(a) General. Do not begin fabrication before the Chief Structural Materials Engineer's inspection and acceptance of the plant. Provide a permanent building offered for the Department's acceptance.

Material, equipment, test procedures, methods of fabrication, handling, storage, and transportation are subject to inspection. Precast facilities fabricating solely non-structural precast architectural products need only to be certified under Architectural Precast Association (APA) plant certification program.

Register and certify the plant under either the Prestressed Concrete Institute (PCI) or National Precast Concrete Association (NPCA) plant certification program. Submit an annual endorsed copy to the Chief Structural Materials Engineer for continued qualification.

(b) QC.

1. General. Establish a level of QC based on uniform production practices. Submit the plant's QC Plan and mix design(s) to the Chief Structural Materials Engineer, Bridge Design & Technology Division, Structural Materials Section, for review and approval. Include with the QC Plan a company organizational chart indicating a separate chain of command from the QC Manager to the Owner/Plant Manager independent of the Production Manager. Resubmit the QC Plan, mix design, and organizational chart, if required by the Chief Structural Materials Engineer, due to changes in processes, materials, or personnel.

2. QC Manager. Provide a QC Manager who has overall responsibility for the adequacy of production facilities, QC, sampling and testing, and fabrication of the product, and who will ensure items are fabricated as shown on the Standard Drawings. QC Managers are required to maintain an active ACI Grade I Field Technician Certification.

3. QC Personnel. Assign sufficient qualified personnel with precast concrete experience to be responsible for QC and sampling and testing during the complete fabrication process, storage, and shipment. Technicians responsible for concrete sampling and testing are required to provide written evidence they successfully completed certification requirements for an ACI Grade I Field Technician Certification or have approval from the Chief Structural Materials Engineer as a technician-in-training. Do not proceed with production until qualified personnel are present and approved.

714.5 PLANTS AND PLANT SITES—

(a) Description. Provide adequate and acceptable lighting for operations not completed in the daylight. Provide a drainage system as needed for the removal of rainfall and curing water. Provide a stabilized area for product storage.

Furnish necessary facilities for the inspection of material and work. Allow Inspectors employed by the Department unrestricted access to the premises during plant working hours. The necessary facilities for inspection include a plant office conforming to the following minimum requirements:

Number of Each	Requirements
150	Floor space: square feet
Yes	Air-conditioned/heated
1	Desk and chair
1	Plan rack
1	Work table
1	Two-drawer fire resistant (D-label) metal file cabinet
Adequate number	Chair and stools
1	Individual Access Phone line

1	Internet Service: a wired broadband Internet service, for exclusive use by Department personnel for official business purposes only. Choose a service that provides the fastest available highspeed broadband internet access, with a minimum connection of 5 Mbps per inspector, to the account by means of a Cable or Digital Subscriber Line (DSL). Provide a wireless broadband router, with a minimum-security setting of WPA2, to connect to the provided wired broadband. Based on the specific type of high-speed connection provided, furnish a compatible modem with built-in hardware firewall protection. If such high-speed wired broadband connection is not attainable at the Inspector Office desk area alternate internet connectivity options must be submitted to the Chief Structural Materials Engineer for review and acceptance. Demonstrate connectivity with the Internet Service Provider once the service is initiated. To ensure reliability and continued access, audits of this connection may be done at any time by a qualified PennDOT/OA IT Personnel.
1	Telephone (business and emergency calls only) and answering machine or voice-mail
1	Sanitary electric water cooler
1	Fire extinguisher
Adequate number	Cupboards, closets, lockers
1	First-aid kit (OSHA 1926.50(d) and 1926.50 Appendix A compliant)

714.6 FABRICATION—

(a) General. Plants must produce a sample element to verify their competency before receiving approval to produce a new product type.

Plants must produce test sections and conduct a prefabrication meeting as specified in Section 1085.3(g) for products containing an architectural finish or requiring staining or both.

(b) Bars, Mesh Reinforcement, Inserts, and Chairs. Fabricate and place bar and mesh reinforcement, as indicated, within specified tolerances. Secure reinforcing in beds and forms using chairs or blocking so the reinforcing maintains its position during placement and vibration of concrete. Bars may be fabricated into cages by tying and tack welding. Do not tack weld epoxy coated; galvanized; uncoated, corrosion-resistant; stainless steel; or Grade 60 reinforcement bars. Use acceptable chairs or ties for support.

If bar spacing is greater than or equal to 12 inches, tie all intersections with annealed iron wire or metal clips. If bar spacing is less than 12 inches, either tie all intersections or tie alternate intersections with annealed iron wire or metal clips in each direction to provide a staggered tie layout prohibit movement of reinforcement bars during manufacturing. For epoxy-coated reinforcement or galvanized reinforcement, provide plastic-coated tie wire, epoxy-coated tie wire, metal clips, or plastic clips.

(c) Beds and Forms. Support casting beds or forms on unyielding foundations. Use forms adequate for the manufacture of products within tolerances, according to approved drawings and specifications. Clean forms after each use to prevent accumulation of coatings. Wooden forms must be adequately coated and sealed to prevent leakage. Wooden form surfaces must be coated to eliminate transfer of wood grain to the finish product.

(d) Marking. Mark the manufacturer's name or trademark and the date of manufacture on one side or end of each precast unit as soon as possible after stripping using permanent marking system. For inlets, manholes, and junction boxes, also provide the type identification. Identify barrier meeting NCHRP 350 by indenting the top section of each barrier section with minimum 2-inch block lettering as follows: "T 350" for temporary barrier and "P 350" for permanent barrier. After 12/31/2019, NCHRP 350 barrier will no longer be fabricated. After 12/31/2025, NCHRP 350 barrier will be prohibited for use on Department projects.

Identify barrier meeting MASH by indenting the top section of each barrier section with minimum 2-inch block lettering as follows: "T-M-XX" for temporary barrier and "P-M-XX" for permanent barrier. The "XX" characters indicate the MASH compliance year (e.g. "16" for 2016 or "18" for 2018, etc.).

(e) Vertical Adjustment Device Assembly. Fabricate vertical adjustment device assemblies for precast concrete deck panels as shown on the Standard Drawings and as specified in Section 1107.01(b). Conduct welding and testing of assembly as specified in Section 1105 and according to the applicable AASHTO and AWS codes. Alternate vertical adjustment devices may be used if the structure can be produced within the specified erection tolerances.

714.7 CONCRETE—

(a) Testing. Verify the minimum curing strength and the 28-day minimum concrete strength, as specified in Section 704, for each lot. If the test results of the acceptance cylinders fail to meet the required 28-day minimum compressive strength, the disposition of the products will be resolved as specified in Section 110.13.

1. Traditional, Non-Self-Consolidating Mixtures. Select an appropriate slump value that provides a workable mix for the precast concrete units. At no time is the slump upper limit to exceed 5 inches for mixes without water-reducing admixtures, 6 1/2 inches for mixes with water-reducing admixtures, and 8 inches for mixes with high range water-reducing admixtures (superplasticizers). If the upper limit is exceeded on any slump test, the plant's technician must reject the cement concrete. Maintain the cement concrete consistency within 1 1/2 inches on either side of the selected value.

2. Self-Consolidating Concrete Mixtures (SCC). Perform slump flow testing according to ASTM C1611. Evaluate the visual stability index (VSI) of the mixture when the slump flow is measured during testing. Reject mixtures with a VSI > 1. Conduct J-Ring testing according to ASTM C1621, whenever the slump flow test is performed. Establish a slump flow target for production of not less than 20 inches nor more than 30 inches and maintain the slump flow within a range of ± 3 inches of the target. Reject the concrete if the upper specification limit is exceeded. If the slump flow test result is less than the lower production range limit or the difference between the slump flow test result and J-Ring test result is greater than 2.0 inches reject the concrete mixture unless the mixture has been approved for vibration and is subsequently vibrated. Take immediate corrective action whenever the slump flow limits or action points are exceeded and test succeeding batches until material control has been reestablished.

(b) Mixture. For traditional, non-self-consolidating mixes, furnish concrete meeting the Class indicated and as specified in Section 704.

For SCC mixes, furnish concrete meeting the Class indicated and as specified in Section 704 except provide concrete with a plastic air content of $7\% \pm 2\%$. In addition, perform the following additional qualification tests before production:

- Column Segregation Test, ASTM C1610: 12% maximum
- Freeze Thaw Resistance, ASTM C666, Procedure A or B: minimum durability factor of 80

Fully automated batch systems using in-mixer moisture probes may be utilized, at the Fabricator's request and approval by the Chief Structural Materials Engineer. Fully automated batch systems must be operated according to Publication 145.

1. Aggregate Mineral Filler (AMF). Aggregate Mineral Filler (AMF), — is a finely divided inorganic material derived from quarried stone, for use as an ingredient in hydraulic cementitious mixtures and meeting specified chemical and physical requirements conforming to ASTM D1797.

AMF is to be used to replace a small percentage of fine aggregate to enhance the optimization of concrete mixes.

Material Specification

Gradation

<u>Sieve</u>	<u>percent passing</u>
#10	100 % passing (maximum)
#200	35% passing (maximum)

Methylene blue value (mg/g)	< 5.0%
Total Organic Carbon Content % by mass	< 0.5%

Moisture Content (%) by mass < 1.0%

Limits on Use

The percentage of AMF shall not exceed 15% (by mass) of the total cementitious factor.

(c) Placing Concrete. Place concrete without segregation. Deposit concrete in its final position in each part of the form. Methods of placement are subject to acceptance. Do not work or flow concrete along the forms from the point of deposit. Work concrete under and around reinforcement.

Place concrete batches in form within one half hour of each other. Consolidate the plastic concrete by internal vibration or external vibration or both. Do not consolidate SCC mixtures without approval and unless the mixture was qualified within 2.0 inches of the upper production slump flow limit during the trial batching and evaluation phase.

Air temperatures within the work area must remain above 40F for production.

(d) Lot Size. Lot size is one shift's production. Mold a minimum of four concrete test cylinders for each lot cast. Mold additional test cylinders for Department acceptance testing if directed.

Mold cylinders according to PTM No. 631. Cure cylinders the same as the product. Test cylinders according to PTM No. 604. Match-mark test cylinders with the lot represented. Record test results and give records to the Representative.

(e) Finishing. Make concrete surfaces true and even, and free from rough, open, or honeycombed areas, depressions, or projections. Do not add water to the concrete to facilitate finishing.

(f) Patching. Patch and repair manufacturing defects and minor damage according to Publication 145. Submit repairs beyond the scope of Publication 145 to the Chief Structural Materials Engineer for evaluation and disposition.

714.8 CURING AND PROTECTIVE COATING—

(a) Curing. Cure and protect concrete according to the approved QC Plan. Develop the QC Plan according to ACI 308.

Set stripping time based on the inherent characteristics of the product.

Accomplish secondary curing by approved methods.

Maintain precast concrete units, after stripping and during secondary curing, in a minimum 50F environment until they have reached a compressive strength of 80% of the 28-day minimum compressive strength for the product as indicated on the shop drawing. Do not place units in an environment of less than 32F after the secondary cure, unless the differential between the units and the air temperature is less than 30F.

Store units until the 28-day minimum compressive strength is obtained.

(b) Protective Coating. Apply protective coating to concrete barrier and inlet tops before shipment. Use boiled linseed oil and apply as specified in Section 503.3(b) or use a penetrating sealer from a manufacturer listed in Bulletin 15 applied according to the manufacturer's specifications. Penetrating sealer must not discolor the concrete. If curing compound is used for secondary curing, wait 14 days before applying the protective coating. Barriers for temporary use need not receive a protective coating.

714.9 TOLERANCES—As shown on the Standard Drawings, according to Publication 145, or according to PCI MNL 135 except as follows:

Length of Member—1/8 inch per 10 feet with a minimum of 1/4 inch and a maximum of 3/4 inch

Cross-Sectional Dimensions— $\leq 36\text{-inch} \dots \pm 1/4\text{-inch}$
 $> 36\text{-inch} \dots \pm 3/8\text{-inch}$

714.10 HANDLING AND STORAGE—Handle and move products to the storage yard when they have gained adequate strength to be moved without causing damage. Maintain adequate support when handling and storing the product. Store the product, until shipment, in areas accessible for inspection.

714.11 TRANSPORTATION—Provide 24-hour advance notice of loading and shipping schedule. Do not ship unapproved items. Include Form CS-4171 with each shipment. Observe hauling restrictions. Ensure that supports, bracing, and shipping methods dampen vibration. Provide adequate padding material between the tie chains or cables to prevent concrete chipping.

714.12 DISPUTES—In matters of disputes over products, the Chief Structural Materials Engineer, BDTD, Structural Materials Section, or the designated on-site representative have the final word on acceptability of the product.

714.13 CERTIFICATION—Section 106.03(b)3, and as further directed by the Chief Structural Materials Engineer, BDTD, Structural Materials Section.

SECTION 720—WATER

720.1 WATER FOR MIXING OR CURING CEMENT CONCRETE, MORTAR, OR GROUT—Use water conforming to ASTM C1602 that is reasonably clean, free from vegetable matter, oil, acid, alkali, sugar, or other substances injurious to the finished product.

720.2 WATER FOR USE OTHER THAN IN MIXING OR CURING CEMENT CONCRETE, MORTAR, OR GROUT—Suitable clean water may be used without testing. If the water source is relatively shallow, enclose the intake to exclude silt, mud, grass, or other undesirable foreign material.

SECTION 721—CALCIUM CHLORIDE

721.1 GENERAL—As listed in Bulletin 15 and conforming to the requirements of AASHTO M 144, Type S, Grade 1, Class A or B. Certify as specified in Section 106.03(b)3.

SECTION 722—SODIUM CHLORIDE

722.1 GENERAL—Sodium chloride for the purpose of roadway de-icing.

722.2 MATERIAL—Furnish sodium chloride from a manufacturer listed in Bulletin 15 and conforming to the requirements of ASTM D 632.

(a) Roadway De-icer – Mined rock salt.

- Classification – Type I, Grade 1, unless otherwise specified by the Department of General Services Statewide Sodium Chloride Contract which shall govern the classification requirement.
- Moisture Content – Shall not exceed 2.0-percent by weight, unless otherwise specified by the Department of General Services Statewide Sodium Chloride Contract which shall govern the moisture content requirement.
- Anti-Caking Compound – Shall be treated with either Yellow Prussiate of Soda (Sodium Ferrocyanide) or Prussian Blue (Ferric Ferrocyanide) introduced uniformly throughout at such a rate that a minimum of 20-ppm anti-caking compound is present, unless otherwise specified by the Department of General Services Statewide Sodium Chloride Contract which shall govern the anti-caking compound requirement.

(b) Certification – Certify as specified in Section 106.03(b)3.

SECTION 723—HYDRATED LIME

723.1 GENERAL—ASTM C 207, Type N. Legibly mark the manufacturer's name, the lot number, and the approximate net weight on each container or, in the case of bulk shipment, on the shipping notice. Certify as specified in Section 106.03(b)3.

SECTION 724—SUPPLEMENTARY CEMENTITIOUS MATERIAL

724.1 GENERAL—From a manufacturer listed in Bulletin 15. Legibly mark the name of the manufacturer, the lot number, and the approximate net mass on each container or, in case of bulk shipment, on the shipping invoice.

Supply sources desiring approval must write the LTS, stating their present QC program, as specified in Section 106.03(a)2.

The material is subject to assurance sampling and testing by the LTS. Materials not conforming to the requirements may result in suspension of source approval. The supply source may reapply for approval after making corrections necessary to ensure all sampled or tested materials meet all applicable Specifications.

Obtain material from a single source, unless directed otherwise in writing. Separate material of different types and from different sources. Use each type and source in continuous segregated portions of the project. If possible, limit material used in an individual structure to a single type or source. If this is not possible, use one type and source for footers, piers, and abutments, and one source for superstructures if allowed.

724.2 FLYASH—

(a) For Use with Lime. ASTM C593, tested according to AASHTO T 135. Certify as specified in Section 106.03(b)3.

(b) For Use with Cement Concrete. AASHTO M 295, Class C, F, or N, except limit Loss on Ignition to a maximum of 6.0%. Certify as specified in Section 106.03(b)3.

TR-7012 - FLYASH Test Results. Form must be filled out and delivered with every certified load.

724.3 SLAG CEMENT—

(a) For Use with Cement Concrete. AASHTO M 302, Grade 100 or 120. Do not use slag cement with a material temperature exceeding 180F at time of delivery to the mixer, unless directed in writing. Certify as specified in Section 106.03(b)3.

TR-7013 - Slag Cement Test Results. Form must be filled out and delivered with every certified load.

724.4 SILICA FUME—

(a) For Use with Cement Concrete. AASHTO M 307 except percent retained on the No. 325 sieve. If the percent retained on the No. 325 sieve is greater than 10%, test the material retained for contamination. Certify as specified in Section 106.03(b)3.

TR-7014 - Silica Fume Test Results. Form must be filled out and delivered with every certified load.

724.5 Mechanically Modified Supplementary Cementitious Materials (SCM) -Cement combinations

(a) For Use with Cement Concrete. Inter-ground Mechanically Modified SCM-Cement combinations which contain a minimum of 90% SCM by weight and as specified in Section 704.1(b) when replacing 50% cement by weight in cement concrete mixtures. Test according to the AASHTO standard for the base SCM as specified in Sections 724.2(b) or 724.3(a). Certify as specified in Section 106.03(b)3.

SECTION 725—LIME POZZOLAN

725.1 GENERAL—Submit samples to the LTS for testing, a minimum of 60 days before anticipated use. From a manufacturer listed in Bulletin 15, and conforming to the following requirements:

- Total calcium and magnesium oxides (nonvolatile basis)—min. 45%
- Available calcium oxide (rapid sugar test, ASTM C 25) plus total MgO content calculated to be equivalent $\text{Ca}(\text{OH})_2$ —min. 25%

As received loss on ignition (carbon dioxide plus moisture, combined and free)—max. 35%

- Free water (as-received basis)—max. 2%
- Residue—The sieve analysis of the by-product lime shall be as follows:

<u>Sieve</u>	<u>Maximum Percent Retained</u>
No. 100	5
No. 200	20

SECTION 727—ASPHALT IMPREGNATED PAPER

727.1 GENERAL—Impregnated with asphalt or tar and conforming to the following requirements:

	ENGLISH	
	One-Ply	Two-Ply
Weight per square foot, ounces	4.8	6.3
Permissible variation, %	6	6

SECTION 735—GEOTEXTILES

735.1 GENERAL—From a manufacturer listed in Bulletin 15 and conforming to the following requirements:

(a) **Fabric.** Use fabric consisting of long chain polymeric filaments or yarns such as polyethylene, polyamide, polyvinylidene-chloride, polypropylene, or polyester formed into a stable network so that the filaments or yarns retain their relative position to each other. Use fabric structures as noted in Table A. Slit film woven fabrics may only be used for Class 3 Geotextiles. Chemically- or thermally-bonded fabrics are not allowed for any class of geotextile. Use fabric inert to commonly encountered construction chemicals or substances. During periods of shipment and storage, protect the fabric from direct sunlight, ultra-violet rays, temperatures greater than 140F, mud, dirt, dust, and debris. To the extent possible, wrap the fabric in a heavy-duty covering or shield from direct sunlight.

Geotextiles will be rejected at the time of installation if any defects, deterioration, or damage was incurred during manufacture, transportation, or storage.

(b) **Physical Requirements.** Table A, for the indicated construction class and type.

(c) **Acceptance.** Acceptance of the geotextile will be based on certified test data submitted by the manufacturer and on testing by Laboratory Testing Section (LTS).

(d) **Certification.** Certify each shipment as specified in Section 106.03(b)3. Visibly label all shipments on the fabric or its container with the manufacturer's name, fabric type or trade name, lot number, and material quantity.

TABLE A
Geotextile Physical Requirements^{(1) (2)}

Fabric Properties	Test Method	Construction Class				
		Class 1	Class 3		Class 4	
		Subsurface Drainage	Sediment Control		Separation and Erosion Control	Stabilization and GRS Abutments
			Type A	Type B	Type A	Type C
Fabric Structure	N/A	Woven Monofilament	Woven Slit Film	Woven Slit Film	Non-woven Needle Punched	Woven Polypropylene
Weight, oz/sy	ASTM D5261	N/A	N/A	N/A	12.0 min	N/A
Grab Tensile Strength, lbs. ⁽³⁾	ASTM D4632	365 min MD x 190 min XD	185 min MD and XD	115 min MD and XD	305 min MD and XD	N/A
Grab Tensile Elongation, % ^{(3),(5)}	ASTM D4632	22 to 34 MD x 9 to 26 XD	13 to 31 MD and XD	13 to 31 MD and XD	50 min MD and XD	N/A

Percent Open Area, %	COE CW-02215	9.0 to 12.0 ⁽⁵⁾	N/A	N/A	N/A	N/A
Permittivity, sec ⁻¹	ASTM D4491	1.9 min	0.05 min ⁽⁵⁾	0.05 min ⁽⁵⁾	0.70 min	0.40 min ⁽⁵⁾
Water Flow Rate, g/min/sf	ASTM D4491	130 min	N/A	N/A	N/A	25 min
Ultraviolet Resistance Strength Retention, %	ASTM D4355	90 @ 500 hrs min	70 @ 500 hrs min	70 @ 500 hrs min	70 @ 500 hrs min	70 @ 500 hrs min

- (1) The numerical values indicate the required minimum or maximum (as indicated) average values for ten test specimens. No more than 20% of the individual specimens may have a value less than the required minimum value or greater than the required maximum value (as indicated), except as noted (see Note 5).
- (2) MD = Machine Direction, XD = Cross Machine Direction
- (3) Test conducted using 1/32 inch thick neoprene pads on grip faces having a Shore A durometer value of 70±5.
- (4) Wide width tensile strength at 2% strain in both the machine and cross machine directions (MD x XD), must be greater than or equal to required design tensile strength.
- (5) The numerical values indicate the allowable range or required minimum (as indicated) based upon the numerical average of all test specimens from a sample.

SECTION 736—GEOMEMBRANE

736.1 GENERAL—From a manufacturer listed in Bulletin 15 and conforming to the following requirements:

(a) **Geomembrane.** Fabricated from high-density polyethylene (HDPE).

(b) **Physical Requirements.**

- Density 59 pounds per cubic foot minimum, ASTM D 1505
- UV stabilization 2% carbon black, ASTM D 1603
- Sheet thickness 30 mils minimum, ASTM D 5199
- Tear resistance 22 pounds ASTM D 1004
- Resistance soil burial 90% retained strength ASTM D 3083
- Minimum roll width 20 feet minimum

(c) **Acceptance.** Acceptance of the geomembrane will be based on certified test data submitted by the manufacturer and on testing by LTS.

(d) **Certification.** Certify each shipment as specified in Section 106.03(b)3. Visibly label all shipments on the geomembrane or its container with the manufacturer's name, geomembrane type, model or trade name, lot number, and material quantity.

SECTION 737—GEOCELL

737.1 GENERAL—From a manufacturer listed in Bulletin 15 and conforming to the following requirements:

(a) **Physical Requirements.** Provide geocell of cell geometric characteristics listed in Table A and meeting one of the depths listed in Table B, as indicated.

