- Fractures or cracks, that, in the opinion of the Representative, will hinder the adhesive/barrier performance; or
- Broken or cracked ends where such damage would, in the opinion of the Representative, prevent making a satisfactory joint.

Provisionally approved adhesive anchor systems will be evaluated randomly, for specification compliance, at job completion by secondary field proof load testing immediately before barrier removal.

If removal, repair, or replacement of anchors is required, provide the manufacturer's recommendations to the Representative, and include manufacturer's data to support that this operation will not damage the surrounding concrete. Following anchor bolt removal (before sealing of anchor bolt holes) clean out the interior of the bolt holes, in such a manner to remove all adhesive/removal materials, that would reduce the performance of the sealing operation.

Maintain alignment, delineation, warning lights and condition of the barriers throughout the life of the project. Upon project completion, or when directed, remove the barriers from the project. Following barrier removal, treat anchors and anchor bolt holes as shown on the Standard Drawings.

(c) Pin Connected Drop-Pin Anchor. Prepare and install drop-pin anchor in hardened concrete as indicated in BC-719M and as directed by the Representative.

1. Placement of Temporary Concrete Barrier. Ensure the concrete deck receiving drop-pin anchor is structurally sound and free of cracks in the vicinity of the anchor to be installed. During the initial barrier layout, use a metal detector specifically designed for locating steel in concrete to minimize conflicts with existing steel reinforcement.

Maintain a smooth barrier face to traffic along the entire barrier length. Use a rotary drill and bit for drilling a 1 3/4 inch hole for a 1 1/2 inch diameter drop-pin anchor. Drill into the deck using the 3 3/4 inch slot in the temporary barrier as a template. The drill may be located anywhere within the slot, but must be maintained 40 degrees ($\pm 2^\circ$) from the bridge deck. In addition the drill is to be positioned at $\pm 2^\circ$ from vertical in a plane parallel to the longitudinal axis of the barrier.

Drill into the deck using methods that will not shatter/damage the concrete surface adjacent to the holes or result in concrete spalling at the underside of the deck. Notify the Representative if spalling occurs. Patch areas of spalling

immediately. The hole may be repositioned within the slot in the barrier to avoid damaging the deck reinforcement during drilling. Patch unused or partially drilled holes as specified in Section 643.3(b)7.

2. Installing Drop-Pin Anchors. Immediately before installation of drop-pin anchor, clean the drilled holes completely of all loose debris. Ensure the drilled holes are cleaned and completely dry at the time of installing the drop-pin anchors. Install drop-pin anchor as shown on the Standard Drawings and verify the head plate is resting flush on the face of barrier.

3. Opening of Work Zone to Traffic. If removal operations of the structure have commenced or safety barriers have been removed on the inactive side of the newly placed temporary concrete barrier, do not open work zone to traffic until all drop-pin anchors have been successfully installed.

4. Removal, Replacement, and Repair of Temporary Concrete Barrier, Structure Mounted. Immediately replace or repair barriers showing the following signs of damage:

- Fractures or cracks, that, in the opinion of the Representative, will hinder the pin connected drop-pin anchor barrier performance; or
- Broken or cracked ends where such damage would, in the opinion of the Representative, prevent making a satisfactory joint.

Provisionally approved pin connected drop-pin anchor barrier systems will be evaluated randomly, for specification compliance.

If removal, repair, or replacement of drop-pin anchor is required, reinstall as specified in Section 643.3(c)1 and 2. Do not damage the surrounding concrete during this operation. Following drop-pin anchor removal (before sealing of drop-pin anchor hole) clean out the interior of the holes, in such a manner to remove all removal materials, that would reduce the performance of the sealing operation.

Maintain alignment, delineation, warning lights and condition of the barriers throughout the life of the project. Upon project completion, or when directed, remove the barriers from the project. Following barrier removal, treat drop-pin anchor holes as shown on the Standard Drawings.

643.4 MEASUREMENT AND PAYMENT—

(a) Temporary Concrete Barrier, Structure Mounted. Linear Foot

(b) Temporary Concrete Median Barrier, Structure Mounted. Linear Foot

(c) Temporary Concrete Glare Screen Median Barrier, Structure Mounted. Linear Foot

(d) Incidental Work.

Adhesive anchor systems will be measured and paid for incidental to the temporary concrete barrier, structure mounted; temporary concrete median barrier, structure mounted; and temporary concrete glare screen median barrier, structure mounted.

Labor, materials, tools, equipment, and incidentals; all work involved in drilling holes, bonding anchors and coring through concrete and reinforcement; and removal of barrier and subsequent repair of deck are included in contract unit price. Removal of unacceptable or failed field tested anchors, as well as all patching/repair of cracked/damaged concrete will be at no additional cost to the Department.

Pin connected drop-pin anchor systems will be measured and paid for incidental to the temporary concrete barrier, structure mounted; temporary concrete median barrier, structure mounted; and temporary concrete glare screen median barrier, structure mounted. Labor, materials, tools, equipment, and incidentals; all work involved in drilling holes and coring through concrete and reinforcement; and removal of barrier and subsequent repair of deck are included in contract unit price.

SECTION 644 - TEMPORARY CONCRETE BARRIER, STRUCTURE MOUNTED, RESET

644.1 DESCRIPTION - This work is the resetting of a temporary concrete barrier, structure mounted; temporary concrete median barrier, structure mounted; or temporary concrete glare screen median barrier, structure mounted from one construction area to another within the project limits. Temporary concrete barrier applies to bridge construction projects that extend continuously for a maximum of three construction seasons.

644.2 MATERIAL - Section 643.2(b), Section 643.2(c), Section 643.2(d), Section 643.2(e), and Section 643.2(f).

644.3 CONSTRUCTION - Section 643.3

Reset barrier if the construction operations require a change in protection of traffic or as directed. Store or transport the barrier as required.

644.4 MEASUREMENT AND PAYMENT –

(a) **Temporary Concrete Barrier, Structure Mounted, Reset.** Linear Foot

(b) **Temporary Concrete Median Barrier, Structure Mounted, Reset.** Linear Foot

(c) **Temporary Concrete Glare Screen Median Barrier, Structure Mounted, Reset.** Linear Foot

(d) Incidental Work.

Adhesive anchor systems will be measured and paid for incidental to the temporary concrete barrier, structure mounted, reset; temporary concrete median barrier, structure mounted, reset; and temporary concrete glare screen median barrier, structure mounted, reset.

Labor, materials, tools, equipment, and incidentals; all work involved in drilling holes, bonding anchors and coring through concrete and/or reinforcement; and removal of barrier and subsequent repair of deck are included in contract unit price.

Removal of unacceptable or failed field tested anchors, as well as all patching/repair of cracked/damaged concrete will be at the Contractor's expense with no additional cost to the Department.

Pin connected drop-pin anchor systems will be measured and paid for incidental to the temporary concrete barrier, structure mounted, reset; temporary concrete median barrier, structure mounted, reset; and temporary concrete glare screen median barrier, structure mounted, reset. Labor, materials, tools, equipment, and incidentals; all work involved in drilling holes and coring through concrete and/or reinforcement; and removal of barrier and subsequent repair of deck are included in contract unit price.

SECTION 651—PAVED SHOULDERS, TYPE 1, TYPE 1-F, TYPE 1-S, AND TYPE 1-SP

651.1 DESCRIPTION—This work is construction of paved shoulders, of the type indicated, on a prepared surface.

651.2 MATERIAL—

- Aggregate Base—Section 350.2
- Asphalt Surface Treatment—Section 480.2
- Slurry Seal—Section 482.2
- Superpave Asphalt Mixture Design, Asphalt Base Course—Section 313.2 and as follows: PG 64S-22, <0.3 million ESALs, or as indicated or directed.
- Superpave Asphalt Mixture Design, Asphalt Base Course—Section 313.2 and as follows: PG 64S-22, <0.3 million ESALs, or as indicated or directed.
- Superpave Asphalt Mixture Design, Asphalt Wearing Course, SRL-L—Section 413.2, Section 410.2, or Section 412.2 and as follows: PG 64S-22, <0.3 million ESALs, or as indicated or directed.
- Superpave Asphalt Mixture Design, Asphalt Wearing Course, SRL-L—Section 413.2, Section 410.2, or Section 412.2 and as follows: PG 64S-22, <0.3 million ESALs, or as indicated or directed.

651.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) Combination Base Course.

- 1. Aggregate Base.** Section 350.3
- 2. Superpave Asphalt Mixture Design, Asphalt Base Course (for Type 1-SP).** Section 313.3

(b) Asphalt Surface Treatment (for Type 1). Section 480.3

(c) Double Slurry Seal (for Type 1-S). Apply a seal, as specified in Section 482.3.

(d) Superpave Asphalt Mixture Design, Asphalt Wearing Course (for Type 1-SP). Section 413.3

(e) Superpave Asphalt Mixture Design, Asphalt Wearing Course (for Type 1-F). Section 410.3 or Section 412.3

651.4 MEASUREMENT AND PAYMENT—Square Yard

SECTION 653—PAVED SHOULDERS, TYPE 3

653.1 DESCRIPTION—This work is construction of paved shoulders on a prepared surface.

653.2 MATERIAL—

- Aggregate Base—Section 350.2
- Asphalt Prime Coat—Section 461.2
- Asphalt Surface Treatment—Section 480.2

653.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) **Aggregate Base.** Section 350.3; except, if granulated steel slag is used as a base material, construct the top 3 inches of the aggregate base using either stone, gravel, or air-cooled blast furnace slag aggregate.

(b) **Prime Coat.** Section 461.3

(c) **Asphalt Surface Treatment.** Section 480.3

653.4 MEASUREMENT AND PAYMENT—Square Yard

SECTION 654—PAVED SHOULDERS, TYPE 4

654.1 DESCRIPTION—This work is construction of paved shoulders, Type 4, and preparation of the underlying surface.

654.2 MATERIAL—

- Aggregate Base—Section 350.2
- Asphalt Prime Coat—Section 461.2
- Asphalt Surface Treatment—Section 480.2
- Shoulder Backfill Material—Section 350.2

654.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) **General.** Remove surplus material on existing shoulders to the bottom of the proposed base course or to a directed depth. If the existing guide rail is to remain in place, excavate the shoulder without disturbing the existing guide rail. Remove and shape material under and in back of existing guide rail to the elevation and slopes indicated or as directed. The Contractor is not required to compact behind the existing rail.

Satisfactorily repair existing guide rail damaged or destroyed by the construction operations, as directed.
Satisfactorily dispose of excess or unsuitable material, as directed.

(b) **Scarifying.** After removing surplus material and at directed locations, scarify existing shoulder areas to a maximum depth of 4 inches below existing grade or to the directed depth.

(c) **Shaping and Compacting.** Shape and compact existing shoulder areas and low areas filled with graded material from the shaping operation to the bottom elevation of the proposed base course. If there is insufficient graded material, provide aggregate base course material to fill low areas to the bottom elevation of the proposed base course. Compact graded material or aggregate base course material as specified in Section 654.3(f).

(d) **Aggregate Base.** Construct, as specified in Section 350.3, to the depth indicated.

(e) **Excavation.** Where indicated, excavate the shoulder area below the bottom of the proposed base course to the depth indicated or directed.

(f) **Shoulder Backfill.** Where the shoulder area was excavated below the bottom elevation of the proposed base course, backfill, shape, and compact aggregate base course material to the bottom elevation of the proposed base course. Compact using rollers as specified in Section 108.05(c)3.a, 3.b, 3.e, or 4. The material is satisfactorily compacted when it does not move under the compaction equipment.

(g) **Prime Coat.** Section 461.3

(h) **Asphalt Surface Treatment.** Section 480.3

654.4 MEASUREMENT AND PAYMENT—

(a) **Paved Shoulders, Type 4.** Square Yard

(b) **Shoulder Backfill.** Cubic Yard or Ton

The unit price includes excavation below the bottom of the proposed base course.

SECTION 656—PAVED SHOULDERS, TYPE 6, TYPE 6-F, TYPE 6-S, AND TYPE 6-SP

656.1 DESCRIPTION—This work is construction of paved shoulders, of the type indicated, and preparation of the underlying surface.

656.2 MATERIAL—

- Asphalt Surface Treatment—Section 480.2
- Shoulder Backfill (if required)—Section 350.2
- Slurry Seal—Section 482.2
- Superpave Asphalt Mixture Design, Asphalt Base Course—Section 313.2 and as follows: PG 64S-22, <0.3 million ESALs, or as indicated or directed.
- Superpave Asphalt Mixture Design, Asphalt Base Course—Section 313.2 and as follows: PG 64S-22, <0.3 million ESALs, or as indicated or directed.
- Superpave Asphalt Mixture Design, Asphalt Wearing Course, SRL-L—Section 413.2, Section 410.2, or Section 412.2 and as follows: PG 64S-22, <0.3 million ESALs, or as indicated or directed.
- Superpave Asphalt Mixture Design, Asphalt Wearing Course, SRL-L—Section 413.2, Section 410.2, or Section 412.2 and as follows: PG 64S-22, <0.3 million ESALs, or as indicated or directed.

656.3 CONSTRUCTION—As shown on the Standard Drawings; as specified in Sections 654.3(a), (b), (c), (e), and (f); and as follows:

- (a) **Asphalt Surface Treatment (for Type 6).** Section 480.3
- (b) **Double Slurry Seal (for Type 6-S).** Apply a seal, as specified in Section 482.3.
- (c) **Superpave Asphalt Mixture Design, Asphalt Base Course (for Type 6-SP).** Section 313.3
- (d) **Superpave Asphalt Mixture Design, Asphalt Wearing Course (for Type 6-SP).** Section 413.3
- (e) **Superpave Asphalt Mixture Design, Asphalt Wearing Course (for Type 6-F).** Section 413.3, Section 410.3, or Section 412.3

656.4 MEASUREMENT AND PAYMENT—

- (a) **Paved Shoulders.** Square Yard
- (b) **Shoulder Backfill.** Cubic Yard or Ton
The unit price includes excavation below the bottom of the proposed base course.

SECTION 657—PAVED SHOULDERS, TYPE 7

657.1 DESCRIPTION—This work is construction of paved shoulders.

657.2 MATERIAL—Same type as the material used to resurface the roadway, except use SRL-L.

657.3 CONSTRUCTION—As shown on the Standard Drawings.

657.4 MEASUREMENT AND PAYMENT—Square Yard

SECTION 658—CONCRETE SHOULDERS

658.1 DESCRIPTION—This work is construction of plain cement concrete (PCC) shoulders, of the type indicated, and roller compacted concrete (RCC) shoulders on a prepared surface.

658.2 MATERIAL—

(a) Plain Cement Concrete Shoulders.

- Class AA Cement Concrete—Section 704
- Joint Sealing Material—Section 705.4(a), (b), or (d)
- Covers for Curing and Protection—Section 711.1
- Concrete Curing Compound—Section 711.2(a)
- Concrete Admixtures—Section 711.3
- Base Courses—Sections 303.2, 350.2, and 360.2
- Deformed and Plain Bar Dowels—Section 709.1(a)
- Premolded Expansion Joint Filler—Section 705.1
- Longitudinal Joint Material—Section 705.2

(b) Roller Compacted Concrete Shoulders. Section 502.2

658.3 CONSTRUCTION—

(a) Plain Cement Concrete Shoulders. Construct PCC shoulders as shown on the Standard Drawing and as specified in Section 501.3, except as follows:

(f) Placement and Initial Strike-Off of Concrete. Revise the third paragraph of Section 501.3(f) as follows:

Do not damage the prepared surface while transporting or depositing concrete ahead of the paver. If the prepared surface is an asphaltic leveling course on rubblized concrete, treated base course of cement or asphalt, or a No. OGS subbase, travel on the prepared surface only in the immediate area of the paving operation for the purpose of depositing concrete ahead of the paver. Do not use the prepared surface for hauling. Repair or replace any damaged areas to the satisfaction of the Representative, at no additional cost to the Department.

(g) Slip-Form Paving Method. Revise Section 501.3(g)4 as follows:

4. Joints. Saw, cure, and protect transverse and longitudinal contraction joints, as specified in Sections 501.3(i) and (j).

(i) Transverse Joints. Revise Sections 501.3(i) as follows:

Delete the second paragraph.

Revise Section 501.3(i)2, first paragraph as follows:

2. Contraction Joints. Accurately mark, using tacks or other approved methods, the location for the center of the sawed transverse contraction joints. Saw joints with equipment having guides, a blade guard, watercooling system, and cut-depth control. Provide adequate, extra equipment and parts at the site, before placing concrete and during sawing operations.

(b) Roller Compacted Concrete Shoulders. Construct RCC shoulders as shown on the Plans and as specified in Section 502.3.

658.4 MEASUREMENT AND PAYMENT—

(a) Plain Cement Concrete Shoulders. Square Yard

(b) Roller Compacted Concrete Shoulders. Square Yard

SECTION 659—HIGH FRICTION SURFACE TREATMENT (HFST)

659.1 DESCRIPTION—This work is the furnishing and applying a High Friction Surface Treatment (HFST) on asphalt and concrete pavements.

659.2 MATERIALS—

(a) **General.** Provide copies of the Material Data Sheets (MDS) and Safety Data Sheets (SDS) for the binder resin system. If serrated squeegees are used, they must be designed to apply a Wet Film Thickness (WFT) of 50-65 mils.

(b) **Binder Resin System (binder).** Use a polymeric or methyl methacrylate resin binder meeting the requirements in Table 1; and listed in Bulletin 15, or listed as an approved experimental evaluation resin by the Department's New Products and Innovative Section (NPI).

**Table 1
Binder Requirements**

Property	Requirement		Test Method
	Polymeric resin	MMA Resin	
Viscosity (poises)	Class C: 7 - 30	Class C: 12 - 20	ASTM D 2556*, mix for 2 to 3 minutes before testing. Use X1.1 for Spindle Selection. Perform testing at a temperature of $73 \pm 2F$.
Gel Time (minutes)	10 minimum	10 minimum	AASHTO M 235*, prepare a 60 g sample, test at $73 \pm 2F$.
Ultimate Tensile Strength (psi)	2,500-5,000	1,500-5,000	AASHTO M 235*, prepare Type I specimen according to ASTM D 638
Durometer Hardness (Shore D)	60 to 80	40 to 75	ASTM D 2240*, use the Type 1 Precision—Type D Durometer Method. Cure specimens for 7 days at $73 \pm 2F$ and relative humidity at $50\% \pm 2\%$. Test specimens at $73 \pm 2F$ without delay.
Compressive Strength (psi)	1,000 min. at 3 hours 5,000 min. at 7 days	1,000 min. at 3 hours 2,000 min. at 7 days	ASTM C 579*, prepare specimen according to Method "B", 2 inch x 2 inch cube, using 2.75 parts of sand to one part of mixed binder by volume. Use sand conforming to ASTM C 778, 20-30 sand. Cure specimens for 7 days at $73 \pm 2F$ and relative humidity at $50\% \pm 2\%$. Test specimens at $73 \pm 2F$ without delay.
Cure Rate (hours)	3 max.	3 max.	ASTM D 1640*, prepare a specimen of 50-55 wet mil thickness. Cure specimens for 3 hours max at $73 \pm 2F$ and relative humidity at $50\% \pm 2\%$. Test specimens at $73 \pm 2F$ without delay.
Water Absorption (%)	1 max.	1 max.	AASHTO M 235*, cure specimens for 7 days at $73 \pm 2F$ and relative humidity at $50\% \pm 2\%$. Test specimens at $73 \pm 2F$ without delay after immersion.
Adhesive Strength (psi) @ 24 hours	250 min. or 100% substrate failure	250 min. or 100% substrate failure	ASTM C 1583*, cure specimens for 24 hours at $73 \pm 2F$ and relative humidity at $50\% \pm 2\%$. Test specimens at $73 \pm 2F$ without delay.

*Prepare the samples according to the manufacturers' recommendations.

(c) **Aggregate Surface Topping (Aggregate).** Use clean, dry, high-friction bauxite aggregate that is free from foreign matter and meets the physical and chemical requirements of Table 2.

Table 2
Bauxite Aggregate Requirements

Properties	Test Methods	Specifications
Polish Stone Value	AASHTO T 279	38 min.
LA Abrasion Test	AASHTO T 96	20% max.
Moisture Content	AASHTO T 255	0.2% max.
Aluminum Oxide	ASTM C 25	87% min.
Aggregate Gradation	AASHTO T 27	
Sieve Designation		Total Percent Passing
No. 4		100
No. 6		95-100
No. 16		0-5

(d) Certification. Certify binder resin as specified in Section 106.03(b)3.

For aggregate, provide independent testing to verify Table 2 requirements are met. Independent testing must be less than 12-months-old and be from an AASHTO Certified Laboratory at the time aggregate is furnished to the project. Submit for project specific, local approval by the Representative as specified in Section 106.02(a)2.c.

659.3 CONSTRUCTION—

(a) Qualification of the Installer. Submit a minimum of three projects including the installer's contact information. The three projects must have a cumulative minimum of 10,000 square yards of HFST and must have been placed within the past 3 years. All submitted projects must have a friction reading of at least 65 SN40S within 90 days of the installation tested according to ASTM E 274 (AASHTO T 242). An installer who does not meet these minimum requirements will be allowed to perform the installation operation if approved in writing by the binder manufacturer.

(b) QC Plan. Prepare and submit a QC Plan, as specified in Section 106, do not begin work until the QC plan is approved. Discuss the QC Plan at the pre-construction meeting. The QC Plan must include key personnel, equipment, materials, proposed methods of installation and operation, and the following requirements:

1. Designated QC Plan Administrator. Has full authority to institute all action necessary for the successful operation of the QC Plan and is responsible for the following:

- Identify and provide contractor procedures for:
 - Documenting quantities used for binder and aggregate at each HFST site so application rates may be confirmed to be according to the specification.
 - Moisture control methods of aggregate.
 - Cleaning and maintenance schedule for machinery and equipment.
 - Corrective actions for unsatisfactory construction practices and deviations from the specifications.
 Any deviation from the approved QC Plan will be cause for immediate suspension of operations.
- Contractor performance of required field QC sampling, testing and record keeping according to the approved QC Plan and contract documents.
- Maintain and make available upon request, complete records of sampling, testing corrective actions, and QC inspection results.

2. Manufacturer's technical person. Responsible for the following:

- Train and provide recommendations to construction personnel in the safe handling and proper application of materials before placing the HFST.
- Must be present at each site if the installer does not meet the minimum requirements as specified in Section 659.3(a).
- Must be present for the first 2 days of installation, for installers that do meet the minimum requirements as specified in Section 659.3(a).

659.3(b)

- Must be present at any job site that requires corrective work due to unacceptable Skid Number (SN) values as specified in Table 6.
- Or must be present as otherwise approved in the QC Plan.

659.3(f)

(c) Delivery and Storage of Materials. Store materials in a clean, dry environment and according to the manufacturer's recommendations. Do not expose the aggregate to rain or moisture. Obtain and post at the storage areas the Safety Data Sheet (SDS), Product Data Sheet, and other information from the manufacturer pertaining to the safe practices for the storage, handling, and disposal of the materials, and to their health hazards. Provide a copy of this information. Storage containers must have the manufacturer's name, date of manufacture, batch/lot number, trade name, quantity, and mixing ratio printed on the label.

(d) Application Conditions. Do not apply the binder if the pavement surface is wet, if the temperature is below manufacturer's recommendation, or if the anticipated weather conditions would prevent the proper application of the surface treatment.

Protect freshly applied HFST from sudden or unexpected rain. Stop all application operations if it starts to rain. The Representative may order removal and replacement of any material damaged by rainfall or placed below the manufacturer's recommended temperature.

(e) Surface Preparation.

1. General. Cover and protect all existing pavement markings and utilities (utility holes/inlets) that are adjacent to the HFST site as directed before performing surface preparation. Remove pavement markings that conflict with the HFST installation as specified in Section 963.3.

Prepare all pavement surfaces immediately before the installation of HFST. Wash pavement surfaces with a mild detergent solution to remove oils, greases, or other deleterious materials that remained after the surface preparation, rinse with clean potable water, and dry using a hot compressed air lance.

Where cracks are present, remove loose material with compressed air and pre-treat cracks 1/4 inch or greater in width with the mixed binder. Do not overfill cracks. If cracks are overfilled, scarify the material to make it flush with the adjacent pavement after the binder material is cured. Install HFST after the binder in the pre-treated cracks has gelled.

2. Asphalt Pavement. Clean asphalt pavement surfaces using mechanical sweepers and high-pressure air wash with sufficient oil traps. Mechanically sweep all surfaces to remove dirt, loose aggregate, debris, and deleterious material. Vacuum sweep or air wash, using a minimum of 180 cubic feet per minute and 80 pounds per square inch of clean and dry compressed air, all surfaces to remove all dust, debris, and deleterious material.

Do not apply HFST applications on new asphalt pavements until after a mandatory 30-day cure period.

3. Concrete Pavement. Clean concrete pavement surfaces by shot blasting and vacuum sweeping. Shot blast all surfaces to remove all curing compounds, loosely bonded mortar, surface carbonation, and deleterious material. Comply with the International Concrete Repair Institute (ICRI) standard for surface roughness (CSP) 5. Provide the necessary concrete surface profile chips to visually verify the surface preparation. After shot blasting, vacuum sweep or air wash using a minimum of 180 cubic feet per minute and 80 pounds per square inch of clean and dry compressed air, all surfaces to remove all dust, debris, and deleterious material.

Do not apply HFST on concrete surfaces or repairs that are less than 28 days of age.

(f) Application Method. Table 3 and Table 4 show the permissible main application methods, depending on the size and Average Daily Traffic (ADT), of each individual HFST installation site. Manual application is permissible at sites as a secondary method where for reasons of access or geometry the mechanized or semi-mechanized equipment cannot physically be used, as approved.

Do not allow the mixed binder material to be exposed, separate, cure, dry, or otherwise harden in such a way as to impair retention and bonding of aggregate. Remove and replace any binder that becomes contaminated at no additional expense to the Department.

Immediately remove loose aggregate that falls onto any part of an active adjacent travel lane after the traffic is temporarily held.

Contractor equipment and traffic is not allowed on the HFST during the curing period.

Table 3
Permissible Methods of Application for Roads Under 25,000 ADT

Site Size (Square Yards)	Main Application Method
Less than 300	Section 659.3(f)1 Hand Mixing and Manual Application, Section 659.3(f)2 Semi Mechanized Application, or Section 659.3(f)3 Automated Continuous Application
300 and above	Section 659.3(f)2 Semi Mechanized Application, or Section 659.3(f)3 Automated Continuous Application

Table 4
Permissible Methods of Application for Roads of 25,000 ADT and Above

Site Size (Square Yards)	Main Application Method
Less than 300	Section 659.3(f)1 Hand Mixing and Manual Application, Section 659.3(f)2 Semi Mechanized Application, or Section 659.3(f)3 Automated Continuous Application
300 to 2,000	Section 659.3(f)2 Semi Mechanized Application or Section 659.3(f)3 Automated Continuous Application
Larger than 2,000	Section 659.3(f)3 Automated Continuous Application

1. Hand Mixing and Manual Application. Provide calibrated containers for proper proportioning of the binder components. Provide a clean, dry, container large enough to blend and mix the proper proportions of the binder.

Uniformly mix the binder components to within $\pm 2\%$ of the manufacturer's specifications (by volume) using a low-speed, high-torque drill fitted with a helical stirrer, moving the stirrer around to all the edges of the mixing container, or as approved by the manufacturer's technical person. Do not use wheel mixers or paddle mixers.

Immediately after the binder application, use a serrated squeegee to distribute a uniform binder thickness of 50-65 mils (25-32 square foot per gallon), then mechanically or manually spread the aggregate onto the wet, uncured binder at a uniform rate of 12-15 pounds per square yard. Completely cover the wet, uncured binder with aggregate to achieve a uniform surface with no exposed binder remaining visible on the surface. Spread the aggregate without displacing the wet binder film during placement. Minimize walking or standing on the binder.

Do not allow loose aggregate onto any part of the adjacent, active travel lanes.

2. Semi Mechanized Application. This application consists of machine mixing of binder, machine application of aggregate, hand squeegee work to apply mixed binder.

Use equipment to continuously mix, meter, and monitor the binder. If recommended by the binder manufacturer, use a heated metering pump. Mix the binder according to the manufacturer's specifications ($\pm 2\%$ by volume).

Immediately after the binder application, use a serrated squeegee to distribute a uniform binder thickness of 50-65 mils (25-32 square foot per gallon). Mechanically spread the aggregate onto the wet, uncured binder at a uniform rate of 12-15 pounds per square yard. Do not allow loose aggregate onto any part of the adjacent, active travel lanes. Hand spread aggregate is allowed as a secondary method if the mechanized equipment cannot physically be used as approved by the Representative.

Completely cover the wet, uncured binder with aggregate to achieve a uniform surface with no exposed binder remaining visible on the surface. Spread the aggregate without displacing the wet binder film during placement. Minimize walking or standing on the binder.

3. Automated Continuous Application. This application consists of machine mixing, machine application of binder, and machine application of aggregate. No hand squeegee work allowed.

Do not apply HFST if wind speed is above 15 mph or if wind gusts of 20 mph or higher are anticipated during the placement of the treatment.

Perform automated application using equipment that mixes, meters, monitors, and applies the binder followed by application of the aggregate by use of equipment capable of placing binder and aggregate in one continuous pass up to a 12-foot width. If recommended by the binder manufacturer, use a heated metering pump.

Blend and mix the binder in accordance with the manufacturer's specification ($\pm 2\%$ by volume) and place a

659.3(f)

uniform binder thickness of 50-65 mils (25-32 square foot per gallon). Apply the aggregate mechanically at a rate of 12-15 pounds per square yard (achieving saturation) by vertical drop onto the wet, uncured binder. Do not allow loose aggregate onto any part of the adjacent, active travel lanes.

Use equipment capable of continuously monitoring binder and aggregate application rates, and capable of placing HFST at a minimum rate of 2,000 square yards per hour.

In sloped areas, minimize the weight of the application truck by filling the bauxite hopper and resin tanks halfway. No walking or standing on the binder is permitted.

(g) Aggregate Cleanup. After the binder treatment has cured, and before opening to traffic, reclaim the surplus aggregate, including the shoulder area by a vacuum sweeper. Collected aggregate can be reused if it is clean, uncontaminated and dry. If contaminated aggregate is mixed with virgin aggregate, all the aggregate in the container will be considered contaminated and not acceptable for use in the HFST.

Between 15 to 30 days after placing the HFST, reclaim all loose aggregate, including the shoulder area using a vacuum sweeper. This reclaimed aggregate cannot be reused.

(h) Performance Testing/Acceptance. After the second aggregate sweeping as specified in Section 659.3(g), reapply the HFST as directed to areas with bare asphalt or concrete pavement, areas with binder material only, and areas with poor aggregate retention. This repair is at no additional cost to the Department.

The Department will conduct a calibrated skid test between 45 and 120 days after the HFST is completed. The Engineering District will request the Skid Testing from the Department's Pavement Testing & Asset Management Section. Skid Testing for each HFST site will be performed according to ASTM E 274 (AASHTO T 242) using a smooth tire lock-wheel apparatus, and Table 5.

Table 5
Number of SN40S Skid Tests per HFST Site, per Lane

HFST Site Length	Number of Runs per Lane	Skid Tests to Obtain per Run
100* feet to 350 feet	2	Run 1 – 2 Skid Tests Run 2 – 1 Skid Test
Greater than 350 feet	1	3

*For sites less than 100 feet, skid testing is not required.

Acceptance payment will be determined utilizing the factors in Table 6.

Table 6
Acceptance and Payment Factor per HFST Site

Average SN40S (per HFST site)	HFST Acceptance	Item Pay Factor (%)
SN \geq 70	Yes	100
SN 65 - 69	Yes	90
SN < 65	No	Remove and replace, or reapply, at no additional cost to the Department to obtain acceptable SNs. Manufacturer's technical person must approve any proposed reapplication treatments and be present during all corrective work. Representative must approve all corrective work plans before implementation.

659.4 MEASUREMENT AND PAYMENT—Square Yard

SECTION 660—RUMBLE STRIPS

660.1 DESCRIPTION—This work is the construction of rumble strips of the type indicated.

660.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) **Equipment.** Use a machine capable of providing a smooth cut without tearing or snagging, and producing rumble strips as shown on the Standard Drawings. Equip machine with guides to provide uniformity and consistency in alignment of each cut with respect to the roadway.

(b) **Milling Operation.** Before the construction of the rumble strips, meet on-site with the Representative to discuss rumble strip installation. Construct rumble strips to have finished dimensions and tolerances as shown on the Standard Drawings. After milling the first 100 feet of rumble strips, examine spacing, widths, length, and depths with straight edge. If adjustments are required, mill an additional 100 feet and confirm correct installation. After installation has been corrected, proceed as directed. Construct rumble strips prior to the placement of the permanent pavement markings.

If constructing rumble strips into new concrete, only construct after curing as specified in Section 501.3(1).

If constructing centerline rumble strips into asphalt pavement, construct before placement of the longitudinal joint sealing operation.

(c) **Disposal of Milled Material.** Satisfactorily remove milled material and clear areas disturbed by the milling operation of all loose material before opening roadway to traffic. Remove and dispose of milled material according to DEP Residual Waste Regulations.

660.4 MEASUREMENT AND PAYMENT— Linear Foot

For the type indicated.

Measured longitudinally along center of rumble strip pattern. The unit prices include removal and disposal of milled material.

SECTION 663—BRICK MASONRY

663.1 DESCRIPTION—This work is construction of brick masonry.

663.2 MATERIAL—

- Brick—Section 713.1
- Mortar—Section 705.7(b)

663.3 CONSTRUCTION—

(a) **Excavation.** Excavate for masonry structure footer, as required, to form a compacted, firm, even foundation surface as specified in Section 204 for Class 3 excavation. Remove unsuitable material as specified in Section 203.1(b).

(b) **Footing.** Construct masonry structure footer as detailed and as specified in Section 1001 using Class A cement concrete as specified in Section 704.

(c) **Sample Panel.** Construct an on-site, sample, masonry panel approximately 4 feet square, indicating the color range, texture, bonding pattern, mortar color, tooling, and workmanship of the proposed brick masonry structure. Obtain approval of the sample panel before erecting the brick masonry.

(d) **Placing Brick.** Lay brick with exposed surfaces true to line, in courses, in a full bed and head of mortar, and with joints not exceeding 3/8 inch in width. Do not furrow beds. Stagger head joints on adjoining courses one-half brick, as nearly as practicable. Make courses level, except as otherwise indicated or directed. Construct at least one course in every six entirely of headers, common bond, unless otherwise directed. Saturate bricks with water and ensure that bricks are surface dry before placement. Do not use broken or chipped brick in exposed faces. When making closures, do not use less than the width of a brick and lay whole brick, with the long side at right angle to the face.

(e) **Pointing.** Finish mortar joints with a concave pointing tool to a depth not exceeding 1/8 inch and to an approved appearance.

(f) **Curing and Protection.** Do not place mortar and bricks or point, in freezing weather, unless otherwise authorized in writing. Protect brickwork and other masonry from freezing until cured. Provide adequate protection from frost, and remove and replace work damaged by frost. Protect completed brickwork from the elements. Cure brickwork with water moisture for at least 3 days. Wet and clean the exposed brick faces with a 10% (by volume) solution of muriatic acid, applied with stiff fiber brushes.

(g) **Select Borrow Excavation (Structural Backfill).** Backfill as specified in Section 205.

663.4 MEASUREMENT AND PAYMENT—

(a) **Brick Masonry.** Cubic Yard

(b) **Class A Cement Concrete.** Cubic Yard

(c) **Excavation.** Cubic Yard
For the class indicated.

SECTION 664—MODULAR ARCHITECTURAL BLOCK SYSTEM

664.1 DESCRIPTION—This work is construction of a modular architectural block system. Modular architectural block systems may be used for nonstructural landscape architecture applications according to the manufacturer drawings and recommendations. An acceptable landscape architectural site cannot have structures with foundations above the aggregate base within 8 feet of the back of the block system. System construction is restricted to a height of 4 feet above grade.

664.2 MATERIAL—

(a) **Modular Architectural Blocks.** Certify as specified in Section 106.03(b)3, Section 713.2, and as follows: Machine-made blocks uniform in color with a minimum compressive strength of 4,500 pounds per square inch and an absorption of 6% or less, when tested according to ASTM C 140, and a minimum durability factor of 80 when tested according to ASTM C 666, Procedure A.

(b) **Geotextile.** Class 4, Type A, non-woven-heat-bonded as specified in Section 735.

(c) **Coarse Aggregate.** AASHTO 8 and Section 703.2(c)2.

(d) **Mortar.** Section 705.7(b)

(e) **Topsoil.** Section 802

(f) **Seeding and Soil Supplements.** Section 804

(g) **Rejection.** Blocks exhibiting any of the following conditions are not accepted:

- Defects that indicate imperfect proportioning, mixing, and molding;
- Non-uniform or contrasting coloration as determined by the Representative; or
- Surface defects, such as honeycombing or open texture, or areas damaged beyond satisfactory repair.