- Sheet material High-density polyethylene (HDPE)
- UV Stabilization 1.5 - 2% carbon black, ASTM D 1603
- Environmental Stress Crack Resistance 1,500 hours minimum, ASTM D 1693
- Sheet surface Sheet, perforated or non-perforated, smooth or textured
- Sheet density 58.7 pounds per cubic foot minimum, ASTM D 1505
- Nominal sheet thickness 47 mils minimum, ASTM D 5199
- Cell wall seams Assemble each seam with 3/4-inch maximum melt pools using continuous or uniformly spaced ultrasonic spot welding. Space welded seams conforming to the requirements of Table A for the Type of geocell.
- Cell seam peel strength Conform to the requirements of Table B, when tested according to PTM 301.

TABLE A
Cell Characteristics per Geocell Type

Type	Nominal Cell Dimensions in.*	Nominal Cell Area in. ² *	Avg. No. Cells per yd. ² *	Weld Spacing in.**
A	8.8x10.2	44.8	28.9	14.0 ± 0.12
B	11.3x12.6	71.3	18.2	17.5 ± 0.12
C	18.7x20.0	187.0	6.9	28.0 ± 0.12

*For informational purposes only.

**In unexpanded configuration.

TABLE B
Required Cell Seam Peel Strength

Depth in.	Cell Seam Peel Strength lbs.
3.0 ± 0.1	240
4.0 ± 0.1	320
6.0 ± 0.1	480
8.0 ± 0.1	640

(b) **Certification.** Certify each shipment as specified in Section 106.03(b)3. Visibly label all shipments on the geocell or its container, with the manufacturer's name and model number or trade name.

Section 738 - GEOGRIDS

738.1 POLYMER REQUIREMENTS –

(a) General. Provide geogrid listed in Bulletin 15 and conforming to the following requirements. Geogrids must be manufactured from either polymeric coated polyester (PET), high density polyethylene (HDPE), or polypropylene (PP) polymer according to the class and type indicated. No post-consumer recycled material is allowed in polymer resins used in the manufacturing of geogrid products. Requirements for the polymers are indicated in Table A.

Table A¹ Requirements for Geogrid Polymers (All values are minimums unless indicated otherwise)					
Property	Units	Test Method	PET	HDPE	PP
Carboxyl End Group (CEG) Content of PET Yarns	mmol/kg	ASTM D7409	< 30.0	N/A	N/A
Number Average Molecular Weight (M_n) of PET Yarns	-	ASTM D4603	25,000	N/A	N/A
Polymeric Coating	Except for manufacturing selvedge edges, the polymeric coating for PET geogrids must be continuous with no more than 10% of the surface area having uncoated, unbound fiber bundles as determined according to ASTM D610, 5.1-5.3 and 5.5 Procedure. ⁴			N/A	N/A
Carbon Black Content ²	%	ASTM D5596, ASTM D1603 or ASTM D4218	N/A	1.0 to 3.5	1.0 to 3.5
Melt Flow Index	g/10 min	ASTM D1238 using Condition 190/2.16 for HDPE and Condition 230/2.16 for PP	N/A	0.50	0.25
Density	g/cm ³	ASTM D792 or ASTM D1505	N/A	0.940	0.905
Resistance to UV Degradation ³	%	ASTM D4355 and ASTM D6637 (Method A or B)	N/A	95	95

Notes:

1. All values are minimum average roll values (MARV), except for CEG for PET polymer which is a maximum average roll value and Carbon Black Content which is a minimum and maximum average roll value range. The maximum average roll values are determined mathematically similar to a MARV, except the values are the average plus two standard deviations.
2. For buried applications only. Do not use geogrids for applications with long-term exposure to sunlight.
3. A sample is exposed to 500 hours of UV radiation according to ASTM D4355. The sample is then tested to determine the Ultimate Tensile Strength (T_U) in the machine direction (MD) for uniaxial geogrids and both the machine and cross machine directions (MD and XD) for biaxial geogrids. The value is calculated by dividing T_U of the UV exposed material by the T_U of the virgin material and multiplying by 100. T_U of all samples are determined according to ASTM D6637, Method B. For biaxial geogrids the minimum required value must be met in both the MD and XD.
4. Use visual inspection and visual examples in ASTM D610 to determine the percentage of uncoated or unbound surface area.

738.2 CLASS 1 UNIAXIAL GEOGRIDS –

(a) General. For use in geosynthetic reinforced soil (GRS) slopes or geosynthetic reinforced mechanically stabilized earth (MSE) walls.

(b) Physical Requirements. Provide geogrid consisting of a regular network of integrally connected longitudinal and transverse polymer tensile elements having aperture geometry sufficient to permit mechanical interlock with the

surrounding material. Required values and test methods for geogrid properties are indicated in Table B. Sample materials according to ASTM D4354.

Table B Requirements for Class 1 Geogrids – Uniaxial Geogrid Reinforcement (All values are minimums unless indicated otherwise)				
Design Parameter	Units	Test Method	Type A	Type B
Polymer Type	-	N/A	Polymeric Coated PET	Integrally Formed ⁵ HDPE
Ultimate Tensile Strength, (T _U)	lbs/ft	ASTM D6637 (Method B)	Design Specific	
Creep Reduction Factor, (RF _{CR}) ¹ (determined for a 100 year design life)	-	AASHTO R 69, ASTM D5262, and ASTM D6992	1.60	2.60
Installation Damage Reduction Factor, (RF _{ID}) ^{1,2}	-	AASHTO R 69	1.30	1.30
Durability Reduction Factor, (RF _D) ¹	-	N/A	1.20	1.10
Combined Reduction Factor (RF _{OV}) ^{1,3}	-	AASHTO R 69	2.50	3.70
Machine Direction (MD) Aperture Size	in.	N/A	0.60 to 6.0 (Min. to Max.)	0.60
Cross Machine Direction (XD) Aperture Size	in.	N/A	0.50	0.50
Rib Section Area Ratio ⁴	-	N/A	0.30	0.30
Percent Open Area	%	N/A	45	45

Notes:

- Value indicated is the minimum reduction factor to be used in determining the Allowable Geosynthetic Tensile Strength. If product specific data values are lower, the value indicated in Table B must be used. If product specific data values are higher, the product specific data values must be used.
- Installation Damage Reduction Factor (RF_{ID}) is valid for a maximum aggregate particle size of 1.5 inch as specified in Section 738.2(b)3.
- RF_{OV} = RF_{CR} x RF_{ID} x RF_D
- Rib Section Area Ratio = Minimum XD Rib Section Area / Minimum MD Rib Section Area
- Manufactured by a punched-drawn process.

1. Ultimate Tensile Strength, (T_U). The calculated T_U is a minimum average roll value (MARV). The MARV is determined by subtracting two standard deviations from the average ultimate tensile strength obtained from the last twelve months of manufacturer quality control testing. Conduct testing for T_U according to ASTM D6637, Method B.

2. Creep Reduction Factor, (RF_{CR}). Determine the geogrid creep reduction factor (RF_{CR}) according to AASHTO R 69, ASTM D5262, and ASTM D6992. Test samples unconfined in the direction in which the load will be applied. Use the ratio of ultimate strength to creep limiting strength to calculate the creep reduction factor. If the calculated creep reduction factor is greater than the creep reduction factor indicated in Table B, use the calculated creep reduction factor.

3. Installation Damage Reduction Factor, (RF_{ID}). Use the minimum installation damage reduction factor (RF_{ID}) indicated in Table B for material with a maximum particle size of 1.5 inches (excluding random oversized particle sizes) unless project specific conditions or a specific geogrid indicates a higher value that was determined according to AASHTO R 69. For materials having greater than 1.5-inch maximum particle size, determine RF_{ID} according to AASHTO R 69 except as follows:

$$RF_{ID} = T_U / T_{dam}$$

RF_{ID} must never be less than 1.3.

4. Durability Reduction Factor, (RF_D). Use the minimum reduction factor for durability (RF_D) indicated in Table B unless project specific conditions or a specific geogrid indicates a higher value.

5. Allowable Geosynthetic Tensile Strength, (T_L). Determine allowable tensile strength of the geogrid using the individual reduction factors to account for installation damage, durability, and creep. The Combined Reduction Factor is the product of the individual reduction factors. Maximum allowable strain of the geogrid is five percent for the 100-year design life when applying the Combined Reduction Factor (RF_{OV}). Determine the allowable long-term geogrid strength (T_L) from:

$$T_L = T_U / RF_{OV}, \text{ or } T_5, \text{ whichever is less}$$

$$RF_{OV} = RF_{CR} \times RF_{ID} \times RF_D$$

$$T_L \geq T_d$$

where:

T_L = long-term allowable geogrid tensile strength (lbs/ft).

T_U = ultimate tensile strength (lbs/ft).

RF_{OV} = combined reduction factor (dimensionless).

RF_{CR} = creep reduction factor (dimensionless). Ratio of T_U to creep-limiting strength, determined according to AASHTO R 69. Use the minimum value indicated in Table B, unless product specific values are greater, use the higher product specific value.

RF_{ID} = installation damage reduction factor (dimensionless). Use the minimum value indicated in Table B. If product specific value is higher, use the product specific value.

RF_D = durability reduction factor (dimensionless). Use the minimum value indicated in Table B, unless project specific conditions or specific geogrid indicate a higher value.

T_d = required design tensile strength of geogrid reinforcement (lbs/ft).

T_5 = MARV tensile strength at 5 percent elongation (lbs/ft).

738.3 CLASS 2 BIAXIAL GEOGRIDS –

(a) General – For use in subgrade or subbase stabilization, load distribution pads, minor slope reinforcement or similar applications. Polypropylene (PP) biaxial grids are required for stabilization (confinement) applications. Polyester (PET) geogrids are required for reinforcement applications such as load distribution pads or slope reinforcement.

(b) Physical Requirements – Provide geogrid consisting of a regular network of integrally connected longitudinal and transverse polymer tensile elements having aperture geometry sufficient to allow mechanical interlock with the surrounding material. Provide Class 2, Type A and B biaxial geogrids fabricated of stiff ribs with connections that are either integrally formed or welded. Provide biaxial geogrid conforming to the properties indicated in Table C. Sample materials according to ASTM D4354.

Table C Required Properties for Class 2 Biaxial Geogrids (All values are minimums unless indicated otherwise)					
Property	Units	Test Method	Type A	Type B	Type C
			Subgrade and Subbase Stabilization	Reinforcement	
Polymer Type	–	-	PP	PP	Polymeric Coated PET
Aperture Size ^{1,2}	in	-	1.0 to 1.7 (Min. to Max.)	1.0 to 1.7 (Min. to Max.)	N/A
Aperture Open Area ³	in ²	-	1.0 to 2.9 (Min. to Max.)	1.0 to 2.9 (Min. to Max.)	N/A
Percent Open Area	%	-	65	65	65
Ultimate Tensile Strength, (T _U) ^{1,4}	lbs/ft	ASTM D6637 (Method B)	1,080	1,780	Design Specific
Elongation at Ultimate Tensile Strength ¹	%	ASTM D6637	5.0 to 15.0 (Min. to Max.)	5.0 to 15.0 (Min. to Max.)	N/A
Junction Efficiency ⁵	%	ASTM D7737 and ASTM D6637	90	90	N/A
Flexural Rigidity	g-cm	ASTM D1388	>1,000	>1,000	N/A
Resistance to Installation Damage ⁶	%	AASHTO R 69	80	80	N/A

Notes:

- Both MD and XD.
- The value is the size of the opening in each direction.
- The value is the product of the aperture openings in the MD and XD.
- Values indicated are minimum average roll values (MARV).
- Calculate by dividing junction strength (as determined by ASTM D7737) by T_U and multiplying by 100.
- When required, conduct installation damage testing as specified in Section 738.2(b)3.

1. Tensile Strength and Reduction Factors – Minimum required T_U for Class 2, Type A and B biaxial geogrids are as specified in Table C. T_L for Class 2, Type C biaxial geogrids is determined as specified in Section 738.2(b)5 for Class 1, Type A uniaxial geogrids, with T_U not less than 2,000 lb/ft in either the MD or XD direction. Do not apply reduction factors to Class 2, Type A and B biaxial geogrids.

738.4 HANDLING and STORAGE – At a minimum, conform to ASTM D4873 for identification, storage, and handling of geogrid. Provide clear identification to every roll of geogrid that provides identification of product designation, the manufacturer's name, lot number, material quantity, and clearly differentiates between rolls of similar geogrid. Protect the geogrid from direct sunlight, ultra-violet rays, temperature greater than 140F, mud, dirt, dust, and debris.

738.5 CERTIFICATION - Certify each shipment as specified in Section 106.03(b)3. Verify that the product received meets the designed value for T_U as specified on the plans. If verification testing is performed, testing must be conducted according to the standards and procedures indicated herein for the material Class and Type. When conducting verification testing for tensile strength, follow ASTM D6637 (Method B), except the calculated tensile strength is determined using the average value of the test results for a minimum of ten test specimens. The calculated tensile strength must be greater than T_U listed in Bulletin 15.

SECTION 800 ROADSIDE DEVELOPMENT

SECTION 801—STOCKPILING TOPSOIL OR TOPSOIL MIXTURE

801.1 DESCRIPTION—This work is separation and salvaging of topsoil or topsoil mixture encountered in grading the project and depositing it in stockpiles at locations within the right of way.

801.2 MATERIAL—

(a) **Topsoil.** Acceptable friable loam that is reasonably free of subsoil, clay lumps, brush, roots, weeds, other objectionable vegetation, stones, other foreign material larger than 2 inches in any dimension, litter, and/or other material unsuitable or harmful to plant growth.

(b) **Topsoil Mixture.** Designated top 8 inches to 12 inches of existing soil collected and combined with organic plant matter such as vegetative slashings consisting of crushed or shredded branches, stems, bark, leaves, seeds, and roots.

801.3 CONSTRUCTION—

(a) **Topsoil.** After clearing and grubbing the area and before starting other construction operations, remove topsoil from areas, as indicated or directed. Adjust equipment and methods of operation to avoid mixing subsoil with topsoil.

Separate the topsoil from other excavated material and stockpile at acceptable locations within the right of way. Do not compact and do not stockpile topsoil in a wet or frozen condition.

Satisfactorily and uniformly grade stockpiled topsoil not required for the project. Apply seeding and soil supplements to these stockpiles, using the formula, as directed, and apply, as specified in Section 804.3. Apply mulch of the type directed, on the stockpiles, as specified in Section 805.3.

(b) **Topsoil Mixture.** During clearing and grubbing operations and before other construction operations, shred all designated vegetation under 4 inches caliper in size using a crawler or loader mounted, self powered, land clearing shredder capable of shredding vegetation to a desired maximum rough size of 12 inches long and 2 inches in diameter. Collect and mix the organic slashings with the top 8 inches to 12 inches of soil to be salvaged, as indicated or directed.

Stockpile topsoil mixture at acceptable locations within the right of way. Do not compact material. Periodically water stockpile as directed.

801.4 MEASUREMENT AND PAYMENT—Cubic Yard

Measured in its final position, as specified in Section 203.4(a)2.

Stockpiled topsoil and topsoil mixture is incidental to Clearing and Grubbing, Excavation, and Borrow Excavation.

SECTION 802—TOPSOIL FURNISHED AND PLACED

802.1 DESCRIPTION—This work is the furnishing and placing of topsoil from outside the project, as indicated.

802.2 MATERIAL—Section 801.2 and containing not less than 2.0% nor more than 10.0% organic matter, according to AASHTO T 194.

Provide topsoil meeting the following grading analysis:

Sieve	Minimum Percent Passing
2 inches	100
No. 4	75
No. 10	60

Sand, silt, and clay material passing the No. 10 sieve, according to AASHTO T 88 and within the following ranges:

	Minimum Percent	Maximum Percent
Sand	5	70
Silt	10	70
Clay	5	36

Provide independent testing to confirm that the topsoil meets the above requirements. Independent testing must be less than 12 months old at the time topsoil is furnished to the project. Submit for approval as specified in Section 106.02(a)2.c.

Obtain topsoil from outside the right of way, where the soil quality has proven ability to grow vegetation. Before topsoil removal, obtain acceptance for the quality of the source, for the depth of the topsoil to be removed, and for the method of removal.

Recondition areas from which topsoil was obtained, as specified in Section 105.14.

802.3 CONSTRUCTION—

(a) Preparation of Areas to be Topsoiled. Grade the areas to be covered by topsoil. Using acceptable methods, loosen soil to a depth of 2 inches before placing the topsoil. Remove stones and other foreign material 2 inches or larger in any dimension. Remove and satisfactorily dispose of unsuitable and surplus material.

(b) Placing and Spreading Topsoil. Place topsoil on the prepared areas and, unless otherwise indicated, spread and compact to a 4-inch uniform depth $\pm 1 \frac{1}{2}$ inches. Compact with a roller having a weight not over 120 pounds per foot width of roller or by other acceptable methods, as directed. Remove overdepth topsoil, unless otherwise agreed upon in writing. Do not place topsoil in a wet or frozen condition.

802.4 MEASUREMENT AND PAYMENT—

(a) Cubic Yard. Measured in the hauling vehicle at the delivery point, as specified in Section 109.01(b). The Contractor may leave overdepth topsoil in place, at no additional cost to the Department.

(b) Square Yard.

SECTION 803—PLACING STOCKPILED TOPSOIL OR TOPSOIL MIXTURE

803.1 DESCRIPTION—This work is the preparation of indicated areas and the placement of topsoil or topsoil mixture on the prepared areas, using topsoil or topsoil mixture removed from stockpiles located on the project or from other indicated areas.

803.2 MATERIAL—Section 801.2

803.3 CONSTRUCTION—Section 802.3 and as follows:

(a) **Topsoil.** Remove topsoil from stockpiles using an acceptable method, which does not mix the topsoil with foreign materials.

(b) **Topsoil Mixture.** Scarify and loosen soil surfaces to a depth of 6 inches lateral to the slope face. Moisten loosened soil, if dry, to optimum moisture content as directed. Remove debris and any other foreign material 2 inches or larger in any dimension. Place stockpiled topsoil mixture to a depth of 6 inches \pm 1 inch measured in place after compaction.

Consolidate topsoil mixture and bond to soil surfaces using a sheepsfoot roller; and provide a firm, stable, rough textured surface. Compact areas not accessible to the sheepsfoot roller with a roller having a weight not over 120 pounds per foot width of roller or by other acceptable methods. Do not place topsoil mixture in a frozen or wet condition.

(c) **Unused Material.** Return unused topsoil or topsoil mixture to stockpiles and grade uniformly. Condition remaining stockpiles and stockpile areas as specified in Section 105.14.

803.4 MEASUREMENT AND PAYMENT—Cubic Yard

Measured in the hauling vehicle at the delivery point, as specified in Section 109.01(b).

SECTION 804—SEEDING AND SOIL SUPPLEMENTS

804.1 DESCRIPTION—This work is furnishing and placing of seed and soil supplements of the type indicated, the application of herbicides, and mowing requirements.

The following definitions apply:

(a) **Certified Seed.** Seed of known genetic identity that has been field and laboratory inspected and tested during its period of growth to provide a source of high quality ground cover and ensure genetic identity and purity. Seeds are certified by recognized certifying agencies that conform to the certification laws and regulations of Pennsylvania or other states. Certification identification is indicated on all seed lot tags or labels.

(b) **Germination.** The emergence and development from the seed embryo of essential plant structures that can produce a normal plant under favorable conditions and is represented by a percentage of an identified seed quantity exclusive of hardseed.

(c) **Hardseed.** Unscarified seed that remains hard or has not germinated at the end of a prescribed test period because the seed has not absorbed water due to an impermeable seed coat.

(d) **Pure Live Seed (PLS).** A term that defines the planting quality of seed exclusive of inert matter and all other seeds not of the seed type being analyzed as determined by inspection and testing regulations. PLS is often used where seed industry standards have not been established for minimum acceptable purity and germination limits.

(e) **Purity.** The genetic identity of a seed that will produce a known plant and is represented by a percentage of an identified seed quantity or seed lot.

(f) **Seed Formula.** A seed mixture of more than one variety of a seed kind in excess of 5% by weight of the whole.

(g) **Seed Lot.** A definite quantity of seed identified by an assigned number or mark which is uniform throughout for all seed quality factors stated on the lot label or are within permitted tolerances.

(h) **Seed Mixture.** A seed batch that consists of more than one kind of seed when each kind is present in excess of 5% of the whole.

(i) **Variety.** A plant subdivision that can be differentiated from other plants of the same kind by growth, yield, fruit, color, seed, or other identifying characteristics.

(j) **Weed Seed.** A seed producing plant generally recognized as a weed by the Pennsylvania Department of Agriculture which includes the seed of prohibited and restricted noxious weeds.

804.2 MATERIAL—The Department may require pretesting reports from the Pennsylvania Department of Agriculture for verification of analysis and legality of labeling, in addition to control of materials, as specified in Section 106.

(a) Soil Supplements.

1. Pulverized Agricultural Limestone. Conforming to the requirements of the Agricultural Liming Materials Act of 1978, P.L. 15, No. 9, as amended; The Agricultural Liming Materials Rules and Regulations (Title 7-Part V); 7 PA Code, Chapter 108 for labeling requirements; and as follows:

- % Total oxides (total calcium oxide and magnesium oxide equivalent) According to (ASTM C 25) 50
- % Calcium carbonate equivalent (% by weight) According to (ASTM C 25) 89

- % Fineness (minimum % by weight)

material passing No. 20 sieve	95
material passing No. 60 sieve	60
material passing No. 100 sieve	50

Furnish material having an Effective Neutralizing Value (ENV) of not less than 90 when calculated according to 7 PA Code Chapter 108 as follows:

- % by weight passing 20 mesh - % passing 60 mesh x 0.4 = (a)
% by weight passing 60 mesh - % passing 100 mesh x 0.8 = (b)
% by weight passing 100 mesh x 1.0 = (c)
- Minimum Calcium Carbonate Equivalent (CCE) = % by weight of calcium carbonate
- (a) + (b) + (c) x CCE divided by 100 = ENV

2. Commercial Fertilizer. Conforming to the requirements of the Pennsylvania Soil Conditioner and Plant Growth Substance Law, Act of December 1, 1977, P.L. 258, No. 86 (3P.S.68.2), as amended.

Use dry formulations of 10-20-20 analysis for seeded and sodded areas. Use dry formulations of 20-10-5 and 16-8-16 analysis controlled release for tree, shrub, and vine type planting operations. Use dry formulations of 19-6-12 analysis controlled release for herbaceous wetland planting operations. Use other analysis as indicated.

3. Slow-Release Nitrogen Fertilizer. Conforming to the requirements of the Pennsylvania Soil Conditioner and Plant Growth Substance Law, Act of December 1, 1977, P.L. 258, No. 86 (3P.S.68.2) as amended.

Use dry formulations of either 38-0-0 ureaform, 32-0-0 to 38-0-0 sulfur coated urea, 31-0-0 IBDU, or another analysis as indicated and conform to the following requirements:

- 38-0-0 ureaform

Total Nitrogen (TN)	— 38.0% minimum
Cold Water Insoluble Nitrogen (WIN)	— 25.0% minimum
Activity Index (AI)	— 40.0% minimum
Urea Nitrogen	— 3.5% minimum
- 32-0-0 to 38-0-0 sulfur coated urea with a 7-day dissolution range of 20% to 30%
- 31-0-0 IBDU — Coarse grade (28 mils to 98 mils)
- Water Insoluble Nitrogen (WIN) — 27.0% minimum

(b) Seed.

1. General. Seed conforming to the regulations of Chapter 71 – Seed of the Pennsylvania Seed Act 164 of 2004, effective January 29, 2005, and amendments. Meet other applicable regulations of the Seed, Testing and Certification Programs of the Pennsylvania Department of Agriculture (PDA), Bureau of Plant Industry.

Provide seeds that have been tested and approved for the specified seed formula's purity, germination, and weed seed analysis limits and other applicable PDA rules for seed testing.

Provide certified seed for all Kentucky Bluegrass, Perennial Ryegrass, Creeping Red Fescue, Chewings Fescue, and Hard Fescue varieties submitted for each seed formula.

Provide premixed seed mixtures from a licensed seed distributor/seed mixing company located within the State and mixed under the supervision of the PDA for the designated Table A seed formulas. Use only seed that has

an approved seed inspector's tag or label signed by a PDA inspector sewn or stapled to the outside of each seed bag or other container in a conspicuous place. Pressure sensitive labels may be used on paper or plastic containers.

Seed mixtures may also be mixed to project specifications at the project site for special seed formulas or mixtures not specified in Table A, if all specified seed species have been previously inspected, tested, and approved by PDA for the designated purity, germination, weed seed limits, or pure live seed analysis. Mix the seed species to the designated formula or mixture specifications under Department supervision.

Do not use seed from containers that have not been properly sealed. Do not use seed that has a sell-by date of more than 15 months from the date of the inspection test, exclusive of the month of the test. The Department may reject or request re-testing for any questionable seed delivered to the project.

2. Standard Seed Formulas. According to Table A.

3. Special Seed Formulas and Pure Live Seed. Seed for special seed formulas consisting mainly of warm-season grasses, forbs, or wildflowers may be required to be provided in quantities based on specified pure live seed application rates. Application rates for the special seed formulas may vary.

The PLS seed application rate is a method of adjusting the amount of seed required to compensate for low seed purity and low germination percentages. The normal amount of seed to be provided for each seed type is higher and based on each seed's PLS analysis. Provide PLS seed calculation amounts based on the seed label for all designated PLS seed formula types for verification and approval before application.

The specified PLS seeding rate for each seed type divided by the percentage PLS value of the proposed seed type will determine the amount of seed required to be provided for that seed type. Note: Seed with a purity of 85% and 70% germination rate would equal a PLS of 60% ($85\% \times 70\%$ divided by 100). A specified rate of 2.5 pounds/acre of PLS seed would therefore require 4.2 pounds quantity of seed to be provided for that seed type.

(c) Inoculant. Standard acceptable commercial product, for treating leguminous seed. A product consisting of a suitable carrier, containing a culture of nitrogen-fixing bacteria specific for the seed to be inoculated.

Keep lids on containers when not in use to avoid contamination. Store containers at moderate temperature. Do not use inoculant after the expiration date shown on the container.

(d) Herbicides. According to all applicable Federal and State pesticide acts and registration requirements and according to PCID No. 1094 – Herbicides (Weed and Brush Control) issued by the Pennsylvania Department of General Services, Bureau of Purchases, Quality Assurance Division, for the appropriate type.

Furnish herbicide in manufacturer's labeled container as follows:

1. Selective Control in Seeded Areas. In areas seeded with Formula B, D, or L, use Type 1, Class C-2, 4-D Liquid Amine Salt Formulations (Dimethylamine) listed in PCID No. 1094, for controlling broadleaf weeds.

(e) Mulch. Section 805.2(a)1., for the type indicated.

(f) Water. Section 720.2

TABLE A
Seeding Requirements

Formula and Species	% By Weight	Minimum %		Max % Weed Seed	Seeding Rate lb/1000 yd ²
		Purity	Germination		
Formula B Mix					44.0 Total
• Perennial Ryegrass mixture (Lolium perenne). A combination of improved certified varieties with No one variety exceeding 50% of the total Ryegrass component.	20	97	90	0.10	8.5
• Creeping Red Fescue or Chewings Fescue (Festuca rubra or ssp commutate) (Improved and Certified)	30	97	85	0.10	12.5
• Kentucky Bluegrass mixture (Poa pratensis). A combination of improved certified varieties with no one variety exceeding 50% of the total Bluegrass component.	45	97	80	0.15	21.0
• Annual Ryegrass (Lolium multiflorum)	5	95	90	0.10	2.0
Formula C Conservation Mix					12.0 Total
• Crownvetch (Coronilla varia)	45	99	70*	0.10	5.5
• Annual Ryegrass (Lolium multiflorum)	55	95	90	0.10	6.5
Formula D Conservation Mix					50.0 Total
• Tall Fescue (Festuca arundinacea var. Kentucky 31)	60	96	85	0.10	30.0
• Creeping Red Fescue or Chewings Fescue (Festuca rubra or ssp commutate) (Improved and Certified)	30	97	85	0.10	15.0
• Annual Ryegrass (Lolium multiflorum)	10	95	90	0.10	5.0
Formula E					10.0 Total
• Annual Ryegrass (Lolium multiflorum)	100	95	90	0.10	10.0
Formula L Mix					48.0 Total
• Hard Fescue mixture (Festuca longifolia). A combination of improved certified varieties with no one variety exceeding 50% of the total Hard Fescue component	55	97	85	0.10	26.4
• Creeping Red Fescue (Festuca rubra) (Improved and Certified)	35	97	85	0.10	16.8
• Annual Ryegrass (Lolium multiflorum)	10	95	90	0.10	4.8

Formula N Conservation Mix					30.0 Total
• Hard Fescue mixture (Festuca longifolia). A combination of improved certified varieties with no one variety exceeding 50% of the total Hard Fescue component	30	97	85	0.10	9.0
• Creeping Red Fescue (Festuca rubra) (Improved and Certified)	30	97	85	0.10	9.0
• Little Bluestem (Andropogon scoparius)	4	80	70	0.20	1.2
• Canada Wild Rye (Elymus canadensis)	6	85	70	0.20	1.8
• Virginia Wild Rye (Elymus virginicus)	4	85	70	0.20	1.2
• Indiangrass (Sorghastrum nutans)	3	85	70	0.20	0.9
• Annual Ryegrass (Lolium multiflorum)	10	95	90	0.10	3.0
• Black Eyed Susan (Rudbeckia hirta)	5	80	60	0.20	1.5
• New England Aster (Symphyotrichum novae-angliae)	3	80	50	0.20	0.9
• Ox-eye Sunflower (Helianthus helianthoides)	5	80	60	0.20	1.5
Formula W Wetland Conservation Mix					15.0 Total
• Tall Fescue (Festuca arundinacea var. Kentucky 31)	30	96	85	0.10	4.5
• Birdsfoot Trefoil (Lotus corniculatus).	10	92	80*	0.10	1.5
• Redtop (Agrostis alba)	10	92	80	0.20	1.5
• Virginia Wild Rye (Elymus virginicus)	24	85	70	0.20	3.6
• Tioga Deertongue (Panicum clandestinum)	14	95	80	0.20	2.1
• Fox Sedge (Carex vulpinoidea)	12	85	60	0.20	1.8
Formula S Special Seed Mix	As indicated				

* Including hardseed and normal seedlings.

804.3 CONSTRUCTION—

(a) **General.** Spread seeds where indicated and at the rates according to Table A, or as otherwise indicated. Spread seeds within the following dates, or as otherwise indicated or directed.

- Formula B, D, and L — March 15 to June 1
August 1 to October 15
- Formula C — Ryegrass Portion:
March 1 to October 15

Crownvetch Portion:
Anytime except September
and October
- Formula E — March 15 to October 15

- | | |
|-------------|---|
| • Formula N | — March 15 to October 15 |
| • Formula W | — April 1 to June 15
August 16 to September 15 |
| • Formula S | — As indicated |

Extend seeding dates where project conditions warrant. Apply full treatment or apply only 50% of the permanent seeding and soil supplements and apply the remaining 50% within the next seeding dates, as directed in writing.

Use tillage and soil supplements before permanent seeding on topsoiled areas, where temporary seeding or mulching has been applied.

The Contractor may apply permanent seed and/or soil supplements without tilling on untilled areas, where temporary seeding or mulching has been applied.

(b) Tillage. On topsoiled areas, 3:1 and flatter, loosen the surface to a depth of at least 2 inches by disking, harrowing, or other acceptable methods until the tillage is satisfactory. On untilled areas, 3:1 and flatter, till only as directed. Also, till or scarify areas if the surface is glazed or crusted.

Correct surface irregularities by filling depressions and leveling rough or uneven areas. Remove metal objects, stones larger than 2 inches in any dimension, and other debris or objects deemed detrimental to maintenance operations.

(c) Soil Supplements. Prepare areas for seeding by uniformly applying supplements, except in areas that will receive Formula E seed. Document bulk delivery as specified in Section 804.2(a)2.

Blend the initial soil supplements into the soil at least 2 inches, on topsoiled areas, by raking, disking, harrowing, or other acceptable methods. Blend the supplements into the soil during tillage operations.

Apply slow-release nitrogen fertilizer to the surface of Formula B, D, L, W, and S seeded areas before project completion. Do not apply slow-release nitrogen fertilizer supplement to Formula C seeded areas.

Apply soil supplements as follows, unless otherwise indicated:

- | | |
|--|---|
| • Pulverized Agricultural Limestone | — 800 lb/1000 yd ² |
| • 10-20-20 Analysis Commercial Fertilizer | — 140 lb/1000 yd ² |
| • 38-0-0 Ureaform Fertilizer
or | — 50 lb/1000 yd ² |
| • 32-0-0 to 38-0-0 Sulfur Coated Urea Fertilizer
or | — 59 lb/1000 yd ² to 50 lb/1000 yd ²
as directed |
| • 31-0-0 IBDU Fertilizer | — 61 lb/1000 yd ² |

(d) Inoculating Legumes. Inoculate leguminous seed, such as Crownvetch and Birdsfoot Trefoil, with proper cultures, according to the manufacturer's directions. Protect inoculated seed from prolonged exposure to sunlight before sowing. Reinoculate seed not sown within 24 hours. If using hydraulic seeders, use inoculant four times the manufacturer's recommended rate.

If inoculated seed is held in a slurry with fertilizers for more than 1 hour, reinoculate or apply legumes separately.

(e) Seeding. At the rates according to Table A, or as indicated sow seeds uniformly on the prepared areas by the helicopter, hydraulic placement, broadcasting, drilling, or hand seeding methods. Inspect seeding equipment and adjust the equipment, if required, to ensure the specified application rates. Periodically perform a check on the rate and uniformity of application, as directed.

Prior to seed application of each designated seed formula, thoroughly clean-out seed tank by rinsing with clean water to prevent contamination from one seed formula to the next. Repeat rinsing cycle until tank is clean. Collect all non-applied seed derived from each clean-out event and remove as waste from the project.

(f) Rolling. After seeding, roll topsoiled areas that are to be mowed. Use a roller with a weight not more than 65 pounds per foot. If soil is wet or frozen, roll only when directed.

(g) Mulching. Section 805.3(a).

(h) Herbicides. Apply herbicides as directed, to areas that are to be mowed and where weed growth is prominent.

The Representative will designate existing plants or groups of plants to be saved within these areas before herbicide application. If directed, more than one application may be required to control undesirable growth.

Apply material with application personnel certified by the Department of Agriculture and with equipment specified in Section 108.05(c).

(i) Liability and Rejection. Final acceptance of seeding and soil supplement materials and installation are subject to the results of official sampling and testing as specified before use and installation and the resultant establishment of the specified vegetation. Remove non-approved materials from the project.

1. Liability. Reseed rejected areas with additional applications of the specified seed and soil supplement materials. Redress soil surfaces when directed. Perform reapplication of seed and soil supplements within the next applicable seeding date if necessary or as directed. When directed, reseed areas damaged by herbicide applications and mowing operations. NOTE: Reseeded areas will also require the application of appropriate mulch as specified in Section 805.

2. Rejection Criteria. Seeded areas may be rejected based on the lack of actual grass seedling establishment exhibited in the area for the specified seed formula.

2.a Table A Seed Formulas. Table A formula seeded areas that exhibit less than 70% surface area coverage with the specified germinated grass seedlings after 90 days of growth may be rejected upon visual inspection. The seed germination and growth period is determined from the date of the seeding operation for the area when these operations are performed within the specified seeding dates.

2.b Eroded Areas. Seeded areas exhibiting soil surface erosion rills or gullies deeper than 1-inch may be rejected upon visual inspection. Redress and reseed designated eroded areas with specified materials and application rates as directed.

(j) Maintenance. Maintain grass and legume ground cover areas, within the grading limits, until the entire project has been completed. Mow as specified in Section 804.3(k).

Control any noxious weed growth found within the right of way by herbicide spraying and cutting. These plants are defined according to the Pennsylvania Weed Control Act of 1982, P.L. 228, No. 74 and as amended by further legislation. Submit for approval a schedule of work and list of herbicide material to be used before starting this operation.

If a slope failure occurs on a slope previously completed, and requires further excavation and redressing to reestablish the slope, reapply the seeding and soil supplement work as specified for the original slope.

(k) Mowing. Maintain turf grass areas within the grading limits, by mowing with approved equipment until the entire project has been completed.

Submit a proposed schedule of mowing operations that covers the length of the construction project for approval.

1. Roadside Turf Areas. Turf grass areas established with Formula D require a different degree of mowing maintenance than areas established with Formulas B and L. Three mowing cycles per year, scheduled between April and October, are anticipated for mowing areas seeded with Formula D. The number of cycles may be adjusted based on the degree of turf establishment, project length, weather conditions, or other factors. Consult the District Roadside Manager for schedule, safety requirements, and mowing equipment approvals.

Schedule the first mowing cycle early in the growth flush period before all seed heads have emerged. Schedule the second mowing approximately 3 to 4 weeks after the first cut to remove the remaining seed heads. Schedule the last mowing cycle in the fall, as directed. Do not mow grass shorter than 4 inches to allow a low growing, competitive ground cover. Do not mow under the following conditions:

- When soil and grass blades are wet.
- During drought conditions, or during summer months when the temperatures are consistently over 90F, and when the grass exhibits dormancy.
- Within 7 days of any scheduled herbicide application or 7 days after a herbicide treatment.

2. Lawn Turf Areas. Maintain Formula B and L turf grass areas at a desired height of 2 inches. Initiate mowing operations when grass seedlings reach a height of 3 inches. Continue mowing operations during the active growing season throughout the length of the project. Follow the non-mow requirements indicated for Formula D grass. Mow at a normal frequency when the grass reaches the 3-inch height, unless directed otherwise.

804.4 MEASUREMENTS AND PAYMENT—

(a) Seeding and Soil Supplements. Pound

Measured by the number of pounds of seed or actual PLS rated seed utilized in the work for designated seed formula and soil supplement applications. Do not use bulk weight of PLS rated seed packages for seed payment.

The Department will pay for reseeding and reapplying soil supplements on slopes that fail due to weather conditions as specified in Section 804.3(j), at the contract unit price, in addition to the original accepted application of seeding and soil supplements.

The Department will not pay for reseeding and reapplying soil supplements on seeded areas that are rejected due to failure of seed germination and growth as specified in Section 804.3(i).

When indicated, the cost of the mulch will be incidental to the seeding and soil supplements item of work and will not be paid for separately.

(b) Seeding. Pound

Measured by the number of pounds of seed or actual PLS rated seed utilized in the work for the designated seed formula. Do not use bulk weight of PLS rated seed packages for seed payment.

The Department will pay for reseeding on slopes that fail due to weather conditions as specified in Section 804.3(j) at the contract unit price, in addition to the original accepted application of seeding.

The Department will not pay for reseeding on seeded areas that are rejected due to failure of seed germination and growth as specified in Section 804.3(i).

When indicated, the cost of the mulch will be incidental to the seeding item of work and will not be paid for separately.

(c) Herbicides. 1000 (M) Gallons

For the type indicated.

(d) Mowing. Acre

(e) Mulch. Section 805.4(a)

SECTION 805—MULCHING

805.1 DESCRIPTION—This work is the furnishing, placing, anchoring, and maintaining of mulch of the type indicated.

805.2 MATERIAL—

(a) **Mulches.** Free from foreign material, coarse stems, mold, substances toxic to plant growth, and mature seed bearing stalks or roots of prohibited and noxious weeds, as defined by law.

1. Seeded Areas. Either one or a combination of the following, as specified:

1.a Hay. Timothy hay, mixed clover and timothy hay, or other acceptable native or forage grasses, well-cured to less than 20% moisture content, by weight.

1.b Straw. Either wheat or oat straw, reasonably free of viable seed, well cured to less than 20% moisture content, by weight.

1.c Wood Fiber. Specially prepared, biodegradable, air-dried wood fibers manufactured from 100% wood chips or bark from lumber mill processing operations, tinted with nontoxic, green dye and containing an organic tackifier approved for use with wood fibers; manufactured to be applied with hydraulic seeding equipment; and conforming to the following requirements:

- | | |
|---|--------------|
| • Moisture content | 15% maximum |
| • Organic matter
(Oven-dried basis) | 95% minimum |
| • Water holding capacity
(Grams of water per 100 grams of fiber) | 1000 minimum |
| • Tackifier content
(By weight) | 2.5% to 3.5% |

Submit a certified physical analysis of the product for approval before application.

1.d Pellet Mulch. A biodegradable, water-absorbing, paper-based pellet that when wetted loses its pellet shape, breaks down and adheres to other pellets, forming a thin, protective mulch mat, and meeting the following requirements:

- | | |
|------------------------|---|
| • Paper content | 85% |
| • Fertilizer | 5% |
| • Polyacrylater | 2% to 5% |
| • Moisture content | 5% to 8% |
| • Dimensions | 1/8-inch diameter,
1/4 inch to 3/4 inch length |
| • Absorption potential | minimum, 3 times dry weight |

1.e Bonded Fiber Matrix (BFM). Specially prepared, water soluble, biodegradable, hydraulically applied system of long strand wood fibers held together by a bonding agent, which adheres to the soil surface and upon drying forms a continuous, insoluble, three dimensional, non-dispersible protective crust-like soil covering.

1.e.1 Polymer or Hydrocolloid Binder Matrix.

1.e.1.a Wood Fiber. Specially prepared, long strand (min. 25% 3/8-inch length), air-dried wood fibers (88% to 92% by weight) manufactured from wood chips, bark, or clean wood waste products, and conforming to the following requirements:

Moisture content	15% maximum
Water holding capacity	1000 minimum (Grams of water per 100 grams of fiber)

1.e.1.b Bonding Agent. High-strength tackifier of powdered polysaccharide guar gum, blended hydrocolloid-based binder, hydrophyllic, or co-polymer material 5 to 12% by weight.

1.e.1.c Synthetic Fiber. System may contain up to 5% by weight of crimped, polyester fibers or other synthetic fibers with wetting and dispersion agents manufactured for use in mulching applications.

1.e.1.d Dye. System may contain a nontoxic, water soluble, colored dye to aid in the visual application coverage of the matrix.

1.e.1.e Activator. System may contain up to 1% by weight of organic and mineral fertilizers.

1.e.2 Gypsum Binder Matrix.

1.e.2.a Wood Fiber. Specially prepared, long strand (min. 25% 3/8-inch length), air-dried wood fibers manufactured from wood chips, bark, or clean wood waste products, and conforming to the following requirements:

Moisture content	15% maximum
Water holding capacity	1000 minimum (Grams of water per 100 grams of fiber)

1.e.2.b Bonding Agent. Naturally occurring, high purity, processed hemi-hydrate gypsum with manufacturer's system additives, which when combined with water will form a cementitious binder that will produce a crust-like soil covering within 4 to 8 hours after application. Material that has become partially air set, lumpy, or caked before use is not acceptable for use.

1.e.2.c Synthetic Fiber. Synthetic fibers manufactured for use in mulching applications, coated with wetting and dispersion agents.

1.e.2.d Dye. System may contain a nontoxic, water soluble, colored dye to aid in the visual application coverage of the matrix.

2. Planting and Other Areas. One of the following:

2.a Tanbark. Suitable fibrous shredded, ground or chunked, aged tanbark derived as a by-product of the tannin extraction process, free from insect life, not decomposed, and between 1/4 inch and 2 inches in any dimension.

2.b Shredded Bark. Suitable shredded, chunked, or ground pieces of predominantly aged, but not decomposed, hardwood or pinewood tree bark produced from lumber mill processing operations, free of excessively fine particles and having a general size range of 1/4 inch to 2 inches in any dimension.

2.c Washed Gravel. Uncrushed, washed, No. 57, as specified in Section 703.2(a)2.

2.d Coarse Aggregate. No. 67, Type C, as specified in Section 703.2(a)1.

2.e Sewage Sludge Compost. A blend of secondary dewatered sewage sludge and wood chips, aerobically composted at a DEP, Bureau of Waste Management permitted site for at least 21 days and cured for 30 to 60 days to ensure pathogen destruction. Free of foreign material and substances toxic to plant growth, nonburning, weed free, screened, and conforming to the following requirements:

- Minimum of 50% organic matter (oven dry basis)
- Minimum of 100% water holding capacity
- Particle Size—3/8 inch to 3 inches
- pH—6.0 minimum
- Heavy metals and toxic compounds (based on sewage sludge content)

	MAXIMUM PPM
Cadmium	25
Chromium	1000
Copper	1000
Lead	1000
Mercury	10
Nickel	200
Zinc	2500
PCBs	3

Submit a certified laboratory analysis with each shipment.

2.f Wood Chips. Suitable chipped or ground wood material produced from predominantly live or non-decayed trees, logs, brush including leaves or post-consumer lumber having a general size range of 1/2 inch to 2 inches in any dimension and free of excessively fine or stringy particles. Chips produced and stockpiled during clearing and grubbing operations or aged chips, at least 6 months old, from lumber mill operations of the desired size and free from foreign debris will also be accepted.

2.g Spent Mushroom Soil Compost. Organic substrate used in mushroom production that has been steam sterilized, then composted for a minimum of 90 days in well-managed windrows, and on a properly surfaced and protected composting pad and blended with ground brush (yard waste), recycled wood, and/or composted bark. Conforms to the requirements specified in Section 808.2(f)4 except as follows:

- Minimum Organic Matter (Oven Dry Basis)—40%
- Moisture Content—60% maximum
- Particle Size—3/8 inch to 3 inches
- Soluble Salt Concentration—20 dS maximum

(b) Mulch Binders. Other acceptable binder materials manufactured for this purpose or the following.

1. Recycled Cellulose Fiber. Specifically prepared, biodegradable, shredded paper particles, comprised of recycled newsprint or other recycled wood cellulose fiber, containing a surfactant and nontoxic, green dye; manufactured to be applied with hydraulic seeding equipment; and conforming to the following requirements:

- Moisture content 17% maximum

- Organic matter 80% minimum
(Oven-dried basis)
- Water holding capacity 900 minimum
(Grams of water per 100 grams of fiber)

2. Wood Fiber. Section 805.2(a)1.c

3. Nonasphaltic Emulsion. Either water soluble natural vegetable gum blended with gelling and hardening agents or a water soluble blend of hydrophylic polymers, viscosifiers, sticking aids, and gums.