664.3 CONSTRUCTION—As indicated on the shop drawings and as follows:

Excavate and place geotextile, Class 4, Type A, non-woven-heat bonded, to the limits specified in Section 212.3(a) and (c). After placing the geotextile, construct a level 8 inches thick aggregate base according to the shop drawings. Ensure that each block course placed is level and aligned correctly with uniform staggered butt joints. Provide a block layout so as not to use any block smaller than half of a block in size. Clean the foreign material from the lower block course to ensure alignment and stability of the subsequent block course. Place the coarse aggregate backfill in 6-inch maximum lifts behind each block course against the geotextile before placing subsequent block courses. Use a vibratory plate to compact the course aggregate backfill before placing subsequent block courses. Wrap the geotextile material over the top of the coarse aggregate as indicated. Place the cap block course on a bed of mortar. Ensure butt joints in cap block course do not align with butt joints in preceding block course. Place topsoil and apply seeding and mulching using material and formula, at rates typical for the project. The contractor must be familiar with the placement of these block systems and certified by the block manufacturer. If not familiar with the block systems and certified by the manufacturer, provide an on-site trained technician from the block manufacturer, at no expense to the Department, during installation until the Representative is satisfied with workmanship.

664.4 MEASUREMENT AND PAYMENT—Square Foot

Measured to equal the area of the vertical face of the blocks, including vertical face concealed by finished grade. Excavation is incidental to this item.

SECTION 665—MASONRY REPOINTING

665.1 DESCRIPTION—This work is cleaning and repointing of existing masonry joints of the type indicated.

665.2 MATERIAL—

(a) **Type A Repointing.** Mortar, Section 705.6(b) and as follows:

1. **Above Grade** – Use Type N Mortar
2. **Below Grade** – Use Type S Mortar
3. **Historical Bridges** – Use Type K Mortar, as specified

(b) **Type B Repointing.** Caulking compound, Section 705.7

(c) **Type C Repointing.** Pressure mortar, Section 1017.2

665.3 CONSTRUCTION—

(a) **Type A Repointing.** Clean exposed masonry joints of loose mortar and dirt to a depth of not less than twice the joint width. Saturate the joints with clean water the day before repointing. Bring wetted surfaces to a saturated surface dry (SSD) condition before filling with mortar and ram well in place. Finish with a pointing tool. Do not apply mortar to a dry surface or to a surface with free standing water. Do not point in freezing weather. Remove and replace work damaged by frost at no additional cost to the Department. Keep the wall in an SSD condition while pointing. Protect pointed masonry from the elements for a period of 3 days. Clean the exposed masonry faces.

(b) **Type B Repointing.** Clean exposed masonry joints of loose mortar to a depth of not less than 1½". Pressure-point caulking compound into the joints by an acceptable method and finish the joints. Protect the caulked pointing from the elements for 3 days. Clean the exposed masonry surface.

(c) **Type C Repointing.** Repoint masonry with mortar, applied under pressure, as specified in Section 1017.3. Fill voids full of mortar and flush with the adjacent structure face using acceptable pressure equipment. Clean the exposed masonry face. Cure as specified in Section 1017.3(g).

665.4 MEASUREMENT AND PAYMENT—

(a) **Type A Repointing.** Linear Foot

(b) **Type B Repointing.** Linear Foot

(c) **Type C Repointing.** Linear Foot

(d) **Class 2 Excavation.** Section 204.4 – If required to expose joints.

SECTION 667—CEMENT CONCRETE PAVING FOR STREAM BEDS

667.1 DESCRIPTION—This work is construction of reinforced cement concrete paving for stream beds.

667.2 MATERIAL—

- Class A Cement Concrete—Section 704
- Joint Sealing Material—Section 705.4(b) or (c)
- Premolded Expansion Joint Filler—Section 705.1
- Reinforcement—Sections 709.3 and 709.4
- Curing and Protecting Covers—Section 711.1
- Concrete Curing Compound—Section 711.2(a)

667.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in the applicable parts of Section 1001.3, and as follows:

(a) General. Excavate the streambed to the required dimensions. Remove unsuitable material below the paving bottom and replace with acceptable material. Compact the entire foundation and finish to a firm, even surface. Protect paving portions under construction from the elements, flowing water, or other disturbances until curing is completed.

(b) Reinforcement. Place reinforcement, as indicated, and then hold firmly in position during the placing of concrete.

(c) Joints. Form or saw contraction joints 3/16 inch wide and 2 inches deep. Saw as soon as possible after the concrete sets sufficiently to preclude raveling during sawing and before any shrinkage cracking occurs in the concrete. The depth of the saw cut may be decreased at the edge adjacent to the pavement if required to obtain a maximum depth without pavement damage.

Tool the edges of construction joints to a 1/4-inch radius.

Place 1/2-inch premolded expansion joint filler, cut to conform to the cross-sectional area at not more than 100-foot intervals, at the end of curve sections, at structures, and at the end of a day's work. Make the filler 1/2 inch less than the pavement depth.

Seal joints as specified in Section 501.3(n).

667.4 MEASUREMENT AND PAYMENT—

(a) Cement Concrete Paving for Stream Beds. Cubic Yard

(b) Excavation. Cubic Yard

For removal of unsuitable material of the same class of excavation for the ditch or channel above the paving.

SECTION 673—PRECAST CEMENT CONCRETE BLOCK SLOPE WALL CAST-IN-PLACE CEMENT CONCRETE SLAB SLOPE WALL

673.1 DESCRIPTION—This work is construction of precast cement concrete block or cast-in-place cement concrete slab slope walls.

673.2 MATERIAL—

- Class A Cement Concrete—Section 704
- Reinforcement—Sections 709.1 and 709.3
- Precast Cement Concrete Blocks—Section 713.2(a)
- Fine Aggregate, Type A—Section 703.1
- Premolded Expansion Joint Filler—Section 705.1
- Joint Sealing Material—Section 705.4(b) or (c)
- Caulking Compound—Section 705.7
- Waterstops—Section 705.5(c)
- Water—Section 720.2
- Mortar—Section 705.7(b)
- Concrete Curing Compound—Section 711.2(a)
- Curing and Protecting Covers—Section 711.1
- Geotextiles, Class 4, Type A—Section 735

673.3 CONSTRUCTION—As indicated, as shown on the Standard Drawings, and as follows:

(a) Precast Cement Concrete Block. Place Geotextiles, Class 4, Type A, as specified in Section 212.3(c). After placing the geotextiles, carefully spread and shape the sand on the graded area.

Except for cutoff walls, lay the concrete blocks with long dimensions parallel to the toe wall, bedded with 3/8-inch joints, staggered, and spaced as indicated. Straighten the courses by striking lightly with a sledgehammer against a suitable wood block placed against every fourth row. Maintain the specified gap between the blocks. Do not use cracked or defective blocks.

Roll or tamp the blocks to a firm, uniform elevation. Wet the joints with as much water as will be readily absorbed. Fill joints with mortar. Use mortar of as dry a consistency as practical and fill joints flush with the top surface of adjacent blocks. Strike off the mortar to form a smooth joint between the blocks. Pointing is not required. If the bond has breaks around a block, remove the block, along with the mortar from the joint, then clean and reset with fresh mortar as specified.

(b) Cast-In-Place Cement Concrete Slab. Place the concrete directly on the prepared graded area, without placing a sand bed. Construct the slabs of Class A Cement Concrete, 4 inches in depth, and of uniform dimension not over 16 feet in length or width, unless otherwise directed for closures.

Place indicated reinforcement midway between the top and bottom of the slabs. Score the slabs to a minimum depth of 1/2 inch in 4-foot squares, or as directed. Place 1/2-inch thick, premolded expansion joint filler, for the full depth, between adjacent slabs and at contact points between slabs and structures.

Construct a cutoff wall 6 inches wide and 16 inches deep, monolithically with the slabs, at each end of the slope paving. Construct toe walls to the dimensions indicated. Use Class A Cement Concrete for toe and cutoff walls. Finish and cure the concrete as specified in the applicable requirements of Sections 501.3(k) and (l). Seal the joints as specified in Section 501.3(n).

673.4 MEASUREMENT AND PAYMENT—

- (a) Precast Cement Concrete Block Slope Wall.** Square Yard
- (b) Cast-In-Place Cement Concrete Slab Slope Wall.** Square Yard

SECTION 674—STONE SLOPE WALLS

674.1 DESCRIPTION—This work is construction of plain or mortared stone slope walls.

674.2 MATERIAL—

(a) **Stone.** Use stones of acceptable quality, sound and free from structural defects and foreign substances. Submit samples to the LTS for petrographic examination before use, unless the rock comes from material providing an approved Type A aggregate. Use stones at least 3 inches thick, of a length at least three times the thickness, and of a width at least equal to the depth of the slope wall from the exposed surface of the slope wall to the subgrade, except for spalls for packing voids. For stones in excess of 6 inches thick, use stones at least twice as long as their thickness.

(b) Other Material.

- Class A Cement Concrete—Section 704
- Premolded Expansion Joint Filler—Section 705.1
- Mortar—Section 705.7(b), except use Type C, fine aggregate.
- Filler—Acceptable coarse sand, gravel, or other material.
- Geotextiles, Class 4, Type A—Section 735

674.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) **Plain Stone Slope Wall.** Place geotextiles, Class 4, Type A, as specified in Section 212.3(c). After placing geotextiles, set stones by hand and firmly bed on the prepared graded area, with the length dimension approximately parallel to the toe wall foundation. Bed stones one against the other with ends and sides in contact, then break joints. Lay the stones flat in toe wall and cutoff wall areas. Set the stones on edge in anchor wall areas and on sloped areas.

Pack spaces between the larger stones with spalls, then ram into place. Tamp the whole area of the wall to a tight, even surface. Fill voids by sweeping filler over the surface.

(b) **Mortared Stone Slope Wall.** Set the stones as specified in Section 674.3(a). Fill the voids with mortar and spalls, as required, to within 1/2 inch of the surface of the adjacent stone. Use mortar with a stiff but workable consistency. Pointing is not required. Do not hammer, roll, or ram the stones after mortaring. If the bond around stones becomes broken, remove stones and mortar, reset the stones, and fill the voids with mortar, as specified.

Do not place mortar in freezing weather, unless permitted in writing, and then only with adequate protection.

Remove and replace work damaged by frost. Protect completed wall from the elements and cure with water for a period of at least 3 days.

(c) **Toe Walls, Cutoff Walls, and Anchor Walls.** Construct concrete toe, anchor, and cutoff walls as indicated and as specified in the applicable parts of Section 1001.3. Obtain approval.

674.4 MEASUREMENT AND PAYMENT—

(a) **Plain Stone Slope Wall.** Cubic Yard

(b) **Mortared Stone Slope Wall.** Cubic Yard

SECTION 675—RANDOM STONE SLOPE WALL

675.1 DESCRIPTION—This work is construction of random stone slope walls.

675.2 MATERIAL—

- Coarse Aggregate, Type A, No. 1 Stone—Section 703.2
- Class A Cement Concrete—Section 704
- Premolded Expansion Joint Filler—Section 705.1
- Joint Sealing Material—Section 705.4(b) or (c)
- Geotextiles, Class 4, Type A—Section 735

675.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

Construct concrete toe, anchor, and cutoff walls as specified in Section 1001.3. Where the wall butts another rigid concrete structure, place a 1/2-inch premolded, expansion joint filler. Seal the top 1/2 inch of the joint with joint sealing material.

Place rock and geotextiles as specified in Section 850.3.

Spot-check the finished surface with a string line. Fill depressions and cut high areas greater than 2 inches as required.

675.4 MEASUREMENT AND PAYMENT—Cubic Yard

The Department will measure to include toe, anchor, and cutoff walls.

SECTION 676—CEMENT CONCRETE SIDEWALKS

676.1 DESCRIPTION—This work is construction of cement concrete sidewalks and curb ramps on an aggregate bed.

676.2 MATERIAL—

- Class A Cement Concrete—Section 704
- Aggregate —Section 350.2
- Reinforcement Steel—Section 709.3
- Premolded Expansion Joint Filler—Section 705.1
- Concrete Curing Compound—Section 711.2(a)
- Curing and Protecting Covers—Section 711.1
- Mortar—Section 1001.2(d)
- Joint Sealing Material—Section 705.4 (a), (b), or (c)
- Boiled Linseed Oil—Section 1019.3(a)

676.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) Preparation of Foundation. Saw cut as necessary, excavate existing concrete sidewalk as specified in Section 203.1(c), and form the foundation at a depth 10 inches parallel with the finished surface of the sidewalk. If directed, remove unsuitable material as specified in Section 203.1(b). Thoroughly compact the foundation; finish to a firm, even surface; moisten if required.

(b) Placing Aggregate for Bed. Spread aggregate on the prepared foundation to form a thoroughly compacted bed 6 inches deep. The area to be compacted is defined as the area directly under the sidewalk and 6 inches beyond each side of the sidewalk if right of way allows.

(c) Forms. Use acceptable wood or metal forms that extend the full depth of the concrete.

(d) Concrete. As specified in Section 1001.3.

Place concrete 4 inches deep. Strike off, finish, and test, as specified in Sections 501.3(k) and (p), except the contractor may use manual placement operations and apply a light broom finish to the cement concrete surface.

Form outside edges and joints with a 1/4-inch radius-edging tool.

Form transverse dummy joints at 5-foot intervals, approximately 1/8 inch wide, and at least 1 inch deep.

(e) Expansion Joints. Place 3/4 inch premolded, expansion joint material for the full depth of the sidewalk, opposite expansion joints in adjacent curb, between the sidewalk and curb, and between the sidewalk and rigid structures. Install dummy joint and eliminate premolded expansion joint material between depressed curb, curb ramp, and flares if placed monolithically.

1. Seal Joints. Clean joints of all scale, dirt, curing compound, and other foreign material with a mechanized wire brush.

Do not place poured joint-sealing material if the air temperature is less than 40F, unless allowed. Use heating equipment of an indirect heating type constructed as a double boiler. Provide positive temperature control and

mechanical agitation. Obtain the safe heating temperature and recommended pouring temperature from the manufacturer's shipping container. Place the material within this temperature range, but as close as possible to the recommended pouring temperature. Maintain a safe heating temperature. Maintain a single material batch at the pouring temperature for no more than 4 hours. Heat the material only once.

Fill the joint reservoir, created by the cleaning operation, with sealing material to a depth 1/8 inch below the top of sidewalk. Do not allow sealing material to spread over concrete surfaces.

(f) Removal of Forms. Do not remove side forms until at least 12 hours after placing concrete. After removal of forms, fill minor honeycombed areas with mortar. As directed, remove and replace defective major honeycombed areas. Apply boiled linseed oil to the entire surface of the concrete as specified in Section 1019.3(a). If curing was performed with a membrane-forming curing compound, remove the curing compound before placing the boiled linseed oil.

(g) Backfilling. After the concrete has cured for at least 72 hours, backfill spaces adjacent to the sidewalk, using acceptable embankment material, as specified in Section 206.3(b)4.

Repair or replace existing pavement, curb, and sidewalk damaged due to construction. Satisfactorily dispose of unsuitable and surplus materials.

(h) Curb Ramps. As required and indicated, construct cement concrete sidewalk for curb ramp configurations as shown on the Standard Drawings except for the detectable warning surface located at the bottom of each ramp. Construct the detectable warning surface as specified in Section 695.

Create a slip-resistant, textured surface for the full width and length of the curb ramp and side-flares excluding the detectable warning surface. Use a coarse, stiff-toothed broom to create a textured pattern worked perpendicular to the slopes of the curb ramp.

Shape rounded edges instead of sharp angled edges while the concrete is still plastic for all slope changes of the curb ramp especially where the top of the curb ramp meets adjacent sidewalk surfaces.

Embed detectable warning surface in fresh, plastic concrete at the proper location for the curb ramp before the plastic concrete has set.

The contractor may place cement concrete for depressed curb monolithically with curb ramps, side flares, or both. Do not place cement concrete curb monolithically with other cement concrete sidewalk.

(i) Sidewalks and driveway aprons through driveways.

1.Preparation of Foundation. Saw cut as necessary and excavate existing concrete sidewalk and driveway apron as specified in Section 203.1(c) and form the foundation at a depth 12 inches parallel with the finished surface of the sidewalk and driveway apron. If directed, remove unsuitable material as specified in Section 203.1(b). Thoroughly compact the foundation; finish to a firm, even surface; moisten if required.

2. Placing Aggregate for bed. Spread aggregate on the prepared foundation to form a thoroughly compacted bed 6 inches deep. The area to be compacted is defined as the area directly under the sidewalk, driveway apron, and 6 inches beyond each side of the sidewalk and driveway apron if right of way allows.

3. Forms. Use acceptable wood or metal forms that extend the full depth of the concrete.

4. Reinforcement Steel. Provide welded wire fabric reinforcement made of W4 or W4.5 wire at 6 inch centers transversely and longitudinally conforming to ASTM A 1064 Steel Wire and Welded Wire Reinforcement. Secure fabric reinforcement at half-depth of cement concrete.

5. Concrete. As specified in Section 1001.3. Place concrete 6 inches deep. Strike off, finish, and test, as specified in Sections 501.3(k) and (p), except the contractor may use manual placement operations and apply a light broom finish to the cement concrete surface. Form outside edges and joints with a 1/4-inch radius-edging tool. Form transverse dummy joints at 5-foot intervals, approximately 1/8 inch wide, and at least 1 inch deep.

676.4 MEASUREMENT AND PAYMENT—

(a) Cement Concrete Sidewalks. Square Yard. Boiled Linseed Oil is incidental.

(b) **Class 1A Excavation.** Section 203.4

(c) **Class 1B Excavation.** Section 203.4

(d) **Sidewalks and driveway aprons through driveways.** Square Yard.

Depressed curb and curb ramp are paid separately according to their unit of measurement.

If depressed curb is placed monolithically with curb ramps, side-flairs, or both, the depressed curb will be measured and paid separately from the curb ramps and side flairs.

SECTION 677—SELECTED MATERIAL SURFACING

677.1 DESCRIPTION—This work is the furnishing and placing of selected material on a prepared area.

677.2 MATERIAL—Section 703.3

677.3 CONSTRUCTION—Uniformly spread aggregate upon the prepared areas, in loose layers not exceeding 5 inches in depth, without segregation of coarse and fine material. Compact with a roller as specified in Section 108.05(c)3.a or 3.b.

Satisfactory compaction will be determined by the stability of the material under the specified compaction equipment. If material used does not contain sufficient fines to properly lock under the roller, add additional fines of the same material, or limestone fines, as necessary, to obtain the compaction and stability.

677.4 MEASUREMENT AND PAYMENT—Cubic Yard or Ton. Excavation, grading, and scarifying are incidental.

SECTION 678—PERMANENT BARRICADES

678.1 DESCRIPTION—This work is construction of permanent barricades.

678.2 MATERIAL—As shown on the Standard Drawings and as follows:

(a) Posts.

1. Wood Posts. No. 1 stress-rated Southern Pine; No. 1 Douglas Fir; Larch; select, structural Hem-Fir; Mountain Hemlock; Western Hemlock; or sound square edge Red Oaks; seasoned before treatment as required by AWPB Standards; and pressure treated according to AWPB Standards and as follows:

Treatment (Species except Red Oaks)	Retention (pounds per cubic foot)
Ammoniacal Copper Arsenite (ACA)	0.60
Pentachlorophenol	0.60
Chromated Copper Arsenate (CCA) Types A, B, or C	0.60
(Red Oaks)	
Pentachlorophenol	0.30

Certify as specified in Section 106.03(b)3.

A tolerance of 1/2 inch scant from nominal dimensions is required for the size of posts.

Do not use posts that, for any reason, prevent attachment of guide rail fittings or alignment with other posts.

Throughout the project, use posts treated with the same type of preservative.

2. Steel Posts. Section 1109

(b) Wood Planks. Seasoned No. 1, structural grade, Long Leaf Yellow Pine; or select, structural grade, Douglas Fir; pressure treated as specified. Certify as specified in Section 106.03(b)3.

(c) Class A Cement Concrete. Section 704

(d) Extruded Aluminum Channel. Section 1103.02(a). The Contractor may use an alternate channel section, of equal or greater section modulus, with suitable dimensions to utilize the mounting hardware. Certify as specified in Section 106.03(b)3.

(e) Aluminum Blanks (for Wood Barricade Panels). Section 1103.04(a), Alloy 6061-T6. Certify as specified in Section 106.03(b)3.

(f) Reflective Sheeting. Section 1103.04(c), Certify as specified in Section 106.03(b)3.

(g) Miscellaneous Material.

- Aluminum Hardware Items—Section 1103.11
- Aluminum Round Head Wood or Lag Screws—Section 1103.11
- Other Hardware Items—Section 1109.05

(h) Extruded Aluminum Channel and Aluminum Blank Preparation. Section 1103.02(b)

678.3 CONSTRUCTION—As shown on the Standard Drawings, using either aluminum channels or wood planks with wood or steel posts.

Apply the reflective sheeting to the aluminum channels as specified in Section 1103.02(c) or to the aluminum blank as specified in Section 1103.03(b).

The post spacing may vary to a maximum of 10 feet center-to-center. Mechanically drive posts or erect in concrete footings.

Cut and peen bolts against the faces of nuts.

After erection, treat galvanized components, including the cut ends of bolts, that are abraded or damaged as specified in Section 620.3(a)1.

678.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 679—SLAB STABILIZATION

679.1 DESCRIPTION—This work is the filling of voids beneath existing rigid base courses or pavements as specified in Section 516 and according to the Standard Drawings and at other locations as directed.

679.2 MATERIAL— Use either cement, asphalt or high density polyurethane grout to stabilize the slab.

(a) Cement Grout Stabilization.

1. Cement. Section 701

2. Water. Section 720.1

3. Admixtures. Section 711.3. A multiphase wetting agent and an expansive agent may be used. Use an accelerator if required.

4. Supplementary Cementitious Material. Section 724.2

5. Rapid Set Concrete Patching Materials. Supplied by a manufacturer listed in Bulletin 15. Use within the shelf life and temperature limitations set by the manufacturer.

6. Mix Design. Submit a mix design to the District Executive for review and acceptance before starting work. Include with the submittal: independent laboratory testing showing 1, 3, and 7-day compressive strengths; flowability; shrinkage and expansion results; and the time of initial set. Proportion the mix as follows:

One part cement (by volume)

Three parts supplementary cementitious material (by volume)

Admixtures—if required and accepted

Water—an amount such that the time of efflux is within 10 seconds to 15 seconds (ASTM C 939)

Furnish mix with an expansion of 0% to 10% (ASTM C 940), an initial setting time of 1 hour to 6 hours (AASHTO T 131) and bleeds no more than 2.5% of the volume (ASTM C 940).

A 7-day compressive strength of 700 pounds per square inch minimum is required, based on the average of five test cylinders (PTM No. 521).

Submit a new mix design if the source of any material is changed.

(b) Asphalt Grout Stabilization.

1. Asphalt Cement. According to ASTM D 3141 with a minimum flash point of 500F. Supplied by a manufacturer listed in Bulletin 15. Provide a supplier certification with each shipment as specified in Section 106.03(b)3.

2. Plugs, cylindrical plugs with tapered ends. As approved by the Representative.

3. Rapid Set Concrete Patching Materials. Supplied by a manufacturer listed in Bulletin 15. Use within the shelf life and temperature limitations set by the manufacturer.

(c) High Density Polyurethane Grout Stabilization.

1. High Density Polyurethane. Supplied by a manufacturer listed in Bulletin 15 and provide a supplier certification with each shipment as specified in Section 106.03(b)3. Certify that the material conforms to the following requirements:

Density, lbs/cu. ft.	ASTM D 1622	min. 3.5
Tensile Strength, psi	ASTM D 1623	min. 60
Compressive Strength, psi	ASTM D 1621	min. 50
Shear Strength, psi	ASTM C 273	min. 40
Closed Cell Content %	ASTM D 6226	min. 85
Water Absorption %	ASTM D-2842	< 2

2. Plugs, cylindrical plugs with tapered ends. As approved by the Representative.

3. Rapid Set Concrete Patching Materials. Supplied by a manufacturer listed in Bulletin 15. Use within the shelf life and temperature limitations set by the manufacturer.

679.3 CONSTRUCTION—

(a) General. Do not begin this work until it is satisfactorily shown that qualified personnel, with successful experience, are available at the job. Assign a crew supervisor that has at least 5 years' experience in work on projects of similar size and character. Submit three references for crew supervisor and injection nozzle-men from people who were responsible for supervision of these projects.

Submit written documentation to the Representative at least 10 working days before start of work.

Do not perform work if daytime temperatures are below 40F or if the subgrade and/or base course material is frozen.

1. Field QC plan. Provide a field QC plan that contains the following:

- Provide details of proposed hole spacing, depth, diameter, drilling methods, and hole injection sequence for the stabilization operations.
- Provide details of method to locate pavement reinforcement prior to drilling, if applicable.
- Provide a list of the proposed equipment, including supply pumps, valves, mixing equipment, injection guns and other items required to complete the work.
- Provide details of proposed means of establishing and controlling line and grade of stabilized slabs.
- Provide details of methods for control and disposal of waste materials.
- Provide details of the curing period and open to traffic times.

Do not start work until the Representative has reviewed and approved all submittals.

2. Deflection Testing. If no preliminary testing was performed, test each joint and crack if directed by the Representative, and as follows:

Do not perform testing if air temperature is below 40F or exceeds 70F. Do not test during spring thaw conditions or if subgrade is frozen.

If the air temperature is not within the air temperature limits to perform deflection testing, then perform visual verification of pumping or poor joint performance before specifying slab stabilization.

Perform deflection testing according to ASTM D 4695. Provide to the representative the test data and the slabs recommended for stabilization 15 working days before start of work for approval.

Repeat this procedure at every transverse joint and crack.

Stabilize all joints or cracks that have a loaded slab corner deflection of 0.02 inch or more, and a joint efficiency at 65%* or more if approved by the representative.

Patch and stabilize all joints or cracks that have a loaded slab corner deflection of 0.02 inch or more, and a joint efficiency of less than 65% if approved by the representative.

Joint efficiency (JE) is defined as follows:

$$JE = \frac{\text{Unloaded Slab Corner Deflection}}{\text{Loaded Slab Corner Deflection}} \times 100$$

* Use the highest Loaded Slab Corner Deflection and the lowest joint efficiency at each joint or crack.

3. Safety. Observe all normal safety rules in the operation of pressure pumps and other equipment. Exercise extra precautions in the handling of hot asphalt hose and nozzle. Provide hot asphalt workmen with safety masks,

protective gloves, heavy clothing in two or more layers, closely fitted at the ankles, wrists and neck.

4. Pumping Operations. Stop pumping when any vertical movement is noted. In the event the Representative determines that continued material placement at any specified location is no longer economically feasible, or vertical movement is going to occur, the Representative may direct the Contractor to cease pumping at that location.

5. Correcting Panel Displacement. Grind pavement, raised in excess of the 0.05 inch allowable tolerance, to the correct grade. Grind as specified in Section 514.3, except grind into the high slab.

6. Radial Cracks. Radial cracks spreading outward from the grout injection holes indicate poor quality or improper methods. Stop work until the cause is determined and corrected.

7. Transverse Cracks. If transverse cracks develop between adjacent grout injection holes, replace the entire slab at no additional cost to the Department as specified in Section 516.

8. Hole Patching. Upon completion of the work, remove wooden plugs and patch drill holes full depth with a rapid set, non-shrink concrete patching material. Strike patches flush with the surface of the surrounding pavement.

9. Retesting. If directed, 24 hours after grouting and before acceptance, retest each stabilized joint or crack as specified in Section 679.3(a)2. Regrout slabs that deflect 0.02 inch or more and retest. The Representative may accept any slab that continues to show movement, in excess of that specified, after two properly performed groutings; or direct the removal and replacement, with a full depth concrete patch, as specified in Section 516 and paid for separately.

(b) Cement Grout Stabilization.

1. Equipment.

1.a Grout Plant. Provide a satisfactory positive displacement cement injection pump and a satisfactory mixing machine, capable of operating at a minimum speed of 800 rpm and a maximum speed of 2000 rpm.

1.b Water Tanker. Supply water from a water truck with adequate capacity and pressure for delivery to the grout machine.

1.c Drill. Provide generator, core drill, and diamond-tip core barrels, or other satisfactory equipment capable of drilling the grout injection holes through the pavement and base material; and equipment in satisfactory condition and operated to produce holes that are smooth, vertical, and do not break out the bottom of the slab.

1.d Vertical Movement Testing. Supply satisfactory equipment to measure slab lift, capable of detecting simultaneously the lift of the pavement edge, or of any two outside slab corners adjacent to a joint and the adjoining shoulder. Use equipment with a capability of making these measurements to within 0.001 inch.

1.e Miscellaneous. Provide necessary hoses, valving, and valve manifolds with positive cutoff and bypass provisions to control pressure and volume, pressure gauges with gauge protectors, expanding packers or hose for positive seal during grout injection, hole washing tools, drill steel, bits, and any other miscellaneous tools required.

2. Procedure.

2.a Drilling Holes. Drill grout injection holes in the pattern shown on the Standard Drawings, or as directed. Drill holes not larger than 1 ½ inches in diameter, vertical and round, and to a depth sufficient to penetrate any stabilized base.

2.b Mixing. Accurately measure the dry materials by mass, if in bulk, or provide them packaged in uniform volume sacks. Batch with water through a meter or scale that totals the day's consumption.

Do not hold mixed material in the mixer or injection pump sump for more than one hour after mixing.

Dispose of material held for longer times.

Make flowability measurements at least two times during each work shift.

2.c Cement Grout Injection. During the filling operation, use a positive means of monitoring lift as specified in Section 679.3(b)1.d. Upward movement of the pavement greater than 0.05 inch will not be allowed. Lower an expanding rubber packer or hose, connected to the discharge from the pump, into the hole. Do not extend the discharge end of the packer or hose below the lower surface of the concrete pavement. Pump each hole until maximum pressure is built up or material is observed flowing from hole to hole. Do not exceed a maximum pressure of 200 pounds per square inch, unless otherwise directed. Monitor the pressure in the grout line. Protect the gauge from the grout slurry. Allow the water, displaced from the void structure by the grout, to flow out freely. Excessive loss of the grout through the cracks, joints, or from back pressure in the hose or in the shoulder area will not be allowed.

2.d. Opening to Traffic. Do not open to traffic for a minimum of 12 hours after grouting operations have been completed, or according to the contractor's approved field QC plan, and according to Manufacturer's recommendations.

(c) Asphalt Grout Stabilization.

1. Equipment.

1.a Asphalt Transport Tanker. Use a fully insulated asphalt tanker with a removable access hatch, a 2 inch minimum size overflow pipe and suitable strainers at the outlet to the pumps. Heat the asphalt in the tanker to the application temperature and circulate it during the entire heating process. Provide necessary readout equipment for temperature in the cab of the tanker. Provide certification for the accuracy of the method used to measure the amount of asphalt used on the project.

1.b Asphalt Underseal Pump. Use a separate, self-contained reversible pump equipped with quick connectors. Use a pump a 1½ inch minimum size, flexible metal circulating hose with a quick cut off valve for recirculation when the asphalt is not being injected into the voids

1.c Pressure Water Distributor Trailer. Provide a pressure water distributor trailer with a minimum 50 gallon capacity. The unit may have its own pump system or be compatible with the air system on the transport tanker or as approved by the Representative.

1.d Compressor Unit. Provide compressor units capable of delivering a minimum of 100 cubic feet of air per minute to blow air into the cavities beneath the pavement.

1.e Drill. Provide generator, core drill, and diamond-tip core barrels, or other satisfactory equipment capable of drilling the grout injection holes through the pavement and base material; and equipment in satisfactory condition and operated to produce holes that are smooth, vertical, and do not break out the bottom of the slab.

1.f Asphalt Nozzles. Provide a tapered nozzle, tube or other mechanical device of sufficient length, approved by the Representative, that can be used to inject the asphalt under the pavement. Use a nozzle with a three way valve designed to circulate the asphalt back to the distributor tank when pumping operations are not in progress. Provide handles so that the operator can move the nozzle from hole to hole without touching the hot nozzle or hose.

1.g Pavement Plugs. Provide cylindrical plugs of sufficient length and diameter to plug the holes. Taper one end so that the plug can be driven a maximum of 2 inches into the hole.

1.h. Vertical Movement Testing. Supply satisfactory equipment to measure slab lift, capable of detecting simultaneously the lift of the pavement edge, or of any two outside slab corners adjacent to a joint and the adjoining shoulder. Use equipment capable of detecting slab lift to measurements of 0.001 inch.

1.i Miscellaneous. Provide necessary sprinkling cans, picks, shovels, water and any other miscellaneous tools required to perform the work.

2. Procedure.

2.a Drilling Holes. Drill grout injection holes in the pattern shown on the Standard Drawings, or as directed.

Drill holes not larger than 1½ inches in diameter, vertical and round, and to a depth sufficient to penetrate any stabilized base.

2.b Blowing Holes. Blow compressed air into the hole, as the drill is being backed out, for approximately 5 to 15 seconds to clear the hole. When water or thin mud is encountered, blow air into the hole until water stops coming through adjacent holes and cracks.

2.c Preparation of Asphalt. Heat the asphalt to a temperature of 380F to 450F before pumping operations begin. Asphalt heated 500F or more will be rejected. Exercise extreme care to ensure that the asphalt does not contact an open flame. Circulate the asphalt prior to pumping to free and warm up the lines of the circulating hose.

2.d Asphalt Grout Injection. Apply water around the hole before pumping to prevent any seepage from sticking to the pavement. Erect a splash shield, no less than 15 square feet, of an approved dimension and stability, between the nozzle and passing traffic to prevent possible damage or injury from uncontrolled spraying of hot asphalt. Pump asphalt at a pressure of 25 pounds per square inch to 45 pounds per square inch. Control the amount of rise by regulating the rate of injection of the material. Use a positive means of monitoring lift, as specified in Section 679.3(c)1.h. Upward movement of the pavement greater than 0.05 inch is not allowed. If asphalt seeps from joints or cracks before undersealing is complete halt pumping until asphalt has congealed. Resume pumping until the slab lift limit is reached. When the nozzle is removed from the hole, remove any excess material from the area.

2.e Opening to Traffic. Do not open to traffic for a minimum of 30 minutes after grouting operations have been completed or according to the contractor's approved field QC plan and according to Manufacturer's recommendations.

(d) High Density Polyurethane Grout Stabilization.

1. Equipment.

1.a Pump Unit. As a minimum, provide a mounted unit capable of injecting the high density polyurethane material at a controlled rate, underneath the pavement and capable of controlling the rate of rise of the pavement. Equip the pumping unit with a calibrated meter to measure the amount of high density polyurethane materials injected at each location and capable of instantaneous control of the material flow to avoid lifting of the pavement slabs. Equip each pumping unit with a display output device capable of recording the amount of material used. The output display device needs to be capable of providing the amount of material used in pounds. Also equip each display output device with a manual reset button. Provide certification of the calibration testing showing that the unit has been calibrated within the last 12 months before the start of the project. Provide pressure and temperature control devices capable of maintaining proper temperature and proportionate mixing of the polyurethane component materials.

1.b Drill. Provide generator, core drill, and diamond-tip core barrels, or other satisfactory equipment capable of drilling the grout injection holes through the pavement and base material; and equipment in satisfactory condition and operated to produce holes that are smooth, vertical, and do not break out the bottom of the slab.

1.c Pavement Plugs. Provide cylindrical plugs of sufficient length and diameter to plug the holes. Taper one end so that the plug can be driven a maximum of 2-inches into the hole.

1.d. Vertical Movement Testing. Supply satisfactory equipment to measure slab lift, capable of detecting simultaneously the lift of the pavement edge, or of any two outside slab corners adjacent to a joint and the adjoining shoulder. Use equipment capable of detecting slab lift to measurements of 0.001 inch.

1.e Miscellaneous. Provide necessary hoses, valving, and valve manifolds with positive cutoff and bypass provisions to control pressure and volume, pressure gauges with gauge protectors, expanding packers or hose for positive seal during injection, hole washing tools, drill steel, bits, and any other miscellaneous tools required.

2. Procedure.

2.a Drilling Holes. Drill grout injection holes in the pattern shown on the Standard Drawings, or as directed.

Drill holes not larger than 5/8 inches in diameter, vertical and round, and to a depth sufficient to penetrate any stabilized base.

2.b Preparation of Polyurethane. Mix components according to manufacturer's specification.

2.c Polyurethane Grout Injection. Inject the high density polyurethane material under the slab. Control the amount of rise by regulating the rate of injection of the material. Use a positive means of monitoring lift, as specified in Section 679.3(d)1.d. Upward movement of the pavement greater than 0.05 inch is not permitted. When the nozzle is removed from the hole, remove any excess material from the area. Stop pumping when any vertical movement occurs. The Inspector-in-Charge may direct pumping to cease if no vertical movement occurs.