4. Polyvinyl Acetate. Emulsion resin, containing 60% \pm 1% total solids by weight.

5. Recycled Cellulose Fiber/Wood Fiber Mixture. Specially prepared mixture of biodegradable, air-dried wood fiber, manufactured from wood chips or bark, and shredded paper particles, comprised of recycled newsprint or other recycled cellulose fiber combined with a surfactant and a nontoxic, green dye; manufactured to be applied with hydraulic seeding equipment; and conforming to the following requirements:

- Wood fiber 45% to 55%
- Recycled cellulose fiber 45% to 55%
- Moisture content 21% maximum
- Organic matter 97% minimum
(Oven-dried basis)
- Water holding capacity 900 minimum
(Grams of water per 100 grams of fiber)

(c) Mulch Control Netting. One of the following:

1. Plastic. A uniformly extruded, rectangular, plastic mesh conforming to the following requirements:

- Weight 0.23 ounce per square yard, minimum
- Mesh opening Nominal 13/4-inch by 3/4-inch

2. Coconut Coir. Undyed, biodegradable, coconut coir yarn woven into a mesh conforming to the following requirements:

- Weight 6 ounces per square yard, minimum
- Mesh opening Nominal 2-inch by 2-inch, maximum

(d) Weed Barrier and Weed Control Mats.

1. Weed Barrier Mat. Stable, evenly distributed, permeable, network of polymeric woven, non-woven or a woven/non-woven combination of polypropylene or polyester filaments or yarns manufactured for weed barrier/soil separator use, inert to commonly encountered construction chemicals or substances and conforming to the following physical requirements:

Type	MARV*	Property
Woven or combination	0.03 sec-1	Permittivity flow rate

Non-woven fabric	1.3 sec-1	ASTM D 4491
Woven or combination Non-woven fabric	0.004 cm/sec	Permeability coefficient Permeability flux
	12 gal/min/sq. ft.	ASTM D 4491 Falling head test
All fabric	40 lbs.	Puncture strength (5/16-inch flat head rod) ASTM D 4833
All fabric	70% after 150 hours	Ultraviolet resistance Strength retention ASTM D 4355

* Minimum Average Roll Value (+95% of the fabric in a lot will meet or exceed the minimum requirements).

Certify as specified in Section 106.03(b).

2. Weed Control Mat. Stable, permeable network of spunbonded, long chain synthetic polyolefins (minimum 95% by weight) filaments or yarns with nodules of trifluralin, carbon black and polyethylene compounded together utilizing time-release characteristics permanently attached to the fabric on 1 1/2-inch centers and conforming to the following requirements.

Physical Property	MARV*
Trifluralin (Nodule)	20%
Puncture strength (5/16-inch flat head rod) ASTM D 4833	39 lbs.
Permittivity ASTM D 4491	0.7 sec-1
Ultraviolet resistance Strength retention ASTM D 4355	70% after 500 hours

* Minimum Average Roll Value (+95% of the fabric in a lot will meet or exceed the minimum requirement).

Certify as specified in Section 106.03(b).

(e) Staples. Section 806.2(c)1

(f) Wood Stakes. Section 806.2(c)3.

805.3 CONSTRUCTION—

(a) Mulching Seeded Areas. Place mulch, of the type indicated, immediately after seeding or within 48 hours after seeding is completed. Unless otherwise indicated, place only straw or wood fiber over topsoiled areas. Use hay, straw, or wood fiber in other areas, as indicated or specified.

Place hay or straw uniformly, in a continuous blanket, at a minimum rate of 1,200 pounds per 1,000 square yards or as otherwise indicated. If directed, increase the rate of application, depending upon the material used, season, soil conditions, or method of application. An acceptable mechanical blower may be used to apply mulch. Do not use machines that cut mulch into short pieces. Anchor mulch with specified mulch binders applied at the following rates:

- Recycled cellulose fiber—160 pounds per 1,000 square yards
- Wood fiber—160 pounds per 1,000 square yards
- Nonasphaltic emulsion—At manufacturer's recommended rate
- Polyvinyl acetate—At manufacturer's recommended rate
- Recycled cellulose fiber/wood fiber mixture—160 pounds per 1,000 square yards

The mulch binder application is incidental to the application of straw and hay mulch.

Apply wood fiber mulch hydraulically according to the manufacturer's tank-mixing instructions. It may be incorporated as an integral part of the slurry after the seed and soil supplements have been thoroughly mixed. Apply uniformly at the rate of 320 pounds per 1,000 square yards unless otherwise indicated.

Mulch temporary seeded areas with hay.

1. Median Areas. On slopes 6:1 or flatter, place pellet mulch by hand or using a mechanical spreader immediately after seeding. Apply uniformly at application rate of 540 pounds per 1,000 square yards. Thoroughly wet pellet mulch with water without dislodging mulch.

(b) Mulch Control Netting.

1. Plastic. Install netting over designated mulch surface. Staple upslope ends, edges, bottom, and overlaps at 24-inch intervals. Overlap adjacent fabric to outside edges. Secure remaining fabric areas by putting in approximately 1 staple per 1 square yard of area.

2. Coconut Coir. Install netting over designated mulch surface. Stretch fabric tightly and anchor with wood stakes along all edges at 7-foot maximum interval. Overlap adjacent fabric widths by not less than 8 inches.

(c) Mulching Planted Areas.

1. Individual Plant Pits. Uniformly apply a designated mulch specified in Section 805.2(a)2 to the entire plant pit to a loose depth of 3 inches and as shown on the Standard Drawing. Apply mulch within 48 hours after completion of the planting operation.

2. Planting Beds. Cover designated shrub beds with mulch or mulch and weed barrier mat or mulch and weed control mat as indicated. Cut mat around the plant stem to ensure mat will not extend above the mulch. Secure mat to the soil surface with staples or other approved anchoring devices at a maximum interval spacing of 3 feet and along all edges and overlaps. Overlap mat edge with 2-inch minimum.

Uniformly apply a designated mulch specified in Section 805.2(a)2 over the entire bed area to a loose depth of 3 inches. Redistribute excessive mulch depth. Taper mulch depth at plant pit as shown on the Standard Drawing. Apply mat and mulch within 48 hours after completion of the planting operation.

(d) Maintenance. Properly maintain mulched areas until the entire project has been completed. Promptly reapply mulch materials, which become dislodged or lost due to wind, rain, or other causes, at initial or modified rates, as directed.

After mulching work on a slope has been satisfactorily completed, if a slope failure occurs, one that requires redressing, excavation, or the establishment of a new slope, replace the mulch, as directed.

(e) Bonded Fiber Matrix.

1. General. Prepare surfaces as specified in Section 804.3(b). Scarify all slopes greater than 3:1 to ensure a rough texture for lodging of seed and BFM. Apply seed at twice the rate specified in Section 804.2(b)2 Table A. Apply soil supplements as specified in Section 804.3(c).

2. Application. Apply bonded fiber matrix components hydraulically with hydromulching (hydroseed)

equipment manufactured for this purpose. Follow manufacturer's mixing and application instructions.

The bonded fiber matrix components may be incorporated as an integral part of the seeding and soil supplement application if seeding and soil supplements are applied hydraulically.

Apply polymer binder or hydrocolloid binder matrixes at an application rate of 3,000 pounds per acre or as indicated to provide a uniform soil surface coverage thickness of 0.16 inch maximum after drying. Test application procedures to ensure a uniform application rate. Do not apply within 24 hours of anticipated rainfall.

Mix gypsum binder matrix components in a homogenous slurry in the following proportions for each 100 gallons of water: gypsum binder—150 pounds; wood fiber—40 pounds; and synthetic fiber—0.6 pounds. Apply gypsum binder matrix at an application rate of 6,000 pounds per acre or as indicated so that the soil surface is covered uniformly. Do not apply within 12 hours of anticipated rainfall.

Place BFM material at least 18 inches beyond the toe and top of all slopes. Apply material in at least two different directions to provide as much uniform coverage with no gaps or spaces greater than 0.04 inch.

805.4 MEASUREMENT AND PAYMENT—

(a) Seeded Areas. Ton

For the type indicated. Measured by the number of tons of mulch actually incorporated into the work, at the specified rates.

(b) Planted Areas. Square Yard

For the type indicated.

(c) Mulch Replacement. The Department will pay for replacing mulch on failed slope areas, as specified in Section 805.3(c), at the contract unit price, in addition to the original accepted mulch application.

(d) Mulching and Weed Barrier Mat. Square Yard

For the type indicated.

(e) Mulching and Weed Control Mat. Square Yard

For the type indicated.

(f) Mulching - Bonded Fiber Matrix. Square Yard

(g) Mulch Control Netting. Square Yard

SECTION 806—ROLLED EROSION CONTROL PRODUCTS

806.1 DESCRIPTION—This work is furnishing, placement, and maintenance of temporary and permanent rolled erosion control products of the types indicated.

806.2 MATERIAL—

(a) Temporary Rolled Erosion Control Products (Temporary RECPs). Ultra short-term, short-term, extended-term, and long-term temporary RECPs meeting the requirements of Tables A, B, C and D, respectively, and having a functional longevity of sufficient duration to allow establishment of permanent vegetation before RECP degradation. Provide manufacturer's RECP specifications, product data sheets, and drawings. Submit for local approval by the Representative (i.e., at the District or project level) as specified in Section 106.02(a)2.c.

TABLE A
Ultra Short-Term Temporary RECP (3 Month Functional Longevity)

Type	Product and Material Description	Slope Applications		Channel Applications	Minimum Tensile Strength (lb/ft) ⁽¹⁾	Minimum Seed Germination Enhancement (Percent) ⁽³⁾	Minimum Weight Per Unit Area (oz/yd ²) ⁽⁴⁾
		Maximum Slope (H:V)	Maximum Allowable C-Factor at Maximum Slope ⁽⁵⁾	Maximum Shear Stress (lb/ft ²) ⁽²⁾			
1.A	Mulch Control Netting - A photodegradable synthetic mesh or woven biodegradable natural fiber netting.	5:1	0.10	0.25	No Requirement	200	6.5
1.B	Erosion Control Blanket Without a Net - Natural and/or polymer fibers mechanically interlocked and/or chemically adhered together.	4:1	0.10	0.50	No Requirement	200	6.5
1.C	Single Net Erosion Control Blanket and Open Weave Textile - Processed degradable natural and/or polymer fibers mechanically bound together by one rapidly degrading, synthetic or natural fiber net, or an open weave textile composed of rapidly degrading natural or polymer yarns or twines woven into a continuous matrix.	3:1	0.15	1.5	50	200	6.5
1.D	Double Net Erosion Control Blanket - Processed degradable natural and/or polymer fibers mechanically bound together between two rapidly degrading, synthetic or natural fiber nets.	2:1	0.20	1.75	75	200	6.5

(1) Tensile Strength machine direction as per ASTM D6818.

(2) The Channel Applications Maximum Shear Stress that an RECP (unvegetated area) can sustain without physical damage or excessive erosion (> 0.5 inch soil loss) during a 30 minute flow event in large-scale testing. An acceptable large scale test method is ASTM D6460.

(3) Seed Germination Enhancement as per ASTM D7322.

(4) Weight Per Unit Area: ASTM D6475 for Temporary Erosion Control Blankets.

(5) Cover-Factor (C-Factor) measured in accordance with the requirements in ASTM D6459.

TABLE B
Short-Term Temporary RECP (12 Month Functional Longevity)

Type	Product and Material Description	Slope Applications		Channel Applications	Minimum Tensile Strength (lb/ft) ⁽¹⁾	Minimum Seed Germination Enhancement (percent) ⁽³⁾	Minimum Weight Per Unit Area (oz/yd ²) ⁽⁴⁾
		Maximum Slope (H:V)	Maximum Allowable C-Factor at Maximum Slope ⁽⁵⁾	Maximum Shear Stress (lb/ft ²) ⁽²⁾			
2.A	Mulch Control Netting - A photodegradable synthetic mesh or woven biodegradable natural fiber netting.	5:1	0.10	0.25	No Requirement	200	6.5
2.B	Erosion Control Blanket Without A Net - Natural and/or polymer fibers mechanically interlocked and/or chemically adhered together.	4:1	0.10	0.50	No Requirement	200	6.5
2.C	Single Net Erosion Control Blanket and Open Weave Textile - Processed degradable natural and/or polymer fibers mechanically bound together by one rapidly degrading, synthetic or natural fiber net, or an open weave textile composed of rapidly degrading natural or polymer yarns or twines woven into a continuous matrix.	3:1	0.15	1.5	50	200	6.5
2.D	Double Net Erosion Control Blanket - Processed degradable natural and/or polymer fibers mechanically bound together between two rapidly degrading, synthetic or natural fiber nets.	2:1	0.20	1.75	75	200	6.5

(1) Tensile Strength machine direction as per ASTM D6818.

(2) The Channel Applications Maximum Shear Stress that an RECP (unvegetated area) can sustain without physical damage or excessive erosion (> 0.5 inch soil loss) during a 30 minute flow event in large-scale testing. An acceptable large scale test method is ASTM D6460.

(3) Seed Germination Enhancement as per ASTM D7322.

(4) Weight Per Unit Area: ASTM D6475 for Temporary Erosion Control Blankets.

(5) Cover-Factor (C-Factor) measured in accordance with the requirements in ASTM D6459.

TABLE C
Extended-Term Temporary RECP (24 Month Functional Longevity)

Type	Product and Material Description	Slope Applications		Channel Applications	Minimum Tensile Strength (lb/ft) ⁽¹⁾	Minimum Seed Germination Enhancement (Percent) ⁽³⁾	Minimum Weight Per Unit Area (oz/yd ²) ⁽⁴⁾
		Maximum Slope (H:V)	Maximum Allowable C-Factor at Maximum Slope ⁽⁵⁾	Maximum Shear Stress (lb/ft ²) ⁽²⁾			
3.A	Mulch Control Netting - A slowly degrading synthetic mesh or a woven natural fiber netting.	5:1	0.10	0.25	25	200	6.5
3.B	Erosion Control Blanket and Open Weave Textile - An erosion control blanket composed of slowly degrading polymer or natural fibers mechanically bound together between two slowly degrading synthetic or fiber nets to form a continuous matrix or an open weave textile composed of processed slow degrading polymer or natural yarns or twines woven into a continuous matrix.	1.5:1	0.25	2.00	100	200	6.5

(1) Tensile Strength machine direction as per ASTM D6818.

(2) The Channel Applications Maximum Shear Stress that an RECP (unvegetated area) can sustain without physical damage or excessive erosion (> 0.5 inch soil loss) during a 30 minute flow event in large-scale testing. An acceptable large scale test method is ASTM D6460.

(3) Seed Germination Enhancement as per ASTM D7322.

(4) Weight Per Unit Area: ASTM D6475 for Temporary Erosion Control Blankets.

(5) Cover-Factor (C-Factor) measured in accordance with the requirements in ASTM D6459.

TABLE D
Long-Term Temporary RECP (36 month Functional Longevity)

Type	Product and Material Description	Slope Applications		Channel Applications	Minimum Tensile Strength (lb/ft) ⁽¹⁾	Minimum Seed Germination Enhancement (percent) ⁽³⁾	Minimum Weight Per Unit Area (oz/yd ²) ⁽⁴⁾
		Maximum Slope (H:V)	Maximum Allowable C-Factor at Maximum Slope ⁽⁵⁾	Maximum Shear Stress (lb/ft ²) ⁽²⁾			
4	Erosion Control Blanket and Open Weave Textile - An erosion control blanket composed of slowly degrading polymer or natural fibers mechanically bound together between two slowly degrading synthetic or fiber nets to form a continuous matrix or an open weave textile composed of processed slow degrading polymer or natural yarns or twines woven into a continuous matrix.	1:1	0.25	2.25	125	200	6.5

(1) Tensile Strength machine direction as per ASTM D6818.

(2) The Channel Applications Maximum Shear Stress that an RECP (unvegetated area) can sustain without physical damage or excessive erosion (> 0.5 inch soil loss) during a 30 minute flow event in large-scale testing. An acceptable large scale test method is ASTM D6460.

(3) Seed Germination Enhancement as per ASTM D7322.

(4) Weight Per Unit Area: ASTM D6475 for Temporary Erosion Control Blankets.

(5) Cover-Factor (C-Factor) measured in accordance with the requirements in ASTM D6459.

(b) Permanent Rolled Erosion Control Products (Permanent RECPs). Permanent RECPs meeting the requirements of Table E and capable of permanently reinforcing vegetation in applications where vegetation alone cannot provide sufficient protection against erosive forces. Provide manufacturer's RECP specifications, product data sheets, and drawings. Submit for local approval by the Representative (i.e., at the District or project level) as specified in Section 106.02(a)2.c.

TABLE E
Permanent RECP⁽⁵⁾

Type	Product and Material Description	Slope Applications Maximum Slope (H:V)	Channel Applications Maximum Shear Stress (lb/ft²)⁽²⁾	Minimum Tensile Strength (lb/ft)⁽¹⁾	Minimum Seed Germination Enhancement (percent)⁽³⁾	Minimum Weight Per Unit Area (oz/yd²)⁽⁴⁾
5.A	Turf Reinforcement Mat - Composed of non-degradable synthetic fibers, filaments, nets, wire mesh and/or other materials processed into a three-dimensional matrix.	1:1	6	125	200	8
5.B		1:1	8	150	200	8
5.C		1:1	10	175	200	8

(1) Tensile Strength machine direction as per ASTM D6818.

(2) The Channel Applications Maximum Shear Stress for a RECP (unvegetated area) can sustain without physical damage or excessive erosion (> 0.5 inch soil loss) during a 30 minute flow event in large-scale testing. An acceptable large scale test method is ASTM D6460.

(3) Seed Germination Enhancement as per ASTM D7322.

(4) Weight Per Unit Area: ASTM D6566 for Permanent Erosion Control Blankets.

(5) UV Stability for Permanent Erosion Control Blankets- 80% per ASTM D4355 (500 hours).

(c) Anchoring Devices.

1. Staples. No. 8 gage steel wire, bent U-shaped or square top with a throat width of 1 inch to 2 inches, with an effective minimum driving depth of 8 inches.

2. Metal Pin. Carbon steel pin, 3/16-inch shank diameter, 18-inch length with attached 1 1/2-inch minimum outside diameter steel washer head.

3. Wood Stakes. Sound, rough sawn, approved hardwood 1-inch by 4-inch nominal stake tapered to a point throughout, with a minimum length of 18 inches.

4. Substitutes. Submit other anchoring devices, as recommended by the RECP manufacturer, for review and approval.

(d) Seeding and Soil Supplements. Section 804.2**(e) Mulch for Seeded Areas.** Section 805.2**806.3 CONSTRUCTION**—As shown on the Standard Drawings and as follows:**(a) Temporary RECPs.**

1. Site Preparation. Prepare final graded and dressed soil surfaces to receive seeding as specified in Section 804.3. Soil surfaces to be free of rocks or other obstructions that prevent the RECP from lying in direct contact with soil.

2. Seeding. Place designated seed formula mixture as specified in Section 804.3. Mulch application normally associated with seeding operation is not required for installation of Temporary RECPs.

3. RECP Installation. Unroll, place, and anchor the RECP evenly and smoothly without stretching. Use appropriate anchoring devices and follow installation directions of manufacturer. Drive staples or anchoring pins flush with soil surface.

(b) Permanent RECPs.

1. Site Preparation. Prepare final graded and dressed soil surfaces to receive permanent seeding or the RECP placement as specified in Section 804.3. Soil surfaces to be free of rocks or other obstructions that prevent the RECP from lying in direct contact with soil.

2. Seeding. Follow the RECP manufacturer's instructions for the correct sequence of seed and RECP placement. When seeding is required before RECP placement, place designated seed formula mixture as specified in Section 804.3. Mulch application normally associated with seeding operation is not required for installation of Permanent RECPs.

3. RECP Installation. Unroll, place, and anchor the RECP evenly and smoothly, without stretching, to conform to the shape of and be in uniform contact with the soil surface. Use appropriate anchoring devices and follow installation directions of the RECP manufacturer. Drive staples or anchoring pins flush with soil surface.

4. Topsoil Placement. When seeding is required after RECP placement, broadcast designated seed formula mixture into the RECP matrix as specified in Section 804.3. After seeding, uniformly place 1/2 inch to 3/4 inch of approved topsoil on the RECP. Work soil into RECP voids to completely fill the RECP matrix flush with top of the RECP. Remove excess topsoil.

(c) **Maintenance.** Properly maintain designated RECP until entire project is accepted. If a protected slope, swale, or other soil surface failure occurs after installation of work, redress affected soil areas and reinstall protection material as specified for original treatment, unless directed otherwise.

806.4 MEASUREMENTS AND PAYMENT—

(a) **Temporary RECPs.**

1. Ultra Short-Term RECP. Square Yard

For the type indicated.

2. Short-Term RECP. Square Yard

For the type indicated.

3. Extended-Term RECP. Square Yard

For the type indicated.

4. Long-Term RECP. Square Yard

For the type indicated.

(b) **Permanent RECPs.** Square Yard

For the type indicated.

(c) **Seeding and Soil Supplements.** Section 804.4(a) for the type indicated.

(d) **Mulch.** Section 805.4(a) and (c) for the type indicated.

SECTION 808—PLANTS, PLANTING, AND TRANSPLANTING

808.1 DESCRIPTION—This work is the furnishing, planting, and transplanting of trees, shrubs, vines, live stakes and other woody or herbaceous plants, and includes shrub-bed preparation.

808.2 MATERIAL—According to the current edition of “American Standard for Nursery Stock” (ASNS), ANSI, Z60.1 of the American Nursery and Landscape Association (ANLA), and as follows:

(a) Plant Stock.

- True to type and name, according to the current edition of Standardized Plant Names of the American Joint Committee on Horticulture Nomenclature;
- Each bundle or each plant, if not bundled, labeled with not less than the plant's common name and size;
- Typical of the species or variety indicated;
- Free from disease and injurious insects, according to State and Federal laws;
- Free from mechanical injuries, cutback leaders, broken branches, decay, or other defects;
- Unless otherwise designated, nursery-grown plants, acclimated to Pennsylvania soil and climatic conditions; and
- Dormant, other than those specified as container grown.

1. Nursery Stock. Grown in a licensed nursery for a period of at least one full-growing season. The use of mechanical digging equipment at the nursery will be allowed only when its use is not detrimental to nursery stock survival.

Pennsylvania is located within U.S. Department of Agriculture (USDA) Plant Hardiness Zones 5 and 6 with winter temperatures ranging from -20F to -10F for Zone 5 and -10F to 0F for Zone 6. Provide plants that have been grown for a period of at least 1 year in a nursery located within the same USDA Plant Hardiness Zone or colder Zone that exists at the location of the planting project.

Submit for approval a complete and detailed source of supply for each plant item indicated in the contract at least 90 days before the anticipated start of the planting operations. The Department reserves the right to reject plants from nurseries that do not qualify for the USDA Hardiness Zone growing requirement.

2. Collected Plants. Plants collected from native or previously established plantings that have not been re-established in a nursery row or grown under regular nursery cultural practices for at least two full-growing seasons. Designate collected plants as such.

3. Balled and Burlapped (B&B) Plants.

- Firmly balled with the original and undisturbed soil in which the plant was growing.
- Wrapped with untreated, biodegradable burlap or similar acceptable material, then tightly laced with biodegradable lacing to hold the ball firm and intact.
- Plants delivered to the planting site with balls broken, loose, or manufactured will be rejected.
- Acceptable nursery trade root protection devices will be allowed in lieu of burlap wrap, as approved.

4. Container-Grown Plants. Grown for at least one year, but not more than 2 years, in the same container so that the roots and soil ball held together and retained its shape when removed from the container. The Department will reject plants that exhibit a “pot-bound” condition with girdling and encircling primary roots. Only ground-cover, vine-type plants with roots exhibiting a “pot-bound” condition will be accepted.

5. Herbaceous Plants.

5.a Rhizome. Resilient, underground propagule collected during dormant condition and exhibiting light colored buds or shoots.

5.b Bulb or Tuber. Firm, underground propagule collected during dormant condition and exhibiting light colored buds or shoots.

5.c Peat Pot. Generally 1 3/4-inch to 2 1/4-inch square, commercial peat pot, filled with an approved potting soil mixture. Containing at least three nursery-grown plants, each with a minimum active top growth of at least 6 inches and having roots sufficiently developed through the peat pot surface so as to be firmly contained.

5.d Plug (Grasses, Rushes, and Sedges). Cubical or cylindrical plant extracts, minimum of 4 inches wide by 4 inches deep, cut from existing plant communities containing stems, roots, associated underground parts, and soil. Keep plug moist and viable for planting. Plug may also be provided in 2 inches square nursery pots or 2 inch wide by 6 inch deep pre-molded plastic tubes (tublings) manufactured to encourage deep root development. Minimum active top growth development of 4 inches.

5.e Starter Plant. Bare root plants with developed root systems capable of being transplanted and generated from seed, rhizome, or rootstock. Starter plant may also be provided in 2 inches square nursery pots or 2 inch wide by 6 inch deep pre-molded plastic tubes (tublings) manufactured to encourage deep root development. Minimum active top growth development of 6 inches.

6. Bare Root (BR) Plants. Plants that have been dug while dormant and have had the soil removed from the roots exhibiting a live, moist, and well-branched, fibrous root system characteristic of the species, free from rot, mold, and damage. Roots dipped into, and thoroughly covered with, a gel comprised of water and a superconcentrated, water-absorbent, nontoxic, neutral pH, starch graft/acrylate copolymer, insoluble material manufactured for this dipping purpose. Mix gel dip to manufacturer's recommended rate.

7. Crownvetch Plants.

7.a Crowns. No. 1, whole, field-grown crowns of certified variety at least one growing season old. Overall plant length of 6 inches to 9 inches, including 1/2 inch of top growth. Measuring not less than 1/8 inch or more than 3/8 inch in caliper, at a point 1 inch below the root collar.

7.b Potted Plants. Certified variety, grown for a period of at least 100 days. In 2 1/4-inch or larger peat pots and “pot-bound,” with a top growth of not less than 6 inches.

8. Live Stakes. Provide live stakes harvested locally, within the same physiographic ecoregion and plant hardiness zone. Live Stakes are composed of freshly cut, dormant branches, with side branches removed cleanly, 1/2 to 2 inches in diameter, 24 to 36 inches in length. Butt ends must be cut at a 30 to 45-degree angle for insertion into the soil. Tops must be cut square or blunt to allow for installation. At least 2 to 5 bud scars are required near the top to facilitate branch development. Collect live cuttings during the dormant period between November 1st and March 31st; live stakes provided and / or installed outside this period are not permitted. Where local conditions warrant, these dates may be extended, if directed in writing by the District Executive. Do not store live stakes for more than 2 weeks after they have been prepared for installation.

9. Storage, Packing, and Handling. According to good nursery practice. Plants showing signs of improper storage, packing, or handling will be rejected.

10. Inspection and Rejection. Plant materials will be inspected at the project planting site prior to planting. Complete form CS 6104, Plant Material Inspection Report, for each shipment. Provide certification as

specified in Section 106.03(b)3. A state nursery inspection certificate is required with each shipment, invoice, or order of plants to verify inspection for pest control, as well as freedom from disease and insect pests, before removal from the nursery or place of growth.

Inspection at the project site is to ensure that plant stock is from an approved source, is in healthy and undamaged condition, and according to size, type, quantities, and appropriate ANSI Z60.1 Standards.

Plants exhibiting the following defects or damage may be rejected:

- Decayed tissue on plant trunk, branches, or twigs.
- Sunscald or sunburn resulting in cambium tissue or bark damage.
- Mechanical damage/bark abrasions resulting in damage to cambium tissue.
- Frost cracks appearing as splits in bark or wood.
- Disease resulting in abnormal growth of leaves, twigs, fruit, bark, discoloration of leaves and bark, or sap discharge.
- Insect damage appearing as borer holes into bark or wood or insect eggs or larvae.
- Other damage or injury such as branch and twig die-back, dry buds, or dead leaves.
- Improper pruning resulting in improper stubs left on trunk, branches, or twigs, removal of excessive branches that leaves the plant asymmetrical or non-uniform in plant density, and pruning wounds larger than 1 inch in diameter.
- Girdling roots appearing as roots growing in a damaging, encircling configuration.
- Non-standard growth patterns for single or multiple stem plants, non-typical for their plant genus, species, or varieties.
- Sheared evergreen trees or shrubs not representative of full-foliaged, natural-growth plants.
- Evidence of undue damage to root ball structure causing broken root balls and plants loosened in the soil ball.
- Evidence of insufficient roots throughout the entire soil ball and with fewer than five undamaged, viable, balanced, primary roots.
- Excessive top growth not in acceptable balance with the root system.

Plant materials will be accepted, subject to responsibility for latent defects, as specified in Section 107.16(b).

Plants damaged during planting operations will also be rejected and require replacement with appropriate indicated plants.

Segregate and remove rejected plants from the planting site within 48 hours or as directed.

11. Substitutions. No substitutions will be allowed without authorization, as provided in Form CS 616, Request for Plant Material Substitution.

12. Shipment. Carefully pack the roots of bare-rooted stock in sphagnum moss, moist straw, or other suitable material that will ensure the plant's arrival in acceptable condition. For material shipped in open vehicles, cover with securely fastened canvas, burlap, or other material to prevent wind burn or drying. Plant material that has heated or "sweated" by reason of tight packing or poor ventilation will be rejected. For plants approved to be shipped during the active growing season, treat plants with antidesiccant and/or antitranspirant material, applied by spraying

or dipping, to prevent excessive transpiration. Comply with local, State, and Federal laws relative to plant material shipment.

(b) Antidesiccant/Antitranspirant. ASTM E 96 in liquid form.

(c) Fertilizer. 20-10-5 tablets (10 gram), 16-8-16 packets, and 19-6-12 fertilizers conforming to the requirements of Section 804.2(a)2. When using packets, use in 4-ounce, individual, heat-sealed, polyethylene envelopes. Application rates are as shown on the Standard Drawings or as directed.

(d) Mulch. Section 805.2(a)2

(e) Backfill Mix for Planting or Transplanting. A uniform mixture of one part peat or compost material, as specified in Section 808.2(f), and three parts soil by volume that was removed from the planting pit.

Where it is determined by the Representative that wet and poorly drained planting conditions exist, backfill with soil removed from the planting pit.

The ratio of peat to soil for plants requiring an acid soil is one part peat to two parts soil by volume.

(f) Soil Amendments.

1. Peat. Shredded reedsedge peat or sphagnum moss peat, or a combination of both, from fresh water sites. Do not use peat material in an advanced stage of decay. Provide peat material, conforming to the following requirements:

- Minimum of 80% organic matter.*
- Maximum of 15% ash content.*
- Minimum of 400% water holding capacity.*
- Maximum delivered density of 30 pounds per cubic foot.
- pH—4.5 to 6.0 (use laboratory analysis to indicate the liming required).

* Oven dry basis.

Submit a laboratory analysis of the peat intended for use. Do not ship peat material to the project until acceptance is received.

2. Paper Mill Compost. A blend of fibrous bark fines and wood-pulp fibers, composted, free of foreign material and substances toxic to plant growth, and conforming to the following requirements:

- Minimum of 70% organic matter.*
- Maximum of 25% ash content.*
- Minimum of 200% water holding capacity.*
- Particle size—1/2 inch maximum.
- Free of weeds.
- pH—7.0 ± 0.5.

* Oven dry basis.

Submit a certified laboratory analysis with each shipment.

3. Sewage Sludge Compost. A blend of composted sewage sludge and wood chips, conforming to the requirements specified in Section 805.2(a)2.e, except the maximum size particle is 3/8 inch.

4. Compost. Decomposed product derived from agricultural, food and yard organic matter source. Composted at a DEP, Bureau of Waste Management permitted site under industry standards and U.S. EPA regulations, to provide a stable, weed free, nontoxic, soil amendment with a non-objectable odor, and conforming to the following requirements:

- moisture content—35 to 55%
- trace elements and heavy metals—meet U.S. EPA Part 503 Exceptional Quality

Concentration Limits

- particle size—pass 1-inch standard screen
- pH—5.5 to 8.0
- soluble salt concentration—3.0 dS maximum
- manufactured foreign matter—less than 1% by weight

For plants requiring an acid soil, provide only compost that has not received the addition of liming agents or ash by-products and having a pH value ranging from 5.5 to 7.0.

5. Water Absorbent Polymer. A synthetic, nontoxic, granular polymer (polyacrylamide) product manufactured to increase the water holding capacity of the soil. Dry, free flowing granules capable of absorbing at least 200 times their weight in water, and conforming to the following requirements:

- Material—cross-linked modified acrylic polymer
- Granular size—40 mils to 157 mils
- Density—45.5 lbs/ft³
- Time to achieve 100% absorption—56 minutes
- Absorption—minimum of 400 g/g (grams of water per gram of product)
- Deionized water—minimum of 200 g/g (grams of water per gram of product)
- Tap water—(rated 160 mg NaCl/liter of water)

6. Mycorrhizal Inoculation.

6.a Trees. Premeasured 3-ounce packets containing live endo and ectomycorrhizal fungi, plant biostimulants, and water absorbent polymers conforming to the following typical requirements:

- | | |
|-------------------------|--|
| • Endomycorrhizal fungi | Minimum 1000 live spores of Vesicular arbuscular (VA) fungi to include <i>entrephospora columbiana</i> , <i>glomus etunicatum</i> , <i>glomus clarum</i> , and <i>glomus</i> species |
| • Ectomycorrhizal fungi | Minimum 60 million live spores of <i>pisolithus tinctorius</i> |

- Biostimulants Dry soluble yucca extract (yucca schidigera); soluble sea kelp extract (ascophylum nodosum); and humic acid (leonardite humates)
- Water absorbent polymer 0.7 mm to 1.5 mm particles of cross-linked polyacrylamide copolymer with certified free acrylamide monomer level of less than 0.05%

6.b BR Seedlings and Transplants. Root dip material containing live endo and ectomycorrhizal fungi, plant biostimulants, and water absorbent polymers conforming to the following typical requirements:

- Endomycorrhizal fungi Minimum 50 000 live spores of VA fungi per pound of product to include entrephospora columbiana, glomus etunicatum, glomus clarum and glomus species
- Ectomycorrhizal fungi Minimum 140 million live spores of pisolithus tinctorius per pound of product.
- Biostimulants Dry soluble yucca extract (yucca schidigera); soluble sea kelp extract (ascophylum nodosum); and humic acids (natural humates)
- Water absorbent polymer 0.2 to 0.8 mm sized particles of polyacrylamide copolymer

7. Spent Mushroom Soil Compost. Organic substrate used in mushroom production that has been steam sterilized, then composted for a minimum of 90 days in well-managed windrows, and on a properly surfaced and protected composting pad. Conforms to the requirements specified in Section 808.2(f)4 except the soluble salt content is 20 dS maximum and the moisture content is 60% maximum.

(g) Stakes and Collar Strap Attachments. As shown on the Standard Drawings and conforming to the following requirements:

1. Wood Stakes. Rough-sawn, red or white cedar, southern yellow pine, or other acceptable hardwoods. Provide stakes free from knots, rot, or other defects that impair strength or render them unfit for the intended purpose.

2. Steel Stakes. Section 1103.08(a)

3. Collar Strap Attachments.

3.a Rubber Collar Strap. A wide, flexible rubber strip ranging in width from 1 1/2 inches to 3 inches with minimum length ranging from 14 inches to 19 inches made from recycled tire inner tube with a 1/2-inch minimum diameter brass plated grommet on each end.

3.b Fiber Collar Strap. High tenacity, flexible, non-stretch polypropylene or heavy-duty nylon fibers; or natural cotton fibers, woven into tubular or flat surfaced, soft edged, abrasion resistant straps with a minimum width of 3/4 inch manufactured for staking trees and conforming to the following requirements:

1. Straps made from a continuous roll of synthetic strap material cut to the appropriate length required to encircle the tree trunk and attach to the stake as specified in Section 808.3(g)5.

2. A manufactured, synthetic strap with #1 brass grommets positioned 1 inch from each end and of an appropriate length to encircle the tree trunk and attach to the stake as specified in Section 808.3(g)5.

3. A manufactured, synthetic strap with a 1-inch galvanized, ribbed nail within a plastic retaining washer at one end of the strap and of an appropriate length to encircle the tree trunk and attach to the stake as specified in Section 808.3(g)5.

4. A manufactured natural cotton strap with #1 brass grommets positioned 1 inch from each end and of an appropriate length to encircle the tree trunk and attach to the stake as specified in Section 808.3(g)5.

3.c Strap Tie. All-purpose, biodegradable, 3 or 4-ply, non-stretch, cotton, hemp, jute, or sisal, natural fiber, twisted twine or rope that will pass through the grommet ends of the straps specified in Section 808.2(g)3.b.

(h) Water. Section 720.2

(i) Time-Release Water. A nontoxic, pH neutral, poly cellulose gel form of water in a biodegradable carton that slowly liquefies in contact with soil micro-organisms as its container decomposes, and conforming to the following requirements:

1. Poly Cellulose Gel.

- 98% water
- 2% vegetable gum and alum

2. Carton. Biodegradable, 1-quart standard size.

808.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) Plant Protection and Temporary Storage. Untie and completely remove any binding materials from plants that were transported with bound branches.

Protect plants at all times. Plants will be rejected if left out of the ground, unprotected overnight; left with roots exposed to wind or sun; or left improperly protected during transit, unloading, storage, or during the planting operation.

Secure a suitable storage area near the planting site that is shaded, if possible, during the hottest times of the day.

Protect root systems from undue exposure to sun and wind during planting operations as follows:

1. B&B and Container Plants. Place the root balls and plant containers close together at the storage area without damaging the plants. Cover root systems with wet burlap, wet mulch, wood chips, straw, or other approved materials to keep the roots moist. Keep cover material moist.

2. BR Plants. Heel-in plants by digging a shallow trench and placing roots in the trench. Cover root systems with wet burlap, wet mulch, wood chips, straw, or other approved materials to keep the roots moist. Keep cover material moist.

3. Live Stakes. During transport, live stakes must be bundled and covered with a tarpaulin or wet burlap. Transport in unheated portions of a vehicle, and in a moist condition to prevent drying out and tree stress.

When on site, protect from overheating, wind damage, and drying out by storing in a cool, moist, and shaded environment. Spray daily or immerse in cool water less than 60F to prevent drying. Do not store for more than 2 weeks.

(b) Layout of Plantings. Delineate the plant pit locations, plant bed, and planting area outlines as indicated. Identify the plants to be placed at the delineated location. Do not start excavation or cultivation until the locations and outlines are accepted. Use shrub bed preparation in all shrub beds.

If rocks or other obstructions prevent planting at indicated locations, the Representative will determine alternate locations or deletions.

(c) Shrub Bed Preparation. For all shrub bed areas, remove any existing sod or other vegetation growth from the bed areas. Add additional topsoil, if required, to re-establish grade.

Uniformly spread approved peat or compost material to a 3-inch depth, and thoroughly incorporate it into the soil to a depth of 6 inches. Remove and dispose of undesirable material larger than 2 inches in any dimension as directed.

(d) Preparation of Plant Pits. Schedule digging operations, particularly on slopes, so that the actual planting operation occurs within 1 week of the digging, unless a delay is approved. Prepare planting pits to the size shown on the Standard Drawing and as follows:

1. Trees. Dig pits with tapered sides and flat bottom so that the pit is wider at the top than at the root mass depth and large enough to accommodate the roots without crowding. Allow for the placement of at least 12 inches of backfill mix around all sides at the bottom of the root mass. Scarify, loosen, or roughen the tapered pit sides for any glazed or hardened soil surfaces immediately before planting.

2. Shrubs and Seedling Transplants. Dig pits, except for slope plantings, with tapered sides and flat bottom so that the pit is wider at the top than at the root mass depth and large enough to accommodate the roots without crowding. Allow for the placement of at least 6 inches of backfill mix around all sides at the bottom of the root mass. Scarify, loosen, or roughen the tapered pit sides for any glazed or hardened soil surfaces immediately before planting. Dig pits for slope plantings with vertical sides and flat bottom.

3. Vines. Dig pits of appropriate size with tapered sides to accommodate the roots without crowding for vine plants such as periwinkle, pachysandra, and ivy. Provide at least 4 inches of backfill mix beneath and around all sides of the root system.

(e) Pruning.

1. Branches. Prune any dead, dying, broken, or undesirable branches not adequately pruned at the nursery or damaged during transport or installation. The removal of too many damaged branches that leaves an asymmetrical or non-uniform sided plant will be grounds for rejection of the plant. Prune according to best horticultural practice for the health of the plant and the natural or designed form and growth characteristics of the individual species.

2. Roots. Cut damaged or broken primary roots immediately above the damage with a clean, oblique cut.

(f) Transplanting Existing Plants. Relocate plant material designated for transplanting to areas indicated. Move plants while dormant unless otherwise approved.

Apply an approved antidesiccant/antitranspirant, according to the manufacturer's application recommendations, to all evergreen plant material and any deciduous trees or shrubs in leaf before digging.

Dig plants with root balls of sufficient diameter and depth to encompass enough fibrous and feeding roots for the full recovery of the plant. Root ball sizes and depths to correspond to the next largest size nursery grown stock listed in the ASNA Standard for deciduous and evergreen trees and shrubs. Dig root ball to have a flat bottom. Keep roots protected and moist at all times during transplanting procedures. Ball and burlap roots using tightly sewn, untreated, biodegradable burlap laced with heavy twine as specified in Section 808.2(a)3 and approved nursery industry practices.

Prune any damaged, broken, or diseased main roots as specified in Section 808.3(e)2.

Carefully transport plants to the transplant site within 24 hours after digging. Handle plants only by the root ball. Pad trunks and major branches to prevent damage.

Replant, prune, water, and maintain transplanted material in the same manner as new stock.

As specified in Section 808.3(a), locate and prepare an acceptable, secured, temporary site for heeling in or above ground storage of all plants that cannot be replanted within 24 hours at their designated transplant site due to construction sequencing. Keep all root balls moist during the storage period.

(g) Planting. Plant when soil and climatic conditions are favorable, according to the following schedule:

- Deciduous trees and shrubs: October 15 to November 30 and April 1 to May 15
- Evergreen trees and crownvetch plants: March 1 to May 15 and August 1 to September 15
- Seedlings and seedling transplants: March 1 to May 15

- Rhizomes, bulbs, tubers, and starter plants: March 1 to May 15
- Plugs and peat pots: March 1 to September 15
- Live stakes: November 1 to March 31

Where local conditions warrant, these dates may be extended, if directed in writing by the District Executive.

1. Placing Plants. Set plants plumb and at the required depth as shown on the Standard Drawings and conforming to the following requirements:

1.a B&B. Handle B&B plants by the ball or other root protective device, not by the stem or branches. Cut or untie the root ball lacing and lay back or cut off the burlap wrap from the top one-third of the root ball. Remove the top one-third of any root ball wire protective baskets.

1.b BR. Carefully handle BR plants by the main plant stem and any packaging material to avoid damage to the bark and roots. Form a raised soil mound in the planting pit of sufficient size to match the lateral spread of the root mass and to bring the plant up to the proper planting depth. Spread roots evenly over the mound before backfilling.

1.c Container Grown. Handle plants by the packing container, not by the stem or branches. Remove the container from the root mass formed by the container. Separate and spread any compacted roots outward in the planting pit before backfilling.

1.d Live Stakes. Soak the bottom half of the live stake in cool water for a minimum of 24 hours before installation. Do not install into frozen ground. Create a pilot hole 1/2 to 1 inch larger in diameter than the diameter of live stakes in firm soil a minimum of 2/3 of the total length of the live stake, puncturing geotextile or matting as needed. Using a rubber mallet or a wooden tamping surface install live stakes with the square end upward and the pointed end downward at approximately a 45-degree angle pointed downstream. Live stakes may be hammered directly into the soft soil when allowed by the Representative.

Install live stakes with a minimum of 2/3 of the total length below the ground and the bud scars above ground. After installation, firmly pack soil removing all gaps and pockets around the live stake. Splits that occur during installation that extend beyond only one bud scar are acceptable. Splits that extend beyond two bud scars will be rejected. Remove and replace at no cost to the Department any rejected live stakes.

2. Fertilizing and Backfilling. Fertilize, according to the fertilizer schedule and as detailed. Mix the specified quantity of water absorbent granules into the backfill material spread around the plant roots in the bottom half of the planting hole. Use 0.5 ounce of water absorbent polymer granules for each 4-inch width of root ball for shrubs and 2 ounces for each 1-inch caliper of trees. Cultivate and completely tamp backfill mix around the ball or roots, in a manner that fills voids and eliminates air pockets. Avoid breaking or damaging roots during backfilling and tamping operations. When backfilling is two-thirds complete, lay back or cut off and remove the top one-third of the root ball wrapping material on B&B plants. Cut off and remove any wire root protection devices from the top one-third of the root ball. Thoroughly water the backfill material around the roots. Complete backfilling and broadcast mycorrhizal fungi around the perimeter of the root ball and incorporate into the top 10 inches of the backfill mix. Thoroughly water again after the initial watering has been completely absorbed. Firm backfill material around the top of the planting hole and plant stem. Fill in any surface irregularities of the planting hole and level soil. Apply one fungi packet of material for each 1 inch of tree caliper measured 6 inches above the top of the root ball. Fungi application is not required for shrub or ground cover plants.

Do not expose fungi packets to direct sunlight until ready to use at the planting pit.

Provide documentation of delivery to planting site of approved fertilizer(s) and fungi product. Certify that fertilizer and fungi requirements were installed as specified in the aforementioned paragraphs.

3. Crownvetch Plants. Plant crownvetch crowns or plants using Reforestation Method A. For areas planted with crownvetch plants, treat the soil before planting with lime and fertilizer at the rates specified in Section 804.3(c). Apply Formula E seed at the rate of 5 pounds per 1,000 square yards. Mulch with hay as specified in Section 805.

4. Reforestation Methods. Space and arrange plants as indicated or as directed. Puddle plants in a mud slurry immediately before planting.

4.a Method A—Crownvetch Plants. Make a vertical hole in the soil 6 inches to 8 inches deep, but do not excessively loosen the soil. Insert the root in a vertical position in the hole with the root collar resting at the same depth as it grew originally. Firmly tamp to close the hole and exclude air pockets without damaging the plant. Thoroughly water the planted area after installation.

4.b Method B—Seedling Material and Seedling Transplants. Prepare plant pits as specified in Section 808.3(d). Dig pits as large as necessary to accommodate plant root system and gel water carton.

Dip all BR seedling and transplant roots into the mycorrhizal fungi root dip inoculant gel immediately prior to planting. Thoroughly cover root surfaces.

Insert plant in a vertical position in the plant pit with the root collar positioned at the same depth as it grew originally. Place fertilizer tablet or fertilizer contact packet(s) and gel water carton(s) at, but not below, the root zone. Cut bottom of gel carton before installation to facilitate gel contact with the soil. Backfill the pit with excavation material from the plant pit. Thoroughly water the plant and firm soil around the plant root collar and gel carton to hold both in an upright position.