2.d Opening to Traffic. Do not open to traffic for a minimum of 30 minutes after grouting operations have been completed, or according to the contractor's approved field QC plan and according to Manufacturer's recommendations.

679.4 MEASUREMENT AND PAYMENT—

(a) Cement Grout Stabilization.

1. Deflection Test. Each

2. Holes Drilled. Each.

The price includes patching of the hole.

3. Grout Material. Bags of Cement

The unit price includes an accelerator, if required. For each 5 linear feet of radial cracking, as specified in Section 679.3(a)6, the Department will reduce this pay item by one bag of cement. The Department will not pay for any wasted grout material.

(b) Asphalt Grout Stabilization.

1. Deflection Test. Each

2. Holes Drilled. Each.

Includes plugs and patching of the hole.

3. Asphalt. Gallons

Measured by calibrated flow meter. The Department will not pay for any wasted grout material.

(c) High Density Polyurethane Grout Stabilization.

1. Deflection Test. Each

2. Holes Drilled. Each. Includes plugs and patching of the hole.

3. Polyurethane. Pounds

Measured by calibrated flow meter. The Department will not pay for any wasted grout material.

SECTION 680—WATERPROOFING

680.1 DESCRIPTION—This work is the furnishing and placing of adhesive preformed membrane waterproofing systems to concrete or other surfaces as indicated.

680.2 MATERIAL—Unless specified or shown on the plans, select from the waterproofing systems listed in Bulletin 15.

(a) **Adhesives, Conditioners, Primers, Mastics, Two-Part Liquid Urethane Membranes and Sealing Tapes.** As recommended for use with the respective preformed membrane sheet materials. Contact the membrane manufacturer or its representative for instructions.

(b) **Adhesive-Backed Preformed Membrane Sheet.** Furnish Adhesive-Backed Preformed Membrane Sheet consisting of a sheet of rubberized asphalt or polymer modified asphalt permanently applied to a polyethylene film, or reinforced with a stitch-bonded polyester/polypropylene fabric, or reinforced with a fiberglass mesh and conforming to the minimum requirements specified in Table A.

(c) **Protective Covers.** Provide a 1/8-inch thick, asphalt protective board or 65-pound roofing material without mica coating, or approved equal that furnishes equivalent protection to the membrane from being cut, scratched, or otherwise damaged from the backfill or equipment.

For bridge deck surfaces, the asphalt overlay is the protective cover.

(d) **Bonding Material.** Section 460 and as recommended by the manufacturer.

(e) **Manufacturer Technical Representative.** Ensure that a trained Manufacturer's Technical Representative is present during every phase of application, unless applied by a factory trained licensed installer, as indicated by written approval from the material supplier. The Manufacturer's Technical Representative will provide training and technical assistance on surface preparation, equipment, mixing of components, type, and method of application, and finish.

(f) **Certification.** Certify each shipment as specified in Section 106.03(b)3. Visibly label all shipments on the membranes or containers with the manufacturer's name, membrane trade name, lot number, and material quantity.

TABLE A
Adhesive-Backed Preformed Membrane Sheet Minimum Requirements

Preformed Membrane Sheets		For Bridge Deck Surfaces		For Surfaces Other Than Bridge Decks	
Property	Test	Rubberized Asphalt Type	Modified Asphalt Type	Rubberized Asphalt Type	Modified Asphalt Type
Tensile Strength, lbs/in (minimum) ⁽¹⁾⁽³⁾	ASTM D882 ⁽²⁾	50	40	20	20
% Elongation at Break, (min) ⁽³⁾⁽⁴⁾	ASTM D882 ⁽²⁾	15	10	25	25
		7 ⁽⁷⁾			
Pliability	ASTM D146 ⁽⁵⁾	No cracks	No cracks	No cracks	No cracks
Thickness, mils (minimum) ⁽⁶⁾	ASTM D1000	Polyethylene Film Backed—60 Fabric Reinforced Backed—65	70	60	60
Softening Point, F (minimum)	ASTM D36	190	210	190	210

Permeance, perms (maximum)	ASTM E96, Method B	0.1	0.1	0.1	0.1
Puncture Resistance, lbs. (min)	ASTM E154	25	25	40	40
Notes: (1) Breaking factor in machine direction. (2) Method A, 1-inch wide strip with 4-inch minimum initial separation and 4-inch gage length at 2 inches per minute. Average 5 samples. (3) At 73.4F \pm 3.6F. (4) Machine direction. (5) 180-degree bend over a 1-inch mandrel at -15F. (6) Total thickness of preformed membrane sheet and polyethylene film or fabric reinforcement. (7) When fiberglass is used as the reinforcing layer.					

680.3 CONSTRUCTION—

(a) Limitation of Operations. Apply waterproofing only if protective covering or asphalt overlay can also be placed within a time that ensures that the membrane will not be damaged by personnel, equipment, exposure to weathering, or from any other cause.

Do not install any part of a waterproofing system in wet, humid, or foggy weather conditions, or if the ambient or concrete surface temperature is below 50F, unless recommended by the manufacturer and authorized in writing by the Representative. Apply the primer and waterproofing membrane only when the concrete surfaces are completely dry.

(b) Surface Preparation. Prepare the surface to be waterproofed to a condition free from holes or projections that might puncture or otherwise damage the membrane. Round (outside) or chamfer (inside) all sharp corners to be covered.

Thoroughly clean all concrete surfaces that are to be waterproofed. Remove any excess laitance, oil, concrete curing compounds, previous membrane treatments, and other foreign materials. Remove all dirt, dust, loose or unsound concrete, and other extraneous material.

Use a scratch coat of asphalt as a leveling course on decks that have been milled and lack a surface that is acceptable to receive a membrane system. Asphalt paving less than one year old does not require a primer or surface conditioner to achieve proper membrane adhesion.

(c) Applying Conditioners and Primers. Thoroughly mix and continuously agitate all primers and conditioners during application according to the manufacturer's instructions. Uniformly apply primer or conditioner to the entire area to be sealed, at the rate stated in the manufacturer's instructions, by squeegee, brush, or roller. Do not apply the primer by spraying. Apply a second coat of primer to any areas of concrete that appear dry. Brush out primer that tends to puddle in low spots to allow complete drying. Cure the primer according to the manufacturer's instructions. Do not let primed areas stand uncovered overnight.

After the primer has dried to a tack free condition, use squeegees or brooms to break any bubbles in the primer. Unless otherwise directed, do not repair the areas where bubbles were broken. If membrane sheets are not placed over primer or conditioner within the time recommended by the manufacturer, recoat the surfaces at no additional cost to the Department.

Before applying the primer or conditioner on a bridge deck, place an oil resistant protective film, held with an adhesive or tape, to any deck areas that will later be covered by expansion dams or headers. Place membrane seal and asphalt concrete across the protective film. If directed, cut the protective film and the preformed sheet at or near the expansion joint.

(d) Adhesive-Backed Preformed Membrane Waterproofing Systems.

1. Installation on Bridge Decks. Before installing any membrane waterproofing systems, drill drain holes, install the drain pipes and galvanized screens as shown on the Standard Drawings.

Apply the preformed membrane sheets, adhesive side down, to the primed or conditioned surfaces either by hand methods or by mechanical applicators. Start placing the membrane sheets at the low side of the deck and work using a shingle overlap toward the high side of the deck so that a shingled effect is achieved in the direction that the water

will drain.

Use either of the two acceptable methods indicated if working from a curb line or barrier railing.

METHOD ONE: As shown on the Standard Drawings and as follows:

Install a 3/4-inch by 3/4-inch cant strip made of wood, metal, plastic, mastic, or other approved joint sealing material at a 90 degree angle between the curb face or barrier railing and the deck. Next, install a 12-inch wide curb strip with the top edge of the strip kept a minimum of 1/2 inch below the wearing surface of the asphalt overlay. Put the 12-inch wide curb strip into positive contact with the curb face, cant strip and bridge deck. Seal the curb strip at the top edge with a two-part urethane liquid membrane or mastic. Overlap the curb strip that extends onto the deck with the next full width membrane sheet by butting the sheet against the curb face at the gutter line. Lay subsequent membrane sheets longitudinally with 3-inch minimum side laps and 6-inch minimum end laps. Install sheets across the deck until the high side curb line is reached. Install a curb strip along the high side curb line as indicated for the low side curb line.

METHOD TWO: Apply a bead of two-part urethane liquid membrane or mastic, as recommended by the manufacturer, between the low side curb face or barrier railing and the deck, extending from the gutter line 2 inches to 3 inches onto the deck. Butt the edge of the membrane firmly against the curb face at the gutter line and embed into the liquid membrane or mastic. Seal the top edge of the membrane at the curb face with a 2-inch bead of liquid membrane or mastic. Lay subsequent membrane sheets longitudinally and side lap with the adjacent sheets not less than 3 inches and end lap by not less than 6 inches. Install sheets across the deck until the high side curb line is reached. Terminate the membrane sheet against the high side curb face. Place a bead of liquid membrane or mastic between the high side curb face and deck. Butt the membrane against the curb face along the gutter line and embed into the bead of liquid membrane or mastic. Seal the top edge of the membrane along the gutter line with a 2-inch bead of liquid membrane or mastic.

After placement, roll the membrane sheets with hand rollers or other apparatus as necessary to develop a firm and uniform bond with the primed or conditioned concrete surfaces. Seal with mastic any laps that were not thoroughly sealed by rolling.

Use procedures that minimize wrinkles and air bubbles. Patch any tears, cuts, or narrow overlaps, using a satisfactory adhesive and by placing sections of membrane sheet over the defective area in a manner that the patch extends at least 6 inches in every direction beyond the edges of the defect. Vent bubbles of 1-inch diameter and larger by piercing with a suitable instrument at a nearly horizontal angle and expel the trapped air. Coat vented bubbles with mastic sealer.

Lay the asphalt overlay the same day as the membrane. If overnight delay is unavoidable, keep the construction traffic off the membrane and make a careful inspection for punctures before placing the asphalt overlay. Provide the asphalt overlay at a mix temperature between 300F and 340F. Rubber tired pavers and trucks may be driven on the membrane provided care is taken to prevent sudden starts and stops. Do not allow trucks to turn their front wheels while standing still.

2. Installation of Other Surfaces. Install as shown on the Standard Drawings, and as specified in Section 680.3(b) and as follows:

On vertical surfaces, place preformed membrane material with each successive horizontal sheet lapped top over bottom to the preceding by a minimum of 3 inches. Lap horizontal splices by a minimum of 6 inches. Seal the exposed edges of membrane sheets after the membrane is placed with a troweled bead of a manufacturer's recommended mastic, or two-part urethane liquid membrane, or with sealing tape.

Provide watertight construction by flashing all projecting pipes, conduits, sleeves, or other facilities passing through the preformed membrane waterproofing with prefabricated or field fabricated boots, fitted coverings, or other approved devices as necessary.

Install protective covers after the application of waterproofing membrane. Apply bonding material, of a type recommended by the waterproofing manufacturer to the surface of the membrane and adjacent concrete surface at a rate, approximately 0.05 gallon per square yard, sufficient to hold the protective covering in position until the backfill is placed. Allow the bonding material to dry until tacky. Place the sheets of protective board or roofing material on the bonding material with edges or ends of the boards either loosely butt-jointed or overlapped.

(e) Nonstandard Applications. For areas not covered in this specification regarding special application techniques of the waterproofing materials, or regarding special application restrictions, follow the manufacturer's recommendations.

(f) Defective Work. Before placing backfill, structural backfill, subbase, or asphalt material, repair or replace damaged membranes or protective coverings according to the manufacturer's recommendations at no additional expense to the Department.

680.4 MEASUREMENT AND PAYMENT—

- (a) Membrane Waterproofing Systems Installed on Bridge Deck.** Square Yard
- (b) Membrane Waterproofing Systems Installed on Other Surfaces.** Square Yard

SECTION 681—SLABJACKING

681.1 DESCRIPTION—This work is filling voids beneath existing rigid base courses or pavements and pressure jacking the pavement or base course to grade.

681.2 MATERIALS—Use either cement or high density polyurethane grout to jack the slab.

(a) Cement Grout Stabilization. Section 679.2(a) modified as follows:

6. Mix Design.

One part cement (by volume)

Three parts supplementary cementitious material (by volume)

Admixtures—if required and accepted

Water—an amount such that the time of efflux is within 16 seconds to 26 seconds (ASTM C 939). A more fluid mix with an efflux time of 10 seconds to 15 seconds may be used for the initial injection in each hole.

Use a stiffer mix, if the above mix fails to raise the pavement slab.

(b) High Density Polyurethane Grout Stabilization. Section 679.2(c)

681.3 CONSTRUCTION—

(a) General. Section 679.3(a) – except Section 679.3(a)2 and 679.3(a)4

1. Field QC Plan. Section 679.3(a)1 modified as follows:

- Provide existing roadway profiles of the areas indicated on the contract documents, showing existing depressions and proposed grade line to be obtained.

2. Roadway Profile Report. Before acceptance of work, provide to the Representative surveyed profile drawings for the areas that were stabilized. Include the existing profile grade, proposed profile grade and profile grade accomplished by the operation. The Representative may require additional injection based on the results indicated by the profile grade report.

(b) Cement Grout Stabilization.

1. Equipment.

1.a Grout Plant. Section 679.3(b)1.a

1.b Water Tanker. Section 679.3(b)1.b

1.c Drill. Section 679.3(b)1.c

1.d Miscellaneous. Section 679.3(b)1.e

2. Procedure.

2.a Drilling Holes. Section 679.3(b)2.a, except penetration of the stabilized base may not be necessary.

2.b Mixing. Section 679.3(b)2.b

2.c Jacking. Connect an expanding rubber packer to the discharge hose on the grout pump and lower into the holes. Do not extend the discharge end of the packer below the lower surface of the concrete pavement. If jacking continuously reinforced concrete pavement, pump in a pattern and in the amount required to raise the pavement to within 0.02 foot, plus or minus, from a string line grade, or as directed. If jacking jointed slabs of concrete pavement and bridge end slabs, pump in a pattern and in the amount required to raise the pavement to within 0.03 foot, plus or minus, from a string line grade, or as directed.

Continuous pressures to 200 pounds per square inch will be allowed. Pressure to 300 pounds per square inch will be allowed only for short periods as directed, except in the event the pavement is bonded to the subgrade, brief pressure rises to 600 pounds per square inch will be allowed.

2.d Overjacking. Bring pavement, raised above the tolerances listed above, to grade by grinding. If the overjacking is greater than 0.10 foot, satisfactorily remove and replace the pavement in as specified in Section 516 at no additional cost to the Department.

2.e Opening to Traffic. Section 679.3(b)2.d

(c) High Density Polyurethane Grout Stabilization

1. Equipment

1.a Pump Unit. Section 679.3(d)1.a

1.b Drill. Section 679.3(d)1.b

1.c Pavement Plugs. Section 679.3(d)1.c

1.d Miscellaneous. Section 679.3(d)1.e

2. Procedure

2.a Drilling Holes. Section 679.3(d)2.a

2.b Jacking. Inject the high density polyurethane material under the slab. Control the amount of rise by regulating the rate of injection of the material. When the nozzle is removed from the hole, remove any excess material from the area. If jacking continuously reinforced concrete pavement, pump in a pattern and in the amount required to raise the pavement to within 0.02 foot, plus or minus, from a string line grade, or as directed. If jacking jointed slabs of concrete pavement and bridge end slabs, pump in a pattern and in the amount required to raise the pavement to within 0.03 foot, plus or minus, from a string line grade, or as directed.

2.c Overjacking. Section 681.3(b)2.d

2.d Opening to Traffic. Section 679.3(d)2.d

681.4 MEASUREMENT AND PAYMENT—

(a) Cement Grout Stabilization.

1. Holes Drilled. Section 679.4(a)2

2. Grout Material. Section 679.4(a)3

(b) High Density Polyurethane Grout Stabilization.

1. Holes Drilled. Section 679.4(c)2

2. Polyurethane. Section 679.4(c)3

SECTION 686—CONSTRUCTION SURVEYING

686.1 DESCRIPTION—This work is construction surveying for roadways, roadway appurtenances, and structures. This work is to preserve vertical and horizontal controls and stationing throughout the construction phase up to and including final inspection and to provide the Department inspection force with surveying control points to ensure quality of construction activities.

Construction surveying is classified into six types as follows:

(a) Construction Surveying, Type A. Surveying for new construction based on precise horizontal and vertical geometry established from surveys and 1 inch equal to 25 feet scale or 1 inch equal to 50 feet scale topographic mapping referenced to the National Spatial Reference System (NSRS)/ Pennsylvania Coordinate System.

(b) Construction Surveying, Type B. Surveying for reconstruction with the alignment based on, or related to, as-built plan horizontal and vertical geometry or horizontal and vertical geometry produced on the existing roadway with minimal realignment. The planimetric features and cross sections may have been developed from mapping or electronic surveying.

(c) Construction Surveying, Type B Modified. Surveying for reconstruction. The alignment may be based on various alignment data such as:

- As-built plan horizontal geometry
- Horizontal geometry produced on the existing roadway
- Random traverse baseline
- Flat chain alignment along the center of the existing roadway
- A combination of two or more items above

The vertical reference may be based on:

- Plan profile or finish grade only
- Cross sections related to the existing roadway section
- Produced base line grades
- Templates based on the existing roadway cross sections

(d) Construction Surveying, Type C. Surveying for general maintenance construction based on existing roadway alignment with no horizontal or vertical geometry. The drawings or detail sketches are developed using flat chain stations or segments/offsets for location reference. Grade and elevations relate to the existing roadway, unless otherwise indicated.

(e) Construction Surveying, Type D. Surveying for the construction or replacement of a bridge, culvert, arch, or special structure. The horizontal alignment is based on Third Order, Class I surveys, closure 1:10,000. Reference all work points shown on the structure stakeout plan.

(f) Construction Surveying, Type D Modified. Surveying for the minor or major rehabilitation of a bridge, arch, or culvert. Bridge rehabilitation may involve repair or replacement of part of the substructure or all or part of the superstructure. Rehabilitation of an arch or culvert may involve the repair or extension or both of the existing structure.

686.2 MATERIAL—

- (a) **Tack.** Standard Engineer's tack.
- (b) **Stake.** Planed hardwood, 18 inches.
- (c) **Hub.** Planed hardwood, 18 inches.
- (d) **Nail.** Metal, 10-pennyweight.
- (e) **Guard Stake.** Stake, 18 inches, with space to identify the point guarded.
- (f) **Grade Point.** Hub with Engineer's tack; or 60-pennyweight spike.
- (g) **Reference for Bridge.** Hub with Engineer's tack, or iron pin with work center punch.
- (h) **Paint.** Latex. Yellow, orange, or white.
- (i) **Flat.** Planed hardwood, 36 inches.
- (j) **PK Nail.** Hardened masonry nail.
- (k) **Flagging.** Vinyl material.
- (l) **Benchmark Discs.** Furnished by the Department.

(m) **Survey Grade Global Navigation Satellite System (GNSS) Inspection Unit(s).** Include all necessary components, communication devices, integrated antennae and receiver, controller or data collector or both, cables, software, operating manuals, attachments, and fastening hardware to meet the minimum requirements described below:

- Equipment must be operational and free from damage, unit(s) of the same manufacturer, and compatible with those used by the Contractor. The positional accuracies of the unit(s) must be demonstrated to the Representative by field staking to existing horizontal and vertical control points in the construction area.
- Be not more than 5 years old from the date of manufacturing to the time of delivery to the job site. Provide a dated copy of the manufacturer's receipt(s) for the purchase, lease, or rental of the units.
- Include the same versions of GNSS planning software, data collection software, navigation software, stakeout software, and post-processing software. Provide the most current version of properly licensed software (including firmware) available from the manufacturer at the time of delivery of the GNSS units.
- Enabled for both standard USB cable and Bluetooth wireless technology for data transfer.
- Ability to import, export, and display point and alignment data in XML format.
- Internal or modular, rechargeable battery system capable of operating a minimum of 8 hours (may include interchangeable batteries), including the battery charger.
- Hard or soft-shell carry case and all appropriate operation manuals.
- Equipped to receive and utilize Real Time Kinematics (RTK) correctional data (current version of Radio Technical Commission for Maritime Services (RTCM) format, Compact Measurement Record (CMR)) through integrated communications with a GNSS base receiver which includes all necessary

communication devices, repeaters and systems to meet the minimum required accuracy and not exceed a 1 second latency at the rover. The RTK data must be available at all locations across the entire contract site during all hours of construction and inspection operations.

- Capability to localize both the horizontal and vertical control to local project monumentation, while utilizing RTK corrections from a reference network.
- Able to display the number of satellites tracked at any one time, and indicate the accuracy quality of each measurement relative to the strength of signals, and the Geometric Dilution of Precision (GDOP).
- Include dual frequency receivers.
- Minimum Required Kinematic Accuracy relative to primary project control: Horizontal: 0.033 feet \pm 1.0 parts per million; Vertical: 0.065 feet \pm 1.0 parts per million.
- The data controller must allow the user to program and store multiple configurations (also known as user preferences) before the actual field measurements. Configurations must be capable of being stored and recalled in the field
- One fixed height rover rod 2 meters in length, one attachable bipod which is compatible with the rover rod, and one topo shoe for each unit provided.
- A GNSS base unit with fixed height tripod to operate as an RTK base station must include all necessary cables, hardware, and fasteners.
- Must possess FCC license and maintain copy of license with equipment.

(n) Surveying Equipment.

- All surveying instruments and accessories must be Survey Grade
- All automatic and digital levels must be Survey Grade
- Provide proof all instruments are “Cleaned, Calibrated, and Certified” no more than 1 year from the certificate date

686.3 CONSTRUCTION—

(a) General. The Department will provide all pertinent survey information at the preconstruction conference. Do not begin construction surveying until on or after the Notice to Proceed. Upon completion of the survey work, return all survey information to the Representative.

The centerline, base lines, side road alignments, channel alignments, plan base lines, and interchange alignments will be established during project design. If there is an extensive time lapse between the design phase and the beginning of work, the Representative will refurbish the alignment by marking and placing new guard stakes at the pre-established control points.

Verify the alignment, grades, elevations, and dimensions indicated.

Document all design errors. Immediately notify the Representative of all errors, omissions, or discrepancies upon discovery.

Give the Representative written notice at least 3 weeks before removal of any existing benchmark disc(s). Return the old disc(s) to the Representative.

Place the new benchmark disc(s) as directed, at a point that can be occupied by a survey level rod. Provide a written statement of completion to the Representative. The Representative will establish the new elevation on the new disc(s) and stamp the disc(s) accordingly.

Provide all construction surveying services, material, and equipment needed to stake, mark, reference, and monitor the project. Provide the Representative with all assistance requested for verification of lines, grades, widths, elevations, and measurements or for QA verification. Record geometric or coordinate ties on all lines produced.

All survey activities will be performed according to Publication 122M.

Employ a Professional Land Surveyor or Professional Engineer, registered in the State, qualified in the use of highway and bridge plans; cross sections and specifications; and procedures for establishing line and grade, structure locations, and dimensions, as required. Assume full responsibility for dimensions and elevations taken from control stakes and for the setting of structure location and line and grade stakes. Provide documentation for all types of construction surveying including:

- Name and address of Professional Land Surveyor or Professional Engineer in Responsible Charge
- Copy of current State of Pennsylvania issued license number and a copy of the Professional Seal
- Resume of route surveying experience
- The Professional Land Surveyor or Professional Engineer in Responsible Charge shall be present periodically throughout the construction phases checking the ongoing surveying activities and be available to address all concerns raised by the Department

For Type A, Type B, Type B Modified, Type D, and Type D Modified construction surveying, provide a surveyor or engineer to work under the direction of the registered Professional Land Surveyor or Professional Engineer. This individual shall have as a minimum: highway surveying knowledge, skills, and abilities equivalent to those of the State's Surveyor Technician Supervisor Job Classification or have experience in the prerequisite work elements of the National Institute for Certification in Engineering Technologies (NICET) Transportation Engineering Technician/Highway Surveys Level III Technician.

References to "minor structure work" or "minor roadway work" refer to structure or roadway work representing 20% or less of the total contract price.

For all projects, including those with unsuitable and borrow excavation material, the Department will provide all cross sections needed to compute quantities for payment.

1. Automated Machine Guidance (AMG). Should the Contractor elect to use this technology, submit an AMG QC Plan to Department as specified in Section 106.03(b) at least 1 week before the preconstruction conference. As a minimum, the AMG QC Plan must demonstrate the grading control equipment meets the performance requirements within acceptable tolerances. Also, the AMG QC Plan must provide a methodology the Representative can utilize to make checks for location, grade, flowline, and position according to the contract and as specified in Section 686.3(b) 1.

The Representative may perform spot checks of the machine control grading results, surveying calculations, records, field procedures, and actual staking. Provide base stations to be set up to facilitate inspection as directed. If the Representative determines the work is not being performed in a manner to ensure accurate results, the Representative may order such work to be redone, to the requirements of the contract documents, at no additional cost to the Department. Checks performed by the Representative do not relieve the Contractor of responsibility for the accuracy of work performed.

2. Department Provided Information and Electronic Files. The Representative will set the initial horizontal and vertical control points in the field for the project as indicated in the contract documents.

Computer Aided Design Drafting (CADD) files will include the following as applicable:

- files representing the design surfaces
- files containing all horizontal and vertical alignment information
- documentation file describing all the profiles
- primary design file
- cross section files
- all reference files

No guarantee is made the data systems used by the Department will be directly compatible with the systems the Contractor uses. The Department will develop and make available electronic data to the Contractor for review as part of the contract bid documents as specified in Section 102.06(e). Ensure the electronic data will function in the Contractor's machine control grading system before the bid.

3. Survey Control Report. Develop and submit a Contractor Survey Control Report for all contracts, which includes a contract pay item for construction surveying and if AMG is utilized by the Contractor. Survey control includes all statewide or local, primary and secondary, and horizontal and vertical controls used for the geospatial positioning of work items. Upon completion of initial survey reconnaissance control verification and 5 working days before the scheduled beginning of primary field operations, submit the Contractor Survey Control Report Form S-686-AMG-1 signed and sealed by a Professional Land Surveyor registered in the State.

Include the following required control information (tabular form is acceptable) as part of the Contractor Survey Control Report Form S-686-AMG-1:

- All contract control shown in the contract documents or in the Contractor Survey Control Report
- Submit all contract control points and benchmarks:
 - Indicate which control points and benchmarks were recovered in the field and their condition.
 - Contract coordinate or elevation
 - Field determined coordinate or elevation
 - Contractor adjusted coordinate or elevation, if necessary
 - Control points and benchmarks intended to be used for construction purposes
 - Site Calibration method utilized and a report of the following:
 - A scaled CADD drawing, sketch, or diagram showing project location and control points used to determine the site calibration. The project location must be fully contained in the site calibration control points.
 - A detailed software report of the site calibration
 - Report all survey control points within tolerance used in the site calibration. Horizontal allowable error ± 0.04 feet, Vertical allowable error ± 0.08 feet
 - Report checks of all recovered original survey control points not used in the site calibration
- Adjustment method used to balance or adjust the control (e.g. Compass Rule for Baseline, Calibration Report for GNSS, etc.). Attach a copy of the localization or site calibration necessary for Survey Grade GNSS Inspection and Automated Machine Guidance along with all other miscellaneous adjustments.
- Control Network diagram (drawn to legible scale) with roadways indicated
- Indicate the Pennsylvania Coordinate System Zone utilized, Horizontal Datum, Vertical Datum, Geoid, and Combined factor used to account for the ellipsoidal reduction factor and the grid scale factor
- Indicate if additional (new) control is anticipated and where they would be set
- If a GNSS base station(s) is used on a project either for inspection or stakeout, provide the determined coordinate and elevation value of the station and the datum differential from existing control provided by the Department

Do not begin primary field operations until the Contractor Survey Control Report is accepted by the Representative. Upon acceptance of the Contractor Survey Control Report, submit a signed and sealed copy to the Representative through the PennDOT Project Collaboration Center (PPCC).

Provide all revisions or additions to contract control for stakeout or layout of proposed work items in writing to the Representative before beginning that revised portion of stakeout or layout work.

Notify the District Chief of Surveys of all project control meetings.

(b) Construction Surveying, Type A. Establish the centerline, baselines, side road alignments, channel alignments, plan base lines, and interchange alignments on the ground at major control points. The maximum interval between referenced major control points may not exceed 1,000 feet. Reference all major control points and establish vertical benchmarks at appropriate locations.

Provide construction stakeout of the project using the horizontal and vertical control established by the Department.

Provide relocation and preservation of all horizontal references of major control points and vertical benchmarks established by the Department.

Provide the Representative with a comprehensive stakeout schedule for development of the project listing areas or grading sections by plan designation or station location.

Check the cross section (original ground and template intersection) on each side of the grade point(s) at each station for accuracy and acceptance. In case of cross sectional or template discrepancy, forward documentation to the Representative before continuing earth disturbance.

If the finished grade is 5 feet or more vertically above or below existing grade, place an offset grade point with a guard stake at right angles to the centerline or base line controlling the grade point(s) or at 90 degrees from the tangent to the curve at each 100-foot station. Offset grade points from the intersection of the cross section template and original ground. Mark guard stakes according to the rounding, station, offset right or left of centerline/base line, and offset from the intersection of the template and original ground. If finished grade is constructed using grading equipment controlled by AMG Systems, the longitudinal interval for setting finished grade points may be increased to not more than 500 feet for tangent sections only, provided the requirements as specified in Section 686.3(b)1 are met.

Establish a finished grade control line offset parallel to the centerline or base line, by setting grade points at 50-foot intervals. Establish grade points at 25-foot intervals for arcs/curves equal to or greater than 16 degrees. Provide control points and conventional grade stakes at critical points such as, but not limited to Point of Curve (PC)'s, Point of Tangent (PT)'s, superelevation points, and other critical points required for the construction of drainage and roadway structures.

Furnish the Representative with grade sheets for all grade points and finish grade points. Show the grade point elevation, finish grade elevation, and offset right or left of the grade point or finish grade point from the centerline or base line on Form D-413.

Stake the plan alignments and grade points for temporary construction easements and temporary roadways or crossovers.

Stake legal right-of-way lines and temporary easement lines, if required.

Provide the Representative with all coordinate networks used in staking the project, including coordinate geometry, horizontal geometry, and referenced network points.

1. Automated Machine Guidance (AMG) Include with the AMG QC Plan the equipment type, control software manufacturer and version, grading plans, quality processes, tolerance requirements, and the proposed location of the local GNSS base station used for broadcasting differential correction data to rover units to the Department as specified in Section 106.03(b).

Provide the Representative with a survey grade GNSS inspection unit(s) for use during the duration of the contract. Maintain the unit(s) until 30 days after physical work has been satisfactorily completed. After the 30 days, unit(s) will be returned. Maintain unit(s) in good working condition and provide replacement due to breakdown, damage, or theft within 3 working days. Ensure all GPS units are fully operational.

Review and apply data the Department has provided to perform AMG machine control grading.

Bear all costs, including but not limited to the cost of actual reconstruction of work that may be incurred due to errors in application of AMG machine control grading techniques. Correction of grade elevation errors and associated quantity adjustments resulting from the Contractor's activities are at no additional cost to the Department.

Convert the Department's electronic data into a format compatible with the machine control system. Manipulation of the Department's electronic data is undertaken at the Contractor's own risk. Check and recalibrate, if necessary, the GNSS machine control system at the beginning of each work day.

Download data to the inspection units for use by the Representative and include horizontal and vertical alignments, project control network points, and 3D models.

Utilize the Department provided survey control network as the spatial reference datum network from which RTK base corrections are derived. Select communication technique(s) and devices to be used to ensure consistent and reliable delivery of RTK correctional data from GNSS units.

Meet the same accuracy requirements as conventional grading construction. This may require supplemental technologies to meet final grade accuracy if using AMG.

Establish secondary control points at appropriate intervals and at locations along the length of the project and outside the project limits and where work is performed beyond the project limits as required at intervals not to exceed 1000 feet. Determine the horizontal position of these points using static or RTK GPS sessions or by traverse connection from the original baseline control points. Establish the elevation of these control points using differential leveling from the project benchmarks forming closed loops. Be responsible for all errors. Correct all deficiencies to the satisfaction of the Representative at no additional cost to the Department.

Preserve all reference points and monuments established by the Representative within the project limits. Reestablish reference points that have not been preserved at no additional cost to the Department. Provide a revised survey control report to the Department for all reestablished reference points.

Provide controls points and conventional grade stakes at critical points such as, but not limited to, PC's, PT's, superelevation points, and other critical points required for the construction of drainage and roadway structures.

Provide electronic construction data for the machine-controlled data surface model compatible with MicroStation.

Mount the base station semi-permanently in a stable and secure location where it will not be disturbed by construction activities or be easily damaged by vandalism. Select a location where the base station will be capable of providing radio signal coverage over the entire contract area. If the base station cannot broadcast a signal covering the entire site, provide adequate repeater radios or other communications. Do not relocate a GNSS unit installed as a base station for inspection operations without approval.

At a minimum, set grade points at right angles to the centerline on tangents and radial offsets on curves at 500 foot intervals the entire length of mainline. In addition, set a minimum of two grade points on each ramp, on each intersecting roadway, and on projects less than 1,000 feet in length. Tabulate and provide offsets and elevations of all grade points using Form D-413 to the Representative. Accompany rough grade and fine grade stakes with a guard stake for easy identification.

Provide other points as directed for verification of accuracy by the Department. Within 100 feet horizontally or longitudinally or both from all tie-ins to existing pavement or structures, set grade points at 25-foot intervals as specified in Section 686.3(b).

Provide the same project specific control network to the Department as that used during construction. The Department will review the network and monitor the project.

Test the finished surface at all hinge points or centerline or both, edge of lane, and edge of shoulders on the cross section at all critical locations and as established in the AMG QC Plan. All locations are required to be within $\pm 1/2$ inch.

Upon successful quality control testing, notify the Representative the finished surface is ready for acceptance. At a minimum, the Representative will witness grade testing of the finished surface, at all hinge points or centerline or both, edge of lane, and edge of shoulders on the cross section at random locations every 500 feet according to PTM No. 1 for acceptance. Test results will be documented on Form S-686-AMG-2.

If more than 10% of all acceptance tests are determined to exceed $\pm 1/2$ inch in any phase of the project, the Representative may require setting grade points at 50-foot intervals in tangent and at 25-foot intervals for arcs/curves equal to or greater than 16 degrees as specified in Section 686.3(b).

1.a Survey Grade GNSS Inspection Unit Training. For all survey grade GNSS inspection units, provide Department staff or their representatives or both with a minimum of two separate 8 hour minimum training sessions on the use and operation of the unit(s) during the first year of the contract. Provide the first session within 1 week of delivery of the unit(s) to the site. Provide the second session upon the request of the Department. Provide one additional 8 hour minimum training session during each additional contract year the unit(s) are in service.

Submit qualifications of the training facilitator and proposed training location to the Representative for approval. All training must be from a manufacturer-verified trainer who is approved.

(c) Construction Surveying, Type B. Provide this type of surveying for roadway construction with minor structure work. Construction surveying required for the minor structure work, if any, is incidental. Perform incidental surveying as specified for the applicable type.

Establish the centerline, baselines, side road alignments, and channel alignments on the ground at major control points. The maximum interval between referenced major control points may not exceed 1,000 feet. Reference all major control points and establish vertical benchmarks at appropriate locations.

Provide construction stakeout of the project, using the horizontal and vertical control established by the Department.

Provide relocation and preservation of all horizontal references of major control points and vertical benchmarks established by the Department.

Establish all base lines, grade lines, parallel lines, traverse lines, and reference lines deemed necessary by the Engineer to control construction operations.

Stake the plan alignment and grade for temporary roadways and crossovers.

Stake legal right-of-way lines and temporary easement lines as required to construct the project. Stake the lines based on plan data.

Provide the Representative with all coordinate networks used in staking the project, including coordinate geometry, horizontal geometry, and reference network points.

(d) Construction Surveying, Type B Modified. Provide this type of surveying for roadway construction with minor structure work. Construction surveying required for the minor structure work, if any, is incidental. Perform incidental surveying as specified for the applicable type.

Establish the centerline and baselines on the ground at major control points. Establish vertical benchmarks at appropriate locations. Establish legal right-of-way lines or temporary easement lines, as required, at project locations controlled by flat chain stations. If curved alignments or complex configurations are beyond the scope of the flat chain survey, the Department will stake the right of way.

Provide construction stakeout of the project, using the alignment established by the Department.

Provide the relocation and preservation of all major control point or vertical benchmark.

Place and maintain all grade points, guard stakes, nails, hubs, or paint marks necessary to control construction of the project.

Stake plan alignment and grade for temporary roadways and crossovers.

Stake legal right-of-way lines or temporary easement lines if controlled by horizontal geometry. Stake the lines based on plan data.