Use one gel carton for plants up to 12 inches in height; two cartons for plants from 12 inches to 24 inches in height; and three cartons for plants from 24 inches to 36 inches in height.

5. Staking. Stake trees using either rubber or fiber collar straps immediately after completion of the backfilling operation of the tree pit as shown on the Standard Drawing and as follows:

5.a Rubber Collar Strap. Use the size of collar strap shown on the Standard Drawings for the appropriate tree caliper size. Wrap straps around the tree trunk so that the rubber strap lies flat against the trunk. Securely fasten strap ends to stake with approved natural fiber twine or rope run through the grommet hole at each end of the strap and wrapped, tightened, and knotted around the stake.

5.b Fiber Collar Strap. Wrap collar strap around the tree trunk so that the fiber material lies flat against the trunk. Follow the strap manufacturer's attachment instructions for the type of collar strap used. Securely fasten the strap ends with either a tied knot; approved natural fiber twine or rope run through the grommet holes at each end of the strap and wrapped, tightened and knotted around the stake; or nailed to the stake. Use polypropylene straps with grommets for trees 3-inch caliper and smaller. Use heavy-duty nylon straps with grommets for trees over 3-inch caliper. Polypropylene straps without grommets can be used for all tree calipers 4 inches and smaller. Cotton straps can be used for trees 3-inch caliper and smaller.

6. Period of Establishment. Maintain all plants in a living, healthy condition until the entire project has been accepted. Plants are required to have been growing in place at least 60 days before project acceptance. During this period of establishment, perform the necessary watering, weeding, applying of acceptable insecticides or fungicides, cultivating, remulching to maintain a depth of 3 inches, and adjusting stakes, all as directed.

7. Watering. Water during the period of establishment as directed. Perform watering promptly with sufficient personnel and equipment to complete the watering requirements within 5 calendar days after having been directed. Apply water using an open-end hose supplied by gravity or low-pressure pump rated less than 10 pounds per square inch. Allow water to thoroughly soak and percolate into the soil without run-off. Furnish measurements and capacities of water tanks used in this operation. Submit source of water and watering schedule for acceptance.

8. Clean-Up. Remove and dispose of any subsoil, rock, debris, and other undesirable planting excavation materials from the planting site. Leave planting sites with a clean and acceptable groundcover condition. An acceptable groundcover condition may include seeding bare soil or damaged ground areas with Formulas B, D, or L as directed and mulching with straw at rates typical for the affected areas.

9. Plant Replacements.

9.a Nursery Stock. Plants not alive or showing declining health and having died back beyond a normal recognize pruning point at the time of final inspection will be rejected and require replacement within the next

specified planting dates. Replace the rejected plants with plants of the same species, size, and quality as originally indicated and specified unless plant substitutions have been approved for these plants. The Representative will determine plants that are not acceptable. Remove unacceptable plants from the project and replace with approved plants within 30 days of official notification in writing from the District Executive and before acceptance of the entire project. Make replacements at the beginning of the next planting season if directed, or if agreed upon in writing, the unacceptable material will be deleted from the contract. Only living, healthy plants are accepted at the time of final inspection.

9.b Transplanted Material. Replace any dead or unhealthy transplanted material with approved nursery grown plants of the same species and general size before final acceptance of the project. If directed, make replacements at the beginning of the next planting season.

10. Mulching. When indicated, mulch the entire individual plant pit or the entire planting bed as specified in Section 805.3(c). Use coarse aggregate mulch for all individual plant pits to be located in non-maintained, unmowed areas. In maintained, mowed areas, use shredded bark, tanbark, wood chips, or approved compost mulch for the individual plant pits.

11. Herbaceous Plants.

11.a Peat Pots and Plugs. Loosen soil to a depth of 6 inches. Wet peat pot surfaces and root masses to saturation before planting. Plant pot or plug approximately 3 inches deep, in wet soil, leaving the growing stems above the surrounding soil. Firm soil by hand around each plant. Water thoroughly.

11.b Tubers, Bulbs, and Rhizomes (Roots). Loosen soil around each planting site to a depth of at least 4 inches. Push roots 1 inch to 2 inches into the soil and firm soil around each root. When planting under standing water, add sufficient weight, such as #8 penny nails held with rubber bands, or place several roots into a loose knit, biodegradable, mesh bag along with several small stones in order to submerge roots to bottom of planting site.

11.c Fertilization. Side dress each plant with 1 ounce of 19-6-12 controlled release fertilizer at the time of planting. Apply fertilizer in furrow around each plant and cover with at least 1 inch of soil. Do not fertilize when planting under standing water.

11.d Starter Plants. Keep roots of plant moist during the planting operation. Loosen soil at planting site to a depth of at least 4 inches. Make a vertical hole in the soil deep enough to accommodate the root depth. Insert roots in a vertical position with the root collar at the proper soil depth. Firmly tamp soil to close the hole and expel air pockets. Water thoroughly.

808.4 MEASUREMENT AND PAYMENT—

(a) Plants, Live Stakes, Planting and Transplanting. Each
The Department will not pay for plants deleted from the contract by the Representative.

(b) Shrub Bed Preparation. Square Yard

(c) Mulching.

1. Individual Plant Pits. Incidental to the planting operation.

2. Planting Beds. Section 805.4(b)

(d) Watering. Watering done at the time of planting or transplanting will be incidental to the planting or transplanting. Any subsequent watering indicated or directed, to keep the plants alive will be measured and paid for by the 1,000 Gallons.

SECTION 809—SODDING

809.1 DESCRIPTION—This work is furnishing, placing, and maintaining cultivated sod on designated areas.

809.2 MATERIAL—

(a) **Sod.** Conforming to the current edition of the Turfgrass Producers International's Guideline Specifications to Turfgrass Sodding, and as follows:

- Certified sod cultivated of two or more approved Kentucky bluegrass varieties.
- Containing not more than 10% of other fine turf grass species.
- Entirely free from weeds, as defined in the Pennsylvania Seed Act of 1965 and amendments.
- Free from harmful insects, disease, and nematodes.
- Cultured in mineral soil.
- Certified by the Pennsylvania Department of Agriculture or the Department of Agriculture of the state from which sod is obtained.
- Rectangular machine sections 12 inches to 24 inches wide, 2 feet to 6 feet long, with a uniform soil thickness of approximately 3/4 inch excluding top growth and thatch. Broken sections or sections having torn or uneven ends will not be accepted.
- Grass height, maximum 1 1/2 inches.
- Well-moistened condition.
- Relatively free of thatch (up to 1/2 inch uncompressed thickness acceptable).

Net sod may be used after submitting a sample to obtain acceptance.

(b) **Lime.** Section 804.2(a)1

(c) **Fertilizer.** Section 804.2(a)2

(d) **Water.** Section 720.2

809.3 CONSTRUCTION—

(a) **Sod.** Place sod within 36 hours after having been cut.

(b) **Temporary Storage.** For sod in temporary storage, protect from drying due to sunlight or wind. Keep sod moist.

(c) **Site Preparation.** Before placing sod, complete soil preparation or topsoiling, as specified in Section 802.3. Provide a sod bed graded so that, after placing, the top of the sod is flush with the surrounding finished grade.

Apply soil supplements, as specified in Section 804.3(c), to areas to be sodded. Moisten soil before placing sod.

(d) **Placing Sod.** Place sod when soil moisture and temperature conditions are suitable. Do not cut or place sod if the temperature is lower than 32F. Do not place frozen sod.

Carefully place sod by hand, with tight joints, no overlap, and in straight lines with rows placed parallel to and tight against each other. Break or stagger transverse joints. Do not use pitchforks or other tools that may damage the sod. Do not dump sod from vehicles. Immediately after placing, saturate sod with water to its full depth. After the initial watering, tamp the sod to close joints and ensure close contact between the sod and sod bed. Tamp to obtain a smooth, even sod surface, free from bumps and depressions. If directed, use a roller having a weight not more than 65 pounds per foot of width to complete firming and smoothing the sod.

If placing sod in ditches, place the strip with the longer dimension perpendicular to the flow of water. At any point where water will start flowing over a sodded area, turn the upper edge of the sod strips into the soil, then place a layer of compacted earth over this juncture to conduct the water over the sod edge. On slopes, place sod with the long axis parallel to the contour, starting at the bottom of the slope. Stagger sod joints.

In ditches and on slope areas (3:1 or greater), stake each strip of sod securely using at least one wood stake for each 2 square feet of sod. Use stakes 1/2 inch by 1 inch and with a length of 8 inches to 8 inches to 12 inches. Drive stakes flush with the top of the sod, with the wide face parallel to the slope contour. .

(e) Maintenance. Properly maintain sodded areas until the project has been accepted. This may include repeated watering, mowing, and repairs or replacement of sod in areas that fail to show a uniform growth of grass, or that are damaged in any way.

Do not mow sodded areas until sod is firmly rooted and secured in place. Maintain grass height at 1 1/2 inches unless otherwise directed.

809.4 MEASUREMENT AND PAYMENT—

(a) Sodding. Square Yard

(b) Watering and Mowing. Initial watering and mowing at the time of sodding is incidental to sodding. The Department will measure and pay for subsequent watering, requested and required for grass survival, or as otherwise directed, by the 1,000 (M) gallons. The Department will measure and pay for subsequent directed mowing by the acre.

SECTION 810—TREE TRIMMING AND SELECTIVE TREE REMOVAL

810.1 DESCRIPTION—This work is the removal of selected trees and shrubs, the trimming of trees and shrubs, the treatment of tree injuries, and the removal of stumps and debris.

810.2 MATERIAL— Stump or Basal Treatment Herbicide—Type 10, Class B or C, Triclopyr liquid formulations. Use either Class B – butoxyethyl ester of triclopyr and inerts or Class C – butoxyethyl ester of triclopyr in ready to use form according to PCID No. 1094 Herbicides (Weed and Brush Control) issued by the Pennsylvania Department of General Services, Bureau of Purchases, Quality Assurance Division. Conform to all current Federal and State pesticide acts and registration requirements. Furnish herbicides in the manufacturer's labeled container.

810.3 CONSTRUCTION—

(a) Tree and Shrub Removal. Trees and shrubs to be removed will be designated either by separate marking, marking in sample areas, or as otherwise identified. Where sample marking is adopted, do not disturb these sample areas until other areas are complete.

For designated trees, shrubs, and stumps, cut to the ground line or to a height of not more than 4 inches, as directed. Fell and remove in a manner preventing injury to remaining vegetation. In areas where felling is not permitted, due to possible damage for any reason, remove trees in sections.

(b) Herbicide Treatment. Treat stumps of cut trees and shrubs with herbicide on the day of cutting. Apply herbicides according to the manufacturer's recommendation. Repeat the herbicide treatment, as directed, if suckers or sprouts develop at any time before final inspection.

(c) Tree Trimming. Selected tree trimming will be designated by separate markings or otherwise identified and indicated. Trim branches 1 inch or more in diameter growing within the legal Right of Way or growing on an adjacent property that overhang or encroach upon the legal Right of Way, to the height indicated. Trim branches to the branch collar as shown on the Standard Drawing.

Provide skilled workers to perform cutting and trimming, according to accepted arboricultural practices. Use acceptable tools and methods to perform the work. Do not use climbing spurs or spikes.

Treat work-related injuries to remaining trees and shrubs, regardless of species, according to accepted arboricultural practices at no additional cost to the Department.

(d) Surrender Material. Trees and branches resulting from the removal and/or trimming operation belong to the property owner. Surrender all such material to the abutting property owner or dispose of it if not accepted by the property owner.

Transport wood chips to approved stockpile areas that will not interfere with construction operations, obstruct drainage, or cause water pollution.

(e) Clean-up. Chip, burn, or dispose of brush and debris resulting from work. Burn, as specified in Section 201.3. Do not burn within 40 feet of vegetation designated to remain.

As directed, dispose of rubbish, broken concrete, litter, and other objectionable material.

(f) Maintenance. Until the project is completed, properly maintain selective tree removal and trimming, including retreatment of sucker growth, the removal of wind-thrown trees and plants or parts of plants, which die from any cause.

810.4 MEASUREMENT AND PAYMENT—

(a) Tree Trimming. Lump Sum or Linear Foot, measured longitudinally along roadway.

To a maximum height of 20 feet or to an unlimited height, as indicated within the limit of work.

810.4(b)

810.4(c)

(b) Selective Tree Removal. Lump Sum or Each

(c) Selective Tree Trimming. Each

SECTION 811—TEMPORARY PROTECTIVE FENCE

811.1 DESCRIPTION—This work is furnishing, installing, and maintaining temporary protective fencing within the project limits for sedimentation traps and basins and for existing trees, shrubs, vegetated wetland areas, and archaeological sites, as indicated.

811.2 MATERIAL—

(a) **Fence.** Acceptable, undamaged, standard picket snow fence or other acceptable, highly visible, weather resistant, easily maintained fencing that provides a substantial barrier.

(b) **Posts.** High carbon channel bar steel, 7 feet in length. Designed to drive satisfactorily into the ground and with at least ten fence-holding lugs of the rivet type. The Representative may accept other posts.

811.3 CONSTRUCTION—Fence desirable wooded areas, individual trees, and shrubs designated for protection, before beginning other general project work. Where directed, fence other adjacent areas to be protected such as sedimentation traps and basins, existing archaeological sites, and existing vegetated wetland areas. To verify extent of protection, conduct a field observation before clearing and grubbing operations with the Representative, and if necessary, the Design Project Manager and the District Environmental Manager.

Do not stockpile materials under, or within, protected vegetation areas. Prohibit construction traffic within protected areas. Place the fence at the dripline of trees or plants, but avoid causing root damage when driving posts. Replace damaged fence in kind within 24 hours of damage, as directed. Remove temporary protective fence when directed or after completion of project.

811.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 845—UNFORESEEN WATER POLLUTION CONTROL

845.1 DESCRIPTION—This work is construction of temporary or permanent control measures, as ordered during the contract life, to control unforeseen pollution of surface water and groundwater.

845.2 MATERIAL—

- As specified in applicable parts of Sections 804, 805, and 806.
- Erosion and sediment pollution control devices—as shown on the Standard Drawings.
- Other water pollution control measures and devices as directed.

845.3 CONSTRUCTION—As directed during construction, provide water pollution control measures to prevent or abate unforeseen pollution of surface water and groundwater resources. These measures are separate from those temporary and permanent water pollution control features designed for the project.

Coordinate control measures with the Erosion and Sediment Control Plan and permanent features to ensure economical, effective, and continuous pollution control throughout the construction and post-construction periods. Also comply with the requirements specified in Section 107.28.

If directed, place pollution control measures for authorized construction areas outside the right of way.

Comply with all applicable Federal, State, and local laws, rules, or regulations.

845.4 MEASUREMENT AND PAYMENT—Dollar

The proposal will include an item and a predetermined amount of money for Unforeseen Water Pollution Control. The contract item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the contingent or unpredictable nature of the work being performed, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for, under the Unforeseen Water Pollution Control item as follows:

(a) Contract Items. The Department will pay for performance of work, identified as having similar items listed in the contract, at the contract unit price.

(b) Non-Contract Items. The Department will pay for items of work not identified in the contract as follows:

1. Negotiated Price. At price agreed upon with the Department before performing the work. If applicable, agreement is also required with FHWA.

2. Force Account Basis. Section 110.03(d)

SECTION 849—ROCK CONSTRUCTION ENTRANCE

849.1 DESCRIPTION—This work is construction, maintenance, and removal of a temporary rock construction entrance.

849.2 MATERIAL—

- (a) **Aggregate.** AASHTO No. 1. Section 703.2
- (b) **Geotextile.** Class 4, Type A. Section 735
- (c) **Wash Rack.**
 - Reinforced Precast Concrete. Section 714.3
 - Welded Steel Pipe. Section 1105.02

849.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated, and as follows:

Clear and grub the footprint of the rock construction entrance as specified in Section 201.3. Construct the rock construction entrance by excavating as specified in Section 203.3, forming embankment as specified in Section 206.3.

Place the geotextiles, as specified in Section 212.3(d)2.

Place wash rack as indicated. Place wash rack such that all wash water is directed to a sediment removal device.

Provide satisfactory drainage through the rock construction entrance.

When directed, place additional rock to satisfactorily maintain the rock construction entrance. Remove sediment from drain space when the drain space becomes clogged. Dispose of removed sediment in a manner satisfactory to the Representative.

When the construction entrance is no longer needed, as directed, remove the entrance and restore the area as specified in Section 105.14.

849.4 MEASUREMENT AND PAYMENT—

- (a) **Rock Construction Entrance.** Each
- (b) **Rock Construction Entrance with Wash Rack.** Each
- (c) **Material Used Basis.**
 - 1. **Aggregate.** Cubic Yard
 - 2. **Geotextile.** Section 212.4(c)
 - 3. **Class 1 Excavation.** Section 203.4
 - 4. **Wash Rack.** Each

SECTION 850—ROCK LINING

850.1 DESCRIPTION—This work is construction of rock lining of the class indicated.

850.2 MATERIAL—

(a) Rock.

1. General. Acceptable quality; sound; free from structural defects and foreign substances, such as soil, shale, and organic materials. Unless the rock comes from material providing an approved Type A aggregate, listed in Bulletin 14, submit samples to the LTS for petrographic examination for durability before use.

Use rock conforming to the following requirements:

- No shale seams.
- Hard and angular shaped rock with neither width nor thickness less than one-third its length.
- Minimum specific gravity of 2.5, as determined according to AASHTO T 85, bulk-saturated, but surface-dry basis.
- Each load of rock well-graded, from the smallest to the largest size.

2. Size and Gradation.

Percent Passing (Square Openings)						
Class, Size No. (NCSA)	R-8**	R-7**	R-6	R-5	R-4	R-3
Rock Size, inches						
42	100*					
30		100*				
24	15-50		100*			
18		15-50		100*		
15	0-15					
12		0-15	15-50		100*	
9				15-50		
6			0-15		15-50	100*
4				0-15		
3					0-15	15-50
2						0-15
Nominal Placement Thickness, inches	48	36	30	24	18	12

* Maximum allowable rock size.

** Use Class 4, Type A geotextile

Acceptance of gradation will be based upon visual inspection and certification. Provide two samples of rock, at least 5 tons each or each one-half the total project quantity, whichever is smaller. Provide one sample in place at the construction site and provide the other sample at the quarry. The construction site sample may be incorporated into the work. These samples will be used as a reference for judging the size and gradation of the rock supplied and placed. Certify as to gradation, as specified in Section 106.03(b)3.

(b) Geotextiles. Class 4, Type A, for the type required. Section 735.

850.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

Prepare the area required for placing the geotextile and rock.

This preparation may include, but not be limited to excavating, removing unsuitable material, backfilling, placing embankment, and clearing and grubbing, as specified in Section 201.3. Place the geotextiles, as specified in Section 212.3(d)2.

Carefully place the rock on the geotextiles to produce an even distribution of pieces, with a minimum of voids and without tearing the geotextile. Place the full course thickness in one operation in a manner to prevent segregation and to avoid displacement of the underlying material. Do not place rock in layers, by dumping into chutes, or by similar methods likely to cause segregation or geotextile damage. Rearrange individual rocks, if necessary, to ensure uniform distribution.

850.4 MEASUREMENT AND PAYMENT—

(a) **Rock.** Square Yard or Cubic Yard

(b) **Geotextile.** Square Yard
Section 212.4(c).

(c) **Excavation.** Cubic Yard
Section 203.4 or 204.4, for the class indicated.

SECTION 851—OUTLET PROTECTION: ROCK

851.1 DESCRIPTION—This work is construction of a rock outlet protection of the type indicated. This work includes the maintenance and removal of temporary outlet protection as indicated.

851.2 MATERIAL—

- (a) Rock, Class as required—Section 850.2(a)
- (b) Geotextiles, Class 4, Type A, for the type required—Section 735
- (c) Grout—Section 601.2(c)

851.3 CONSTRUCTION—As shown on Standard Drawings, as specified in Section 850.3, and as follows:

(a) **Rock Basin.** Control flow of surface water runoff as needed. Excavate below final grade as required, install geotextile, and backfill with rock of the class indicated. If required, after rock is in place, saturate the rock with water, then completely fill the voids between pieces with grout, for at least the top 6 inches, and sweep the surface with a stiff broom. Do not place grout if the air temperature is below freezing. In hot, dry weather, protect grouted rock from excessive heat and keep moist for at least 3 days after grouting, using saturated burlap.

(b) **Rock Energy Dissipator.** Control flow of surface water runoff as needed. Excavate below final grade as required, install geotextile, and backfill with rock of the class indicated. Make appropriate connection to downstream receiving watercourse as indicated. If required, after rock is in place, saturate the rock with water, then completely fill the voids between pieces with grout, for at least the top 6 inches, and sweep the surface with a stiff broom. Do not place grout if the air temperature is below freezing. In hot, dry weather, protect grouted rock from excessive heat and keep moist for at least 3 days after grouting, using saturated burlap.

(c) **Rock Apron.** Control flow of surface water runoff as needed. Excavate below final grade as required, install geotextile, and backfill with rock of the class indicated. If required, make appropriate connection to downstream receiving watercourse as indicated.

(d) **Riprap Basin.** Control flow of surface water runoff as needed. Excavate below final grade as required, install geotextile, and backfill with rock of the class indicated. Make appropriate connection to downstream receiving watercourse as indicated.

(e) **Temporary Installations.** Remove rock and geotextile from temporary outlet protection as indicated. Stockpile rock used in temporary installations on site if necessary before permanent installations. Reuse rock for permanent outlet protection as indicated.

(f) **Maintenance.** Maintain outlet protection until the project has been completed. Remove excessive sediment and repair or replace washed out areas to restore outlet protection functionality.

851.4 MEASUREMENT AND PAYMENT—

- (a) **Rock Basin.** Each
- (b) **Rock Energy Dissipator.** Each
- (c) **Rock Apron.** Square Yard

851.4(d)

851.4(e)

(d) Riprap Basin. Square Yard

(e) Temporary Installations. Each

SECTION 852—PAVED ENERGY DISSIPATOR

852.1 DESCRIPTION—This work is construction of a reinforced cement concrete channel, with embedded stones or solid precast blocks.

852.2 MATERIAL—

- Class A Cement Concrete—Section 704
- Reinforcement—Section 709.3
- Precast Concrete Blocks—Section 713.2(a)
- Joint Sealing Material—Section 705.4(b) or (c)
- Premolded Expansion Joint Filler—Section 705.1
- Asphalt Impregnated Paper—Section 727
- Stones—Section 850.2

852.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

Excavate to the required paving depth. Remove unsuitable material below the bottom of the paving and replace with suitable material. Thoroughly compact and finish the entire foundation area to a firm, even surface.

Mix, place, finish, and cure the concrete, as specified in the applicable parts of Section 1001.3. Hold the reinforcement firmly in position during the placing of concrete.

Pave in uniform 10-foot lengths or sections except where shorter sections are necessary for closures or curves. Form intermediate joints between sections, with two thicknesses of one-ply asphalt impregnated paper cut neatly to the paving cross section.

Place premolded expansion joint filler, 1/2 inch thick, cut to conform to the paving cross section at the ends of curved sections, at intervals of not more than 100 feet, at the end of a day's work, and where paving is adjacent to a rigid structure. Use premolded expansion joint filler that has a depth of 1/2 inch less than the paving depth and press firmly against the adjacent concrete. Seal the joint top with joint-sealing material.

Protect paving from the elements, flowing water, or other disturbances until curing is completed.

852.4 MEASUREMENT AND PAYMENT—

(a) **Paved Energy Dissipator.** Cubic Yard

(b) **Excavation.** Cubic Yard

For removal of unsuitable material of the same class of excavation for the ditch or channel above the paving.

SECTION 854—TEMPORARY SLOPE PIPE

854.1 DESCRIPTION—This work is construction of a temporary slope drainage facility.

854.2 MATERIAL—

- End Section—Section 616.2
- Pipe (Inlet and Outlet)—Section 601.2
- Fill Slope Pipe—Plastic, metal, or flexible rubber pipe of acceptable quality.
- Geotextiles, Class 4, Type A—Section 735

854.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

Construct the berms of suitable compacted embankment material, as specified in Section 206.3. Construct the inlet end to channel water into the temporary drain. Use a slope pipe that can easily be moved, with the length varying, as necessary, to reach a suitable discharge area. Place the discharge end so the outlet water does not cause erosion. Place geotextiles, Class 4, Type A, at the discharge end of the pipe; if necessary, use rock, to prevent erosion. Place fabric, as specified in Section 212.3(c).

Remove and satisfactorily dispose of pipes and end sections if they are no longer required.

854.4 MEASUREMENT AND PAYMENT—Each

SECTION 855—PUMPED WATER FILTER BAG

855.1 DESCRIPTION— This work is furnishing, installing, maintaining, and disposing of a Pumped Water Filter Bag as indicated.

855.2 MATERIAL—

- (a) **Pumped Water Filter Bag.** From a manufacturer listed in Bulletin 15, meeting the following requirements:

1. Constructed from non-woven geotextile material with the physical properties listed below:

Property	Test Method	Units	Value
Mass per Unit Area, Min.	ASTM D 5261	oz/sy	10
Breaking Load (Grab Strength), Min.	ASTM D 4632	lbs	250
Tearing Strength (Trapezoidal Method), Min.	ASTM D 4533	lbs	100
Puncture Strength, Min.	ASTM D 6241	lbs	775
UV Resistance After 500 Hours, Min. Strength Retained	ASTM D 4355	%	70
Apparent Opening Size (AOS), Max. Sieve Size	ASTM D-4751, Method A	U.S Standard Sieve	No. 100 (0.150 mm)

2. Bag size: 15.0 feet by 15.0 feet (± 0.25 feet).
 3. Sewn with a double 401 chain lock stitch or double needle stitch with a minimum seam strength of 100 pounds per inch according to ASTM D 4884.
 4. Constructed with an adjustable sewn in spout capable of handling a maximum hose size diameter of 6 inches.
 5. Labeled with maximum flowrate of bag in gallons per minute.
- (b) **Coarse Aggregate.** AASHTO No. 57. Section 703
- (c) **Lifting Straps.** Of sufficient strength to support load of bag.
- (d) **Geotextile for Underlayment.** Class 4, Type A. Section 735

855.3 CONSTRUCTION—As shown on the Standard Drawings, at the location indicated or directed, and as follows:

Locate bag in a well vegetated (stabilized) area. Discharge onto a stable, erosion resistant area. When vegetated area is not available, provide geotextile (Class 4, Type A) lined flow path to a stable erosion resistant receiving water course or a well vegetated (stabilized) area.

Install compost berm or compost filter sock below bags located in High Quality (HQ) or Exceptional Value (EV) watersheds, within 50 feet of any receiving surface water, or where a well vegetated (stabilized) area is not available.

Locate bag on level area. When level area is not available, place AASHTO No. 57 Coarse Aggregate to level bag. Do not install bags in areas with slopes steeper than 5%.

Do not exceed a pump rate of 750 gallons per minute or half the maximum specified by the manufacturer, whichever is less.

Insert hose into sewn-in spout and double clamp bag firmly to pump discharge hose. Do not install more than one pump hose into a single bag.

Do not allow discharge from the bag to drain back into work or access areas of the project.

Monitor and evaluate entire pumping operation to assure that bag continues to function properly. Replace bag when contained silt reduces flow to approximately 50 percent of rate of initial bag discharge, or when directed.

Dispose of bag and sediment in a manner satisfactory to the Representative.

Do not cut open bags and seed.

Restore area as specified in Section 105.14.

855.4 MEASUREMENT AND PAYMENT—Each

SECTION 856—ROCK BARRIER

856.1 DESCRIPTION—This work is construction, maintenance, and removal of a rock barrier for channel and slope protection.

856.2 MATERIAL—

- (a) Rock, Class R-4—Section 850.2(a), except petrographic examination by the LTS is not required.
- (b) Coarse Aggregate, No. 57—Section 703.2

856.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

- (a) **Installation.** Determine the required dimensions of the rock barrier. Produce an even distribution of rock with minimum voids. Provide a 12" layer of coarse aggregate on the uphill side of the barrier.
- (b) **Maintenance.** Inspect the rock barrier weekly and after each runoff event throughout the duration of the project. If needed, immediately repair any damaged areas of the rock barrier found during inspection. Remove sediment when accumulations reach half the height of the barrier. Remove and dispose of sediment in an approved manner.
- (c). Remove sediment and rock barrier upon stabilization of each channel as indicated.

856.4 MEASUREMENT AND PAYMENT—

- (a) **Rock.** Square Yard or Cubic Yard
- (b) **Coarse Aggregate.** Cubic Yard
- (c) **Removal Sediment and Rock Barrier.** Each
Includes removal of accumulated sediment and proper disposal of all removed materials.

SECTION 857—CONCRETE BLOCK REVETMENT SYSTEMS

857.1 DESCRIPTION—This work is construction of an articulating system of interlocking precast concrete blocks or cable-connected precast concrete block mats for erosion protection of slopes and channels.

857.2 MATERIAL—

(a) **Blocks.** Precast, Section 714, or if machine-made, Section 713 and having 28-day compressive strength of 4,000 pounds per square inch and an absorption of 6% or less when tested according to ASTM C140 and a minimum durability factor of 80 when tested according to ASTM C666 (Procedure A, freezing and thawing in water).

(b) **Stainless Steel Cable.** For connected block systems, ASTM A368 or MIL-W-87161.

(c) **Geotextile.** As specified by the system manufacturer, and from a manufacturer listed in Bulletin 15.

(d) **Soil Anchors.** Conforming to the manufacturer's recommendations.

(e) **Other Material.** Backfill.

1. **Aggregate.** Section 703

2. **Topsoil.** Section 802

- Seeding and Soil Supplements—Section 804
- Mulching—Section 805
- Rolled Erosion Control Products—Section 806.2(a)

(f) **Hydraulic Performance Requirements.** Provide documented evidence that the system being furnished meets hydraulic performance characteristics, derived from tests conducted under controlled flow conditions and conforming to U.S. Federal Highway Administration and U.S. Bureau of Reclamation Testing protocol, as documented in "Hydraulic Stability of Articulating Concrete Block Revetment Systems During Overtopping Flow," Report No. FHWA-RD-89-199.

(g) **Certification.** Section 106.03(b)3

(h) **Delivery, Storage, and Handling.** Transport blocks in a manner that minimizes damage during shipping. Store and handle in a manner that protects them from damage by construction activities or traffic.

857.3. CONSTRUCTION—Excavate to allow placement of the geotextile and concrete blocks as indicated or directed. Remove obstructions such as tree roots, projecting stones, or other foreign matter to a depth of 6 inches below subgrade. Grade the slope to a smooth surface. Backfill voids or soft areas with suitable material and compact to non-movement. Fine grade the area and hand dress, where necessary, before placing the geotextile. Place geotextile as specified in Section 212.3(d)2.

Place concrete blocks over a geotextile, according to the system manufacturer's instructions. Submit field samples to LTS to verify that the manufacturer's prescribed geotextile is installed. Secure cable connected concrete block systems to the slope with soil anchors as indicated or directed. Do not use unsound or damaged blocks. Minor cracks, incidental to the usual methods of manufacturer, or minor chipping resulting from shipment and delivery are not grounds for rejection unless the Representative determines the material unacceptable. After placing blocks, backfill the open areas of the block with topsoil or aggregate, as indicated, to the top of the blocks. Complete backfilling within 7 days of placing the geotextile. If using aggregate, size aggregate according to the manufacturer's recommendation. If using topsoil, seed the backfill area as specified in Section 804 and mulch as specified in Section 805. Use Rolled Erosion Control Products (RECP), as specified in Section 806.2(a), to establish vegetation in a wet weather channel

as directed.

857.4 MEASUREMENT AND PAYMENT—

- (a) **Concrete Block Retention System.** Square Yard
Aggregate backfill, if used, is incidental to the work.
- (b) **Seeding and Soil Supplements.** Section 804.4(a) as indicated.
- (c) **Mulching.** Section 805.4 as indicated.
- (d) **Rolled Erosion Control Products.** Section 806.4(a) as indicated.
- (e) **Topsoil.** Section 802.4 as indicated.

SECTION 858—GEOCELL CONFINEMENT SYSTEM

858.1 DESCRIPTION—This work is furnishing, placement, and maintenance of a geocell confinement system for slope erosion protection.

858.2 MATERIAL—Use geocell as specified in Section 737

- (a) **Stakes.** Conforming to manufacturer's recommendations and as indicated.
- (b) **Fasteners.** Heavy-duty 3/8-inch steel wire staples clinched on the reverse side or No. 1 hog rings.
- (c) **Backfill.**
 - 1. **Topsoil.** Section 802
 - 2. **Coarse Aggregate.** Section 703.2. AASHTO No. 67 or No. 2A, as indicated.
- (d) **Seeding and Soil Supplement.** Section 804.2
- (e) **Mulching.** Section 805.2
- (f) **Geotextile, Class 4, Type A, Non-Woven.** Section 735

858.3 CONSTRUCTION—Construct as indicated and as follows:

- (a) **Geotextile.** Place geotextile as specified in Section 212.3(a) and (d)2.
- (b) **Geocell Confinement System.** Store and transport geocell confinement sections in an unexpanded configuration until ready to install. Place and expand the geocell sections on the geotextile with the longer dimension up and down (parallel with the slope direction) the side slope. Place geocell section flush or slightly lower than the adjacent terrain or final grade. Anchor as indicated. Mechanically fasten adjacent sections using wire staples or hog rings as shown on the shop drawings. Align abutting external cells at contact points and keep top edges flush before fastening. Place backfill material flush with the top of cells, as indicated. Do not operate equipment on finished subgrade, geotextile, unfilled geocell sections, or uncompacted backfill, except compaction equipment.
- (c) **Seeding and Mulching.** As indicated and as follows:
 - 1. **Seeding and Soil Supplements.** Section 804.3
 - 2. **Mulching.** Section 805.3.
- (d) **Maintenance.** Properly maintain slope erosion protection systems until the entire project has been completed. Maintenance includes regrading of washed-out areas and replacing fill material, reseeding, and mulching, as directed as specified in Section 105.13.

858.4 MEASUREMENT AND PAYMENT—

- (a) **Geocell Confinement System.** Square Yard
The unit price includes backfill as indicated.
- (b) **Seeding and Soil Supplements.** Section 804.4(a)
- (c) **Mulching.** Section 805.4

(d) **Geotextile.** Class 4, Type A, non-woven, Section 212.4 (b).

SECTION 859—SEDIMENTATION POND

859.1 DESCRIPTION—This work is construction of a dam to impound water in a storage area.

859.2 MATERIAL—

(a) **Rock Basin.** Section 851.2

(b) **Other Material.** As shown on the Standard Drawings and as follows:

- Embankment—Section 206.2(a)
- Seeding and Soil Supplements—Section 804.2
- Mulch—Section 805.2
- Class A Cement Concrete—Section 704
- Corrugated Metal Pipe—Section 601.2(a)4.b or 4.c
- Reinforcement—Section 709.1
- Steel Plate—Section 1105.02
- Welding Material—Section 1105.02(t)

859.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

As specified in Section 201.3, clear and grub the storage area and embankment foundation area site. Excavate the key trench for the full length of the dam. Excavate the emergency spillway in natural ground. Install the pipe spillway, with the anti-seep collar attached, at the location indicated. Construct the concrete footing for the riser pipe, as specified in the applicable parts of Section 1001.3. Construction of the embankment and trench before placing the pipe is not required. Do not use coarse aggregate as backfill material around the pipe. Backfill the pipe with suitable embankment material to prevent dam leakage along the pipe. Construct rock basin at outlet end of pipe, as specified in Section 851.3(a). Place the embankment material, as specified in Section 206.3. If required, obtain borrow excavation for the formation of the embankment, as specified in Section 205. Apply seeding and soil supplements, as specified in Section 804.3. Mulch, if required, as specified in Section 805.3.

When the sedimentation dam is no longer required, or if otherwise directed, satisfactorily recondition the site by filling in excavated areas, and by removing embankments, riser pipe assemblies, corrugated metal pipe, and anti-seep collars. Restore the areas as specified in Section 105.14. Satisfactorily dispose of removed materials.

859.4 MEASUREMENT AND PAYMENT—

(a) **Class 1 Excavation.** Cubic Yard
Section 203.4.

(b) **Riser Pipe Assembly.** Lump Sum

(c) **Corrugated Metal Pipe.** Linear Foot
Section 601.4(a).

(d) **Anti-Seep Collar.** Each

(e) **Embankment.** Section 206.4

(f) **Borrow Excavation.** Cubic Yard
Section 205.4.

(g) **Seeding and Soils Supplements.** Section 804.4 for the type indicated.

(h) **Mulch.** Section 805.4 for the type indicated.

(i) **Rock Basin.** Section 851.4(a)

SECTION 860—STORM INLET PROTECTION

860.1 DESCRIPTION—This work is the furnishing, installing, maintaining, and removal of storm inlet protection of the type indicated.

860.2 MATERIAL—

(a) Inlet Filter Bag.

1. Provide bag from woven polypropylene material with the properties listed below:

Property	Test Method	Units	Value*
Grab Tensile Strength	ASTM D4632	lbs	300
Grab Tensile Elongation	ASTM D4632	%	15-50
Seam Strength	ASTM D4632	%	90
Puncture Resistance	ASTM D4833	lbs	120
Mullen Burst Strength	ASTM D3786	psi	800
Trapezoidal Tear Strength	ASTM D4533	lbs	120
UV Resistance	ASTM D4355	% @ 150 hrs	80
Apparent Opening Size	ASTM D4751	Sieve No.	40
Flow Rate	ASTM D4491	gal/min/sf	40
Permittivity	ASTM D4491	Sec -1	0.55

* The numerical values indicate minimum average roll value (MARV).

2. Provide manufacturer's inlet filter bag specifications product data sheets and drawings. Submit for project-specific, local approval by the Representative (i.e. at the District or project level) as specified in Section 106.02(a)2.c.

(b) Concrete Block/Gravel Inlet Protection for Type M, S, or C Inlets.

1. **Aggregate.** AASHTO No. 57. Section 703.2
2. **Precast Concrete Block.** Hollow Cores, Section 713.2
3. **Mesh.**
 - 3.a Wire Mesh, Galvanized, No. 11 gage, 0.25 inch maximum opening. Section 626.2(c)1 OR
 - 3.b Plastic Mesh, 0.25 inch maximum opening.
4. **Wood Stud.** Spruce/pine/fir, 2-inch x 4-inch nominal sizing, Construction Grade

(c) Pipe/Gravel Inlet Protection for Type M, S, or C Inlets.

1. **Aggregate.** AASHTO No. 57. Section 703.2
2. **Mesh.**
 - 2.a Wire Mesh, Galvanized, No. 11 gage, 0.25 inch maximum opening. Section 626.2(c)1 OR
 - 2.b Plastic Mesh, 0.25 inch maximum opening.
3. **Pipe.** Polyvinyl Chloride, 15-inch diameter, ASTM D3034, SRD-35

(d) Other Material. As follows:

- Embankment—Section 206.2(a)
- Sandbags—Provide sandbags as indicated, directed and approved by the Representative.

860.3 CONSTRUCTION—As shown on the Standard Drawings, at the location indicated or directed, and as follows:

(a) Inlet Filter Bag. Install bag in accordance with manufacturer's recommendation. Construct downstream earthen or sandbag berm as indicated and directed. Inspect bag after each runoff event to ensure that the bag continues to function properly. Replace or remove and clean bag when sediment has accumulated to 1/3 full or when flow capacity has been reduced so as to cause flooding or bypassing of the inlet. Upon final stabilization of tributary area, when directed, remove bag and downstream earthen or sandbag berm in a manner satisfactory to the Representative. Dispose of bag and sediment in a manner satisfactory to the Representative.

(b) Concrete Block/Gravel Inlet Protection. Install as indicated. Construct downstream earthen or sandbag berm as indicated and directed. Inspect inlet protection after each runoff event to ensure that it continues to function properly. Remove and replace aggregate when it is contaminated with sediment, washed out, or as directed. Upon final stabilization of tributary area, when directed, remove inlet protection and downstream earthen or sandbag berm in a manner satisfactory to the Representative. Dispose of sediment and materials in a manner satisfactory to the Representative.

(c) Pipe/Gravel Inlet Protection. Install as indicated. Construct downstream earthen or sandbag berm as indicated and directed. Inspect inlet protection after each runoff event to ensure that it continues to function properly. Remove and replace aggregate when it is contaminated with sediment, washed out, or as directed. Upon final stabilization of tributary area, when directed, remove inlet protection and downstream earthen or sandbag berm in a manner satisfactory to the Representative. Dispose of sediment and materials in a manner satisfactory to the Representative.

860.4 MEASUREMENT AND PAYMENT—

- (a) Inlet Filter Bag.** Each
- (b) Concrete Block/Gravel Inlet Protection.** Each
- (c) Pipe/Gravel Inlet Protection.** Each

SECTION 861—CLEANING SEDIMENTATION STRUCTURES

861.1 DESCRIPTION—This work is removal and disposal of sediment deposited in erosion and sedimentation control structures and/or devices.

861.3 CONSTRUCTION—Install cleanout stakes near the center of sediment trap and/or sediment basin as indicated or directed. When sediment accumulation has reached the associated cleanout elevations indicated on plans and as directed, remove and dispose of the sediment. Do not damage the structure or device. Maintain or replace cleanout stake as required, as indicated, or as directed.

861.4 MEASUREMENT AND PAYMENT—Cubic Yard

The sediment removed will normally be measured by the number of full loads hauled multiplied by the rated capacity of the hauling equipment, in cubic yards. Cross-sectional measurements will be used for large quantities and when not using hauling equipment.

SECTION 864—DIVERSION DITCH

864.1 DESCRIPTION—This work is construction of a ditch, at the indicated locations, to divert surface run-off water.

864.2 MATERIAL—

- Seeding and Soil Supplements—Section 804.2
- Mulch—Section 805.2

864.3 CONSTRUCTION—Windrow the excavated material on the low side of the ditch, then satisfactorily compact with a heavy wheel load or other acceptable method. On the entire ditch area, apply soil supplements and sow Formula D seed as specified in Section 804.3. Mulch with hay as specified in Section 805.3.

864.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 865—SILT BARRIER FENCE

865.1 DESCRIPTION—This work is furnishing, placement, maintenance, and removal of silt barrier fences of the height indicated.

865.2 MATERIAL—

- (a) **Geotextile.** Class 3, Type A or B. Section 735
- (b) **Mesh Support.** Metallic coated steel, 14.5 gage wire mesh, arranged in a maximum grid of 6 inches by 6 inches, or an acceptable, equivalent plastic mesh.
- (c) **Posts.** Of sufficient length for 18-inch embedment in the ground. Either wood, nominal 2.0 inches square; or steel, 1.25-inch by 1.00-inch T-section or equivalent; or acceptable plastic, with an equivalent section.
- (d) **Fasteners.** No. 9 staples, 1.5-inch long, or tie wires, 17 gage steel, of appropriate length, acceptably metallic coated.
- (e) **Ground Anchors.** 1-inch by 2-inch by 12-inch wooden stakes or steel equivalent to anchor guy wire as shown on the Standard Drawings.
- (f) **Guy Wires.** No. 10 gage, galvanized, according to ASTM A 392, Class II. Install as directed.
- (g) **Rock Filter Outlet.**
 - 1. **AASHTO No. 1 Coarse Aggregate.** Section 703.2
 - 2. **AASHTO No. 57 Coarse Aggregate.** Section 703.2

865.3 CONSTRUCTION—As shown on the Standard Drawings, with or without mesh support fencing, and as follows:

- (a) **Installation.** Excavate trench and install posts. Fasten the geotextile securely to the top of the mesh, at a maximum spacing of 30 inches, and to the posts. Keep sag to a minimum. Extend the geotextile a minimum of 6 inches vertically along the front face of the excavated trench and a minimum of 6 inches along the bottom of the excavated trench, backfill the trench with the excavated soil, and compact.
- (b) **Maintenance.** After installation, satisfactorily maintain the silt barrier fence. Periodically clean silt barrier fence by tapping the dry geotextile from the downstream side. When directed, provide rock filter outlets to replace undercut and overtopped sections of the silt barrier fence.

When the barrier fence is no longer needed, remove the fence and restore the area as specified in Section 105.14.

865.4 MEASUREMENT AND PAYMENT—

- (a) **Silt Barrier Fence.** Linear Foot
- (b) **Silt Barrier Fence Replacement.** If silt barrier fence is required to be replaced, the Department will pay for it at the contract unit price for Silt Barrier Fence.

SECTION 866—HEAVY DUTY SILT BARRIER FENCE

866.1 DESCRIPTION—This work is furnishing, placement, maintenance, and removal of heavy duty silt barrier fence.

866.2 MATERIAL—

- (a) **Geotextile.** Class 3, Type A. Section 735
- (b) **Posts.** Of sufficient length for 36 inches embedment into the ground and 2 1/2 inch diameter galvanized steel or aluminum
- (c) **Fasteners.** Tie wires, 17 gage steel, of appropriate length, acceptably metallic coated to fasten geotextile to wire fabric.
- (d) **Wire Fabric and Components.** Section 1110.01(a)
- (e) **Rock Filter Outlet.**
 - 1. **AASHTO No. 1 Coarse Aggregate.** Section 703.2
 - 2. **AASHTO No. 57 Coarse Aggregate.** Section 703.2

866.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated, and as follows:

(a) **Installation.** Excavate trench and install posts. Provide drive anchors when required or as directed by the Representative. Fasten the geotextile securely to the top of the wire fabric, at a maximum spacing of 24 inches and to the posts. Keep sag to a minimum. Extend the geotextile and wire fabric a minimum of 8 inches into the excavated trench backfill the trench with the excavated soil, and compact.

(b) **Maintenance.** After installation, satisfactorily maintain the heavy duty silt barrier fence. Periodically clean heavy duty silt barrier fence by tapping the dry geotextile from the downstream side. When directed, provide rock filter outlets to replace undercut and overtopped sections of the heavy duty silt barrier fence.

When the fence is no longer needed, as directed, remove the fence and restore the area as specified in Section 105.14.

866.4 MEASUREMENT AND PAYMENT—

- (a) **Heavy Duty Silt Barrier Fence.** Linear Foot
- (b) **Heavy Duty Silt Barrier Fence Replacement.** If silt barrier fence is required to be replaced, the Department will pay for it at the contract unit price for Heavy Duty Silt Barrier Fence.

SECTION 867—COMPOST FILTER SOCK

867.1 DESCRIPTION—This work is furnishing, placement, and maintenance of a compost filter sock erosion and sedimentation pollution control system.