(e) Construction Surveying, Type C. Establish the limits of work by marking the beginning and ending station, or the beginning and ending segments and offsets. Establish the limits of work only once during the life of the Contract.

For Group Contracts, establish the limits of work using State Route and segment markers.

Place additional stakes or marks as necessary to control construction operations.

(f) Construction Surveying, Type D. Provide this type of surveying for structure construction with minor roadway work. Construction required for the minor roadway work, if any, is incidental. Perform incidental surveying as specified for the applicable type.

Establish all centerline, base lines, and structure control points on the ground.

Provide the construction stakeout of bridges, arches, culverts, and other special structures, as required to facilitate and control the work, using the horizontal and vertical control established by the Department.

Review the structure stakeout plan sheet designating work points to be referenced with the Representative before performing the field stakeout.

If beam seat layout is required, submit a report verifying staked points. Include the contract coordinates and elevations, field staked coordinates and elevations, and computed residuals.

Obtain approval for all variances and exceptions to the field stakeout plan before performing the work.

Reference all designated work points. Reference each work point on a direct line through all adjacent work point(s). Establish three reference points for the work point at each corner of abutments and at each end of wingwalls. Establish three reference points for work points on proprietary or other walls. For land piers, establish three reference points, on each side of the substructure, for work points on the centerline of bearing. The distance between a work point and its first reference point is to be less than 100 feet, with the exception of centerline pier reference.

Establish a Third Order, Class I traverse network, at each structure site, coordinating abutment and pier reference. Show the precision ratio and comparisons of longitudinal distances.

Before structure construction activities, furnish the Representative with a field stakeout sketch (a sketch will not be required for single span bridge, culverts, and arches), based on the structure plan stakeout, showing only centerline/base line stations, span lengths, reference angles, and reference lengths. Show two described vertical benchmarks.

Before structure construction activities, furnish the Representative with a sketch showing a triangulation network or traverse network at each structure site (a sketch will not be required for single span bridge, culverts, and arches). For water-bound piers, include base line control showing length of sides "a" and "b" and interior angles A and B.

Include the date, structure description, Contractor's name, and person responsible for the stakeout, on field stakeout sketches, signed and sealed by a Professional Land Surveyor or Professional Engineer registered in Pennsylvania.

(g) Construction Surveying, Type D Modified. Provide this type of surveying for structure construction/rehabilitation with minor roadway work. Construction surveying required for the minor roadway work, if any, is incidental. Perform incidental surveying as specified for the applicable type.

Establish all centerline, base lines, and structure control points on the ground.

Provide the construction stakeout of the structure rehabilitation, using the horizontal and vertical control established by the Department.

Review the structure stakeout plan sheet designating the work points to be referenced with the Representative, before performing the field stakeout.

Reference all designated work points. Reference each work point on a direct line through all adjacent work point(s). Establish three reference points for the work point at each corner of abutments and at each end of wingwalls. For land piers, establish three reference points, on each side of the substructure, for work points on the centerline of bearing or as indicated on the structure plan stakeout. The distance between a work point and its first reference point is to be less than 100 feet, with the exception of pier reference. For water-bound piers, use base line reference.

Before structure construction activities, furnish the Representative with a field stakeout sketch, based on the structure plan stakeout, showing reference points, lengths, vertical control, and pertinent plan data.

Before structure construction activities, furnish the Representative with a separate sketch showing a triangulation network or traverse network, or methodology for a mathematical check of the survey produced, signed and sealed by a Professional Land Surveyor or Professional Engineer registered in Pennsylvania.

(h) Highway Joint Locations. As specified in Section 515.3, locate all transverse joint locations and report them to the Representative. To utilize GPS in locating joints, perform a site calibration and complete Form S-686AMG-1. If no contract control exists, establish a horizontal control network referenced to the Pennsylvania Coordinate System. Submit all documentation, reports, and field notes to the Representative. If utilizing a total station to locate joints, a closed loop traverse is required with a precision closure of 1: 15,000.

(i) Right of Way Monumentation. If called for either by a recorded right-of-way plan or signed and sealed construction plan, right-of-way monuments are to consist of No. 5 rebar, 24-inches in length, with either aluminum or plastic caps inscribed with "PennDOT R/W". For monuments in asphalt surfaces, use a railroad spike, or any heavy duty, hardened, steel survey nail no less than 3 1/2-inches in length. For monuments in concrete or bedrock, set an engraved or drilled hole with a cross-cut, well-dressed, and unmistakable surveyed mark.

Perform all work under the supervision of a Professional Land Surveyor, registered in the Commonwealth of Pennsylvania. After monuments are set, submit a survey report signed and sealed by a licensed Professional Land Surveyor, registered in the Commonwealth of Pennsylvania, to the District Chief of Surveys for review and approval. In the survey report, include a scaled CADD drawing, sketch, or diagram of all set monuments, noting the materials used, date set, the horizontal coordinates for each monument, and the centerline stations and offsets. Use the same coordinate base and datum on the CADD drawing as used on the said right-of-way or construction plan. Use positional accuracy according to Publication 122M. Include photographs in the survey report of all set monuments. Index and label the photographs. Publication 122M explains the overall objective for the setting of the right-of-way monuments. If the monuments cannot be set as indicated or according to Publication 122M, consult with the District Chief of Surveys before proceeding.

686.4 MEASUREMENT AND PAYMENT—

(a) Construction Surveying. Lump Sum

For the type indicated.

The Department will pay for this item as specified in Section 110.05, in four payments, according to the following schedule:

- When work representing 10% of the total contract price is completed, excluding the bid price for this item, the Department will pay 25% of the amount bid for this item.
- When work representing 30% of the total contract price is completed, excluding the bid price for this item, the Department will pay 25% of the amount bid for this item.
- When work representing 90% of the total contract price is completed, excluding the bid price for this item, the Department will pay 20% of the amount bid for this item.
- Upon completion of the project, the Department will pay the remaining 30% of the amount bid for this item.

Required system checks, training, maintenance, calibration, electronic file data preparation, and one survey-grade GNSS inspection unit are incidental to this item

(b) **Unidentified Work.** The Department will pay for unidentified work as follows:

1. **Negotiated Price.** At an agreed upon price. The Department and the Contractor will agree upon this price before performing the work.

2. **Force Account Basis.** Section 110.03(d)

(c) **Additional Survey Grade GNSS Inspection Units as requested by the Department.** Each

(d) **Right-of-Way Monuments.** Each

SECTION 688—MICROCOMPUTER SYSTEM

688.1 DESCRIPTION—This work is furnishing, setting up, and maintaining a microcomputer system, for the exclusive use of Department personnel.

688.2 MATERIAL—

(a) General. Provide all material necessary for setup and operation of a microcomputer system, including all connectors (cords, cabling, adapter, etc.). Upon delivery to the field office, ensure that all hardware and software are compatible and operational.

(b) Microcomputer. The microcomputer is a laptop computer, with an attached minimum 14.0-inch widescreen monitor. The minimum hardware specifications for each type microcomputer systems are as indicated in Table A and as follows:

1. Monitor. For each microcomputer, provide an external 22-inch (minimum), widescreen monitor, compatible with the microcomputer(s).

2. Surge Protector. Provide a surge protector for each microcomputer, with a minimum of six AC outlets and one telephone outlet, with a 6-foot minimum length cord, having a line voltage regulator/conditioner that protects against chronic high voltage, voltage spikes, and radio frequency interference.

3. Input Devices. Provide a Windows compatible, 104 key, full size multimedia function keyboard, Universal Serial Bus (USB) with a 6-foot minimum length cord. Provide a Microsoft compatible 3 button optical scrolling mouse, USB with a 6-foot minimum length cord.

4. Docking Station. Provide a compatible docking station for all microcomputers with USB Ports to connect a mouse, keyboard and two free ports. Provide video connection ports for up to two monitors, along with High-Definition Multimedia Interface (HDMI), ethernet connectivity, and audio in/out ports.

5. Carrying Case. Provide a carrying case large enough to carry the microcomputer, external pointing device (mouse), and AC adapter.

(c) Software. All system software must be installed on the C: drive partition.

- Provide Microsoft (MS) Windows 10 Enterprise (64-bit) operating system, with latest service pack update, to include all MS Windows and MS updates. Set up this operating system as a new installation, not as an upgrade from a previously installed, older version of MS Windows.
- Provide MS Office Home & Business 2019 (or latest version) or MS Office 365 Business Premium, with all MS Office updates.
- Provide Acrobat Reader DC or newer with the most current version.
- Provide Sun Microsystems' Java with most current version with all updates.
- Provide an up-to-date version of anti-virus software recognized and supported by the installed Microsoft Windows Operating system, capable of receiving automated updates in order to keep software current.
- Provide the Inspector-In-Charge with all Original Equipment Manufacturer (OEM) software CD's/licenses, manuals, and documentation, to be maintained in the department's project field office for the duration of the project.

- Provide the Internet Explorer browser that meets the Department's current standard for ECMS.

TABLE A
Minimum Specifications

System Type	Laptop Computer
Central Processing Unit	Intel Core i7 or AMD Ryzen PRO 7
Total Minimum CPU Speed	3.00 GHz with or without boost
Random Accessible Memory (RAM)	16 GB RAM
Internal Solid State Hard Drive	256 GB
USB 3 Button Optical Mouse	Yes
USB 104 key, full size Multimedia Function Keyboard	Yes
Internal Pointing Device (Touchpad)	Yes
USB 2.0 Ports	2
Network Port	Yes

(d) Maintenance Agreement. Furnish a maintenance agreement, which provides for on-site repair service within 24 hours of notification. If the system cannot be repaired, provide a replacement within 48 hours of notification.

(e) Compatibility. All references to compatibility require that compatibility be demonstrated in the Inspector's Field Office.

688.3 CONSTRUCTION—Furnish microcomputer(s) for Department use no later than 5 working days after the Notice to Proceed date or 5 days before the scheduled start of work. Provide the type of microcomputer specified and install in the Inspector's Field Office. Maintain the system from installation until 30 days after physical work, including work on punch list items identified during the final inspection, has been satisfactorily completed unless released earlier by the Representative. The Representative may direct that the system be maintained for more than 30 days after physical work has been satisfactorily completed, as necessary, to allow time for Department personnel to process outstanding project records, due to the Contractor's failure to submit, complete, and/or correct required certificates or documents, as established during the final inspection. Remove and properly dispose of all dispensable items for the life of the project and upon release by the Representative.

688.4 MEASUREMENT AND PAYMENT—Lump Sum

For the type indicated.

Paid in three payments, in accordance with the following schedule:

- Whenever all the requirements specified of Section 688.2(a) have been met and compatibility satisfactorily demonstrated to the Representative, 80% of the amount bid for this item will be paid.
- Whenever work is performed equal to 40% of the original contract amount, excluding the bid price for this item, 10% of the amount bid for this item will be paid.
- Whenever work is performed equal to 80% of the original contract amount, excluding the bid price for this item, the remaining 10% of the amount bid for this item will be paid.

(a) Price Adjustments. Adjustments to the lump sum prices for the indicated type microcomputer system, as applicable, will be made as follows:

1. Time Extensions and Reductions. In the event the time for completion of all work on the project is extended or reduced, as specified in Section 108.06, to be more than A percent or less than B percent of the original

contract time, where A and B are as specified in Table B, an appropriate adjustment (payment to the Contractor or rebate to the Department) will be made to the lump sum prices bid for the indicated microcomputer systems, as applicable, for that portion of adjusted contract time in excess of A percent of (payment) or less than B percent of (rebate) the original contract time, at the following daily rate:

$$\text{Daily Price Adjustment Rate} = \frac{75\% \times \text{Contract Lump Sum Price}}{\text{Original Contract Time in Days}}$$

TABLE B
Contract Time

Original Contract Time in Days		Percent	
From More Than	To and Including	A	B
0	100	130	70
100	300	120	80
300	500	115	85
500	1000	112	88
1000		110	90

2. Systems Maintained More than 30 Days After Physical Work Completion. In the event the Representative directs that the microcomputer systems be maintained for more than 30 days after the date of physical work completion, as specified in Section 688.3, an appropriate adjustment (payment to the Contractor) will be made to the lump sum prices bid for the indicated microcomputer systems, as applicable, for the days in excess of 30 until released by the Representative, at the Daily Price Adjustment Rate specified in Section 688.4(a)1.

No adjustment will be made if the Representative directs that the microcomputer systems be maintained for more than 30 days after the date of physical work completion due to the Contractor's failure to submit, complete, and/or correct required certificates or documents, as established during the final inspection.

SECTION 689—CONSTRUCTION SCHEDULING

689.1 DESCRIPTION—This work is the preparation, maintenance, and revision of the construction project schedule using a Narrative, Critical Path Method (CPM), or Resource Loaded CPM Schedule, as indicated, to monitor progress of project operations. For Design/Build or Partial Design/Build projects, include in the construction schedule design activities associated with the Design/Build elements of the project as well as the review and approval durations as indicated in the contract provisions.

Definitions are as follows:

- **Controlling Activities.** Those activities that control the total length of the project time by forming a chain that makes up the largest sum of activity durations. In the CPM Schedule these activities are also identified as Critical Path Activities.
- **Float.** The length of time that the start or finish of an activity can be delayed without affecting the Required Completion Date of the project. Float is a shared commodity.
- **Redundant Relationship.** A relationship representing a link between activities that is also represented in a parallel path or relationship. Redundant relationships can be removed without impacting the logic or calculations of the schedule and may add unnecessary complexity to the schedule and hinder review and analysis.
- **Resource.** The labor and equipment required by an activity and needed to perform the work of the project.

689.2 MATERIAL—The Department's software standard for scheduling and project management is Asta Powerproject produced by Elecosoft.

The Contractor may use a commercial scheduling software package to produce the schedule and reports according to the requirements of this specification. The Contractor may elect to submit the Narrative Schedule or related reports to the Representative in electronic format. In all cases, the CPM Schedule must be developed in Asta Powerproject (.pp) or a compatible format (.mpp, .xml, .xer, .p3b, .dir, and .stx). Verify the compatibility of the other software packages with the Department's version of Asta Powerproject. The CPM Schedule must be submitted to the Representative in an Asta Powerproject (.pp) electronic format. If the CPM Schedule is developed in an Asta Powerproject compatible format, convert the native CPM Schedule format to an Asta Powerproject (.pp) file format using the PennDOT Construction template before submitting to the Representative. Ensure the converted file is a one to one comparison between the native format and the Asta Powerproject file before submittal.

Upload and submit the Asta Powerproject (.pp) schedule through the PennDOT Project Collaboration Center (PPCC). Uploading the schedule into PPCC will allow all authorized parties to view the current baseline schedule. The Department will then review the submitted schedule and will either accept, Accept as Noted, Revise and Resubmit, or reject the schedule. Once the schedule is accepted by the Department, the Asta Powerproject (.pp) file will be the governing schedule on record. After the schedule is accepted, the Department will download the accepted schedule from PPCC and upload it to the Asta Web Portal. Any subsequent changes to the baseline schedule through the submission of any updates, revisions or recovery schedules will also be uploaded to the project within PPCC in the same way in order to maintain a record of schedule versions.

689.3 CONSTRUCTION—As specified in Section 108.03(b), Construction Project Scheduling, and as follows:

(a) Narrative Schedule. Base the initial Narrative Schedule on the anticipated Notice to Proceed Date in the proposal. Submit the Narrative Schedule within 15 calendar days after the actual Notice to Proceed Date. The District Executive may withhold current estimate payments until the Narrative Schedule is submitted and accepted.

If the actual Notice to Proceed is issued after the anticipated Notice to Proceed Date in the proposal, submit a Narrative Schedule based on the actual Notice to Proceed Date within 15 calendar days after the acceptance of the Narrative Schedule based on the anticipated Notice to Proceed Date. The Narrative Schedule based on the actual Notice to Proceed Date will not be considered without prior acceptance of the Narrative Schedule based on the anticipated Notice to Proceed Date in the proposal.

The Representative will review and respond to the detailed Narrative Schedule and supporting documentation

within 14 calendar days of receipt.

Include, as a minimum, the following in the initial Narrative Schedule and in all Schedule revisions:

- Activity description;
- Activity duration, in working days; and
- Start and finish calendar dates of activities.

In addition, submit a workday calendar showing work days and non-work days, number of shifts per day, and number of hours per shift.

Provide enough activities to demonstrate the necessary interdependencies. Use the above information to complete a narrative description of the construction schedule.

If the Narrative Schedule is not received within 15 calendar days after the actual Notice to Proceed Date, the Contractor will be required to attend a scheduling workshop in order to prepare an acceptable Narrative Schedule. The District Executive may elect not to release current estimate payments until the Narrative Schedule is submitted and accepted.

(b) CPM Schedule. As specified in Section 108.03(b), Construction Project Scheduling and as follows:

1. 60 Calendar Day Work Plan. At the Preconstruction Conference, submit a .pdf of the 60 Calendar Day Work Plan from Asta Powerproject that includes a breakdown of activities. Provide a generalized project schedule for the balance of the work, to meet the Required Completion Date and specified Milestone Date(s).

In lieu of the 60 Calendar Day Work Plan, the Contractor may submit the CPM Schedule specified in Section 689.3(b)3 within 30 calendar days after the contract execution. Maintain and submit, on a bi-weekly basis, a 60 Calendar Day Work Plan until the CPM Schedule is accepted.

2. Bid Preparation Schedule. Submit the schedule used to prepare the contract bid within 30 calendar days after contract execution. At a minimum, this schedule should include the scheduling concepts and logic that were used in sequencing work activities to prepare the contract bid, a workday calendar that identifies work days and non-work days, the number of shifts per day, and the number of hours per shift.

In lieu of the Bid Preparation Schedule, the Contractor may submit the CPM Schedule specified in Section 689.3(b)3 within 30 calendar days after the Notice to Proceed. The District Executive, after consultation with the Contractor, may withhold current estimate payments until the Bid Preparation Schedule or CPM Schedule is submitted and accepted.

3. CPM Schedule. Base the initial CPM Schedule on the anticipated Notice to Proceed Date in the proposal. Submit the CPM Schedule through PPCC in an Asta Powerproject (.pp) file format using the PennDOT Construction template as defined in Publication 615 within 30 calendar days after the actual Notice to Proceed Date. Also, submit the schedule as a portable document format (PDF) through PPCC. The PDF must be generated from Asta Powerproject as an 11-inch by 17-inch page size, with no more than 25 activities per sheet. Ensure the PDF text is large enough to read.

If the actual Notice to Proceed is issued after the anticipated Notice to Proceed Date in the proposal, submit a CPM Schedule based on the actual Notice to Proceed Date within 15 calendar days after acceptance of the CPM Schedule based on the anticipated Notice to Proceed Date. The CPM Schedule based on the actual Notice to Proceed Date will not be considered without prior acceptance of the CPM Schedule based on the anticipated Notice to Proceed Date in the proposal.

Include, at a minimum, the following information for each activity in the initial baseline schedule submission and all subsequent submissions:

- Activity ID
- Activity description
- Activity duration, in working days
- Early start date
- Early finish date
- Late start date
- Late finish date
- Total float

- Predecessor
- Successor
- Calendar
- Resource Allocation (if applicable)
- Resource Effort (if applicable)

The Representative will review and respond to the detailed CPM Schedule within 14 calendar days of receipt.

If the Department does not accept the schedule, revise the schedule and re-submit within 10 days of receiving the Department's comments. If the CPM Schedule is not received within 30 calendar days of the actual Notice to Proceed Date, the Contractor will be required to attend a scheduling workshop in order to prepare an acceptable CPM Schedule. The District Executive, after consultation with the Contractor may withhold current estimate payments until the CPM Schedule is submitted and accepted.

A standardized list of activities must be utilized in all CPM and CPM Resource Loaded schedules. These activities must be used verbatim if they are applicable to the project. The description of these activities cannot be modified. The following is a list of standardized activities that must be included where applicable:

- Project Award
- Notice to Proceed (Anticipated, unless issued after the Anticipated then use Actual)
- Physical Work Start
- Implement Detour
- Remove Detour
- Open to Traffic
- Physical Work Complete
- Project Completion

Use a unique activity ID to describe each activity throughout the duration of the project. Limit activities with duration times in excess of 15 working days to a minimum. Provide enough activities to demonstrate the necessary interdependencies. Limit the fineness of detail, where possible, to a minimum, 5-day activity duration. All activities, with the exception of the single start activity and the single finish activity must have at least one predecessor and one successor. The number of redundant relationships is not to exceed 5% of the total number of relationships in the schedule.

Submit the CPM Schedule with the following format:

- Make all relationships finish to start relationships.
- Identify a single start activity and a single finish activity for the entire schedule.
- Imposed start date set to anticipated Notice to Proceed (or actual if applicable.)
- Incorporate lag/lead times as a separate activity.
- Incorporate the standardized activities verbatim (if applicable to the project.)
- 'Start on' or 'Start on or After' Constraint on Notice to Proceed.
- 'Finish on' or 'Finish on or Before' Constraint on Project Completion.
- Interim Milestone included in the contract should use soft constraints (i.e. 'Start on or After' or 'Finish on or Before') and utilize a 7 day no holiday calendar.

(c) CPM Schedule with Updates. As specified in Section 689.3(b) and as follows.

Submit schedule updates at the frequency specified in Section 108.03(b) using the accepted baseline schedule as the basis for the update. Ensure updates are prepared in the proper format and include the content as described. Failure to submit acceptable schedule updates will impact contractor evaluations.

Activity IDs or descriptions must remain constant throughout the project. Major changes to activities will be addressed by eliminating the existing activity and substituting a new activity with a unique ID and Description.

Progress the schedule through the end of the established progress period with actual start and finish dates and remaining duration (or overall percent complete). Perform a 'reschedule' of the Asta Powerproject (.pp) file with the options set as follows:

- straighten the progress period to 'Progress Entry Period'
- set progress entry period to Default (progress date agreed upon with District)

Include with updates:

- Electronic schedule in Asta Powerproject (.pp) file format for review.
- A narrative report including:
 - The reason for the update.
 - Progressed Activities
- Logic changes (including relationship type and imposed date(s))
- Calendar changes (including activity association and/or work day(s))
- Duration changes
- Critical Path changes
- Any schedule concerns.
- A PDF of the updated schedule showing the following information (In the PennDOT Construction Template the Construction Update view includes all of these columns):
 - Unique Task ID
 - Activity description
 - Activity duration, in working days
 - Original Baseline Duration
 - Early start date
 - Early finish date
 - Late start date
 - Late finish date
 - Total float
 - Predecessor (using unique task ID)
 - Successor (using unique task ID)
 - Actual Start date
 - Actual Finish date
 - Remaining Duration (or overall percent complete)
 - Resource Allocation and Effort (if applicable)
- Submit the narrative report, the CPM Schedule update in an Asta Powerproject (.pp) format, and PDF of progressed schedule through PPCC. The PDF must be generated from Asta Powerproject, should be a 11-inch by 17-inch page size, with no more than 25 activities per sheet. Ensure the PDF text is large enough to read.

The Department will review the updated schedule within 14 calendar days of receipt. If an updated schedule is not submitted in the format required, the District Executive, after consultation with the Contractor, may withhold current estimate payments until acceptable monthly updates as specified herein are received.

(d) Resource Loaded CPM Schedule. As specified in Section 689.3(b) and Section 689.3(c) and as follows:

The resources allocated to meet the Required Completion Date and any specified Milestone Dates. Also include, at a minimum, the following information for each summary activity in the initial schedule submission and all subsequent submissions:

- Business Partner Identification Number (ID)
- Proposed Equipment Name
- Proposed Equipment Number (example: Backhoe 1 and 2)
- Activity Resource
- Activity Resource Duration in working days
- Labor

In addition submit a spreadsheet in an electronic format or a PDF similar to Table A or use Allocation Groups within Asta Powerproject. Have it display labor and equipment that will be on the project site 80% of the time for the following:

- Business Partner ID(s)
- Labor Crews with crew designation, number of personnel per crew, and activity resource

- Proposed Equipment Name and Proposed Equipment Number (example: Backhoe 1 and 2) and activity resource

Table A

Crew	Crew Designation	Workforce					Equipment				
(Firm Name) Business Partner 1 Crew A	1-A										
(Firm Name) Business Partner 2 Crew 1	2-1										

689.4 MEASUREMENT AND PAYMENT—Lump Sum

(a) Narrative Schedule. Paid, as specified in Section 110.05, in three payments, as follows:

- The first payment, equal to 50% of the amount bid for this item, will be paid upon submission of the Narrative Schedule, as specified in Section 689.3(a), in the form required by this specification.
- The second payment, equal to 25% of the amount bid for this item, will be paid whenever work representing 40% of the total contract price is completed, excluding the bid price for this item.
- The third payment, equal to 25% of the amount bid for this item, will be paid whenever work representing 80% of the total contract price is completed, excluding the bid price for this item.

(b) CPM Schedule. Paid, as specified in Section 110.05, in four payments, as follows:

- The first payment, equal to 20% of the amount bid for this item, will be paid upon submission of an acceptable 60–Calendar Day Work Plan, as specified in Section 689.3(b)1, in the form required by this specification, or upon submission of an acceptable CPM Schedule, as specified in Section 689.3(b)3, in the form required by this specification.
- The second payment, equal to 30% of the amount bid for this item, will be paid upon submission of an acceptable CPM Schedule, as specified in Section 689.3(b)3, in the form required by this specification.
- The third payment, equal to 25% of the amount bid for this item, will be paid whenever work representing 40% of the total contract price is completed, excluding the bid price for this item.
- The fourth payment, equal to 25% of the amount bid for this item, will be paid whenever work representing 80% of the total contract price is completed, excluding the bid price for this item.

(c) Resource Loaded CPM Schedule. Paid, as specified in Section 110.05, in four payments, as follows:

- The first payment, equal to 20% of the amount bid for this item, will be paid upon submission of an acceptable 60–Calendar Day Work Plan, as specified in Section 689.3(b)1, in the form required by this specification, or upon submission of an acceptable CPM Schedule, as specified in Section 689.3(b)3, in the form required by this specification.

- The second payment, equal to 30% of the amount bid for this item, will be paid upon submission of an acceptable CPM Schedule, as specified in Section 689.3(b)3, in the form required by this specification.
- The third payment, equal to 25% of the amount bid for this item, will be paid whenever work representing 40% of the total contract price is completed, excluding the bid price for this item.
- The fourth payment, equal to 25% of the amount bid for this item, will be paid whenever work representing 80% of the total contract price is completed, excluding the bid price for this item.

SECTION 690–PARTNERING

690.1 DESCRIPTION—This work is to outline a structured process designed to develop a collaborative environment for the project so that communication, coordination, and cooperation are the norm. This Collaborative Partnering approach will aid issue resolution and will lessen impacts on project budget, schedule and quality.

Participation in the formal Partnering process defined here will not void any contract part. All rights and remedies defined by the final contract will be preserved.

Definitions are as follows:

- **Project Team.** The group of people and organizations who are executing a construction project and who have influence on the outcome. The Project Team is comprised of the Department, the Department's Consultants, the Contractor, the Designer, the subcontractor(s), and other stakeholders including Government agencies, property owners, utility owners, materials suppliers, concessionaires, and third parties affected by the construction project.
- **Partnering.** An effort by the Project Team to develop joint goals and to establish a cooperative atmosphere regarding execution of the construction project, regardless of delivery method.
- **Project Team Leaders.** Project Managers from both the Department and Contractor who are accountable for the day-to-day operations of the project and are responsible for leading the Partnering effort. They will also oversee coordinating Partnering meeting times, selecting meeting locations, and other logistics.

Construction partnering facilitation is classified into three types as follows:

(a) Internal Facilitation. Shall be co-facilitated by the Department Manager and the Contractor's Project Manager. At the pre-construction meeting, these individuals shall address the partnering practices and values that apply to all projects and are integral to the success of the project. If this facilitation type is selected as specified in Section 690.3(a), Sections 690.3(b) through 690.3(g) are not required.

(b) Semi-Formal Facilitation. The Department Manager and Contractor Project Manager shall meet to discuss and prepare for the partnering workshop. They will determine the dates, locations, required attendees, and a professional, third party facilitator (optional) for the partnering workshop. For the workshop, they will also be responsible for preparing presentations, giving an overview of the project, deciding which portions of the workshop they would like to facilitate, having a list of potential/actual project issues, and if desired, developing a mission statement for the project. Shall have, at a minimum, half day for a facilitated partnering workshop.

(c) Formal Facilitation. The Department Manager and Contractor Project Manager shall meet to discuss and prepare for the partnering workshop. They will determine the dates, locations, required attendees, and a professional facilitator (required) for the partnering workshop. They will be responsible for preparing presentations, giving an overview of the project, deciding which portions of the workshop they would like to facilitate, having a list of potential/actual project issues, and developing a mission statement. This information shall be reviewed with the third party facilitator so that they can assist in developing an overall agenda for the workshop. Shall have, at a minimum, one full day for a professional facilitated partnering workshop.

690.2 MATERIAL—When required, provide a Professional Partnering Facilitator or Consultant and partnering workshop location. Also, furnish adequate material for presentations, evaluations, and workshops.

690.3 CONSTRUCTION—

(a) Project Facilitation. After the project has been awarded but not later than the preconstruction conference, use Form CS-9, Project Facilitation Type Score Sheet, to determine what recommended facilitation type is best for the project. The recommended facilitation type may be moved up or down one facilitation level if agreed upon by both the Department and the Contractor.

(b) Kick-off Partnering Workshop. Hold the Kick-off Partnering Workshop within 30 days of the Notice to Proceed, but not later than 10 days after work has started. Prior to the Kick-off Partnering Workshop, the Project Team Leaders will meet to discuss and prepare for the partnering workshop. At a minimum, they will present an overview of the project, decide which portions of the workshop they would like to facilitate, have a list of potential/actual project issues, develop an agenda for the Kick-off Partnering Workshop, and develop a mission statement for the project. This meeting will also involve selecting potential dates and locations for the workshop and a facilitator, if required/desired. Once these are selected, a list of attendees will be developed, making sure that the Kick-off Partnering Workshop date(s) work for the key participants. The Project Team Leaders will also discuss their objectives for the partnering on the project. This information should be used for designing the workshop to meet the objectives. The Project Team Leaders will also prepare presentations.

At a minimum, the Partnering Workshop agenda should be developed using the following points of interest:

- Discuss and define partnering values for the team
- Establish project specific goals and potential action items to accomplish the goals
- Exchange organizational charts representing the project personnel
- Develop a project specific organizational/communication plan
- Discuss roles and responsibilities as necessary
- Discuss the team's commitment to resolve claims at the lowest possible level
- Develop the Escalation Plan for escalating unresolved issues for resolution (Form CS-8)
- Identify regular scheduled meetings to promote communications
- Overview of project phasing, including MPT and high level scope of work within each phase
- Identify potential Value Engineering Proposals
- Discuss and develop Potential Risk and Mitigation Strategies ("Rocks in the Road")
- Develop action items

Encourage all subcontractors, material suppliers and other entities within contractual control to participate in the Partnering process as necessary. Make this a specific contractual condition for all subcontractors, material suppliers, and other entities working on this project. The designer for this project and any other consultants engaged in this project will participate in the Partnering process as defined here.

(c) Partnering Charter. At the end of the partnering workshop, the participants shall sign a partnering charter (agreement). This charter includes all the principles and commitments made during the partnering session, the project goals and the identified values for the team, the partnering follow-up plan, and the partnering dispute resolution plan. The minimum goals of the Partnering Charter are:

1. Safe Project Completion
2. Quality Project Completion
3. Timely Project Completion
4. Effective Use of Budget Funds

(d) Facilitator/Partnering Session Evaluation. At the end of the partnering workshop, the participants will fill out an evaluation form for the facilitator and partnering workshop. Use Form CS-10 (Partnering Workshop and Facilitator Evaluation) if another partnering workshop evaluation form is not provided by the facilitator or the Project Team Leaders. Evaluations will be submitted to the Assistant Construction Engineer/Manager or a designee appointed by the Assistant Construction Engineer/Manager.

(e) Partnering Meetings. A follow-up partnering plan should be created at the end of the kick-off partnering workshop. Consider holding joint partnering meetings with the Project Team at all milestones, when there is a significant change of personnel on the project, when lingering unresolved issues are present, when the project enters a new phase of work, and at the beginning of each season for multi-year projects. For internally facilitated projects, joint partnering meetings can be held on an as needed basis. These meetings should discuss the schedule and how the team is going to accomplish it, unresolved or outstanding issues, new issues which need resolution, and any action items and deadlines.

(f) Partnering Evaluations. Department, Contractor, major subcontractors, and major stakeholders will participate in partnering evaluation surveys to measure progress on mutual goals and short-term key issues as they

arise. The frequency of the partnering evaluation surveys may be determined by the Project Team Leaders. Use Form CS-11 (Project Partnering Survey) if another partnering evaluation survey form is not provided by the facilitator or the Project Team Leaders. The partnering evaluations will be collected by the Project Team Leaders and the results will be shared with the project team. The results will be presented in a graphical format so trends can be easily identified. Negative responses in any survey should be identified quickly so that they can be investigated and corrective action can occur.

1. Facilitator evaluations. Facilitator evaluations must be completed by the Department, Contractor, and major stakeholders at the end of the kick-off partnering workshop and at the project close-out partnering workshop. The Representative will provide the evaluation forms to the project team and collect the results. The evaluation results will be made available upon request.

(g) Project Close-out Partnering Workshops. Conduct a project close-out workshop to discuss the project's successes and challenges. Document the lessons learned as a condition of final project acceptance.

(h) Partnering Dispute Resolution Plan. Complete Form CS-8 (Issue Escalation Matrix) as required in Section 108.03(a). Use Form CS-8, Issue Escalation Matrix, to escalate and resolve issues at the appropriate hierarchy level. It is the Department's expectation that issues not effectively settled at the field level will elevate in accordance with the Issue Escalation Matrix. The goal is to maintain project momentum while a decision is reached by the next tier of project management, who can rely on a broader project perspective.

690.4 MEASUREMENT AND PAYMENT—DOLLAR

(a) Facilitation Costs. The Department agrees to reimburse 50% of the invoice costs for the following:

- Facilitator workshop and session costs.
- Monthly partnering evaluation survey service cost.
- Cost for partnering skills development trainer and training site cost.

Payment amount will be based on invoice prices without any markup costs.

SECTION 692—SHOULDER RELIEF JOINT

692.1 DESCRIPTION—This work is construction of a shoulder relief joint on a prepared surface.

692.2 MATERIAL—

- Superpave Asphalt Mixture Design, Asphalt Base Course—Section 504.2
- Asphalt Cement, PG 64S-22—Section 702

692.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) **Base Course.** Construct Superpave Asphalt Mixture Design, Asphalt Base Course as specified in Section 313.3.

692.4 MEASUREMENT AND PAYMENT—Linear Foot
Measured transversely.

SECTION 695 – DETECTABLE WARNING SURFACE

695.1 DESCRIPTION – This work is furnishing all material, equipment, tools, and labor required for the placement and installation of detectable warning surfaces on cement concrete sidewalk curb ramps and other designated surfaces in order to provide a tactile warning for pedestrians with visual impairments under the provisions of the Americans with Disabilities Act (ADA).

695.2 MATERIAL –

(a) **Detectable Warning Surface (DWS).** Provide a DWS product from a manufacturer listed in Bulletin 15 and meeting the requirements of the Proposed Accessibility Guidelines for Pedestrian Facilities in the Public Right-of-Way (PROWAG). Provide certification as specified in Section 106.03(b)3 that the DWS meets the following PROWAG criteria:

- **General.** Detectable warning surface with the surface comprised of truncated domes. Dome size and spacing as specified and as shown on the Standard Drawings.
- **Surface.** Slip resistant.
- **Contrast.** Provide a DWS color, as approved by the Representative, that contrasts visually with adjacent walking surfaces either light-on-dark or dark-on-light.

(b) **Other Material.**

- **Class A Cement Concrete** – Section 704
- **Subbase** – Section 350
- **Joint Sealant Material** – Section 705.4(a), (b), or (c)

695.3 CONSTRUCTION –

(a) **General.** Provide a copy of the DWS manufacturer's written installation instructions.

(b) **New Construction.** Coordinate this work with the requirements for new Cement Concrete Sidewalks, Section 676. Follow DWS manufacturer's instructions for a cast-in-place installation at the locations indicated and in accordance with the requirements as shown on the Standard Drawings for the designated curb ramp type or other designated surface.

(c) **Alteration or Retrofit Construction.** Saw cut and remove the entire depth of existing concrete from the area where the DWS will be placed. Replace any removed or disturbed aggregate subbase and compact before placing new concrete.

Place new cement concrete and follow the DWS manufacturer's installation instructions for a cast-in-place installation.

Fill any saw cut gaps with approved joint sealant material. Fill any gaps around the DWS edge installation with the joint material if necessary.

(d) **Protection.** Protect the new sidewalk and DWS surface from pedestrian traffic until the adjoining cement concrete surfaces have properly cured and work is complete at the curb ramp location. Clean the DWS surface using a method recommended by the manufacturer.

695.4 MEASUREMENT AND PAYMENT – Square Foot

SECTION 696—TEMPORARY IMPACT ATTENUATING DEVICES

696.1 DESCRIPTION—This work is the furnishing, placing, and removing of temporary impact attenuating devices for maintenance and protection of traffic during construction, as indicated.

696.2 MATERIAL—

- Temporary impact attenuating device as listed in Bulletin 15 that is crashworthy according to the 2016 AASHTO Manual for Assessing Safety Hardware (MASH) with either an FHWA eligibility letter or determination by an accredited testing laboratory stating that the product has passed all critical tests. Temporary impact attenuating devices manufactured on or before December 31, 2019, and successfully tested to NCHRP 350 or the 2009 edition of MASH, may continue to be used throughout their normal service lives.
- Reflective sheeting from a manufacturer listed in Bulletin 15, as shown on the Standard Drawings, and as specified in Section 1103.05.
- Flat sheet signs from a manufacturer listed in Bulletin 15, as shown on the Standard Drawings, and as specified in Section 1103.04(a).

696.3 CONSTRUCTION—

(a) General. Submit shop drawings as specified in Section 105.02(d).

(b) Installation. Install according to manufacturer's specifications and installation instructions, or as indicated.

Apply reflective sheeting onto the space provided on the manufacturer's impact head for delineation.

Apply reflective sheeting onto flat sheet signs for a left clearance marker (OM-3L) and/or right clearance marker (OM-3R) to delineate a sand barrel array system. Attach the left clearance marker (OM-3L) and/or right clearance marker (OM-3R) securely to the front of the sand barrel array system, according to the manufacturer's recommendations, where traffic is required to pass to the left and/or right.

(c) Training. Provide at least one trained installer as specified in Section 620.3(g)2.

696.4 MEASUREMENT AND PAYMENT—

(a) Temporary Impact Attenuating Device. Each

Reflective sheeting as specified in Section 1103.05 is incidental. Flat sheet signs as specified in Section 1103.04(a) are incidental.

(b) Repair of Impact Attenuating Device. The Department will pay for repair of Temporary Impact Attenuating Devices as specified in Section 110.03(d) Force Account Work, if money has not been secured through other sources for the same purpose.

SECTION 697—RESET TEMPORARY IMPACT ATTENUATING DEVICES

697.1 DESCRIPTION—This work is the resetting of a temporary impact attenuating device from one construction area to another within the project limits, as indicated.

697.2 MATERIAL—Section 696.2

697.3 CONSTRUCTION—Section 696.3 and as follows:

Reset temporary impact attenuating device if construction operations require a change in the protection of traffic, or as directed. Store or transport the attenuating devices as required.

697.4 MEASUREMENT AND PAYMENT—Each

Reflective sheeting as specified in Section 1103.05 is incidental. Flat sheet signs as specified in Section 1103.04(a) are incidental.

SECTION 700 MATERIAL

SECTION 701—CEMENT

701.1 GENERAL—Obtain cement from a producer listed in Bulletin 15 and from silos set aside for Department use. Do not use retrieved or reclaimed cement. Do not use cement with a material temperature exceeding 150F at the time of delivery to the plant.

(a) **QC.** Section 106.03(a)2

(b) **Certification.**

1. General. Conduct a Monthly Mill Test according to ASTM C150 or ASTM C595. Submit a copy of the Monthly Mill Test Form TR-7011 or Form TR-7015 for blended cement) to the LTS for verification of compliance with Department specifications:

- Base the Monthly Mill Test on actual or historical statistical process controls.
- Specify the type of material and cross-reference the test to the bill of lading.
- Ensure that a responsible company official sign the Monthly Mill Test.
- Submit split sample with corresponding test results monthly.

2. Levels of Certification. Section 106.03(b)3.e

(c) **Handling and Transportation.** Section 106.06 and as follows:

For each shipment to the project, furnish two copies of the vendor's bill of lading. Include one copy with the shipment to the project; the vendor shall retain the other copy. Use a form acceptable to the LTS that contains the following information:

- Statement that material has been tested and conforms to Department specifications.
- Type of material
- Silo number
- Company lot identification
- Date of shipment
- Producer's name and location
- Consignee's name and location
- Temperature of cement
- Trailer number
- Quantity (tons)

- Alkali content (%)—determined according to AASHTO T 105.

Ship bulk cement in clean, acceptable, metal, rubber, or plastic waterproof containers or compartments. Ship bagged cement 94 pounds net per bag) in suitable paper bags with the brand, type, and manufacturer's name printed on them. Protect cement bags from the weather. Reject cement bags with net weight more than 3% below that specified.

(d) Storage. Section 106.05 and as follows:

- Provide storage capacity sufficient to maintain the paving schedule.
- Store bulk cement in acceptable silos.
- Store bagged cement in enclosed buildings.
- Store bagged cement in stacks not exceeding eight bags in height and cover.

(e) Chemical and Physical Requirements and Testing. AASHTO M 85 and AASHTO M 240, except sample according to PTM No. 509.

(f) Limited Number of Sources. Obtain cement for each project from a single source, unless otherwise allowed by the Representative in writing. If using more than one source, separate cement of different types and from different sources. Use each type and source in continuous, segregated portions of the project. If possible, limit cement used in an individual structure to a single type and source. If this is not possible, use one type and source for footers, piers, and abutments, and one type and source for superstructures.

SECTION 702—ASPHALT MATERIAL

702.1 GENERAL—Obtain asphalt material conforming to the requirements of Bulletin 25 from a producer listed in Bulletin 15.

(a) **QC.** Prepare a QC Plan as specified in Section 106.03(a)2. Submit the QC Plan to the LTS for review annually at the beginning of each calendar year before shipping material to the project or by March 31, whichever is earlier. Prepare a QC Plan according to AASHTO R 26 and Bulletin 25 for Performance Graded Asphalt Binder (PGAB). Prepare a QC Plan according to AASHTO R 77 and Bulletin 25 for emulsified asphalt.

(b) **Certification.**

1. General.

- Obtain a verification sample from each batch and test according to Bulletin 25. A batch is a tank completely filled, partially filled, or refilled with a blend of residual and new material. Test one-third of each sample and forward the test results along with the second one-third of each sample to the LTS. Retain the remaining one-third of each sample and submit the retained sample to the LTS whenever LTS releases a failed sample test result for the second one-third of each sample or whenever LTS requests the retained sample. The LTS will evaluate QC based on verification samples.
- Provide Form CS-4171, Certificate of Compliance, signed by a responsible company official that lists the type of material, tank number, and company lot number for cross-referencing to the bill of lading.
- The Department's QA Teams will periodically review the QC Plan, inspect production and testing facilities, and take QA samples of material either at the plant or at the point where the material will be incorporated into the project.

2. Levels of Certification. Section 106.03.(b)3.e

(c) **Handling and Transportation.** Section 106.06 and as follows:

For each shipment to the project or asphalt mixture producer, submit one copy of the vendor's bill of lading on a form acceptable to the LTS that contains the following information:

- Statement that the material has been tested and conforms to Bulletin 25.
- Statement that the shipment container was free of contamination before loading.
- Class or grade of material.
- Tank number.
- Company batch number.
- Date of shipment.
- Producer's name and location.
- Consignee's name and location (Asphalt Mixture Producer or Plant, Department Maintenance District or County, or Contractor).

- For cutback asphalts and emulsified asphalts, minimum and maximum mix or application temperature requirements, handling and storage requirements for proper usage, and percent asphalt residue by weight.
- For the specific emulsified asphalt grades requiring the compatibility or stone coating test according to Bulletin 25, a statement that the material is compatible with the job aggregate. Perform the compatibility or stone coating test according to AASHTO T 59, Section 17 (Coating Ability and Water Resistance).
- For non-polymer-modified PGAB, a temperature-viscosity chart for each lot or batch of material to be shipped based on the rotational viscosities in either Pascal-seconds (Pa-s) or centipoises at 275F and 329F. Instead of plotted data, provide minimum and maximum laboratory mixing and compaction temperatures based on the mixing temperature range and compaction temperature range according to AASHTO T 312.
- For polymer-modified PGAB, any specific handling and storage requirements and minimum and maximum laboratory mixing and compaction temperatures as recommended by the PGAB supplier.
- Specific gravity at a temperature of 60F.
- Quantity of material.

SECTION 703—AGGREGATE

703.1 FINE AGGREGATE—

(a) **General.** Fine aggregate is natural or manufactured sand consisting of hard, durable, and uncoated inert particles reasonably free from clay, silt, vegetation, and other deleterious substances such as reactive chert, gypsum, iron sulfide, amorphous silica, and hydrated iron oxide. Substances present in amounts large enough to cause inconsistent performance in asphalt concrete or plastic or hardened portland cement concrete are considered deleterious. Spent foundry sand may be used as fine aggregate in asphalt concrete and flowable fill.

Obtain fine aggregate with physical properties according to Table A from a source listed in Bulletin 14 or approved by the LTS before use.

1. Natural Sand. Natural sand is fine aggregate resulting from glacial or water action. Fine aggregate produced simultaneously with gravel coarse aggregate may contain crushed particles.

2. Manufactured Sand. Manufactured sand is fine aggregate from the controlled mechanical breakdown of rock, air-cooled blast furnace slag, or air-cooled steel slag into sound, approximately cubical particles.

Fine aggregate manufactured from limestone may not be used in concrete wearing surfaces.

Fine aggregate manufactured from steel slag may not be used in cement concrete or mortar mixtures. Steel slag fine aggregate may only be used in asphalt wearing courses with the approval of the LTS; however, do not use steel slag fine aggregate in conjunction with steel slag coarse aggregate. Provide steel slag fine aggregate that is uniform in density and quality. If steel slag was manufactured after January 1, 2007, traceability of material must be established. If traceability cannot be established, perform chemical testing according to DEP General Permit WMGR144 and submit the test results to the LTS. Cure steel slag fine aggregate according to the following procedure:

- After gradation preparation, place steel slag fine aggregate, whether reclaimed from an old stockpile or processed directly from the steel-making process, in a controlled stockpile. Limit the stockpile size to a maximum of 30,000 tons. Completely soak the steel slag fine aggregate with water before or during stockpiling. Submit the method of constructing and controlling the stockpile to the Representative for review.
- Maintain the stockpile in a uniform moist condition for a period of not less than 6 months. After the minimum cure period, the Representative will sample and test the stockpile for expansive characteristics according to PTM No. 130. The Representative will approve the stockpile for use if the average total volumetric expansion according to PTM No. 130 is less than 0.50%.
- If the stockpile fails expansion criterion, continue curing the stockpile for a minimum of 2 additional months. The Representative will resample and retest the stockpile after the required additional cure period.

The LTS will evaluate the quality of fine aggregates by conducting petrographic analysis according to PTM No. 518 and other tests necessary to demonstrate that required construction of acceptable durability can be achieved.

(b) Production Testing.

1. Personnel and Equipment. Provide and assign to the work a PennDOT Certified Aggregate Technician who will test fine aggregate at the source according to the requirements listed in Bulletin 14.

Provide equipment for acceptance testing and for developing and maintaining a QC program to ensure compliance with specification requirements during production according to Bulletin 14.

2. Testing and Documentation. Perform tests as required by Bulletin 14. Evaluate the test results to ensure the quality requirements are met.

Document the results of tests made during production and make them available to the Department upon request.

(c) Grading and Quality Requirements.

1. Gradation. Table A lists the extreme limits for determining the suitability of supply sources.

Control the grading of Type A Fine Aggregate so the fineness modulus of at least nine out of ten consecutive test samples from a single source delivered to a project or plant varies less than ± 0.20 from the average fineness modulus of the consecutive test samples. Determine the fineness modulus according to PTM No. 501.

For asphalt mixtures:

- If directed, vary the gradations within the limits according to Table A.
- A blend of fine aggregates may be used if the proposed gradation limits for blending are approved by the District Executive in writing.
- If filler is required, provide fine aggregate conforming to the gradation according to Table A and use cement, cement dust, fly ash, or fines from the crushing of stone, gravel, or slag reasonably free of clay.

2. Material Finer than the 75 μm (No. 200) Sieve. Determine the loss by washing according to PTM No.100.

3. Minimum Strength Ratio. Determine the organic impurities in fine aggregate (Type A and Type C only) according to AASHTO T 21. If the color value result is greater than Organic Plate No. 3, determine the minimum strength ratio according to AASHTO T 71 and use fine aggregate meeting the strength ratio according to Table A.

4. Soundness Test. Determine the percentage loss after five cycles of immersion and drying using a sodium sulfate solution according to PTM No. 510.

5. Specific Gravity and Absorption. AASHTO T 84.

TABLE A
Fine Aggregate
Grading and Quality Requirements

	Cement Concrete Sand	Asphalt Concrete Sand Type B			Mortar Sand
Sieve Size	Type A	#1	#3	Filler	Type C
9.5 mm (3/8-inch)	100	100	100	—	—
4.75 mm (No. 4)	95-100	95-100	80-100	—	100
2.36 mm (No. 8)	70-100	70-100	65-100	—	95-100
1.18 mm (No. 16)	45-85	40-80	40-80	—	—
600 μm (No. 30)	25-65	20-65	20-65	100	—
300 μm (No. 50)	10-30	7-40	7-40	95-100	—
150 μm (No. 100)	0-10	2-20	2-20	90-100	0-25
75 μm (No. 200)	—	0-10	0-10	70-100	0-10
Material Finer Than 75 μm (No. 200) Sieve Max. Percent Passing	3	—	—	—	—
Strength Ratio Min. Percent	95	—	—	—	95
Soundness Test Max. Loss Percent	10	15	15	—	10
Fineness Modulus	2.30-3.15	—	—	—	1.6-2.5

703.2 COARSE AGGREGATE—

(a) General. Coarse aggregate consists of hard, tough, durable, and uncoated inert particles reasonably free from

clay, silt, vegetation, and other deleterious substances such as reactive chert, gypsum, iron sulfide, amorphous silica, and hydrated iron oxide. Substances present in amounts large enough to cause inconsistent performance in asphalt concrete or plastic or hardened portland cement concrete are considered deleterious.

The LTS will evaluate the quality of coarse aggregates by conducting petrographic analysis according to PTM No. 518 and other tests necessary to demonstrate required construction of acceptable durability can be achieved.

Furnish coarse aggregate crushed and prepared from one of the materials described below with physical properties conforming to Tables B, C, and D. Obtain coarse aggregate from a source listed in Bulletin 14 or approved by the LTS before use.

1. Stone. Durable stone free from slate texture or cleavage planes.

2. Gravel. Durable gravel particles. For use in cement concrete, wash thoroughly during production. For use in all asphalt wearing courses, unless otherwise specified, a minimum of 85% crushed particles with at least two faces resulting from fracture is required. For use as No. Open Graded Subbase (OGS), a minimum of 75% crushed particles with at least three faces resulting from fracture is required. For all Type A use, the maximum allowable absorption determined according to AASHTO T 85 is 3.0%; however, this restriction does not apply to dredged river gravel used in portland cement concrete. For all Type B use, the maximum allowable absorption determined according to AASHTO T 85 is 3.5%.

3. Blast Furnace Slag. By-product of a pig-iron making process. Tough, hard, and durable pieces of air-cooled blast furnace slag. If blast furnace slag was manufactured after January 1, 2007, traceability of material must be established. If traceability cannot be established, perform chemical testing according to DEP General Permit WMGR144 and submit the test results to the LTS. Blast furnace slag is excluded from the abrasion requirements. The density (unit weight) of blast furnace slag cannot be less than 70 pounds per cubic foot. If there is more than 5% contamination of steel slag in a stockpile, the stockpile is considered steel slag. Limit the stockpile size to a maximum of 30,000 tons.

4. Steel Slag. By-product of a steel making process. Tough, hard, and durable pieces of steel slag reasonably uniform in density and quality. If steel slag was manufactured after January 1, 2007, traceability of material must be established. If traceability cannot be established, perform chemical testing according to DEP General Permit WMGR144 and submit the test results to the LTS. After crushing, grading, and forming a stockpile, take a sample from the stockpile and submit it to the LTS for testing of expansive characteristics. The LTS will accept the stockpile for use if the total expansion determined according to PTM No. 130 is less than 0.50%. Once a stockpile is accepted, do not add to it if it is for Department use. Limit the stockpile size to a maximum of 30,000 tons. If the stockpile fails expansion requirements, cure the aggregate stockpile as follows:

- Rework the stockpile and soak the aggregate completely with water.
- Submit the proposed method of constructing and controlling the stockpile during the cure period for review and acceptance.
- Maintain the aggregate in a uniformly moist condition in the stockpile for a period of at least 6 months. Take a sample after this curing period and submit it to the LTS for testing according to PTM No. 130.
- The Representative will accept the stockpile for use if the total expansion is less than 0.50%. If the stockpile still fails the expansion requirement, continue curing for at least 2 additional months before resampling and retesting.

Aggregate manufactured from steel slag is not acceptable for pipe or structure backfill, in cement concrete, or as subbase. Aggregate manufactured from steel slag may be used for selected granular material, shoulders, selected material surfacing, and in asphalt surface courses.

5. Granulated Slag. By-product of an iron-making process. Granulated blast furnace slag is the granular glassy material formed if molten slag from iron-making is rapidly quenched by immersion in water and contains not more than 3% total iron reported as Fe_2O_3 . If granular slag was manufactured after January 1, 2007, traceability of material must be established. If traceability cannot be established, perform chemical testing according to DEP

General Permit WMGR144 and submit the test results to the LTS. Limit the stockpile size to a maximum of 30,000 tons.

Provide material containing not more than 20% by mass (weight) of substances that are not granulated slag. Use material with a dry rodded density (unit weight) determined according to AASHTO T 19 of not more than 80 pounds per cubic foot. Provide uniform material having a maximum size of 50 mm (2 inches) and not more than 20% passing the 150 μ m (No. 100) sieve. Granulated slag may only be used for subbase material as specified in Section 350.

6. Lightweight Aggregate. Acceptable types of lightweight aggregate are as follows:

- Aggregate prepared by expanding, pelletizing, or sintering products such as blast-furnace slag, diatomite, fly ash, clay, shale, or slate.
- Aggregate prepared by processing natural materials such as pumice, scoria, or tuff.

Furnish lightweight aggregate conforming to AASHTO M 195, the soundness and abrasion limits for Type A aggregate according to Table B, and the following durability requirements.

- | | | |
|--|--------|-----|
| • Aggregate Absorption Factor (PTM No. 526) | Max. % | 2.5 |
| • Freeze-Thaw Resistance of Concrete, Decrease of Dynamic Modulus at 300 Cycles (AASHTO T 161, Procedure B, except after 14 days of moist cure, dry the beams 3 inches by 4 inches by 16 inches at 72F \pm 3F and approximately 50% relative humidity for 14 days. Then soak the beams in water for 3 days before starting the freezing and thawing test.) | Max. % | 60 |
| • Freeze-Thaw Resistance of Aggregate (PTM No. 525) | Max. % | 25 |

TABLE B
Coarse Aggregate
Quality Requirements⁽⁷⁾

	Type A	Type B	Type C	Type S
Soundness, Max. %	10	12	20	16
Abrasion, Max. %	45	45	55	55

Glassy Particles, Max. %	4 or 10 ⁽³⁾	4 or 10 ⁽³⁾	—	—
Iron, Max. %	3 ⁽⁵⁾	3 ⁽⁵⁾	3 ⁽⁵⁾	3 ⁽⁵⁾
Absorption, Max. %	3.0 ⁽⁴⁾	3.5 ⁽⁴⁾	—	2 ⁽⁴⁾
Total of Deleterious Shale, Clay Lumps, Friable Particles, Coal, or Coke Allowed, Max. %	2	2	15	15
Notes: (1) Section 703.2(c)4. (2) Section 703.2(c)5. (3) Section 703.2(c)9. (4) Gravel only for Types A and B. as specified in Section 703.2(c)2. All natural aggregates for Type S. (5) Section 703.2(c)10.. (6) Natural coarse aggregates with an absorption less than 2% are considered freeze thaw resistant and not subject to testing according to AASHTO T 103, Procedure A. Natural aggregates with an absorption exceeding 2% shall be considered freeze thaw resistant if either their sodium sulfate soundness level is less than 16% or their AASHTO T 103 freeze thaw loss after 25 cycles (coarse fraction) does not exceed 7.0%. Type S 2A aggregate may be supplied where Type 2A aggregate for purposes other than subbase is specified at no additional cost to the Department. (7) Test methods to determine the quality requirements of Table B as specified in Section 703.2 (c).				

7. Recycled Concrete. Salvaged and crushed concrete pavements and concrete highway structures from Department, county, or municipal projects for use as 2A aggregate, shall not be used in subbase.

(b) Production Testing.

1. Personnel and Equipment. Provide and assign a PennDOT Certified Aggregate Technician to test coarse aggregate at the source according to Bulletin 14.

Provide equipment for acceptance testing and for developing and maintaining a QC program to ensure compliance with specification requirements during production according to Bulletin 14.

2. Testing and Documentation. Perform tests as required by Bulletin 14. Evaluate the test results to ensure the quality requirements are met.

Document the results of tests made during production and make them available to the Department upon request.

(c) **Quality Requirements.** The following notes are applicable to Table B.

1. Soundness. Determine the percentage loss after five cycles of immersion and drying using a sodium sulfate solution according to PTM No. 510. The LTS may accept aggregate failing the test if it can be demonstrated in writing the aggregate has a satisfactory service record in both pavements and structures. Acceptable aggregate produced from recycled concrete need not conform to soundness requirements since cementitious material cannot be evaluated with this test.

2. Abrasion. Determine the percentage of loss according to AASHTO T 96.

3. Thin and Elongated Particles. ASTM D4791, Method B, using the material retained on the 4.75 mm (No. 4) sieve. Measure the ratio of 5:1, comparing the length to the thickness of the aggregate particles. Calculate the percentage of flat and elongate particles by mass.

TABLE C
Size and Grading Requirements for Coarse Aggregates
(Based on Laboratory Sieve Tests, Square Openings)

AASHTO Number	Total Percent Passing

OGS**				100			52-100		36-65	8-40		0-12			

* Applies only for asphalt mixtures.

** PennDOT Number – Only Type C and Type S will be listed in Bulletin 14.

*** For 75 µm (No. 200), see Table D.

Note A: A combination of No. 7 and No. 5 may be substituted for No. 57, if no more than 50% or less than 30% of the combination is No. 7 size.

Note B: Provide No. OGS material that has a minimum average coefficient of uniformity of 4.0. The average coefficient of uniformity is defined as the average of the sublots within each lot. Determine the coefficient of uniformity according to PTM No. 149 each time the gradation is determined. The required minimum coefficient of uniformity for individual samples is 3.5. If the coefficient of uniformity of any sample falls below 3.5, reject the lot. Do not use the coefficient of uniformity in the multiple deficiency formula.

4. Material Finer than the 75 μm (No. 200) Sieve. Determine the loss by washing according to PTM No. 100 and Table D.

This test is not required for aggregate processed through a mechanical dryer for use in asphalt concrete; however, the aggregate is required to be clean and free of fines that would adversely affect the coating of the aggregate with asphalt material.

This test is not required for AASHTO No. 10 aggregates.

TABLE D
Material Passing the 75 μm (No. 200) Sieve —
(Based on Laboratory Sieve Tests, Square Openings)

Section	Specification	% Maximum
350	Subbase (No. 2A)	10
350	Subbase (No. OGS)	5
470	Bit. Seal Coat	1.0
471	Bit. Seal Coat w/ Precoat. Aggr.	2.0
480	Bit. Surf. Treatment	1.0
704	Cement Concrete	1
—	All other uses	2

5. Crushed Fragments. ASTM D5821

6. Deleterious Shale. Determine the percentage of deleterious shale by four cycles of wetting and drying according to PTM No. 519. The LTS will use petrographic analysis to confirm the results.

7. Friable Particles. Percent loss according to PTM No. 620.

8. Coal or Coke. Determine the percentage of mass (weight) by visual identification and hand separation. If required, the LTS will use petrographic analysis to confirm the results.

9. Glassy Particles. Determine the percentage of mass (weight) by visual identification and hand separation. Pieces of slag containing more than 50% glass are considered to be glassy particles. Waste glass is also considered to be glassy particles. For coarse aggregate used in cement concrete, the maximum percentage of glassy particles allowed is 4%. For other uses, the maximum percentage of glassy particles allowed is 10%. Coarse aggregate containing glassy particles consisting of waste glass may not be used in cement concrete or asphalt wearing courses.

10. Metallic Iron. The LTS will use petrographic analysis to determine the content of metallic iron. Pieces of slag containing metallic iron are considered to be metallic iron. This requirement is waived if aggregate with metallic iron is used in asphalt mixtures or subbase. PTM No. 518.

11. Clay Lumps. Determine the percentage of mass (weight) by visual identification and hand separation. If required, the LTS will use petrographic analysis to confirm the results.

12. Specific Gravity and Absorption. AASHTO T 85.

13. Bulk Density (Unit Weight) and Voids. AASHTO T 19.

(d) Testing and Acceptance. Section 703.5(b)

703.3 SELECT GRANULAR MATERIAL (2RC)—

(a) General. Select granular material consists of durable bank or crushed gravel, stone, or slag mixed or blended with suitable filler materials to provide a uniform mixture. Obtain select granular material from a source listed in Bulletin 14. Stockpile, sample, and test material before it is used to ensure reasonable uniformity and acceptability. Use material free from vegetable or organic matter, lumps, or an excessive quantity of clay or other objectionable or foreign substances and not more than 10% deleterious shale by mass (weight).

(b) **Gradation.** Conforming to the following gradation, determined according to PTM No. 616:

- Passing 50 mm (2-inch) sieve—100%
- Passing 4.75 mm (No. 4) sieve—15% to 60%
- Passing 150 μ m (No. 100) sieve—0% to 30%

703.4 ANTI-SKID MATERIAL—

(a) **General.** For use on ice or snow-covered pavement surfaces, furnish anti-skid material conforming to Table E from a producer or agent listed in Bulletin 14. Do not use material containing metal, glass, or substances harmful to automotive equipment and vehicles. Use material reasonably free of deleterious substances or foreign materials including, but not limited to, dirt, shale, slate, incinerated asphalt coal mine waste, and within the maximum limits of the individual deleterious and total deleterious materials according to Table B, Type C.

(b) **Description.**

1. **Type AS1.** Either natural sand, manufactured sand (except slag aggregates), or a combination of the two conforming to the following requirements:

- Bulk Density (Unit Weight). Minimum 70 pounds per cubic foot and not exceeding 110 pounds per cubic foot determined according to AASHTO T 19.
- Crushed Fragments. If natural sand is furnished, not less than 35% of the fragments retained on the 2.36 mm (No. 8) sieve are required to be crushed fragments, determined according to ASTM D5821.
- Iron. Total of individual anti-skid particles containing metallic iron may not exceed 1.0% by mass (weight) of material, determined by dividing the mass (weight) of such particles retained on the 4.75 mm (No. 4) sieve by the total dry mass (weight) of the sample.

2. **Type AS2 and AS3.** Crushed stone or crushed gravel conforming to the following requirements:

- Bulk Density (Unit Weight). Minimum 70 pounds per cubic foot and not exceeding 105 pounds per cubic foot determined according to AASHTO T 19.
- Los Angeles Abrasion. Abrasion loss not exceeding 55%, determined according to AASHTO T 96, Gradation D.
- Crushed Fragments. If crushed gravel is furnished, not less than 60% of the fragments retained on the 4.75 mm (No. 4) sieve are required to be crushed, one face, determined according to ASTM D5821.
- Iron. Total of individual anti-skid particles containing metallic iron may not exceed 1.0% by weight of material, determined by dividing the mass (weight) of such particles retained on the 4.75 mm (No. 4) sieve by the total dry mass (weight) of the sample.

3. **Type AS4.** Crushed slag conforming to the following requirements:

- Bulk Density (Unit Weight). Minimum 70 pounds per cubic foot and not exceeding 105 pounds per cubic foot determined according to AASHTO T 19.
- Los Angeles Abrasion. Abrasion loss not exceeding 55%, determined according to AASHTO T

96, Gradation D.

- Iron. Total of individual anti-skid particles containing metallic iron may not exceed 1.0% by mass (weight) of material, determined by dividing the mass (weight) of such particles retained on the 4.75 mm (No. 4) sieve by the total dry mass (weight) of the sample.

(c) **Gradations.** According to Table E.

TABLE E
Anti-Skid Gradation

Anti-Skid Type	Maximum Percent Passing Sieve								
	31.5 mm (1 1/4")	19.0 mm (3/4")	12.5 mm (1/2")	9.5 mm (3/8")	4.75 mm (No. 4)	2.36 mm (No. 8)	300 µm (No. 50)	150 µm (No. 100)	75 µm (No. 200)*
Type AS1				100	60-100	0-80		0-8	0-5
Type AS2				100	35-80	0-45		0-6	0-3**
Type AS3			100	90-100		0-30		0-8	
Type AS4				100		0-30		0-8	0-5

* Determined by PTM No. 100.

** If the total percent passing the 2.36 mm (No.8) sieve is less than 25%, the total percent passing the 75 µm (No. 200) sieve is allowed to be 0-5.

(d) **Testing.** If shipping, test material for moisture content according to PTM No. 513. A minimum of two tests per day is required. If conditions exist that would cause a change in moisture content, conduct additional tests. A Department representative will verify the test results.

Document tests at the end of delivery quantity at the end of the day and determine the average moisture content. The Department will adjust the delivery quantity by deducting the average moisture content from the aggregate quantity shipped. Payment is based on the calculated oven dry mass (weight).

703.5 ACCEPTANCE OF CONSTRUCTION AGGREGATES—

(a) **General.** The following describes the certification acceptance of construction aggregates. Accept AASHTO No. 1 Coarse Aggregate as specified in Section 850.2(a)1.

(b) **Testing and Acceptance.** Certify each day's shipment of aggregate as specified in Section 106.03(b)3.

1. **QC.** Section 106.03(b)2 and as follows:

- Submit for annual review a QC Plan conforming to the minimum Department requirements for aggregate suppliers.
- Establish and positively identify aggregate stockpiles that have been tested according to the approved QC Plan and conform to Department Specifications. Material may be added to or shipped from stockpiles at the producer's discretion.

2. **Source Verification Samples.** Under the direction and supervision of the Representative, obtain a verification sample (n=3) from each stockpile to be tested. Obtain the sample from the stockpile according to AASHTO R 90 or from a mini-stockpile. If the mini-stockpile method is chosen, obtain the sample according to the following procedure:

- Place approximately 10 tons of aggregate into a mini-stockpile on a suitable surface. Use a loader to strike off the top of the mini-stockpile.
- Obtain sufficient material for sampling from random locations on the mini-stockpile using a square faced shovel.

If project verification samples or lot acceptance samples in Section 703.5(b)3 result in a Percent Within Limits

(PWL) < 90, the Representative will direct additional source verification sampling of the stockpile(s) from which the failing material was shipped. In such instances, do not ship additional materials from the stockpile(s) until test results from source verification samples have $PWL \geq 90$.

Immediately deliver the source verification sample to the Representative for testing using the equipment provided as specified in Sections 703.1(b) and 703.2(b). The Representative will test all three increments according to Tables A, B, C, and D, as applicable. If the test results verify the material conforms to the specifications, use the material under certification, unless project verification samples require lot acceptance.

If the material does not conform to the specifications, the Representative will determine the PWL as specified in Section 106.03(a)3. If source verification results indicate a $PWL < 90$, the Representative will reject the stockpile.

If a stockpile is rejected, increase QC testing according to the reviewed QC Plan. Construct another stockpile of the aggregate to be tested consisting of 300 tons to 500 tons of material or the remainder of the quantity identified for Department projects, whichever is less. The Representative will accept the material under certification if test results verify the material from the new stockpile conforms to the specifications, unless project verification samples require lot acceptance.

3. Project Verification Samples. Under the direction and supervision of the Inspector, obtain verification samples ($n=3$) according to Table F for aggregates used for subbase applications under the roadway and shoulders as specified in Section 350. At the preconstruction conference provide the Representative estimated aggregate quantities for subbase applications under the roadway and shoulders. Other aggregate types or applications may be sampled for project verification if the Representative determines the material is visually suspect. Obtain samples at the point of placement (loose aggregate sample on grade before trimming and compaction) and not from project stockpiles unless directed:

TABLE F
Verification Samples

Aggregate Quantities	Number of Samples ($n=3$)
1,000 tons or more, but less than 2,000 tons	1
2,000 tons or more, but less than 10,000 tons	2
10,000 tons or more, up to 25,000 tons	3
Each additional increment of 25,000 tons	1

The Inspector will select sample locations according to PTM No. 1.

Under the direction and supervision of the Inspector, immediately deliver the sample(s) to the test site at either the producers' location or the project site. The Inspector will test the sample(s) using the equipment provided as specified in Sections 703.1(b) and 703.2(b). The Inspector will test all three increments for compliance with Tables C and D, plus the Crushed Fragments Test of Table B if applicable. The Inspector will provide the test results within 5 days from the date of sampling. The Department will continue to accept material under certification if test results verify the material conforms to the specifications.

If the material does not conform to the specifications, the Inspector will determine the average PWL of the material as specified in Section 106.03(a)3. If results indicate a $PWL < 90$ for the material, the Department will discontinue certification acceptance and begin project lot acceptance of the aggregate. Discontinue all operations using that size of aggregate until the Representative determines new lot sample locations according to PTM No. 1 and authorizes operations to continue. Conduct lot acceptance testing at the point of placement according to the following procedure:

- Under the direction and supervision of the Inspector, use a PennDOT Certified Aggregate Technician to obtain an acceptance sample ($n=3$) at the point of placement (loose aggregate sample on grade before trimming and compaction) for each 7,500 tons of material placed. The lot size of 7,500 tons will be divided into three equal sublots.
 - The Inspector will select sample locations according to PTM No. 1. The Inspector will take possession of the sample and immediately transport the sample from the sampling point to the testing site. The Inspector will test all three sample increments for compliance as specified in Section 703.2(c), Tables C and D plus the Crushed Fragments Test of Table B. Aggregates other than gravel will use 100 as the PWL for the Crushed Fragments Test according to Table

- B. The Inspector will provide the test results within 5 days of sampling. Failure to provide test results within the targeted timeframe will not form a basis to dismiss the test results, and the test results will govern in all cases.
- If less than 7,500 tons remain for the project, the remaining quantity will be considered a lot. Divide the remaining approximated quantity into three equal sublots so three increments are obtained.
 - If a change in aggregate sources is made before three increments are obtained for a lot, obtain additional increments from remaining materials on the project to provide one full acceptance sample ($n=3$) from the first source.
 - The Inspector will document the placement location(s) by station of material placed to clearly delineate the location of all material within the lot.
 - The Department will continue project lot acceptance testing until five consecutive lots are accepted at ≥ 90 PWL. Once five consecutive lots are accepted at ≥ 90 PWL, acceptance may again be by producer certification and verification testing will begin again at the frequency according to Table F for the remaining project quantity. The Contractor will be charged \$600 for each lot of material placed, for the project lot acceptance testing performed by the Inspector.
 - For all test values, the Department will determine the lot PWL as specified in Section 106.03(a)3. If results indicate a $PWL \geq 90$, the lot is accepted at full payment. If results indicate a $PWL < 90$ for the material, the Department will determine the Degree of Non-Conformance (DNC) for the lot according to the following:
 - Lot average values for all sieve sizes which do not conform to the specified limits will be used to calculate the DNC. For each sieve where the average does not conform to specifications, the difference between the average test value and the closest specified limit will be computed (upper limit for average values where the upper limit has been exceeded or lower limit for average values where the lower limit was not reached). Each difference will be multiplied by the factor according to Table G.
 - Crushed fragment average test results which do not conform to the specified limits will also be included in the DNC. The DNC will include the difference between the lower specified limit and the lot average crushed fragment test results.
 - The Department will determine the total DNC for the lot by summing of all the non-conformances for each sieve size and crushed fragments after each has been multiplied by applicable factors according to Table G and Table H. The total DNC will be used to adjust the payment represented by the non-conforming lot according to Table I.

TABLE G
Multiplication Factors for DNC

Sieve Size	Multiplication Factor
4 inch to No. 4 inclusive	1.0
No. 5 to No. 80 inclusive	1.5
No. 100	2.0
No. 200 (Table D)	Table H
Crush Count	1.0

TABLE H
No. 200 Sieve Upper Limit and Multiplication Factor

% Maximum	Upper Limit To Calculate DNC	Multiplication Factor
10	10.49	2.5
5	5.49	2.5
2	2.49	2.5
1	1.49	2.5
2.0	2.05	5
1.0	1.05	5

TABLE I
DNC Pay Reduction Percent

Total Sum of DNC	Percent of Contract Unit Price Reduction
0.5 to 3.0	2%
3.1 to 5.0	4%
5.1 to 8.0	7%
8.1 to 12.0	11%
Greater than 12.0	**
**If the sum of the DNC is greater than 12.0, the Representative will direct the material represented by the lot (n=3) be removed and replaced at no additional cost to the Department or left in place and final payment for the material will be at 70% of the contract unit price. Pending the decision by the Representative, do not place additional materials on or incorporated with the non-conforming material.	

4. QA Samples. CMD QA samples (n=3) may be taken at the source of supply or at the point of placement on the project. Submit samples to the LTS for testing. If results for any type of material indicate a PWL of less than 90, the District will immediately obtain an additional verification sample (n=3) at the appropriate site (project or source). The Department will test all three sample increments at either the producer's location or at the project site and determine the PWL for the material. If results indicate a PWL for the material of less than 90, obtain source verification samples and project verification samples as specified in Section 703.5(b)2 and Section 703.5(b)3.

(c) Weighing Responsibilities. Prepare weight slips and certifications attesting to the accuracy of the weights recorded and ensuring conformance as specified in Section 107.23(b). Designate a licensed weigh person(s) to act as the Contractor's agent. Ensure scales are calibrated annually by an independent agency acceptable to the Department. A Department Inspector may provide random checking.

Weigh empty trucks used to haul material measured by mass (weight) daily unless otherwise directed. If the invoice mass (weight) exceeds the net mass (net weight) determined by a Department mobile weigh team by more than 3%, the Department will consider the deviation to be excessive. Take immediate corrective action upon notification of an excessive deviation. Within 30 days of notification, provide the District Executive with a written description of corrective actions and safeguards and the time they were implemented.

703.6 CERTIFICATION OF AGGREGATES AT ASPHALT AND CEMENT CONCRETE PLANTS—

(a) Certification. Certify aggregate at asphalt and cement concrete plants yearly for quality requirements as specified in Section 106.03(b)3 using Form CS-4171 or another acceptable form.

SECTION 704—CEMENT CONCRETE

704.1 GENERAL—

(a) Description. Furnish the indicated class of cement concrete according to the requirements of Table A. Cement concrete is a mixture of portland cement, fine aggregate, coarse aggregate, water and air-entraining admixture, with or without water reducing admixture, retarding admixture, or supplementary cementitious material (SCM)

The methods of producing concrete referred to in these Specifications are defined as follows:

1. Plant Mixed Cement Concrete. Concrete proportioned and mixed in either a stationary, commercial, and central plant or a stationary plant located near the project. Concrete is delivered to the work site by truck, agitator truck, or mixer truck.

2. Truck Mixed Cement Concrete. Concrete prepared by dry batching in a proportioning plant and placing the dry ingredients in a truck mixer. Measured water is then added to the truck drum from the plant water system and the concrete is mixed in the truck at the plant. Mixing is not allowed en-route to or at the work site.

3. Volumetric Mixed Cement Concrete. Concrete proportioned and mixed in a truck-mounted mobile mixer. The unit is capable of proportioning concrete ingredients from self-contained bins and mixing the materials with measured water in a self-contained mixer. The concrete is mixed and discharged at the work site.

(b) Material.

- Cement—Section 701
- Fine Aggregate, Type A—Section 703.1
- Coarse Aggregate, Type A, maximum size AASHTO No. 467, No. 57, No. 67 or No. 8 (Stone, Gravel, or Slag)—Section 703.2
- Coarse Aggregate, Type A Lightweight, Section 703.2(a) 6
- Water—Section 720.1
- Admixtures—Section 711.3
- Supplementary Cementitious Material (SCM)—Section 724

Table A
Cement Concrete Criteria

Class of Concrete	Use	Cement Factor ⁽²⁾⁽⁴⁾ (lbs./cu. yd.)		Maximum Water Cement Ratio ⁽⁵⁾ (lbs./lbs.)	Minimum Mix ^(1,7) Design Compressive Strength (psi)				28-Day Structural Design Compressive Strength (psi)
					Days				
		Min.	Max.		3	7	28 ⁽⁸⁾	56 ⁽⁸⁾	
AAAP	Bridge Deck	560	640	0.45	—	3,000	4,000	—	4,000
AAA ⁽³⁾	Other	634	752	0.43	—	3,600	4,500	—	4,000
AAAP LW	Bridge Deck	600	730	0.45	---	3,000	4,000	---	4,000
AA	Slip Form Paving	587	752	0.47	—	3,000	3,750	—	3,500
AA	Paving	587	752	0.47	—	3,000	3,750	—	3,500
AA	Accelerated ⁽⁶⁾	587	800	0.47	—	—	3,750	—	3,500
AA	Structures and Misc.	587	752	0.47	—	3,000	3,750	—	3,500
AA LW		587	752	0.47	---	3,000	3,750	---	3,000
ASC ⁽⁹⁾		587	846	0.47	---	---	4,000	---	4000
A		564	752	0.50	—	2,750	3,300	—	3,000
C		394	658	0.66	—	1,500	2,000	—	2,000
HES		752	846	0.40	3,000	—	3,750	—	3,500

- (1) Test Procedures: Slump—AASHTO T 119; Compressive Strength—PTM No. 604, or Maturity Meter Method—PTM No. 640. The upper age limit and lower age limit are defined by the values listed for 7-day and 28-day compressive strength.
- (2) For use in miscellaneous or structural concrete, if the Fineness Modulus (FM) is between 2.3 and 2.5, increase the minimum cement factor for the class of concrete 47 pounds per cubic yard. This requirement may be waived after adequate strength data is available and analyzed according to the mix-design section in ACI 211.
- (3) AAA concrete is not allowed to be used for new bridge decks.
- (4) For exception, see Section 704.1(c). Cement factor may be increased to a maximum of 690 pounds per cubic yard with the approval of the DME/DMM.
- (5) If a portion of the cement is replaced by SCM, use a water to cement plus SCM ratio by weight. The minimum water cement ratio for AAAP is 0.40 pounds per pounds.
- (6) For accelerated cement concrete, submit mix design, as specified, Section 704.1(c), having a minimum target value compressive strength of 1,500 pounds per square inch at 7 hours if tested according to PTM No. 604. (1,500 pounds per square inch at 7 hours is for mix design acceptance only). The required compressive strength for opening to traffic is specified in Section 501.3(q).
- (7) Trial Mix Designs for Class AAAP, AAAP LW, ASC and all concrete paving mixtures are required to meet a minimum 28-day compressive strength overdesign requirement of 28-day Minimum Mix Design Compressive Strength plus 500 pounds per square inch.
- (8) DME/DMM may accept mix designs based on the 56-day strength based on qualification testing.
- (9) For accelerated structural cement concrete, submit mix design, as specified in Section 704.1(c), having a minimum target value compressive strength of 3,500 pounds per square inch at 24 hours and 3,000 pounds per square inch to open to traffic when tested according to PTM No. 604.

1. Density of Material. Except for admixtures, use the following material densities (unit weights) if proportioning cement concrete:

Type of Material	Density
Water	62.4 pounds per cubic foot
Cement	94.0 pounds per cubic foot
Fine Aggregate	Based on bulk specific gravity as specified in Section 704.1(b)2
Coarse Aggregate	
Stone or Gravel	Based on bulk specific gravity as specified in Section 704.1(b)2
Slag	Based on field tests as specified in Section 704.1(b)2
Lightweight	Based on bulk specific gravity as specified in Section 704.1(b)2
SCM	Based on the LTS Tests

2. Specific Gravity of Aggregates. For fine and coarse aggregates, use the bulk specific gravity (saturated, surface-dry basis) listed in Bulletin 14.

For lightweight aggregate use the bulk specific gravity value (saturated surface-dry basis) listed in Bulletin 14, or the SSD gravity provided by the lightweight aggregate if purchased. As an alternative, the producer may run the SSD test and absorption with District Materials unit present.

If slag is used, test at the site to determine its loose-struck unit weight, solid volume per cubic yard, and bulk specific gravity factor (saturated surface-dry basis). Establish the concrete proportions based on the bulk specific gravity factor determined by the test. Check the unit weight of the slag daily to maintain the established solid-volume proportions.

3. Adjustment of Weight of Free Water. Adjust the batch weight of the aggregate to compensate for the free water on the aggregate. Base this adjustment on tests of representative samples taken from aggregate stockpiles.

4. Batching. For plant and truck mixed cement concrete, batch by weight. For volumetric mixed cement concrete, batch by volume.

(c) Design Basis.

1. General. Compute and prepare concrete mix designs according to ACI 211. For AAAP, AA Paving, and AA Slip Form Paving mix designs, determine the aggregate gradation for the mix design according to PTM No. 528. This does not apply to AAAP with #8's. Base concrete mix designs on the materials to be used in the work.

Overdesign strengths will be a minimum of 1,000 pounds per square inch except for AAAP, AAAP LW, AA Paving, and ASC which will be 500 pounds per square inch.

Make trial mixtures for each class of concrete and mold and cure test specimens. If the requirements of Table A cannot be achieved, furnish other acceptable materials or make necessary changes in the mixing procedure to conform to the specified requirements. Notify the DME/DMM at least 3 days in advance of preparing trial mixtures.

At the start of construction, mix a full-sized batch using the type of mixer and the mixing procedure planned for the project. Use this batch to provide the basis for final adjustment of the accepted design.

Mixture qualifications testing of Anti-Washout concrete according to PTM No. 641 to determine the maximum loss and required anti-washout admixture dosage may be conducted at an accredited lab or by the ready-mix producer with oversight from a technical representative from the admixture supplier. Trial batching for determination and verification of other design requirements must be performed by the ready-mix producer as specified in Section 704.1(c). Document the test results from the mixture qualification testing on the mix design before submitting for Department review.

2. Cement Factor. For all classes of concrete, use the minimum cement factor (cement, blended cement, or cement and SCM(s) combined) specified in Table A, except as follows:

Portland cement may be replaced with SCM(s) provided the maximum replacement by mass percentages in Table G, Prevention Level Z are not exceeded. The maximum limit of the cement factor may be waived if SCM(s) is/are added to the mix provided the portland cement portion does not exceed the maximum cement factor specified.

For AAAP and AAAP LW cement concrete, replace Type I or Type II portland cement with SCM (silica fume, flyash or slag cement) weighing as much as or more than the portland cement replaced. The percentages of SCM applicable to AAAP concrete are as shown below. Limit SCM to not more than two of the three SCMs listed below in one mix design as long as one of the SCM supplements meets the minimum percentage of replacement.

Cement factor must include at least one of the following as a replacement for a portion of the cement:

Slag Cement (Grade 100 or higher)	25% (min)
Flyash (Type C or Type F)	15% (min)
Silica Fume	5%-10%

3. Air Content. Design cement concrete to have an air content of 6.0% in the plastic state. Design AAAP and AA(pave) concrete mixes to have an air content of 7.0% in the plastic state. Obtain the air content through the addition of a solution of an air-entraining admixture as specified in Section 704.1(c)4. Use the quantity of air-entraining admixture necessary to maintain the plastic concrete air content, determined according to AASHTO T 152 (DO NOT APPLY AN AGGREGATE CORRECTION FACTOR) for stone and gravel and AASHTO T 196 (DO NOT APPLY AN AGGREGATE CORRECTION FACTOR) for slag or lightweight coarse aggregate, within a tolerance of $\pm 1.5\%$ during the work. The plastic concrete air content includes entrapped and entrained air.

If the hardened concrete exhibits deficiencies or the Representative suspects the hardened concrete to have deficiencies, and, if directed, determine the percent of entrained air in the hardened concrete according to PTM No. 623. Voids greater than 0.2 mils and less than 40 mils in their smallest dimension are considered entrained air. Voids 40 mils or more in diameter are considered entrapped air. The entrained air in the hardened concrete must be between 3.5% and 7.5%, inclusive. For AAAP and AA(pave) mixes, the entrained air in the hardened concrete must be between 4.5% and 8.5% inclusive.

4. Mix Design Acceptance. Submit a copy of each completed mix design to the Representative before its use in the work. The Department reserves the right to review all design through plant production before its use in Department work at no additional cost to the Department. The concrete design submitted for review is required to comply with the specified concrete class requirements, supported by slump, air content, and compressive strength test data according to ACI 211.

The Department will accept concrete designs based on the 7-day strength tests (Class High Early Strength (HES) may be accepted based on 3-day strength tests); however, conduct 28-day tests to show the potential of the design mix. The Department may also accept designs based on the 28-day tests.

Design AAAP cement concrete mixtures to achieve slow strength gain. Adjust component proportions with an objective of attaining a 28-day to 7-day compressive strength ratio during mix design greater than or equal to 1.20. A PennDOT inspector will witness the compressive strength tests. The 1.20 ratio is for mix design purposes only and not to be utilized as an acceptance factor during production. In no case will the Department accept any mixture during design which fails to meet a minimum 28-day to 7-day compressive strength ratio of 1.20.

Additional criteria for mix design acceptance of AAAP concrete are as follows:

The producer is required to complete the following tests before mix design submittal and approval.

- **Permeability** – Design the concrete mixture to meet a target chloride ion penetration of Low, Very low, or Negligible after a 56 day or less curing period according to AASHTO T 277 or AASHTO T 358.

The DME/DMM has the option of accepting mix designs with a chloride ion penetration of Moderate, however, the chloride ion penetration must meet one of the following:

AASHTO T 277, Table 1, not to exceed 2,800 coulombs; or

AASHTO T 358, Table 1, not to exceed 15.6k Ω -cm for 4-inch by 8-inch cylinders and 12.3 k Ω -cm for 6-inch by 12-inch cylinders.

- **Shrinkage (Microstrain)** – The 28-day shrinkage according to ASTM C157 is not to exceed 500 microstrain unless approved up to 550 microstrains by the DME/DMM. Wet cure specimens in the lab for 14 days before beginning the 28-day shrinkage testing (42 total days).

If permeability and shrinkage testing have been met for AAAP with #57's, these tests are not required for AAAP with #8's, provided the aggregates are from the same source.

A higher-class concrete may be used in place of an indicated lower-class concrete if the higher-class concrete conforms to all the requirements of the indicated lower class, and if approved by the Department.

5. Lightweight Cement Concrete (AAP LW and AA LW). Compute and prepare concrete mix designs according to ACI 211.2. Design lightweight cement concrete to have a range of Equilibrium Density of 110 pounds per cubic feet to 117 pounds per cubic feet with a target of 115 pounds per cubic feet, when tested according to ASTM C567

Supply the following information to the District Materials Unit at least two weeks before conducting trial mixes:

- Approximate absolute volume of coarse aggregate (cubic feet)
- Suggested coarse aggregate factor (CAF) (pounds per cubic yard)
- Oven-dry loose weight of coarse aggregate (pounds per cubic feet)
- Specific gravity factor
- Percent absorption

Store and use lightweight aggregates in a stable, uniform, saturated condition to ensure the aggregate, if batched, is at a moisture greater than saturated surface dry (SSD). Use the same source of aggregates and mix design throughout the entire project.

Plastic density can be used for field acceptance once a correlation between plastic density and equilibrium density is established. Equilibrium density as measured according to ASTM C567.

Entrained air content can be determined by the unit weight method according to ASTM C138. Once established, a correlation between air content as tested according to ASTM C 173 and the unit weight method can be made.

6. Sulfate Resistance Concrete. Design sulfate resistant concrete according to ACI 201.2.

(d) Testing and Acceptance.

1. QC Plan. Prepare a QC Plan as specified in Section 106.03 and submit it for review before the start of the project and at least annually thereafter. Include in the QC Plan testing frequencies and action points to initiate corrective measures. Do not start work until the Department has reviewed the QC Plan. Furnish a copy of the QC Plan to be maintained in the Department's project field office.

1.a Field Operation QC Plan. Prepare a field operation QC Plan for the Representative's review, as outlined on Form CS-704, to evaluate concrete field operation. Submit the field operation QC Plan at the Pre-construction conference or at least 2 weeks before the first concrete pour. Describe the construction equipment, personnel, and methods necessary to construct and test concrete courses for all structural elements. Include testing frequencies and action points to initiate corrective measures. Do not establish action points at either the upper or lower specification limits.

2. Concrete Technician. Provide, and assign to the work, a concrete technician properly instructed and trained to develop the concrete design, to control the quality and gradation of aggregates used, to perform required concrete tests, and to control the operations and concrete deliveries so the completed mixture conforms to the specifications at the point of placement.

The Department's concrete plant Inspector will not allow concrete considered unacceptable to be shipped to the project. The Inspector will not assume, by act or by word, any responsibility for batch control adjustments; calculations; or for setting of dials, gauges, scales, or meters. Failure of the Inspector to reject unacceptable concrete will not relieve the Contractor's obligation to provide concrete conforming to the specifications.

2.a Concrete Field Testing Technician. Provide, and assign to the work during placement of material, a PennDOT certified field testing technician, meeting the requirements according to Publication 536, to perform the required acceptance testing. The technician must carry a valid PennDOT certification card during placement of material.

3. Testing Facilities and Equipment. Provide sufficient thermometers, air meters conforming to AASHTO T 196 and T 152, and slump cones conforming to AASHTO T 119 for each separate project operation as needed. In the presence of the Inspector, calibrate all air meters a maximum 2 weeks before beginning concrete placement. Recalibrate all air meters, in the presence of the Inspector, every 2 weeks during concrete placement. Have back-up

equipment available to ensure no tests are missed. Provide sufficient 6-inch by 12-inch cylinder molds and tight-fitting domed caps (PTM No. 611) for QC, acceptance, verification, and QA samples. Provide sufficient incidental equipment such as wheelbarrows, shovels, and scoops as needed.

Provide acceptable means to conduct compressive strength testing using a compression machine and capping device conforming to PTM No. 604. Provide a curing tank conforming to PTM No. 611. Provide curing boxes, or other acceptable equipment, conforming to PTM No. 611 and capable of maintaining the air temperature immediately adjacent to the field-cured cylinders in the range of 60F to 80F for the first 24 ± 2 hours. Provide sufficient high-low thermometers or other temperature recording devices to monitor the temperatures next to the test cylinders. If required, cap cylinders at the testing site under the Representative's supervision.

If using the maturity method to estimate concrete compressive strength, provide one or more maturity meters and a sufficient number of temperature sensors conforming to PTM No. 640. Note: Casting concrete cylinders according to PTM 611 is recommended in case maturity meter equipment malfunctions.

Maintain all equipment used for testing in an operable condition. Using an independent agency acceptable to the Department, calibrate scales, balances, and the compression machine at least once per year. Recalibrate the compression machine whenever it is relocated. Maintain accurate records of calibration. If the compression machine is out of tolerance or malfunctions, return it to working order within 24 hours or supply a back-up machine until the problem is corrected.

Provide the necessary facilities for inspection, including a plant office as specified in Section 714.5(a), with the exception of a minimum floor space of 120 square feet.

4. QC Testing. Perform QC testing according to the reviewed QC Plan and as follows:

4.a QC Sampling and Testing of Plastic Concrete. Select an appropriate slump target value and range that will provide a workable mix for the construction element. The Contractor's technician must have a copy of the Department reviewed QC Plan in their possession during testing and must be aware of the target slump for the structural element being placed. Do not exceed the following slump upper limits:

Type of Mix	Slump Upper Limit
without water reducing admixtures	5 inches
with water reducing admixtures	6 1/2 inches
with high range water reducing admixtures (superplasticizers)	8 inches
mixes specified in Section 704.1(h)	2 1/2 inches
(except tremie concrete as specified in Section 1001.2(j))	
AAAP (regardless of admixtures used)	5 1/2 inches
AAAP LW (regardless of admixtures used)	6 inches

Perform plastic concrete slump, air, density (for AAAP LW and AA LW) and temperature tests on the first three consecutive trucks at the beginning of concrete placement operations or after a significant stoppage such as plant or equipment breakdown to determine if material control has been established. Material control is established when all test results of concrete slump, air, and temperature for three consecutive trucks are determined to be within the established action points. Obtain samples of fresh concrete according to PTM No. 601. Perform slump tests according to AASHTO T 119, air content tests according to AASHTO T 152 (DO NOT APPLY AN AGGREGATE CORRECTION FACTOR) or T 196 (DO NOT APPLY AN AGGREGATE CORRECTION FACTOR) (AASHTO T196 for AAAP LW and AA LW), temperature tests according to ASTM C1064, and density testing according to AASHTO T 121(for AAAP LW and AA LW) Report test data to the concrete technician promptly in order to facilitate necessary changes. Continue testing consecutive trucks until material control is established. Once material control is established, the frequency of testing may be reduced to a minimum of one test per 50 cubic yards. Select concrete batches for sampling according to the reviewed QC Plan or as directed by the Inspector. Notify the Inspector if sampling and QC testing are to be performed. The Inspector will witness the sampling and QC testing. If a QC test fails to conform to the specified requirements or exceeds the upper or lower action points included in the reviewed QC Plan, increase the testing frequency to every truck until material control has been reestablished.

Maintain the cement concrete consistency within 1 1/2 inches of the selected target slump value (target range). If the upper slump limit is exceeded on any slump test, the Contractor's technician shall reject the cement concrete. If any slump test result falls outside the target range and has not exceeded the upper limit, immediately perform the air content and temperature tests. If the air content and concrete temperature is within the specified limits, the Contractor may incorporate the material into the work provided a full set of quality control and acceptance cylinders are molded in addition to the cylinders made for the originally selected PTM No. 1 sample location, for compressive strength

testing according to PTM No. 611 and PTM No. 604. If one or more truckloads of cement concrete exceeds the slump target range, make additional quality control and acceptance cylinders from each truck. Use the lowest compressive strength cylinders for acceptance of the lot.

Do not incorporate concrete into the work that does not conform to the specified requirements.

4.b QC Compressive Strength Test Cylinders. From the same sample of concrete selected for acceptance testing as specified in Section 704.1(d)5, mold a sufficient number of concrete QC cylinders to be tested for 3-day or 7-day compressive strength, 14-day compressive strength (AAP), 28-day compressive strength, form removal strength, and loading strengths, as specified.

If using the maturity method to estimate concrete compressive strength, mold two or more cylindrical specimens for temperature history recording and embed a temperature sensor at the vertical and horizontal center of the cylindrical specimen and activate the maturity meter or data acquisition equipment to record the temperature history for the 3-day, 7-day, 14-day (AAP), 28-day, and, as required, 56-day compressive strength analysis.

Field cure cylinders according to PTM No. 611, Section 11.2, for the specified curing period. After concrete curing is discontinued, QC cylinders may be relocated to a preapproved, acceptable, secure area, to protect them from damage. Provide maintenance and security for the area at no additional cost to the Department. The secure area must be easily accessible for inspection at all times. Continue to provide the same field cure and protection from the elements on all surfaces of the cylinders as that provided for the in-place concrete the cylinders represent until the cylinders are tested for compressive strength. Remove cylinders from molds at the same time formwork is removed.

Perform QC testing for 3-day or 7-day compressive strength, 14-day compressive strength (AAP), 28-day compressive strength, and form removal and loading strengths according to PTM No. 611. If using the maturity method to estimate concrete compressive strength, perform QC testing using the procedure to estimate in place strength according to PTM No. 640. Do not use the maturity method for determining acceptance strength, typically at 28 days. Notify the Inspector when QC testing is to be performed. The Inspector will witness the QC testing.

Unless otherwise directed, use QC test results for 3-day or 7-day compressive strength and form removal and loading compressive strength to determine whether to place additional concrete in areas that will be impacted by the lot of concrete represented by the QC cylinders. Acceptable QC compressive strength test results do not relieve the Contractor's responsibility for providing concrete conforming to the 28-day minimum mix design compressive strength acceptance requirements as specified in Section 704.1(d)5.

For AAP and Prevention Level Z mixes, in addition to the samples required above, mold two concrete cylinders and cure them under QC conditions for 56 days. After 56 days test the two cylinders for compressive strength and report the compressive strengths.

4.b.1 3-Day or 7-Day or 14-Day (AAP) QC Compressive Strength. If the average 3-day (HES concrete only) or average 7-day QC compressive strength test result is greater than or equal to the minimum mix design compressive strength requirement specified in Table A, the Contractor may discontinue the field cure on the lot of concrete represented by the QC cylinders unless otherwise directed. If the average 14-day (AAP) QC compressive strength test result is greater than or equal to 3,500 pounds per square inch, the Contractor may discontinue the field cure on the lot of concrete represented by the QC cylinders, unless otherwise directed.

If the average 3-day (HES concrete only) or average 7-day QC compressive strength test result is less than the minimum mix design compressive strength requirement specified in Table A, continue the field cure on the lot of concrete represented by the QC cylinders until the specified 28-day minimum mix design compressive strength is obtained, or for a maximum of 28 days. If the average 14-day (AAP) QC compressive strength test result is less than 3,500 pounds per square inch, continue the field cure on the lot of concrete represented by the QC cylinders, until the specified 28-day minimum mix design compressive strength is obtained, or for a maximum of 28 days.

4.b.2 28-Day QC Compressive Strength. If the average 28-day QC compressive strength test result is greater than or equal to the 28-day minimum mix design compressive strength specified in Table A, acceptance of the concrete lot will be based on the compressive strength testing of acceptance cylinders as specified in Section 704.1(d)5.

If the average 28-day QC compressive strength test result is less than the 28-day minimum mix design compressive strength specified in Table A, but greater than or equal to the 28-day structural design compressive strength specified in Table A, acceptance of the concrete lot will be based on the compressive strength testing of acceptance cylinders as specified in Section 704.1(d)5, and as follows:

- Perform an investigation of procedures for material sampling, testing, and concrete cylinder molding and curing, and evaluate the concrete mix design and specification compliance to determine possible causes for the QC test result not meeting the specified

minimum mix design compressive strength.

- Implement corrective actions as required.
- Submit an investigation report to the District Executive within 10 working days for review and approval.

If the average 28-day QC compressive strength test result is less than the 28-day structural design compressive strength specified in Table A, acceptance of the concrete lot will be based on compressive strength testing of cores obtained from the lot of concrete represented by the QC cylinders as specified in Section 110.10(d).

5. Acceptance Testing. Determine the lot size(s) for material acceptance according to Table B and notify the Representative. Establish new lots daily for each class of concrete. Lots must be specific to a particular structural element, except for incidental concrete items. The Contractor may use a lot combining structural elements if allowed in writing before concrete placement and if the following conditions are met:

- The total volume is 100 cubic yards or less.
- The combined structural elements are constructed using the same mix design concrete.
- The combined structural elements are cured using identical curing methods and conditions.

Cylinders (and cores if necessary) for this lot will represent all the combined elements.

TABLE B
Maximum Lot Size for Concrete Acceptance

Construction Area	Maximum Lot Size
Structural Concrete	100 cu. yd.
Pavement Concrete	500 cu. yd.
Pavement Patching Concrete	200 cu. yd.
Incidental Concrete	100 cu. yd.

The Representative will select sample locations for acceptance testing according to PTM No. 1 (n=1). Perform sampling and testing for acceptance in the presence of the Representative. Obtain samples of fresh concrete at the point of placement according to PTM No. 601. Perform concrete temperature tests. Perform air content tests according to AASHTO T 196 or T 152. Reject all concrete not conforming to the specification requirements at the point of placement.

If the results of plastic concrete testing conform to the specification requirements, mold a sufficient number of acceptance cylinders according to PTM No. 611 from the same sample of concrete taken for slump, air content, and temperature determination. Standard cure acceptance cylinders according to PTM No. 611, Section 11.1, for 28 days and 56 days (AAP and Prevention Level Z) at an acceptable location. Conduct 28-day and 56-day (AAP and Prevention Level Z mixtures only) compressive strength testing of two acceptance cylinders according to PTM No. 604. If for any reason two testable acceptance cylinders are not available for compressive strength testing, obtain two cores of the representative concrete within 3 working days as directed, and at no additional cost to the Department. Conduct 28-day compressive strength testing of the cores according to PTM No. 604.

The Department will accept the lot of concrete if the average 28-day acceptance cylinder compressive strength test result is greater than or equal to the 28-day minimum mix design compressive strength specified in Table A and if the average 28-day QC compressive strength requirements specified in Section 704.1(d)4.b have been met.

If the average 28-day acceptance cylinder compressive strength test result is less than the 28-day minimum mix design compressive strength specified in Table A, acceptance of the concrete lot will be based on the procedures as specified in Section 110.10.

6. Verification Testing. The Representative will perform verification testing on the initial acceptance sample for each type of concrete specified in Table B and a minimum of one verification test for every ten acceptance samples

thereafter. Verification testing will consist of testing for temperature, air content, and compressive strength. Verification tests will be performed on concrete from the same sample used for acceptance testing.

The Representative will obtain the temperature of the sample concurrently with the acceptance sample. Immediately after an acceptable air content test result for acceptance is obtained, the Representative will test the sample for air content according to AASHTO T 196 or T 152 using the same air meter.

The Representative will mold two verification cylinders according to PTM No. 611. Standard cure the verification cylinders along with the acceptance cylinders according to PTM No. 611, Section 11.1, for 28 days. The Representative will conduct 28-day compressive strength testing of the verification cylinders according to PTM No. 604. Conduct the testing at the same time the acceptance cylinders are tested and using the same equipment.

Verification test results will be compared to the associated acceptance test results and will not be used to determine acceptance of the lot. If there is a difference in test results of more than 5F for temperature, 1.0% for air content, or 500 pounds per square inch for compressive strength, the Representative will immediately review the testing procedures, equipment, and personnel used in the acceptance testing and implement corrective measures to ensure the tests are performed within the prescribed tolerances. The Representative will record the acceptance test results, the verification test results and applicable corrective measures in the Concrete Inspector's Daily Record Book, Form CS-472.

7. QA Testing. The CMD QA personnel will obtain QA samples as part of the operation review process according to the QA Manual, Publication 25.

QA personnel will select concrete to be sampled. Obtain samples of fresh concrete at the point of placement according to PTM No. 601. Perform concrete temperature tests adjacent to those conducted by QA personnel. Perform air content tests according to AASHTO T 196 or T 152 with the air meter used for acceptance testing. QA personnel will perform air content tests according to AASHTO T 196 or T 152 with the backup air meter on the project. Immediately report all test results to the QA personnel. Reject all concrete not conforming to the specification requirements at the point of placement.

QA personnel will immediately perform an independent assurance evaluation of the temperature and air content test results. If the difference in test results is more than 5F for temperature or 1.0% for air content, the Representative will immediately review the testing procedures, equipment, and personnel used in the acceptance testing and implement corrective measures to ensure the tests are performed within the prescribed tolerances.

QA personnel will mold five QA cylinders from the selected sample according to PTM No. 611. Field cure the QA cylinders according to PTM No. 611, Section 11.2, for the specified curing period for the structural element the cylinders represent. After curing of the in-place concrete is discontinued, QA cylinders may be relocated to a pre-approved, acceptable, secure area, to protect them from damage. Provide maintenance and security for the area at no additional cost to the Department. The secure area must be easily accessible for inspection at all times. Continue to provide the same field cure and protection from the elements on all surfaces of the cylinders as that provided for the in-place concrete the cylinders represent until the cylinders are tested for 28-day compressive strength.

Conduct 28-day compressive strength testing on two QA cylinders according to PTM No. 604 using the same equipment used for acceptance and verification testing.

The Representative will forward the remaining three QA cylinders to the LTS for 28-day compressive strength testing according to PTM No. 604 and hardened air content testing according to PTM No. 623. Furnish packaging material and package cylinders under the direction and supervision of the Representative. Place the cylinders in individual containers cushioned with suitable material to prevent damage during shipment. The total weight of each container, cylinder and cushioning material must not exceed 50 pounds.

QA personnel will perform an independent assurance evaluation of the 28-day compressive strength test results. If the difference between the test results of the cylinders tested at the project site and the cylinders tested at the LTS is more than 500 pounds per square inch, the Representative will immediately review the testing procedures, equipment, and personnel used in the acceptance testing and implement corrective measures to ensure the tests are performed within the prescribed tolerances.

(e) Measurement of Material.

1. Cement. AASHTO M 157 and as follows:

For plant and truck mixed concrete, measure by weight. The Contractor may measure the weight of the cement separately in an enclosed compartment in the aggregate hopper. The Contractor may measure the weight of the cement and discharge it simultaneously with the aggregates, except as specified in Section 106.05(c).

For volumetric mixed concrete, measure by volume.

2. Aggregates. AASHTO M 157 and as follows:

For plant or truck mixed concrete, measure by weight unless otherwise allowed. Base measurements on the material weight-volume relationship, as specified in Section 704.1(b)1.

For volumetric mixed concrete, measure by volume.

3. Water. AASHTO M 157 except as follows:

Use water-measuring systems capable of discharging the total quantity of measured water into the plant or truck mixer drum in a time not greater than one-fourth of the specified mixing time. For truck mixed concrete, do not add water from the truck water system. Add water only from the plant water measuring system.

4. Admixtures. Incorporate the air-entraining admixture solution into the batch with the mixing water using a suitable visual measuring device. If another type of admixture is used with an air-entraining admixture, add it in solution to another portion of the mix water, as directed, by an additional suitable visual measuring device, except high range water reducing and anti-washout admixtures will be added according to the manufacturer's recommendations.

Equip the measuring device with interlocks to prevent discharging during the charge cycle and to prevent charging during the discharging cycle. Provide a means to calibrate the measuring device to within $\pm 3\%$.

Dispense the air-entraining admixture solution into the batch from a bulk supply tank. For paving, and if directed, provide a bulk supply tank containing sufficient solution for the entire day's concreting operations.

On the dispensing system, provide device(s) capable of detecting and indicating the presence or absence of admixture flow. Agitate admixtures, as required, to insure consistency of the solution.

5. SCM. If the use of SCM is allowed by the specification, add separately and measure cumulatively as specified in Section 704.1(e)1.

(f) Mixing Conditions.

1. During Cool and Cold Weather. If concrete is to be placed at air temperatures below 40F, or if the local weather bureau forecasts air temperatures to descend to 40F or lower at any time during the 24-hour period following concrete placement, use an acceptable method to ensure the aggregate is free of frozen lumps and at a temperature of not less than 40F or more than 100F at the time of charging into the mixer. Heat mixing water, if necessary, but do not exceed 150F. Do not allow water with a temperature above 90F to come in contact with the cement until the cement has been mixed with the aggregates.

2. During Hot Weather. In hot weather, cool the aggregates and the mixing water as necessary to maintain the concrete temperature from 50F to 90F at the time of placement. For bridge deck concrete placement, maintain the concrete temperature from 50F to 80F at the time of placement. For accelerated concrete placement, maintain the concrete temperature from 50F to 100F at the time of placement.

3. Retarding Admixtures. The Contractor may use retarding admixtures, or may be directed to use retarding admixtures, if any of the following conditions are anticipated:

- rapid drying of the concrete as a result of low humidity
- high winds
- high air temperatures

Introduce the retarder into the concrete mixture as specified in Section 704.1(e)4. Adjust the proportions of the design as necessary but do not use the retarder to replace any portion of the specified volume of cement.

Use a retarder available in sufficient quantities to provide the required degree of retardation under the prevailing weather conditions at the time of concrete placement.

(g) Mix Designs Using Potentially Reactive Aggregate.**1. Definition of Terms.**

1.a Alkalis. Oxides of sodium and potassium generally derived from Portland cement, but may also be available to concrete from other sources such as; admixtures, de-icing salts, and, in rare instances, aggregates. Alkalis are calculated according to AASHTO M 85.

1.b SCM. A siliceous or siliceous and aluminous material that possesses little or no cementitious value but will, in finely divided form and in the presence of moisture, chemically react with calcium hydroxide at ordinary temperatures to form compounds possessing cementitious properties. The term “SCM,” includes flyash, slag cement, silica fume, and metakaolin.

1.c Lithium Nitrate Admixtures. A lithium nitrate admixture as listed in Bulletin 15.

1.d Alkali-Aggregate Reaction. A chemical reaction in concrete between alkalis and certain constituents of some aggregates. The products of this reaction, under certain conditions, may cause deleterious expansion within the concrete.

1.e Alkali-Silica Reaction. An alkali-aggregate reaction involving certain siliceous aggregates and some calcareous aggregates containing certain forms of silica.⁽¹⁾

Note (1)—Siliceous substances known to react with alkalis are as follows: opal; chalcedony as a constituent of chert in carbonate rock or sand and gravel particles; tridymite and cristobalite, which are high temperature forms of silica found in andesite or rhyolite; acid glasses containing more than 65% silica; or intermediate glasses containing between 55% and 65% silica. Other siliceous substances that are potentially reactive with alkalis are strained quartz as a constituent of granite or granite gneiss and clay minerals as a constituent of graywackes, argillites, phyllites, and siltstones.

1.e.1. Determining Aggregate Reactivity.

1.e.1.a. Field Performance History. Field performance history according to AASHTO R 80, Section 6.1 of an aggregate may be used to establish the potential to contribute to deleterious ASR with the approval of the DME/DMM.

1.e.1.b Petrographic Examination. Petrography may be used to classify an aggregate as potentially reactive, but expansion testing is required to determine the extent of potential reactivity and the appropriate level of prevention.

1.e.1.c. Expansion Testing. Aggregates will be tested according to ASTM C1293 or AASHTO T 303 and listed in Bulletin 14. ASTM C1293 test results will be used to determine the reactivity level of an aggregate. Unless it is a new source, the AASTHO T 303 results will be used until ASTM C1293 testing is completed by the Department. The reactivity class of the aggregate will be used to determine the required level of prevention. If using aggregates with different reactivity levels, the highest reactivity level will be used for mitigation. If the expansion result for a coarse aggregate size is not listed in Bulletin 14, use of the expansion result from another coarse aggregate size listed in Bulletin 14 from the same source will be acceptable.

Use aggregates deemed potentially reactive only with cements or cement-SCM combinations as specified in Section 704.1(g)3. If one or both of the aggregates (coarse or fine) used in a mix is reactive, mitigation is required as specified in Section 704.1(g)3. This requirement applies to all concrete used in paving or permanent structures on Department projects, including latex modified overlays and precast and prestress concrete products.

For new Type A aggregate sources which do not have LTS expansion listed, LTS will initially perform AASHTO T 303 to determine the reactivity class. Any new source with an expansion that indicates the aggregate is non-reactive (R0) will initially be listed with an expansion of 0.11% (R1) requiring ASR mitigation until ASTM C1293 testing by LTS is completed.

Sources will be tested on a 5-year cycle according to ASTM C1293. Testing will be performed by LTS. If the new test results change the mitigation level of the aggregates, mix designs must be started immediately and all designs must be completed within 90 days of receiving test results.

2. Selecting Preventive Measures for Alkali-Silica Reaction.

2.a Using the Concrete Prism Test (ASTM C1293) to Evaluate Preventive Measures.

2.a.1 Mixture Qualification. The concrete prism test may be used to evaluate the efficacy of SCMs or blended cements or both used with volumetric SCM replacements less than those specified in Section 704.1(g)2.c as a prescriptive remediation method and for all mixtures utilizing remediation with either metakaolin or a lithium nitrate admixture. If lithium nitrate admixtures are used, the admixture must be added to the mix water and necessary corrections made to account for the water in the admixture. If the expansion of concrete prisms is less than 0.04 percent after 2 years, the preventive measure will be deemed effective with the reactive aggregate(s).

For mixtures qualified using the preventive measure, substitutions of the cement (type for type), or SCM(s), type for type will be allowed provided the alkali limits as specified in Section 704.1(g)3 are not exceeded. Substitution of aggregates using the preventive measure is prohibited.

2.b Steps for Selecting Preventive Measures for Alkali Silica Reaction.

2.b.1 Determine the level of prevention by considering the reactivity class of the aggregate(s), classification of the structure type, and the associated risk level.

2.b.1.a Aggregate Reactivity. The degree of alkali silica reactivity of an aggregate will be determined as specified in Section 704.1(g).1.d.1.c and as indicated in Table C.

Table C
Classification of Aggregate Reactivity

Aggregate Reactivity Class	Description of Aggregate Reactivity	1-Year Expansion in ASTM C1293 (percent)	14-d Expansion in AASHTO T 303 (percent)
R0	Non-reactive	≤ 0.04	≤ 0.10
R1	Moderately reactive	>0.04 to ≤ 0.12	>0.10 to ≤ 0.30
R2	Highly Reactive	>0.12 to ≤ 0.24	>0.30 to ≤ 0.45
R3	Very Highly Reactive	>0.24	>0.45

2.b.1.b Risk of ASR. Determine the level of ASR risk occurring in a structure by considering the aggregate reactivity class in Table D.

Table D
Level of ASR Risk

Aggregate Reactivity Class	R0	R1	R2	R3
Level of ASR Risk	Risk Level 1	Risk Level 2	Risk Level 3	Risk Level 4

2.b.1.c Level of Prevention. The level of prevention is determined from Table E by determining the risk of ASR from Table D together with the class of structure from Table F.

Table E
Determining the Level of Prevention

Level of ASR Risk	Classification of Structure		
	S1	S2	S3
Risk Level 1	V	V	V
Risk Level 2	V	W	X
Risk Level 3	W	X	Y
Risk Level 4	X	Y	Z

**Table F
Structure Classification**

Structure Class	Consequences	Acceptability of ASR	Structure/Asset Type	Sections
S1	Safety and future maintenance consequences small or negligible	Some deterioration from ASR may be tolerated	Temporary structures. Inside buildings. Structures or assets that will never be exposed to water	620, 621, 624, 627, 628 643, 644, 859, 874, 930, 932, 934, 952, 953, and 1005
S2	Some minor safety, future maintenance consequences if major deterioration were to occur	Moderate risk of ASR acceptable	Sidewalks, curbs and gutters, inlet tops, concrete barrier and parapet. Typically structures with service lives of less than 40 years	303, 501, 505, 506, 516, 518, 523, 524, 525, 528, 540, 545, 605, 607, 615, 618, 622, 623, 630, 633, 640, 641, 658, 667, 673, 674, 675, 676, 678, 714, 852, 875, 910, 948, 951, 1001, 1025, 1040, 1042, 1043, 1086, 1201, 1210, 1230, and Miscellaneous Precast Concrete
S3	Significant safety and future maintenance or replacement consequences if major deterioration were to occur	Minimal risk of ASR acceptable	All other structures. Service lives of 40 to 75 years anticipated.	530, 1001, 1006, 1031, 1032, 1040, 1080, 1085, 1107, MSE walls, Concrete Bridge components, and Arch Structures

2.c Minimum Levels of Supplementary Cementitious Materials (SCM) based on Level of Prevention.
Utilize a minimum mass replacement level from Table G below.

Table G
Minimum Replacement Level of SCM (percentage by mass of cementitious material ⁽¹²⁾)

Type of SCM ⁽¹⁾	Alkali Level of SCM (% Na ₂ O _e) ^{(2), (3)}	Level V ⁽⁴⁾	Level W	Level X	Level Y	Level Z ^{(5), (11)}
Class F or C flyash ⁽⁶⁾	≤ 3.0	—	15	20	25	35
Class F or C flyash ⁽⁶⁾	>3.0 to ≤ 4.5	—	20	25	30	40
Slag Cement	≤ 1.0	—	25	35	50	65
Silica Fume ^{(7), (8), (9), (10)}	≤ 1.0	—	1.2 x LBA	1.5 x LBA	1.8 x LBA	2.4 x LBA

Notes:

- (1) The SCM may be added directly to the mixture, be a blended cement, or a combination of a blended cement and a SCM.
- (2) Where combinations of Class C and Class F are used, the alkalinity of the Class C flyash may exceed 4.5% provided the calculated alkalinity of the combination, based on the mass replacement, does not exceed 4.5%.
- (3) If two or more SCMs (including SCMs in blended cements) are used in combination, the minimum mass replacement levels given in Table G for the individual SCMs may be reduced provided the sum of the parts of each SCM is greater than or equal to one. For example, if silica fume and slag are used together, the silica fume level may be reduced to one-third of the minimum silica fume level given in the table provided the slag level is at least two-thirds of the minimum slag level required.
- (4) No remediation is required at prevention Level V unless otherwise indicated by specification, e.g. Section 530.
- (5) The alkali level of the concrete may be limited as specified in Section 704.1(g) 2.c.1
- (6) The CaO must be limited to a maximum of 18%.
- (7) The SiO must be greater than or equal to 85%
- (8) The minimum level of silica fume is calculated based on the alkali (Na₂O_e) content of the concrete contributed by the Portland cement and expressed in LBA (lbs./cy) by multiplying the cement content of the concrete in lbs./cy by the alkali content of the cement divided by 100. For example, for a concrete containing 500 lbs./cy with an alkali content of 0.81% Na₂O_e, the value of LBA = 500 x 0.81/100 = 4.05 lbs./cy. For this concrete, the minimum replacement level of silica fume for Level Y is 1.8 x 4.05 = 7.3 percent.
- (9) Regardless of the calculated value, the minimum level of silica fume should not be less than 7 percent if it is the only method of prevention.
- (10) It is impractical to modify a mix design frequently during production based on the actual alkali limit of the cement used, therefore, where silica fume is used as the sole method of prevention, the maximum assumed alkali limit of the cement must be indicated on the mix design.
- (11) Additional options for prevention Level Z are specified in Section 704.1(g)2.c.1 and Table H
- (12) The use of high levels of SCMs in concrete may increase the risk of problems due to deicer salt scaling if the concrete is not properly proportioned, finished, and cured.

2.c.1 The minimum replacement levels in Table G are appropriate for use with portland cements of moderate to high alkali contents (0.70 to 1.25 percent Na₂O_e). Table H provides an alternative approach for utilizing SCMs if the alkali content of the Portland cement is less than or equal to 0.70%.

Table H
Adjusting the Minimum Level of SCM if using low alkali Portland cement

Cement Alkalis (% Na₂O_e)	Level of SCM
≤ 0.70	Reduce the minimum amount of SCM given in Table G by one prevention level. ⁽¹⁾
(1) The replacement levels should not be below those given in Table G for prevention Level W regardless of the alkali content of the Portland cement.	

2.c.2 Requirements for Prevention Level Z. Where prevention Level Z is required, use the minimum level of SCM shown in Table G or use the minimum level of SCM and the maximum concrete alkali content indicated in Table I.

Table I
Using SCM and Limiting the Alkali Content of the Concrete

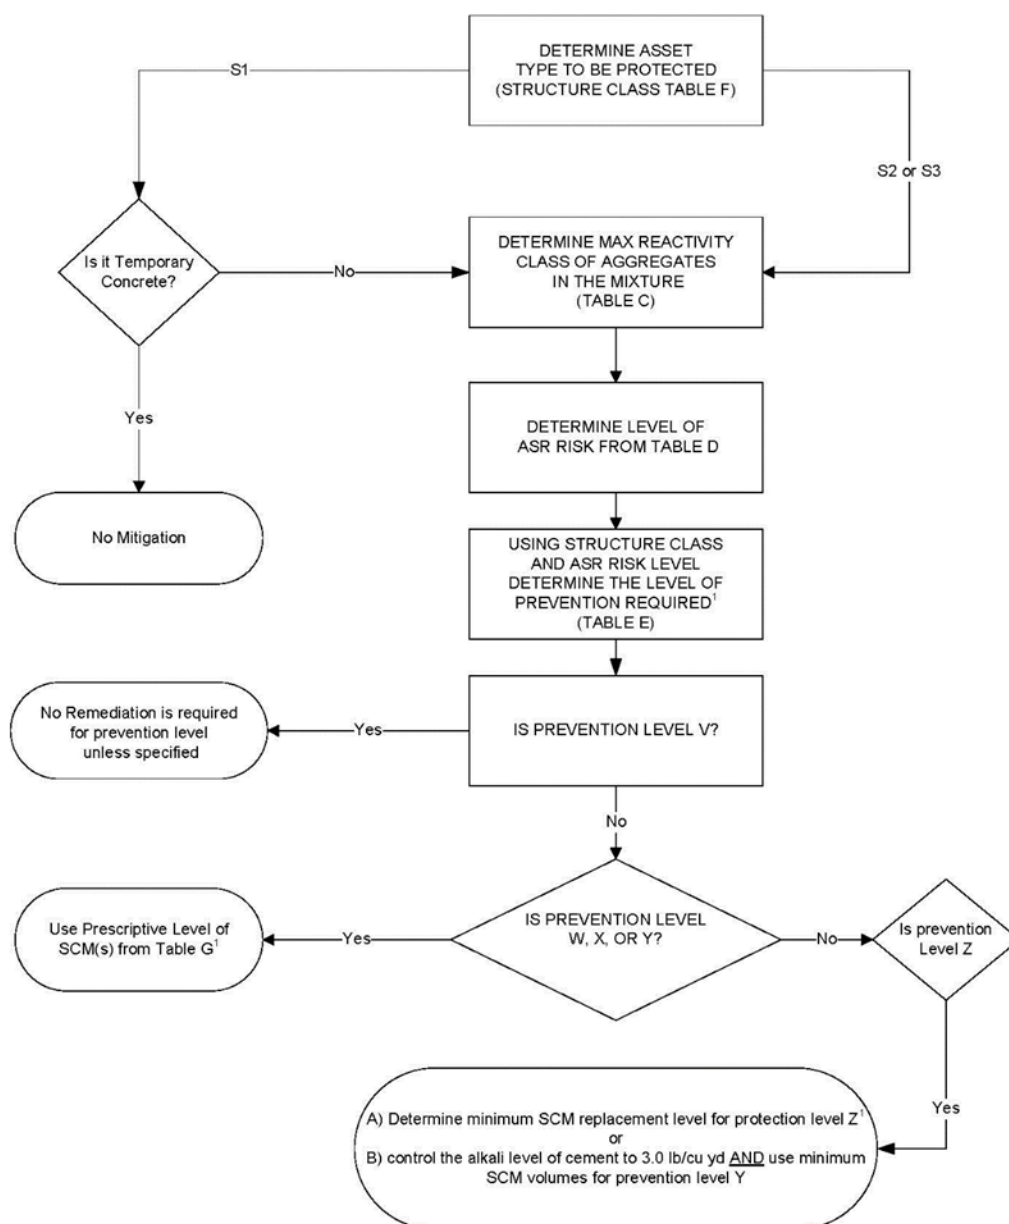

Prevention Level	SCM as sole prevention	Maximum Alkali Content, (lbs./cy) and Minimum SCM Level
Z	Level Z from Table G	Maximum Alkali Level Content: 3.0 AND minimum SCM Level Y from Table G

3. Cement/Cement-SCM Requirements. For use with aggregate deemed potentially reactive as specified in Section 704.1(g), provide Portland cement, blended hydraulic cement, or Portland cement-SCM combinations as specified in Section 704.1(b) and the following:

3.a Portland Cement. Conforming to the optional chemical requirement in AASHTO M 85 for a maximum alkali content of 1.25% Na₂O_e if used for ASR prevention.

3.b Blended Hydraulic Cement. Type IS or IP, AASHTO M 240 (ASTM C595). From a manufacturer listed in Bulletin 15.

3.c. ASR Mitigation Flowchart.

Note 1: The prevention level may be reduced by one level if low alkali cement (≤ 0.70) is used.

4. Admixture Requirements. Furnish chemical admixtures as specified in Section 711.3.

5. Exceptions. If a service record of nonreactivity can be documented, the Department may exempt aggregates

classified through testing as potentially reactive, as specified in Section 704.1(g)2, from the cement/cement-SCM requirements as specified in Section 704.1(g)3.c. The service record must include a minimum of 10 structures, each over 10 years of age and preferably over 15 years of age.

Include the following documentation in the service record:

- A report on the visual examination of each structure for cracking including expansion at joints where applicable.
- Structure type and age.
- Concrete class or mix design proportions if available.
- Cement and alkali content of the cement used during construction.
- Use and type of all SCMs used in the mixture/structure.
- Presence and type of symptoms of distress if found.

Take cores from a representative number of structures and perform petrographic analysis of cores according to ASTM C856 to determine the presence or absence of alkali-silica gel formations and associated microcracking.

Determination of the aggregate classification according to ASTM C295. This analysis must confirm the aggregates from the structures are similar in mineralogical composition to that of the aggregate currently being considered for use.

If field performance history and subsequent testing indicates an aggregate source has begun to form ASR expansion, no exception for use other than the prescriptive methods provided will be accepted.

(h) Extra Cement Concrete. If 25% extra cement is allowed rather than the standard use of an anti-washout admixture (AWA) as specified in Section 1001.3(k)3.a, the extra cement may be replaced with other cementitious material in the same proportions as established in the mix design or as specified in Section 704.1(c). Up to 50% of the water dose for the extra cementitious material, based on the water cement ratio of the mix being utilized, may be added. Add additional admixtures, other than an AWA, as required for performance or to meet other mixture criteria as specified.

704.2 PLANT AND TRUCK MIXED CEMENT CONCRETE—

(a) Batching Plant. Proportion cement, aggregates, water, and admixtures in a plant conforming to AASHTO M 157 for batching plants.

Install a moisture meter to accurately and continuously indicate the variability of the fine aggregate moisture content. If approved, automatic moisture compensating probes for fine and coarse aggregate may be used to control the amount of batched water. Calibrate moisture probes according to the reviewed QC Plan.

Provide scales with graduation increments no greater than 1/1000 of the total scale capacity to measure the weight of aggregates or cement. Increments of less than 5 pounds are not required. Provide scales with capacities approximately equal to the hopper capacity or the central mixer capacity under normal proportioning conditions.

Provide a minimum of ten 50-pound weights at the plant for checking the scale's accuracy. Store the weights in a manner to maintain their weight-calibration accuracy.

Check the accuracy of the bin scales according to PTM No. 410.

Provide the plant with the following equipment for developing the concrete design and to control the quality of aggregates used and the concrete produced:

Number of Each	Equipment
1	Sample splitter for fine aggregate having an even number of equal width chutes that discharge alternately to each side of the splitter. A minimum of 12 total chutes is required. The minimum width of the individual chutes is to be at least 50% larger than the largest particles in the sample and the maximum width of the individual chutes is to be 3/4 inch. Include two receptacles to hold the samples following splitting. Splitter design must allow samples to flow smoothly without restriction or loss of material.
1	Sample splitter for coarse aggregate having an even number of equal width chutes that discharge alternately to each side of the splitter. A minimum of eight total chutes is required. The minimum width of the individual chutes is to be at least 50% larger than the largest particles in the sample. Include two receptacles to hold the samples following

	splitting. Splitter design must allow samples to flow smoothly without restriction or loss of material.
	Or
1	Adjustable sample splitter for both coarse aggregate and fine aggregate having an even number of equal width chutes that discharge alternately to each side of the splitter. A minimum of 12 total chutes is required. For coarse aggregate, the minimum width of the individual chutes is to be at least 50% larger than the largest particles in the sample. For fine aggregate, the minimum width of the individual chutes is to be at least 50% larger than the largest particles in the sample and the maximum width of the individual chutes is to be 3/4 inch. Include two receptacles to hold the samples following splitting. Splitter design must allow samples to flow smoothly without restriction or loss of material.
1	Mechanical Sieve Shaker (with timer)—PTM No. 616
1 Set Each	Standard Sieves for Fine and Coarse Aggregate—ASTM E 11
1	Oven capable of maintaining a uniform temperature of 230F ± 9F—PTM No. 616
1	Calculating machine
1	Cylindrical Metal Measure 1 cubic foot— AASHTO T 19 and T 121, ASTM C136
1	Air Meter, acceptable type— AASHTO T 196 and T 152
1	Slump Cone— AASHTO T 119
1	Cylinder Compression Machine—PTM No. 604 ⁽¹⁾
1	Curing Tank—PTM No. 611 ⁽²⁾
1	Capping Device—PTM No. 604 ⁽¹⁾
1	Balance conforming to the requirements of AASHTO M 231 for the class of general purpose scale required, for the principle sample weight of the sample being tested—PTM No. 616.
1	Platform scale conforming to the requirements of AASHTO M 231 for the class of general purpose scale required, for the principle sample weight of the sample being tested—PTM No. 616, and AASHTO T 121 and ASTM C136
Sufficient	6-inch by 12-inch Cylinder Molds—PTM No. 611
	Necessary Incidental Equipment
1	Maturity Meter—PTM No. 640, if used
Sufficient	Temperature Sensors—PTM No. 640 if used

Note (1)—Equipment requirements may be waived if arrangements for testing have been made at the producer's central facility or at a commercial testing laboratory that participates in the AASHTO Accreditation Program in the area of Concrete Testing. Commercial testing laboratories are to conform to ASTM E329 for Concrete Inspection and Testing except for the equipment listed above.

Note (2)—Equipment requirements may be waived if, after 24 hours (±2 hours), specimens made for checking the strength of trial mixes are properly transported to a central facility or commercial testing laboratory for curing according to PTM No. 611.

Provide the plant with proper laboratory equipment, space, and utilities as specified in Section 609.

(b) Mixers and Agitators. AASHTO M 157. If directed, test air content of individual mixed concrete samples taken approximately at the beginning, the midpoint, and the end of the batch. If the air content varies by more than 1.5%, discontinue the use of the mixer or agitator until the condition is corrected.

If mixing in truck mixers at the plant, use inclined-axis, revolving-drum type mixers or horizontal-axis, revolving-drum high-discharge type mixers.

(c) Mixing and Delivery. Maintain concrete temperature after mixing between 50F and 90F for general concrete, and between 50F and 80F for bridge deck concrete. Do not ship concrete exceeding these temperature ranges. Maintain adequate two-way communications between the concrete plant and the work site to provide both uniformity and control of the concrete mixture.

For each truck, furnish a plant delivery slip signed at the plant by the technician or other designated person. Include the following information on the delivery slip:

- Contract number, complete state project number or purchase order number.

- The concrete plant supplier code.
- Method of concrete mixing (i.e., central or truck).
- Class of concrete, JMF number, and trial mix number (i.e., trial #1, 2, etc.).
- Number of cubic yards.
- Time of completion of mixing.
- Truck number.
- Number of mixing revolutions, if applicable.
- Total amount of batch water used in each truck (pounds).
- The total weight in pounds of the total cementitious materials.
- The types of additives used in each truck (i.e., water reducer, AEA, retarder, etc.).

Submit the plant delivery slip and batcher-mixer slip (according to AASHTO M 157) to the Inspector-in-Charge. Do not use any concrete until it is approved for use by the Inspector-in-Charge.

Conform to AASHTO M 157, except as follows:

- If mixing in a plant, mix for not less than 50 seconds or more than 90 seconds for normal strength concrete, and not less than 70 seconds for HES concrete.
- If mixing in the truck drum at the plant, mix for not less than 70 or more than 125 truck-drum revolutions, at a mixing speed of not less than 6 truck-drum revolutions per minute (rpm) nor more than 18 truck-drum rpm. Upon completion of the designated number of mixing revolutions, reduce the truck-drum speed to not less than 2 rpm or more than 6 rpm. Do not exceed a total of 300 truck-drum revolutions.

Deliver the mixed concrete to the work site and discharge within 1 1/2 hours after completion of mixing. As an alternative, use a set retarding admixture or a workability retention admixture or both, listed in Bulletin 15 and according to manufacturer's dosage recommendations, to extend the initial set time and time for discharge to 2 hours after the completion of mixing. Agitate, but do not mix the concrete en-route to the work site.

- In hot weather, under conditions contributing to quick concrete stiffening, or if the concrete temperature is 80F or above, do not allow the time between completion of mixing and discharge to exceed 1 hour. As an alternative to maintaining the concrete temperature below 80F, use an approved, set retarding admixture to extend the initial set time and enable the mix to remain workable for the full 1 1/2 hours of allowable mixing time.
- If using mixer or agitator trucks, agitate concrete for at least 20 revolutions immediately before placement. Do not use concrete that has exceeded 45 minutes without agitation.
- If wash water is used to clean the truck drum, completely discharge this wash water before the introduction of the succeeding batch.
- Do not allow concrete to come in contact with aluminum unless the aluminum is coated with an acceptable coating (delivery of concrete in an aluminum truck bed is allowed).

(d) Clean Out Areas. Concrete clean out areas, either contractor designed, or detailed within the contract documents, are incidental.

704.3 VOLUMETRIC MIXED CEMENT CONCRETE

(a) General. Use a plant inspected and listed in Bulletin 42. Make trial mixtures with a calibrated mixing plant. Provide plant equipment, facilities, and a concrete technician(s) as specified in Section 704.1. Do not begin production until the mixing plant and all equipment and facilities necessary for performing the work have been inspected and accepted. Mixing plants may be truck mounted.

(b) Usage. Volumetric mixing plants may be used to produce concrete for endwalls, inlets, manholes, end anchors, sign posts, and similar miscellaneous structures requiring small quantities of concrete. If allowed by the District Executive in writing, volumetric mixing plants may also be used for pavement patching and structures. Approved plants may produce concrete for precast items.

(c) Equipment. Prominently attach a permanent metal plate(s) to the plant plainly marking the gross volume in terms of mixed concrete, the operating speed, the plant auger mixing angle, and the plant weight-calibrated cement constant in terms of a revolution counter or other output indicator, all as rated by the manufacturer.

1. Compartments. Provide separate compartments to carry the ingredients. Cover the aggregate bins and prevent contamination and intermixing of the fine and coarse aggregates during loading and transporting. Keep the cement bins free of moisture and contamination. Provide suitable means to carry water and additives and to incorporate the additives with the mixing water in the mix

2. Feed System. Provide a feeder system mounted under the compartment bins to deliver the ingredients to the mixing unit. Equip each bin with an accurately controlled individual gate to form an orifice for volumetrically measuring the material drawn from the bin compartment. Do not charge aggregate bins more than 4 hours before mixing.

Set the cement bin feeding mechanism to discharge a given volumetric weight equivalent of cement at a continuous and uniform rate during the concrete mixing operation. Coordinate the coarse and fine aggregate feeding mechanisms with the cement feeding mechanisms to deliver the required proportions.

3. Mixing Unit. Provide an auger-type mixer incorporated in the plant's discharge chute, or another suitable mixing mechanism that produces concrete of uniform consistency and discharges the mix without segregation. Examine the mixing screw daily and clean as necessary to prevent the build-up of mortar or concrete.

4. Dials and Measuring Devices. Equip the plant with accurate revolution-counter indicators that allow the volumetric weight equivalent of cement, fine aggregate, and coarse aggregate discharged to be read during the concrete-mixing operation. Equip the counter with a ticket print-out to record this quantity.

Equip the plant with a water flow meter or gauge to indicate the discharge rate of water (by volume) entering the mix and a water meter to register the total amount of water discharged during the mixing operation. Also, equip the plant with suitable gauges for checking the rate of flow of all additive(s) entering the mix. Coordinate the water and additive flow meters with the cement and aggregate feeding mechanisms. Equip the flow meters with scales appropriate for the type and amount of material being measured. Mount a tachometer indicating the drive shaft speed on the plant.

Place gauges, dials, and other devices that indicate the accuracy of concrete proportioning and mixing in full view so the operator can accurately read or readjust them while concrete is being produced. Provide the operator convenient access to all controls.

(d) Calibration. Use a unit constructed to allow convenient calibration of the gate openings and meters. Conduct a calibration once a year in the presence of Department representatives. Make satisfactory arrangements with the Department at least 1 week in advance of calibration. During the yearly calibration, calibrate the cement meter according to the manufacturer's recommendation and check the aggregate gate settings against the calibration data for the plant. Maintain the calibration data in the plant and submit the data to the District.

After performing the yearly calibration and before starting work, provide a mix design for review and acceptance and run a yield test to verify the design. Adjustments to correct for yield may require recalibration or a design change.

Conduct a recalibration if there is a change in the source of fine or coarse aggregate or cement. Conduct additional calibrations if directed. Provide each plant with data on the accepted recalibration.

If hydraulic drive units are used, perform the following additional calibration procedure: At the beginning of the actual batching operation, check the cement meter against the count and time used for the cement during the calibration

of the individual materials. If a discrepancy occurs, adjust the belt speed of the unit so the actual cement meter count does not vary from the calibrated meter count by more than two counts per 60 seconds.

(e) Mixing and Delivery. Proportion, measure, and batch cement and aggregates by a weight equivalent method. The measuring and batching mechanism is required to produce the specified proportions of each ingredient within the following tolerances:

- Cement, Weight 0 to +4%
- Fine Aggregate, Weight $\pm 2\%$
- Coarse Aggregate, Weight $\pm 2\%$
- Admixtures, Weight or Volume $\pm 3\%$
- Water, Weight or Volume $\pm 2\%$

The tolerances are based on a volume/weight relationship established during the calibration of the measuring devices.

During mixing, maintain the drive shaft speed, as indicated by the tachometer, within 50 rpm of the operating speed. Set the auger mixer angle in the range determined by the manufacturer. Do not exceed 1/2 hour between the continuous placing of succeeding batches.

1. Testing. Conduct slump and air content tests according to PTM No. 601. Conduct the unit weight test, the concrete uniformity test, and the output meter calibration test according to AASHTO T 121, ASTM C136, AASHTO M 157, and PTM No. 626. If there is any doubt in the uniformity of the concrete, perform further testing as directed.

2. Recording. Provide a batcher mixer slip with each load of ingredients. Include the following information on the batcher mixer slip:

- Aggregate gradation and moisture information.
- Class of concrete and the corresponding dial setting, as determined in the design.
- Water discharge rate limitations.

Use a separate batcher mixer slip for each class of concrete. Deliver the batcher mixer slip to the Inspector-in-Charge at the work site. Do not use the concrete until the Inspector-in-Charge verifies the data noted on the slip complies with the specifications.

(f) Clean Out Areas. Concrete clean out areas, either contractor designed, or detailed within the contract documents, are incidental.

SECTION 705—JOINT MATERIAL

705.1 PREMOLDED EXPANSION JOINT FILLER—From a manufacturer listed in Bulletin 15, provide one of the following cork, sponge rubber, fiber joint fillers, or polypropylene foam conforming to the following requirements:

(a) **General.** As shown on the Standard Drawings, or as indicated.

If used for transverse joints in reinforced or plain cement concrete pavement, furnish lengths equal to the width of the traffic lane, ramp, or taper with a minimum thickness of 1 inch. Provide a smooth top surface and holes punched for dowel bars to provide a snug fit without loss in thickness of the material.

If used for longitudinal joints in concrete base courses, furnish pieces at least 8 feet in length and join securely.

If used for joints in structures, furnish pieces at least 8 feet in length, or as otherwise indicated, and join securely.

(b) **Cork or Preformed Rubber.** AASHTO M 153 and as follows:

Joint filler modified to include polyurethane bonded recycled rubber, consisting of preformed strips of a durable composite of ground recycled rubber from automobile tires bonded together with polyurethane adhesive, is allowed.

(c) **Fiber.** AASHTO M 213, except for the compression test use a specimen at least 4 inches on a side with a minimum area of 16 square inches. For glass fiber tested for compression, the applied force may be less than the minimum 100 pounds per square inch.

(d) **Preformed Polypropylene Foam Expansion Joint Filler.** ASTM D8139, test the physical properties of a semi-rigid, non-extruding, resilient type, closed-cell polypropylene foam, preformed joint filler.

(e) **Certification.** Section 106.03(b)3.

705.2 LONGITUDINAL JOINT MATERIAL—From a manufacturer listed in Bulletin 15 and as shown on the Standard Drawings or as indicated. Use tie bars, tiebolts, and key formers conforming to the following requirements:

(a) **Tie Bars.**

1. Deformed Tie Bars. Section 709.1(a)1, 709.1(b)1, 709.1(d)1, or 709.1(e), and epoxy coated as specified in Section 709.1(c).

2. Deformed Bent Tie Bars. Section 709.1(a)1, 709.1(b)1, 709.1(d)1, or 709.1(e) and epoxy coated as specified in Section 709.1(c).

(b) **Tiebolts.** Certify as specified in Section 106.03(b)3 and as follows:

- Manufactured from mild steel.
- A 9/16-inch diameter bar with rolled threads or a 5/8-inch diameter bar with cut threads, with a threaded sleeve nut.
- For the nut, steel pipe or hexagonal steel bar (1 1/16 inches diameter by 1 7/8 inches long), or a high strength steel bar (27/32-inch diameter by 2 inches long).
- For the assembled tiebolt, a minimum yielding load of 15,000 pounds is necessary.
- Epoxy coated or galvanized, excluding threads, as specified in Section 709.1(c) or 1105.02(s).

(c) **Key Former.** Manufactured of a material that does not deform during concrete placement.

705.3 LOAD-TRANSFER UNITS FOR REINFORCED AND PLAIN CEMENT CONCRETE PAVEMENTS—

(a) **General.** As shown on the Standard Drawings and as follows:

1. Coated Dowel Bars and Supporting Members. Section 709.1(a)2, or ASTM A513, and AASHTO T 253 Section 5, or Structural adequacy testing according to PTM No. 642 showing a maximum Linear Variable Differential Transformers (LVDT) differential deflection for dynamic and static loading, for both the approach and leave sides of the joint of not more than 7.5 mils at 1 million cycles and not greater than a 2.5-mil increase in the LVDT differential deflection at 10 million cycles from the corresponding 1 million cycle LVDT deflection. The differential deflection is the absolute difference in deflection between the loaded and unloaded sides of the joint.

Provide bars with their free end a true circle and without burrs.

2. Alternate Shaped Coated Dowel Bars. Bars with properties equivalent to conventional, round steel-coated dowel bars may be used if documentation of conformance to applicable requirements of Section 705.3 are accepted by LTS.

3. Bondbreaking Requirements. AASHTO M 254

3.a Type A. Coating material develops sufficiently low bond strength with concrete so a shop applied bond breaker or bond breaker lubricant is not necessary.

3.b Type B. Coating material develops bond strength with concrete so a shop applied bond breaker or bond breaker lubricant is necessary. Shop-applied bond breakers are to conform to the pull-out load requirements of AASHTO M 254.

(b) **Dowel Bar Coating.** AASHTO M 254 modified as follows:

Provide fusion-bonded epoxy coating as a Type B coating with a minimum non-abraded thickness of 8 mils. No more than 2 holidays per linear foot average, as detected with a 67.5 V holiday detector, are allowed. Repair areas damaged during shipment, handling, fabrication, or placement. The sum of all damaged areas to be repaired per linear foot may not exceed 2% of the bar surface area per linear foot. Repair all visible signs of rust and all visible defects. Repair is accomplished by means of a mechanical wire brush cleaning, or another acceptable procedure, followed by application of an approved epoxy paint utilizing the paint manufacturer's recommended procedure. Do not cover more than 5% of the total bar surface area with patching material.

(c) **Mechanically Galvanized Dowel Bars.** Provide galvanizing as specified in Section 1105.02(s) (ASTM B695 and B 696). Coating thickness to be not less than 3.4 mils (2.0 ounces per square foot).

(d) **Stainless Steel Dowel Bars.** If specified, provide stainless steel dowel bars and stainless steel dowel baskets conforming to ASTM A955/A955M as specified in Section 709.1(f) for stainless steel reinforcement

1. Storage. Section 1002.4(i)3.

(e) **Uncoated, Corrosion-Resistant Dowel Bars.** If specified, provide steel dowel bars conforming to AASHTO M 334 categorized as Level 3 by AASHTO T 374 for uncoated, corrosion-resistant steel reinforcement.

(f) **High Performance Dowel Bars.** As shown on the Standard Drawings and as follows:

1. Physical Requirements. Provide dowel bars or tubes with a smooth-finished surface meeting the requirements of Table A and as follows:

- Diameter of 1.5 inches or 1.25 inches (+ 0.25 inch, - 0.001 inch) as shown on the Standard Drawing RC-20M or as indicated.
- Length of 18 inches (+/- 1/2 inch)

- For tubular dowels, provide nonmetallic or epoxy coated metallic caps on the ends of the tube that do not exceed the outside diameter of the tube, and prevent intrusion of concrete or other materials.
- Submit structural adequacy testing according to PTM No. 642 showing a maximum Linear Variable Differential Transformers (LVDT) differential deflection for dynamic and static loading, for both the approach and leave sides of the joint of not more than 7.5 mils at 1 million cycles and not greater than a 2.5-mil increase in the LVDT differential deflection at 10 million cycles from the corresponding 1 million cycle LVDT deflection. The differential deflection is the absolute difference in deflection between the loaded and unloaded sides of the joint.

Table A – High Performance Dowel Bar Requirements

Dowel Surface Material	Configuration	Solid Bar or Tube Material		Cladding or Coating Material	
		Material	Minimum Wall Thickness (in.)	Material	Minimum Wall / Coating Thickness (in.)
Stainless Steel	Solid Bar	Stainless Steel ⁽¹⁾	—	—	—
	Clad Bar	Steel ⁽²⁾	—	Stainless Steel ⁽¹⁾⁽⁴⁾	0.04
	Clad Tube	Steel ⁽²⁾	0.12	Stainless Steel ⁽¹⁾⁽⁴⁾	0.04
	Solid Tube	Stainless Steel ⁽¹⁾	0.12	—	—
Zinc Clad	Clad Bar	Steel ⁽²⁾	—	Rolled Zinc Alloy ⁽⁵⁾	0.04
	Clad Tube	Steel ⁽²⁾	0.12	Rolled Zinc Alloy ⁽⁵⁾	0.04
Glass Fiber-Reinforced Polymer Coated (GFRP)	Coated Bar or Tube	Steel ⁽²⁾	—	GFRP ⁽³⁾	0.125
Multi-Layer Epoxy Coated	Coated Bar or Tube	Steel ⁽²⁾	—	Minimum 2 Coats of Epoxy ⁽⁶⁾	0.02

- (1) ASTM A955, Grade 60 or higher for solid steel dowels. For tubular dowels, ASTM A312 for solid tubular dowels, and ASTM A249 for clad tubular dowels meeting one of the following UNS Designations: S31603, S31653, S31803.
- (2) ASTM A615, Grade 40 or higher for solid steel dowels, or ASTM A513 with a minimum yield strength of 60 kips per square inch or higher for tubular dowels.
- (3) GFRP coating according to the requirements of Section 3 of AASHTO LRFD Bridge Design Guide Specification for GFRP Reinforced Concrete Bridge Decks and Traffic Railings. Provide clips that firmly hold the GFRP dowel bars in the Load Transfer Unit. Provide clips to positively secure the GFRP dowels to the Load Transfer Unit. Do not weld GFRP dowel bars to Load Transfer Unit.
- (4) Press fit the stainless steel tube using an epoxy adhesive between the tube and the carbon steel core.
- (5) Rolled zinc alloy (U.N.S. Z41121) sleeve mechanically bonded to a steel bar or tube.
- (6) Provide epoxy coated bars with a minimum of two layers of epoxy coating. Provide epoxy coating according to ASTM A934 for the first epoxy coating layer and an abrasion resistant second epoxy layer passing NACE TM0215 using 110 pound weight, and the Smooth Cut Carbide Bit gouge tool with a

maximum gouge depth of 17.3 mils. Provide a total non-abraded epoxy coating thickness of 20 mils to 60 mils. Zero holidays are allowed. Weld areas used for dowel basket attachments must be ground for welding, and cleaned, and recoated after welding. Remove and replace dowel bars that have epoxy coating damaged (including the ends of the dowels) during shipment, handling, fabrication, or placement, prior to paving.

2. **Alternate Shaped Coated Dowel Bars.** Bars with properties equivalent to conventional, round steel-coated dowel bars, may be used, if documentation of conformance to applicable requirements of Section 705.3(f) are accepted by LTS.

3. Bond Breaking Requirements. AASHTO M 254

3.a. Type A. Coating material develops sufficiently low bond strength with concrete so that a bond breaker is not necessary.

3.b. Type B. Coating material develops bond strength with concrete so that a bond breaker is necessary. Shop-applied bond breakers are to conform to the pull-out load requirements of AASHTO M 254.

(g) **Certification.** Section 106.03(b)3

705.4 JOINT SEALING MATERIAL—

(a) **Silicone Joint Sealing Material.** Low modulus, non-sag-silicone, sealing material in a nonacid-curing, one-part formulation, which requires tooling, from a manufacturer listed in Bulletin 15. Furnish silicone joint sealing material conforming to the following physical requirements:

- | | |
|---|---|
| • Tensile Stress at 150% elongation, pounds per square inch, max. (ASTM D412, Die C) 7-day cure at 77F ± 3F and 45% to 55 % relative humidity | 45 |
| • Elongation at maximum tensile strength, %, min. (ASTM D412, Die C) | 600 |
| • Extrusion rate, grams/minute, min. 0F to 100F (Test for extrusion using an air-powered caulking gun, having a 1/8-inch orifice, at 90 pounds per square inch) | 75 |
| • Specific gravity (ASTM D792, Method A) | 1.010 to 1.515 |
| • Durometer hardness, shore “A” (ASTM D2240) 7-day cure at 77F ± 3F and 45 to 55% relative humidity. | 10 to 25 @ 0F |
| • Shelf life, days, min., from date of manufacture. | 180 |
| • Ozone and ultraviolet resistance (ASTM C793) | No chalking, cracking, or bond loss after 5000 hours. |
| • Flow (ASTM C639-Type II) | Nil |
| • Bond to cement mortar, pounds per square inch, min., primed if required. (Mold three cement mortar briquets according to AASHTO T 132 and moisture cure for at least 28 days. Saw briquets in half, clean, and oven dry to a constant weight in an oven at 110 °C ± 5 °C. After cooling, bond halves together with approximately 10 mils of silicone sealant, cure 7 days at 77F ± 3F and 45 to 55% | 50 |

relative humidity, and test using clips conforming to AASHTO T 132. Test specimens in tension at loading rate of 0.3 inch/minute.

- Tack free time, minutes, max. (ASTM C679) 90
- Movement capability and adhesion (ASTM C719) Cyclic movement:
+100% / -50%
(extension/compression), no
adhesive or cohesive failure
after 10 cycles @ 0F

(b) Rubberized Joint Sealing Material. From a manufacturer listed in Bulletin 15, use ASTM D6690-Type II or Type IV for sealing asphalt pavement joints. Use only ASTM D6690-Type IV for all other joint sealing applications.

(c) Rubberized Joint Sealing Material. ASTM D6690-Type I, from a manufacturer listed in Bulletin 15.

(d) Preformed Neoprene Compression Seals and Strip Seals and Lubricant Adhesive.

1. Physical Requirements. ASTM D2628 and ASTM D3542 (Movement Range) for pavement seals, ASTM D 3542 for bridge seals, and as follows:

1.a Seals.

- Free of pin holes and uncured areas and uniform in all dimensions.
- Function properly at temperatures between -20F and +140F.
- Misalign the walls by not more than 1/8 inch if the pavement seal is in a compressed condition.
- Exceed nominal width by not more than 1/16 inch for seals up to 1 1/2 inches; 3/16 inch for seals greater than 1 1/2 inches up to 2 1/2 inches; 1/4 inch for seals greater than 2 1/2 inches up to 4 inches; and 5/16 inch for seals greater than 4 inches. Allow no negative tolerance from nominal width.
- Vary from nominal height by not more than 1/8 inch if pavement seals are used and 1/4 inch if bridge seals are used.
- Allow no tolerance in the movement range for initial qualification samples. Allow up to a -5% tolerance in the movement range for routine production samples.
- Allow no negative tolerance on the movement classification for bridge seals. The movement classification for each bridge seal configuration is determined by rounding the movement range criterion down to the nearest 1/2-inch increment.
- Pavement seals have a minimum seal recovery as follows:

Temperature	Percent Recovery*	
	Plant Verification Samples (PV)	Field Samples (QA, DQA, FV, etc.)
-20F	88	83
14F	95	88
212F	90	85

*based on nominal width

Seal Size	Minimum Movement
1 inch	0.365 inch
1 1/4 inches	0.540 inch

- Pavement seals have a minimum side wall bearing pressure of 4 pounds per square inch at 85% nominal width.

1.b Lubricant Adhesive. ASTM D4070 and as follows:

Of suitable viscosity at installation temperature and compatible with application equipment. Do not use lubricant adhesive more than nine months after date of manufacture.

2. Acceptance. Before using each lot of seal, obtain the eCAMMS generated laboratory test report with the automated statement of approval or rejection. A seal lot is a continuous production not exceeding 10,000 linear feet for pavement seals, and not exceeding 3,000 linear feet for bridge seals.

3. Marking and Shipping.

3.a Seals. Clearly and permanently mark the top of each seal with appropriate line characters of not less than 0.0625 inch in height, in increments not exceeding 4 feet. The line characters must designate the lot or batch number, the cure date code, and the type of seal designation. Mark the top of each pavement seal at 1 foot \pm 1/8 inch intervals in a manner clear and durable to enable stretch/compression determinations of the seal.

3.b Lubricant Adhesive. Label each container with the code or type designation, plant place, lot number, and manufacture date.

(e) Preformed Closed Cell Polyethylene Joint Filler. ASTM D7174, Type I, and as follows:

Compressibility:

Pressure necessary to compress test specimen by 25% min. 5 pounds per square inch

Pressure necessary to compress test specimen by 85% max. 30 pounds per square inch

(f) Preformed Polyurethane Foam Joint Filler. A semi-open, flexible, polyurethane foam that is molded to a cross-sectional shape and easily installed in a pavement joint with parallel sides and is sufficiently self-locking to prevent the material from floating out of the joint. Furnish joint filler from a manufacturer listed in Bulletin 15 and as follows:

1. Dimensions.

- Length—minimum 8-foot lengths
- Width—4 7/16 inches to 4 3/4 inches
- Depth—7 3/4 inches to 13 inches

2. Properties. Determine using a skinless sample.

- Density, pounds per cubic inch. 6.0-10.0
- Compressive deflection (ASTM D7174)
- Pressure (Load) necessary to compress the test specimen 25% min. 5 pounds per square inch

- Pressure (Load) necessary to compress the test specimen 65% max. 30 pounds per square inch
- Recover, % of original, min. 95%
65% deflection, calculated after 60 seconds of relaxation
form deflection return.
- Water absorption, max. 30% vol.

(g) **Asphalt Rubber Sealing Compound.** ASTM D5078 from a manufacturer listed in Bulletin 15.

(h) **Certification.** Section 106.03(b)3

705.5 GASKETS AND WATERSTOPS—From a manufacturer listed in Bulletin 15 and conforming to the following requirements:

(a) **Shipment and Certification.** Label shipments with style or code number, lot or batch number, plant, place, and manufacture date. Certify materials, as specified in Section 106.03(b)3.

(b) **Gaskets.**

1. **Elastomeric.** ASTM C443 for rubber gaskets and ASTM C361 for neoprene gaskets.

2. **Preformed Flexible Joint Sealant – Butyl Rubber Sealant.** ASTM C990, with the following exceptions:

- Flash Point, Cleveland Open Cup (C.O.C.) min., F 350
- Fire Point, C.O.C. min., F 375

3. **Resilient Connectors between Inlets/Utility Holes and Pipes.**

- Storm Water Systems – ASTM C1478
- Sanitary Sewer Systems – ASTM C923

(c) **Waterstops.**

1. **Metal.** ASTM B370. Copper sheets used for waterstops, of a weight indicated and containing a minimum copper mass of 99.5%.

2. **Polyvinyl Chloride.**

2.a **Physical Requirements.**

- Manufactured from virgin polyvinyl chloride resin with the addition of only those plasticizers, stabilizers, and other materials necessary to ensure aging stability and in-place durability.
- Not factory scrap or reclaimed polyvinyl chloride.
- Brittleness temperature, ASTM D746 -20F max.

- Modulus of flexure, ASTM D747, pounds per square inch. 400 min.
- Tensile strength, ASTM D412,

Die C original, pounds per square inch.	1,000 min.
Across job splice, pounds per square inch.	1,150 min.
- Elongation

Original, percent	280 min.
Across job splice, percent	200 min.
- Tear strength, ASTM D624, Die B

Original, pounds per inch.	260 min.
----------------------------	----------
- Oven aging, ASTM D573, 70 hours at 212F

Change in tensile strength, percent change	20 max.
Change in elongation, percent change	20 max.
- 14-Day extraction, 140F/150F

Change in tensile strength, percent change	40 max.
Change in elongation, percent change	40 max.

2.b Marking. Permanently label with the manufacturer's name and style or code number, at intervals not exceeding 3 feet.

2.c Acceptance. Material shipped is subject to inspection at the delivery point. If directed, provide samples, selected at random from the shipment, consisting of one portion 4 feet long and another portion from a job splice consisting of a minimum of 12 inches of splice, within 6 inches of unspliced material on each side. Submit samples to the LTS for material confirmation and compliance.

705.6 MORTAR—Mix mortar in an acceptable type of mixer, unless otherwise allowed. Do not use retempered mortar or mortar mixed for more than 1/2 hour, unless otherwise specified. Certify as specified in Section 106.03(b)3.

(a) For Pipe Joints.

1. Job-Mixed Mortar. Mix one part cement, two parts fine aggregate, and sufficient water to form a plastic composition. Use materials conforming to the following requirements:

- Cement—Section 701
- Fine Aggregate—Section 703.1, Type C
- Water—Section 720.1

(b) For Masonry Joints and Horizontal Joints Between Precast Components in Utility Holes and Inlets. ASTM C270, Type N

705.7 CAULKING COMPOUND—Certify as specified in Section 106.03(b)3. From a manufacturer listed in Bulletin 15 and conforming to the following requirements:

(a) For Caulking Pipe Joints and Horizontal Joints Between Precast Components in Utility holes and Inlets. ASTM D4586

(b) **For Other Caulking.** ASTM C834 or C920

705.8 JOINT BACKING MATERIAL—Expanded, low-density, polyethylene foam from a manufacturer listed in Bulletin 15 and conforming to ASTM D5249. Certify each shipment as specified in Section 106.03(b)3. If indicated, the foam may be used as a bond breaker between joint filler material and joint sealer.

SECTION 706—CONCRETE BONDING COMPOUND

706.1 Epoxy-Bonding Compound—Provide an epoxy bonding compound conforming to ASTM C 881 and specify Type and Grade as per operation. Obtain compound from a manufacturer listed in Bulletin 15. Certify as specified in Section 106.03(b)3. Submit a copy of the manufacturer's recommendations for proper application to the Representative. Apply the compound according to the manufacturer's recommendations.

(a) **General.** If epoxy-bonding compounds are used, the Type and Grade of epoxy must be specified for each specific operation. Use the following classifications in conjunction with Bulletin 15:

1. Application/Operation Specific Types.

- Type I—For use in non-load bearing applications, bonding hardened concrete (28 days or older) to hardened concrete surfaces.
- Type II—For use in non-load bearing applications, bonding freshly mixed concrete to hardened concrete.
- Type III—For use in bonding skid-resistant materials to hardened concrete and as a binder in epoxy mortars or epoxy concretes used on traffic bearing surfaces (or surfaces subject to thermal or mechanical movements).
- Type V—For use in load bearing applications, bonding fresh concrete to hardened concrete.

2. Grades. Flow characteristics.

- Grade 1—Low viscosity
- Grade 2—Medium viscosity
- Grade 3—Non-sagging consistency

3. Classes. Temperature use range.

- Class A—For use below 40F, to the lowest allowable temperature defined by the manufacturer.
- Class B—For use between 40F and 60F
- Class C—For use above 60F, to the highest allowable temperature defined by the manufacturer.

706.2 Other Bonding Compound—Provide a bonding compound with a minimum 14-day bond strength of 1,500 pounds per square inch as tested according to ASTM C 882. Obtain compound from a manufacturer listed in Bulletin 15. Certify as specified in Section 106.03(b)3. Submit a copy of the manufacturer's recommendations for proper application to the Representative. Apply the compound according to the manufacturer's recommendations.

SECTION 709—REINFORCEMENT STEEL

709.1 REINFORCEMENT BARS—As indicated, from a manufacturer listed in Bulletin 15, and conforming to the following requirements:

(a) Billet-Steel Bars.

1. Deformed. AASHTO M 31 (ASTM A615), Grade 60. Where AASHTO M 31 (ASTM A615), Grade 40 is indicated (non-bridge items only), Grade 60 may be substituted on a bar-to-bar basis at no additional cost to the Department. If using deformed bent tie bars in pavement structures, use only Grade 40.

2. Plain. AASHTO M 227 (ASTM A663) or AASHTO M 255 (ASTM A675), Grades 70, 75, or 80. AASHTO M 31 (ASTM A615), Grades 40 or 60.

(b) Rail-Steel Bars.

1. Deformed. ASTM A996, Grade 60, including supplementary requirements. Do not weld or bend.

2. Plain. ASTM A996, Grades 50 or 60, including supplementary requirements. Do not weld or bend.

(c) Epoxy Coating (Where Indicated).

1. Coating. Coat bars according to ASTM A775, modified as follows:

- Section 5—Materials

Subsection 5.2. “Maintain the certification for the powder coating material at the applicator's site. Provide only a light colored coating that will reveal rusted or undercoated areas of steel.”

Subsection 5.2.1. Revise as follows: “Provide written certification in accordance with Pennsylvania Department of Transportation Publication 408, Section 709.5 that the powder supplied meets the requirements of Annex A1 of this specification.”

- Section 8—Requirements for Coated Steel Reinforcing Bars.

Subsection 8.1.3. Revise the first sentence as follows: “For acceptance purposes, 90% of all recorded coating thickness measurements shall not be less than the specified minimum thickness or more than the specified maximum thickness.”

Subsection 8.2.1 Add a second sentence as follows: For Department verification purposes, after shipment, a hand held 67.5V, 80 000 ohm, wet-sponge type direct current holiday detector or equivalent method will be used to test plant or project samples consisting of an approximate 4 ft. length of bar cut from a full production bar or cut from a bar shipped to a project.

Subsection 8.2.2. Add a third sentence as follows: For quality control and quality assurance purposes, the average applies to the full production length of a bar or to a Department verification sample consisting of an approximate 4 ft. length of bar cut from a full production length bar or cut from a bar shipped to a project.

2. Fabrication.

2.a QC. Section 106.03(a)2. Submit a QC Plan to the CMD.

2.b Repair all sheared or cut ends and/or damaged areas with epoxy patching material according to the QC Plan and ASTM D3963, modified as follows:

- **Section 3—Coating Repair Materials**
Subsection 3.1. Add the following sentences: “Provide verification that the material has been tested and conforms to Annex 1. Certify each shipment of this material as specified in Pennsylvania Department of Transportation Publication 408, Section 106.03(b)3.”
- **Section 7—Repairs**
Subsection 7.1.3 Coat sheared/cut ends with approved patch material to have a minimum coating thickness of 7 mils.

Control repair of damaged epoxy coating and sheared/cut ends according to ASTM A775, Section 11. Furnish patching or repair material that is compatible with the coating as approved and listed in Bulletin 15. Furnish patching or repair material that is inert in concrete. Furnish patching or repair material that can be satisfactorily used at the coating application facility, at the bar fabrication facility or at a project location in the field.

The patching or repair material must be compatible with the coating, inert in concrete, and feasible for repairs at the applicator, fabricator, or in the field. Control repair of damaged epoxy coating and sheared/cut ends according to ASTM A775, Section 11, modified as follows.

- **Section 11—Permissible Amount of Damaged Coating and Repair of Damaged Coating**
Subsection 11.2. Furnish patching or repair material that is compatible with the coating as approved and listed in Bulletin 15. Furnish patching or repair material that is inert in concrete. Furnish patching or repair material that can be satisfactorily used at the coating application facility, at the bar fabrication facility, or at a project location in the field.

Subsection 11.4. Coat sheared/cut ends with approved patch material to have a minimum coating thickness of 7 mils.

Handle and store coated bars at the fabricator’s facility according to the requirements of ASTM D3963.

(d) Low-Alloy Steel Bars.

1. Deformed. ASTM A706, Grade 60.

(e) Galvanized Reinforcement Bars. Galvanized reinforcement bars may be substituted for epoxy coated reinforcement bars. Separate bundled pieces before pickling. Galvanize straight bars only in accordance with ASTM A767. Where bent bars are indicated, bending may be performed only after galvanizing is performed. Provide a Class 1 coating weight conforming to the requirements given in Table 1. Ensure that each piece is completely galvanized. During galvanization, use methods that prevent bars from becoming stuck together. Immediately quench the galvanized reinforcement bars in the chromate bath specified in ASTM A767. Repair all sheared or cut ends and/or damaged areas, as defined in ASTM A767, in accordance with ASTM A780. Cracking, flaking, tears, or spikes in the zinc coating at bend areas is considered to be damaged.

Test galvanized reinforcement bars for embrittlement after galvanizing by bend testing samples of the galvanized reinforcement bars in accordance with ASTM A615. Reject any lots found to be embrittled.

(f) Stainless Steel Reinforcement Bars. When indicated or specified, provide hot rolled deformed stainless steel reinforcement bars in accordance with ASTM A955, Grade 60 meeting one of the following UNS Designations:

- S24100, S30400, S31653, or S31803

(g) Uncoated, Corrosion-Resistant Steel Reinforcement Bars. Uncoated, corrosion-resistant steel reinforcement bars may be substituted for epoxy coated reinforcement bars on a bar-to-bar basis. Substitutions other than on a bar-to-bar basis may only be pursued through the Value Engineering (VE) process for substructure units only, which includes the submission of a substructure design utilizing the higher strength available from uncoated, corrosion-

resistant reinforcement bars. The VE must be approved and accepted in writing by the Department before any substructure bar substitutions are allowed. Provide steel reinforcement bars conforming to AASHTO M 334, modified as follows:

- Section 13—Finish

Subsection 13.2. “Seams and surface irregularities shall not be cause for rejection provided the weight, dimensions, cross-sectional area, and tensile properties are not less than the requirements of this specification. Visible mill scale oxidation or corrosion deposits are cause for rejection.”

709.2 BAR MATS—Steel Bars, Section 709.1, assembled into mats, as shown on the Standard Drawings, by rigidly welding or clipping the bars at joints or points of intersection.

(a) Clips. For mechanical assembly, use No. 9 gage steel wire of sufficient ductility to prevent clip fracture in mat fabrication.

For manual assembly, use No. 12 gage spring steel wire of high elastic limit, conforming to the following chemical analysis:

Element	Percent	
	Min.	Max.
Carbon	0.45	0.70
Manganese	0.90	1.20
Sulfur	0.00	0.045
Phosphorus	0.00	0.045
Silicon	0.08	0.12

(b) Method of Assembly (Using Clips). Hold the bars in close contact by clips designed to exert constant pressure. Assemble at the point of manufacture, using clips of acceptable design, and fasten by mechanical means.

Use double-latching type clips for manual assembly. Use some form of locking device on the clips' free or latching ends so that when the clips are latched in place, no creeping occurs that would allow the bars to be easily moved from their necessary positions.

Provide, approximately, a 1-inch spread of the clips at intersections for necessary leverage to hold bars at right angles. Latch each alternate clip at right angles to the adjacent clips, to ensure maximum rigidity. Use clips of a length so the material is not stressed beyond the elastic limit during the latching process. A minimum length of 3 1/2 inches is necessary for No. 3 to No. 10 bars.

Other types of clips that ensure equal rigidity may be submitted for acceptance.

(c) Acceptance of Design. Submit designs for acceptance, before use.

709.3 STEEL WELDED WIRE FABRIC—ASTM A1064 Grade 70. From a manufacturer listed in Bulletin 15, rigidly welded at joints and points of intersection to form a fabric reinforcement, and as shown on the Standard Drawings.

(a) Epoxy Coating (Where Indicated). ASTM A884, Type 1, Class A.

(b) Galvanized Welded Wire Fabric. Galvanized Welded Wire Fabric may be substituted for Epoxy Coated Welded Wire Fabric. Galvanize in accordance with ASTM A123 with a coating grade consistent with the measured wire diameter of the fabric. Chromate in accordance with ASTM A767, Section 6.8.

709.4 DEFORMED WELDED WIRE FABRIC—ASTM A1064 Grade 75. From a manufacturer listed in Bulletin 15 and as shown on the Standard Drawings.

(a) **Epoxy Coating (Where Indicated).** Section 709.3(a).

(b) **Galvanized Welded Wire Fabric.** Galvanized Deformed Wire Fabric may be substituted for Epoxy Coated Deformed Wire Fabric. Galvanize according to ASTM A123 with a coating grade consistent with the measured wire diameter of the fabric. Chromate in accordance with ASTM A767, Section 6.8.

709.5 CERTIFICATION—Certify as specified in Section 106.03(b)3 and conforming to the following requirements.

- Identify the appropriate specification on the certification and include the grade of steel. Forward a copy to the project with the shipment of steel.
- Epoxy coaters or galvanizers of reinforcement steel must complete and maintain the original copy of Form CS-4171C in addition to the original CS-4171 and all component certifications at the epoxy coater's or galvanizer's location for a period of not less than 3 years from the date of the last shipment to a project, distributor, supplier, private label company, fabricator, or precast plant. Make files available for inspection and verification by a Department Representative. Submit a copy of Forms CS-4171 and CS-4171C, with each shipment of epoxy coated or galvanized reinforcement steel to a project, distributor, supplier, private label company, fabricator, or precast plant. Form CS-4171C does not have to be completed if the fabrication of epoxy coated or galvanized reinforcement steel is performed at the same location as listed in Bulletin 15.
- Fabricators of epoxy coated or galvanized reinforcement steel must complete and maintain the original copy of Form CS-4171F in addition to the CS-4171C, when applicable, and all component certifications at the fabricator's location for a period of not less than 3 years from the date of the last shipment to a project, distributor, supplier, private label company, or precast plant. Make files available for inspection and verification by a Department Representative. Submit a copy of Forms CS-4171 and CS-4171F, with each shipment of epoxy coated or galvanized reinforcement steel to a project, distributor, supplier, private label company, or precast plant.

SECTION 711—CONCRETE CURING MATERIAL AND ADMIXTURES

711.1 CURING AND PROTECTING COVERS—

(a) **White Polyethylene Sheeting.** ASTM C171, except minimum tensile strength requirements are as follows:

Machine Direction	Cross Machine Direction
7.0 lbs/lin. in.	7.0 lbs/lin. in.

(b) **White Polyethylene Sheeting—Burlap-Backed.**

1. White Polyethylene Sheeting—natural burlap backed. ASTM C171.
2. White Polyethylene Sheeting—synthetic burlap backed. ASTM C171, except weight of synthetic burlap backed white polyethylene sheeting is 8.0 ounces per square yard.

(c) **White Polypropylene Sheeting—Polypropylene Fiber Backed.**

1. White Polypropylene Sheeting—polypropylene fiber backed, with maximum moisture loss of 113 pounds per 1,000 square feet in 72 hours when testing according to ASTM C156.
2. Daylight reflectance of white polypropylene sheeting is at least 70% when measured according to ASTM E1347.
3. White Polypropylene Sheeting—polypropylene fiber backed, weighing not less than 6.0 ounces per square yard.
4. A white sheeting layer with a nominal thickness of 0.0040 inch and not less than 0.0030 inch.
5. Minimum strength requirements are as follows:

Grab Tensile Strength	Grab Tensile Elongation	Puncture
120 lbs	50%	65 lbs
ASTM D4632	ASTM D4632	ASTM D4833

(d) **Burlap.** AASHTO M 182, Class 1.

(e) **Insulating Mats.** Treated new wood fibers, rock wool, or glass fibers, completely enclosed on all sides within weather-proof covers of asphalt-saturated kraft crepe or polyethylene sheeting, and conforming to the following requirements:

- Asphalt-saturated crepe covers manufactured from extra heavy, two-ply, kraft crepe, totaling not less than 30 pounds per 1,000 square feet, on the weather side and of kraft paper or kraft crepe, of not less than 15 pounds per 1,000 square feet, on the reverse side.
- Polyethylene covers manufactured from sheeting of not less than 6 mils normal thickness on the weather side and of not less than 4 mils normal thickness on the reverse side.
- Fiber bonded to the covers of insulating mats over 24 inches in width, to prevent bunching of the mats during storage, shipping, or handling.

(f) **Foam Insulation.** Molded, extruded, or spray-applied polyurethane or molded or extruded polystyrene, forming closed-cell foam insulation, with the cells uniformly distributed and conforming to the following requirements:

- Water absorption, percent by volume, tested according to ASTM D2842—3.0 max.
- Density, lbs/cu. ft., tested according to ASTM D1622—1.0 - 6.0

(g) **Certification.** Section 106.03(b)3

711.2 CURING COMPOUNDS—

(a) **Liquid Membrane-Forming Curing Compound, Clear or White.** ASTM C309, Type 1-D, clear or translucent and containing a red fugitive dye; Type 2, white pigmented.

The rate of application for testing untextured specimens is 200 square foot per gallon.

Type I cement from Lafarge Bath plant in Ontario and Ottawa ASTM graded sand are used in the mortar for testing.

The curing compound must be manufactured to:

- Remain sprayable at temperatures above 40F
- Control sagging, pigmented settling, leveling, and de-emulsification
- Maintain the specified properties for at least 1 year

Settlement of pigment must be a thoroughly wetted, soft, mushy mass allowing the complete and easy vertical penetration of paddle. Settled pigment must be easily predisposed, with minimum resistance to the sideways manual motion of the paddle across the bottom of the container, to form a smooth, uniform product of the proper consistency.

Do not dilute or alter the curing compound after manufacture.

Package the curing compound in clean 275-gallon totes, 55-gallon barrels, or 5-gallon pails, or supply curing compound from a suitable storage tank located at the job site. The containers must comply with 49 CFR 171-180. Provide 275-gallon totes and 55-gallon barrels with removable lids and airtight fasteners. The 5-gallon pails must be round and have standard full open head and bail. Do not use lids with bung holes.

Fill containers in a way that prevents skinning.

Line steel containers and lids with a coating that prevents destructive action by the compound or chemical agents in the air space above the compound. The coating must not come off the container or lid as skins.

Plastic containers and lids must not react with the curing compound.

Label each curing compound container with:

- Manufacturer's name
- ASTM C309 classification
- Lot number
- Volume
- Date of manufacture
- Shelf Life
- Volatile organic compound content
- Warning that curing compound containing pigment must be well stirred before using with no dilution, introduction of air or other foreign substances into the curing compound
- Precautions concerning the handling and application of curing compound
- Statement that the contents fully comply with State air pollution control rules and regulations

Use the curing compound within 12 months from the date of manufacture or before the expiration of the product shelf life, whichever occurs first.

(b) **Liquid Membrane-Forming Curing Compound, White, Poly-alpha-methylstyrene (PAMS).** ASTM C309, Type 2, Class B as modified below:

- Total Solids (% by weight of compound): to be used as a reference
- % Reflectance in 72 hours (ASTM E1347): 60 minimum
- Loss of Water, pounds per square foot in 72 hours (ASTM C156): 0.082 maximum
- VOC content (pounds per gallon): 2.90 maximum
- Infrared Spectrum, Vehicle: 100% alpha methylstyrene

The rate of application for testing untextured specimens in 200 square feet per gallon.

Type I cement from Lafarge Bath plant in Ontario and Ottawa ASTM graded sand are used in the mortar for testing.

The curing compound must be manufactured to:

- Remain sprayable at temperatures above 40F
- Control sagging, pigmented settling, leveling, and de-emulsification
- Maintain the specified properties for at least 1 year

Settlement of pigment must be a thoroughly wetted, soft, mushy mass allowing the complete and easy vertical penetration of paddle. Settled pigment must be easily predisposed, with minimum resistance to the sideways manual motion of the paddle across the bottom of the container, to form a smooth, uniform product of the proper consistency.

Do not dilute or alter the curing compound after manufacture.

Package the curing compound in clean 275-gallon totes, 55-gallon barrels, or 5-gallon pails, or supply curing compound from a suitable storage tank located at the job site. The containers must comply with 49 CFR 171-180. Provide 275-gallon totes and 55-gallon barrels with removable lids and airtight fasteners. The 5-gallon pails must be round and have standard full open head and bail. Do not use lids with bunnholes.

Fill containers in a way that prevents skinning.

Line steel containers and lids with a coating that prevents destructive action by the compound or chemical agents in the air space above the compound. The coating must not come off the container or lid as skins.

Plastic containers and lids must not react with the curing compound.

Label each curing compound container with:

- Manufacturer's name
- ASTM C309 classification
- Lot number
- Volume
- Date of manufacture
- Shelf Life
- Volatile organic compound content
- Warning that curing compound containing pigment must be well stirred before using with no dilution, introduction of air or other foreign substances into the curing compound
- Precautions concerning the handling and application of curing compound
- Statement that the contents fully comply with State air pollution control rules and regulations

Use the curing compound within 12 months from the date of manufacture or before the expiration of the product shelf life, whichever occurs first.

(c) Liquid Membrane-Forming Curing Compound, Black. Emulsified asphalt (Class E-1, Bulletin 25) or cut-back asphalt (Class RC-70, ASTM D2028) both conforming to the performance requirements of ASTM C309 for Type 4.

(d) Bridge Deck Intermediate Curing Compound. A monomolecular film, composed of a film-forming fatty alcohol, capable of retarding moisture evaporation from concrete. Use material from a manufacturer listed in Bulletin 15.

(e) Certification. Section 106.03(b)3, including the date of manufacture and the product shelf life on Form CS-4171.

711.3 CONCRETE ADMIXTURES—Of an approved type, from a manufacturer listed in Bulletin 15, and conforming to the following requirements:

(a) General. If tested by precipitation, the chloride ion content is not to exceed the following:

- 1.0% by weight of the admixture for use in conventional reinforced cement concrete

- 0.1% by weight of the admixture for use in prestressed concrete

(b) Certification. Section 106.03(b)3

(c) Shipment. Ship and deliver in drums, in bulk or in bags. Mark or tag each drum or bag with the batch or lot number and date of manufacture. Forward a bill of lading with each bulk shipment, bearing the same information as necessary for drums. Each shipment will be subject to sampling and testing at any time.

(d) Air Entraining Admixtures. AASHTO M 154

(e) Latex Emulsion Admixture. A nontoxic, film-forming, polymeric emulsion in water to which all stabilizers have been added at the point of manufacture and homogeneous and uniform in composition. Conform to the prequalification requirements specified in Report FHWA-RD-78-35, "Styrene-Butadiene Latex Modifiers for Bridge Deck Overlay Concrete," April 1978.

(f) Other Admixtures. AASHTO M 194

(g) Fibers for Plastic Shrinkage Cracking. Monofilament or collated fibrillated synthetic fiber, complying with ASTM C1116, 4.1.3-Type III. Provide test report complying with ICC Evaluation services (ICC-ES) AC308 Acceptance Criteria for Concrete with synthetic fibers, Section 3.2.1 from an Independent Certified Laboratory.

Provide a method of adding the fibers to the mix such that the fibers are dispersed during mixing and no clumps of fibers are present at the end of a mix cycle.

(h) Pigment for Internally Colored Concrete. Colored or white pigments in powder or liquid form, complying with ASTM C979.

Provide test report complying with ASTM C979 from an Independent Certified Laboratory. The maximum prescribed dosage rate of the pigment must be less than 10% by weight of the cement. Maintain water/cement ration when using liquid pigments. Demonstrate that the amount of pigment added has little or no effect on the physical properties of the fresh or hardened concrete.

SECTION 713—MASONRY UNITS

713.1 BRICK—

(a) **Sewer Brick.** ASTM C32, Grade SS; except, with a maximum water absorption of 12.0% for the average of 5 bricks and 15% for individual bricks.

(b) **Building Brick.** ASTM C62, Grade SW

(c) **Certification.** Section 106.03(b)3

713.2 PRECAST CONCRETE BLOCKS—As listed in Bulletin 15, conforming to the applicable requirements of ASTM C 90, and as follows:

(a) **General.** Machine made blocks with a minimum compressive strength of 2,500 pounds per square inch, when tested according to ASTM C140.

Do not use liquid membrane-forming compounds for curing.

Certify each shipment of precast concrete blocks as specified in Section 106.03(b)3.

(b) **Material.**

- Cement—Section 701
- Fine Aggregate, Type A—Section 703.1*
- Coarse Aggregate, Type A—Section 703.2*
- Water—Section 720.1
- Supplementary Cementitious Material—Section 724

* The gradation of aggregates does not apply.

(c) **Acceptance.** Prepare a QC Plan, as specified in Section 106.03(a)2.a, and submit it for review at the start of the project. Provide two samples for each lot number, or as directed. A lot may represent each day's production. Acceptance will be based on the results of compression tests made on these samples and on inspection of the finished product to determine conformance with specifications and lack of defects.

(d) **Rejection.** Blocks exhibiting any of the following conditions will be considered defective and will not be accepted:

- Defects that indicate imperfect proportioning, mixing, and molding;
- Surface defects, such as honeycombing or open texture; or
- Areas damaged beyond satisfactory repair.

SECTION 714—PRECAST CONCRETE PRODUCTS

714.1 GENERAL REQUIREMENTS—As shown on the Standard Drawings, as indicated and as follows:

(a) **Description.** Precast concrete units are those cast in other than their permanent location by a manufacturer listed in Bulletin 15.

(b) **Shop Drawings.** As accepted. Standard precast elements may be fabricated as shown on the Standard Drawings without submitting shop drawings to the Bureau of Project Delivery for acceptance, unless otherwise indicated. For deviations or modifications of the standards, submit shop drawings for acceptance.

714.2 PRECAST CONCRETE UNITS—Approved plants may fabricate any of the following items:

- Concrete barrier: median barrier, single face, temporary, permanent, structure mounted, etc.
- Manholes
- Inlet Boxes
- Concrete Top Units for Inlet Boxes
- Junction boxes
- Endwalls
- Sound barrier posts and panels
- Non-structural precast architectural products such as balustrade, rails, pylons, etc.
- Other precast products, as approved by the Chief Structural Materials Engineer.

714.3 MATERIAL—

- Storage of Material—Section 106.05
- Cement Concrete—Section 704, except Sections 704.1(d)4., 704.1(d)5., 704.1(d)6., and 704.1(d)7. Requirements for remediation of a potential alkali-silica reaction do not apply for cement concrete used in the fabrication of precast concrete barrier that is to be used in temporary installations only, as specified in Section 627, and as specified in Section 714.6(d).
- Coarse Aggregate, Type A, No. 8, No. 57, or No. 67—Section 703.2
- Fine Aggregate, Type A—Section 703.1
- Concrete Curing Material—Sections 711.1 and 711.2(a).
- Reinforcement Steel—Section 709. Epoxy coated or galvanized reinforcement bars or epoxy coated or galvanized welded wire fabric are not required for the fabrication of precast concrete barrier that is to be used in temporary installations only, as specified in Section 627, and as specified in Section 714.6(d).
- Steel Anchor Bolts—Section 1105.2(c)

- Metal Units—Sections 605.2(a) and (b)
- Manhole Steps—Section 605.2(c)
- Protective Coating (Boiled Linseed Oil)—Section 503.2

714.4 PLANT ACCEPTANCE—