867.2 MATERIAL—

(a) **Compost.** Provide well-decomposed, stable, weed-free, organic compost derived from agriculture, food, stump grindings, and yard or wood/bark organic matter sources – aerobically composted with no objectionable odors. The compost product should not resemble the raw material from which it was derived. Wood and bark chips, ground construction debris, or reprocessed wood products are not acceptable as the organic component of the mix. Provide compost meeting the compost standards for compost filter socks contained in the DEP Erosion and Sediment Pollution Control Program Manual:

• Moisture content, dry weight basis	30% - 60%
• pH	5.5 - 8.5
• Soluble salt concentration (electrical conductivity) maximum	5.0 dS/m
• Man-made inert contaminants, dry weight basis	Less than 1%
• Organic matter content, dry weight basis	25%-100%
• Particle size, % passing 3/8 sieve, dry weight basis	30%-50%

Provide a written statement by the supplier certifying that the compost meets the above requirements. Submit for project-specific, local approval by the Representative (i.e. at the District or project level) as specified in Section 106.02.(a)

(b) **Filter Sock.** Provide filter sock meeting the compost filter sock requirements of the DEP Erosion and Sediment Pollution Control Program Manual, as shown in the Table below. Provide manufacturer's filter sock specifications, product data sheets, and drawings. Submit for project-specific, location approval by the Representative (i.e. at the District or project level) as specified in Section 106.02(a)2.c.

Material Type	3 mil HDPE	5 mil HDPE	5 mil HDPE	Multi-Filament Polypropylene (MFPP)	Heavy Duty Multi-Filament Polypropylene (HDMFPP)
Material Characteristics	Photo-degradable	Photo-degradable	Bio-degradable	Photo-degradable	Photo-degradable
Filter Sock Diameters (in.)	12 and 18	12, 18, 24, and 32	12, 18, 24, and 32	12, 18, 24, and 32	12, 18, 24, and 32
Mesh Opening (in.)	3/8	3/8	3/8	3/8	1/8
Tensile Strength (psi)	N/A	26	26	44	202
Ultraviolet Stability % Original Strength (ASTM G-155)	23% at 1000 hr.	23% at 1000 hr.	N/A	100% at 1000 hr.	100% at 1000 hr.
Minimum Functional Longevity	6 months	9 months	6 months	1 year	2 years

867.3 CONSTRUCTION— As shown on the Standard Drawings, as indicated, and as follows:

(a) Installation. Fill filter sock with compost at the designated erosion control area or fill and transport to the project site. Fill filter sock with compost using pneumatic (blower) equipment or similar filter sock filling equipment to the length required.

Place compost filter sock downslope of the earth disturbance on level contour as indicated. Extend both ends of the compost filter sock at least 8 feet upslope at 45 degrees to the main compost filter sock alignment. For lengths greater than 200 feet, use multiple compost filter sock sections and overlap ends at least 12 inches.

Anchor compost filter socks placed on earthen slopes with stakes driven through the center of the compost filter sock or immediately downslope of the compost filter sock at 10 foot intervals consistent with the RC Standard Drawings and the DEP Erosion and Sediment Pollution Control Program Manual. Use concrete blocks immediately downslope of the compost filter sock (at the same intervals recommended for the stakes) where compost filter socks are placed on paved surfaces.

Do not place the compost filter sock where it will concentrate drainage runoff or channel water to another location.

(b) Maintenance. Maintain compost filter sock until the project has been completed. Routinely inspect compost filter sock installation for damage that would make the compost filter sock non-functioning. Repair or replace damaged areas as directed. Replace compost filter socks after the minimum functional longevity time period identified in the Section 867.2(b) table for the type of filter sock material used. Remove built-up sediment retained by the compost filter sock when the sediment reaches 1/2 of the exposed height of the compost filter sock. Dispose of sediment as specified in the Erosion & Sediment Control Plan.

Upon stabilization of the area tributary to the compost filter sock, remove the stakes. Remove compost filter sock or leave in place. If left in place, cut open the filter sock to expose the compost material completely and spread evenly to the contours of the site. Remove the filter sock unless the Representative authorizes it to remain.

867.4 MEASUREMENT AND PAYMENT— Linear Foot for the specified filter sock diameter.

SECTION 868—COMPOST BLANKET AND COMPOST FILTER BERM

868.1 DESCRIPTION—This work is furnishing, placement, and maintenance of a compost blanket or compost filter berm erosion and sedimentation pollution control system.

868.2 MATERIAL—

(a) Compost. Provide well-decomposed, stable, weed-free, organic compost derived from agriculture, food, stump grindings, and yard or wood/bark organic matter sources – aerobically composted with no objectionable odors. The compost product should not resemble the raw material from which it was derived. Wood and bark chips, ground construction debris, or reprocessed wood products are not acceptable as the organic component of the mix. Provide compost meeting the compost standards for compost filter berm contained in the DEP Erosion and Sediment Pollution Control Program Manual:

- | | |
|--|--------------|
| • Moisture content, dry weight basis | 30% - 60% |
| • pH | 5.5 to 8.5 |
| • Soluble salt concentration (electrical conductivity) maximum | 5.0 dS/m |
| • Manufactured inert contaminants, dry weight basis | Less than 1% |
| • Organic matter content, dry weight basis | 25%-100% |
| • Particle size, % passing 3/8 inch size sieve, dry weight basis | 30%-50% |

Provide a written statement by the supplier certifying that the compost meets the above requirements. Submit for project-specific, local approval by the Representative (i.e. at the District or project Level) as specified in Section 106.02(a)2.c.

(b) Seed. Section 804 for the designated seed formula. Soil supplements are not required with these compost systems.

868.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated, and as follows:

(a) Compost Blanket.

1. Soil Preparation. Roughen/scarify soil surface with appropriate equipment. Remove and dispose of large unworkable soil clumps, debris, large rocks, and undesirable woody matter such as stumps. Track soil surface before compost application with equipment capable of working perpendicular to the slope gradient in order to create soil indentations that will hold compost. Avoid excessive soil compaction during this operation.

2. Compost Application. Uniformly apply compost to the specified depth with approved pneumatic (blower) units, or other appropriate equipment designed to handle and distribute compost material. Do not apply compost in direct-flow drainage channels such as ditches or the centerline of swales.

Apply compost approximately 3 feet beyond and overlapping all edges of the bare soil surfaces designated to receive the compost.

2.a Application Rate.

- Surfaces to be seeded up to 2:1 slope – 270 cubic yards/acre or 2 inches depth with $\pm 1/2$ inch tolerance.
- Surfaces not to be seeded up to 2:1 slope – 540 cubic yards/acre or 4 inches depth with $\pm 1/2$ inch tolerance.

3. Seeding Designated Areas. Apply seed by injection of the appropriate seed formula into the compost flow stream during the compost application, or apply the seed in a separate surface applied operation. Apply seed at twice the seeding rate indicated in Section 804.2(b)2, Table A, for the designated seed formula. Test and verify the specified application rates for the equipment used.

Soil supplements and separate mulch application are not required.

4. Maintenance. Maintain compost blanket depth until the project has been completed or directed otherwise. Routinely inspect blanket for any material dislodgement. Replace and redress any dislodged material and reseed if necessary. Control any noxious weeds with approved herbicides meeting the applicable requirements of Section 804.3(j).

Leave compost blanket in place upon completion of the project.

(b) Compost Filter Berm.

1. Installation. Apply approved compost using specially designed pneumatic (blower) equipment and a berm forming/shaping device, or other appropriate equipment designed to handle compost and form berms. If blower is used, blow compost directly at the soil surface to help settle, compact, and shape the berm.

Construct compost filter berm to comply with the requirements of the DEP Erosion and Sediment Pollution Control Program Manual. Construct berm downslope of the earth disturbance on level contour as indicated. Extend both ends of the berm at least 8 feet upslope at 45 degrees to the main berm alignment.

Construct a trapezoidal shaped compost filter berm, 2 feet high by 4 feet wide at the base with 1:1 side slopes. Position the berm around the designated disturbed soil areas and parallel to the slope base. Construct berm ends pointing upslope so that the ends are at a higher elevation than the berm body to prevent drainage water from flowing around the ends of the berm. Net or anchor the berm after installation.

2. Maintenance. Maintain filter berm in a functional condition. Routinely inspect berm and replace any dislodged compost or reshape any collapsed berm areas. Compost may be replaced by hand and tamped into place. Remove built-up sediment retained by the berm when the sediment reaches 1/3 of the height of the berm. Dispose of sediment as specified in the Erosion & Sediment Control Plan. Replace any compost dislodged by this operation. At completion of project or when directed, leave compost in place by pushing over the berm and spreading the compost material evenly over the adjacent ground to match the contours of the site.

868.4 MEASUREMENT AND PAYMENT—

(a) Compost Blanket, Seeded. Square Yard for the designated seed formula.

(b) Compost Blanket, Unseeded. Square Yard

(c) Compost Filter Berm. Linear Foot

SECTION 870—SEDIMENT TRAP – EMBANKMENT

870.1 DESCRIPTION—This work is construction, maintenance, and removal of an embankment type sediment trap.

870.2 MATERIAL—

- (a) **Aggregate.** AASHTO No. 57. Section 703.2
- (b) **Rock.** Class R-3, Section 850.2(a), except petrographic examination by the LTS is not required.
- (c) **Plywood Extensions.** Where indicated.
 - **Posts.** 2-inch by 2-inch Alkaline Copper Quat (ACQ) Pressure Treated, Spruce/Pine/Fir, Grade 2 (minimum) of the length required. Certify as specified in Section 106.03(b)3.
 - **Plywood.** 3/4-inch thick, Alkaline Copper Quat (ACQ) Pressure Treated, Spruce/Pine/Fir. Certify as specified in Section 106.03(b)3.
 - **Fasteners.** Deck screws of adequate length and approved for use with Alkaline Copper Quat (ACQ) Pressure Treated wood. Certify as specified in Section 106.03(b)3.
- (d) **Geotextile.** Section 735
- (e) **Embankment.** Section 206.2(a)
- (f) **Seeding and Soil Supplements.** Section 804.2
- (g) **Mulch.** Section 805.2
- (h) **Cleanout Stakes.** 2 inches by 2 inches, Spruce/Pine/Fir, Construction Grade, of the length required, or other approved material of adequate size and length.

870.3 CONSTRUCTION—Construct, as shown on the Standard Drawings, at the location indicated or directed, as follows:

Clear and grub the site, as specified in Section 201.3. Construct the sediment trap by excavating as specified in Section 203.3, forming embankments as specified in Section 206.3, and placing aggregate or rock at the outlet as indicated.

If a plywood extension is required, construct as indicated to the elevations indicated.

Place geotextiles, as specified in Section 212.3 for the type indicated. If required, obtain borrow excavation for the formation of the embankment, as specified in Section 205. Apply seeding and soils supplements, as specified in Section 804.3. Mulch, if required, as specified in Section 805.3. Install and maintain cleanout stake as required, as indicated, or as directed.

Inspect sediment trap after each runoff event. Remove accumulated sediment as specified in Section 861.3 and replace aggregate when it is contaminated with sediment, washed out, or as directed.

When the tributary area to the sediment trap is stabilized, or the sediment trap is no longer required, or when directed, recondition the site by filling in excavated areas, by removing embankments, plywood extension (where required), and aggregate and by restoring the area, as specified in Section 105.14.

870.4 MEASUREMENT AND PAYMENT—

- (a) **Class 1 Excavation.** Section 203.4.
- (b) **Embankment.** Section 206.4

(c) **Aggregate.** Cubic Yard

(d) **Borrow Excavation.** Cubic Yard
Section 205.4.

(e) **Seeding and Soil Supplements.** Section 804.4
For the type indicated.

(f) **Mulch.** Section 805.4
For the type indicated.

(g) **Rock.** Cubic Yard
Section 850.4(a).

(h) **Geotextile.** Section 212.4
For the type indicated.

(i) **Plywood Extensions.** Each

(j) **Cleaning of Sedimentation Structures.** Section 861.4

SECTION 871—SEDIMENT TRAP – RISER

871.1 DESCRIPTION—This work is the construction, maintenance, and removal and/or conversion of riser type sediment trap to a permanent stormwater management facility.

871.2 MATERIAL—

- (a) **Embankment.** Section 206.2(a)
- (b) **Pipe.** Section 601.2 (for the type indicated)
- (c) **Outlet Protection: Rock.** Section 851.2
- (d) **Temporary Baffle Wall.** Section 873.2
- (e) **Cleanout Stake.** 2-inch by 2-inch, Spruce/Pine/Fir, Construction Grade, of the length required, or other approved material of adequate size and length.
- (f) **Temporary Riser Pipe Assembly.** Section 874.2 (where indicated)
- (g) **Concrete Outlet Structure.** Section 875.2 (where indicated)
- (h) **Emergency Spillway.** (Where indicated)
 - **Rock.** Section 850.2(a)
 - **Geotextile.** Class 4, Type A. Section 735
- (i) **Seeding and Soil Supplements.** Section 804.2
- (j) **Mulch.** Section 805.2

871.3 CONSTRUCTION—As shown on the Standard Drawings, at the location indicated or directed, and as follows:

As specified in Section 201.3, clear and grub the storage area and embankment foundation area site. Excavate the key trench for the full length of the embankment (when located in permanent stormwater management facility). Install the outlet protection, outlet pipe with the anti-seep collar attached (where indicated), and outlet structure at the location indicated.

When indicated, construct the temporary riser pipe assembly, as specified in Section 874.3.

When a concrete anti-seep collar is specified, construct collar as specified in the applicable parts of Section 1001.3.

When the sediment trap is located in a permanent stormwater management facility and a concrete outlet structure is indicated, construct concrete outlet structure as specified in Section 875.3.

Construction of the embankment before placing the pipe is not required. Do not use coarse aggregate as backfill material around the pipe. Backfill the pipe with suitable embankment material to prevent embankment leakage along the pipe. Construct outlet protection of the type indicated at outlet end of pipe, as specified in Section 851.3. Place the embankment material, as specified in Section 206.3. When required, obtain borrow excavation for the formation of the embankment, as specified in Section 205. Apply seeding and soil supplements, as specified in Section 804.3. Mulch, if required, as specified in Section 805.3.

Install and maintain cleanout stake as required, as indicated, or as directed.

Inspect sediment trap after each runoff event to assure that it continues to function properly. Remove accumulated sediment as specified in Section 861.3 and repair as required or as directed.

When the tributary area to the sediment trap is stabilized or the sediment trap is no longer required, or if otherwise directed, satisfactorily recondition the site as follows:

- **Temporary Sediment Trap:** Fill in excavated areas, removing embankments, riser pipe assemblies, outlet

pipe, and anti-seep collars, or as directed. Restore the areas as specified in Section 105.14. Satisfactorily dispose of removed materials.

- Sediment Trap located in a Permanent Stormwater Management Basin area: Remove accumulated sediment and restore sediment trap to final basin contouring as indicated, stabilize disturbed areas as indicated, remove temporary orifice covers, temporary stand pipes, affix permanent stormwater management features as specified in Section 875.3, as indicated, or as directed. Satisfactorily dispose of removed materials.

871.4 MEASUREMENT AND PAYMENT—

(a) Class 1 Excavation. Section 203.4.

(b) Temporary Riser Pipe Assembly. Section 874.4

(c) Pipe. Section 601.4

For the type indicated.

(d) Anti-Seep Collar. Each.

For the type indicated.

(e) Embankment. Section 206.4

(f) Borrow Excavation. Cubic Yard

Section 205.4.

(g) Seeding and Soil Supplements. Section 804.4

For the type indicated.

(h) Mulch. Section 805.4

For the type indicated.

(i) Concrete Outlet Structure. Section 875.4

(j) Outlet Protection: Rock. Section 851.4

For the type indicated.

(k) Rock. Cubic Yard

Section 850.4

(l) Geotextile. Square Yard

Section 212.4

(m) Cleaning of Sedimentation Structures. Section 861.4

(n) Temporary Baffle Wall. Section 873.4

SECTION 872—SEDIMENT BASIN

872.1 DESCRIPTION—This work is the construction, maintenance, removal and/or conversion of a sediment basin to a permanent stormwater management facility.

872.2 MATERIAL—

- (a) **Embankment.** Section 206.2(a)
- (b) **Pipe.** Section 601.2 (for the type indicated)
- (c) **Outlet Protection, Rock.** Section 851.2
- (d) **Temporary Baffle Wall.** Section 873.2
- (e) **Cleanout Stake.** 2 inch by 2 inch, Spruce/Pine/Fir, Construction Grade, of the length required, or other approved material of adequate size and length.
- (f) **Temporary Riser Pipe Assembly.** Section 874.2 (where indicated)
- (g) **Concrete Outlet Structure.** Section 875.2 (where indicated)
- (h) **Emergency Spillway.**
 - **Rock.** Section 850.2(a)
 - **Geotextile. Class 4, Type A.** Section 735
- (i) **Seeding and Soil Supplements.** Section 804.2
- (j) **Mulch.** Section 805.2

872.3 CONSTRUCTION—As shown on the Standard Drawings, at the location indicated or directed, and as follows:

As specified in Section 201.3, clear and grub the storage area and embankment foundation area site. Excavate the key trench for the full length of the embankment. Excavate the emergency spillway as indicated. Install the outlet protection, outlet pipe with the anti-seep collar attached, and outlet structure at the location indicated.

When indicated, construct the temporary riser pipe assembly, as specified in Section 874.3.

When concrete anti-seep collar is specified, construct collar as specified in the applicable parts of Section 1001.3.

When the sediment basin is located in a permanent stormwater management facility and a concrete outlet structure is indicated, construct concrete outlet structure as specified in Section 875.3.

Construction of the embankment and trench before placing the pipe is not required. Do not use coarse aggregate as backfill material around the pipe. Backfill the pipe with suitable embankment material to prevent embankment leakage along the pipe. Construct outlet protection of the type indicated at outlet end of pipe, as specified in Section 851.3. Place the embankment material, as specified in Section 206.3. If required, obtain borrow excavation for the formation of the embankment, as specified in Section 205. Apply seeding and soil supplements, as specified in Section 804.3. Mulch, if required, as specified in Section 805.3.

Install and maintain cleanout stake as required, as indicated, or as directed.

Inspect sediment basin after each runoff event. Remove accumulated sediment as specified in Section 861.3 and repair as required or as directed.

When the tributary area to the sediment basin is stabilized, or the basin is no longer required, or when directed, satisfactorily recondition the site as follows:

- **Temporary Sediment Basin:** Fill in excavated areas, removing embankments, riser pipe assemblies, corrugated metal pipe, and anti-seep collars, or as directed. Restore the areas as specified in Section 105.14.

Satisfactorily dispose of removed materials.

- Sediment Basin located in a Permanent Stormwater Management Basin area: Remove accumulated sediment and restore basin to final contouring as indicated, stabilize disturbed areas as indicated, remove temporary orifice covers, temporary stand pipes, affix permanent stormwater management features as specified in Section 875.3, as indicated or as directed. Satisfactorily dispose of removed materials.

872.4 MEASUREMENT AND PAYMENT—

- (a) Class 1 Excavation.** Section 203.4.
- (b) Temporary Riser Pipe Assembly.** Section 874.4
- (c) Pipe.** Section 601.4
For the type indicated.
- (d) Anti-Seep Collar.** Each
For the type indicated.
- (e) Embankment.** Section 206.4
- (f) Borrow Excavation.** Cubic Yard
Section 205.4.
- (g) Seeding and Soil Supplements.** Section 804.4
For the type indicated.
- (h) Mulch.** Section 805.4
For the type indicated.
- (i) Concrete Outlet Structure.** Section 875.4
- (j) Outlet Protection, Rock.** Section 851.4
For the type indicated.
- (k) Rock.** Cubic Yard
Section 850.4
- (l) Geotextile.** Square Yard
Section 212.4
- (m) Cleaning of Sedimentation Structures.** Section 861.4
- (n) Temporary Baffle Wall.** Section 873.4

SECTION 873—TEMPORARY BAFFLE WALL

873.1 DESCRIPTION—This work is construction, maintenance, and removal of a temporary baffle wall.

873.2 MATERIAL—

(a) **Posts.** 4-inch by 4-inch Alkaline Copper Quat (ACQ) Pressure Treated, Spruce/Pine/Fir, Grade 2 (minimum) of the length required. Certify as specified in Section 106.03(b)3.

(b) **Plywood.** 3/4-inch thick, Alkaline Copper Quat (ACQ) Pressure Treated, Spruce/Pine/Fir. Certify as specified in Section 106.03(b)3.

(c) **Fasteners.** Deck screws of adequate length and approved for use with Alkaline Copper Quat (ACQ) Pressure Treated wood. Certify as specified in Section 106.03(b)3.

873.3 CONSTRUCTION—As shown on the Standard Drawings, and as follows:

Place the pressure treated posts and fasten plywood sheets as indicated and directed. Drive posts and plywood to minimum dimensions indicated to insure flow is diverted along the length of the baffle. Clean the baffle as necessary to insure adequate flow is maintained during all construction phases. When no longer required, satisfactorily remove.

873.4 MEASUREMENT AND PAYMENT—Linear Foot.
All necessary hardware is incidental.

SECTION 874—TEMPORARY RISER PIPE ASSEMBLY

874.1 DESCRIPTION—This work is furnishing, placement, maintenance and removal of a temporary riser pipe assembly that functions as an outlet structure for a temporary sediment trap or sediment basin.

874.2 MATERIAL—

(a) Riser and Stub Pipe.

- **Pipe.** Corrugated Metal Pipe, Section 601.2(a)4(d) for the size indicated.
- **Welding Material.** Steel Shapes - Section 1105.02(t)

(b) Class A Cement Concrete. Section 704

(c) Joint Sealing Material. Section 705.4

(d) Trash Rack and Anti-Vortex Device.

- **Reinforcement.** Section 709.1
- **Steel Shapes.** Section 1105.02(a)2
- **Welding Material.** Steel Shapes - Section 1105.02(t). Reinforcement – AWS D1.4 Structural Welding Code, Reinforcing Steel.

874.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated, and as follows:

Fabricate riser and stub pipe as indicated.

Fabricate trash rack and anti-vortex device as indicated.

Excavate for temporary riser pipe assembly as required.

Place concrete foundation and form bottom of riser pipe assembly with Class A Cement Concrete to channel the flow toward the outlet pipe as indicated.

Join the riser pipe assembly to the outlet pipe using acceptable connections. Seal connection as specified in Section 601.3(d) and (i).

Backfill using suitable embankment material.

Attach trash rack to structure as indicated.

Maintain as required or directed.

When indicated or directed, remove temporary riser pipe assembly.

Satisfactorily dispose of unsuitable and surplus material.

874.4 MEASUREMENT AND PAYMENT—Each

SECTION 875—CONCRETE OUTLET STRUCTURE

875.1 DESCRIPTION—This work is construction of a permanent concrete outlet structure for a stormwater management facility and where applicable, the conversion to and from a temporary sediment trap or sediment basin.

875.2 MATERIAL—

- (a) **Inlet.** Standard Box, with Type M Top Unit. Section 605.2 or Section 714
- (b) **Grate.** Structural Steel for Top Indicated. Section 605.2
- (c) **Trash Rack.**
 - **Reinforcement.** Section 709.1
 - **Steel Shapes.** Section 1105.02(a)2
 - **Welding Material.** Steel Shapes - Section 1105.02(t). Reinforcement – AWS D1.4 Structural Welding Code, Reinforcing Steel.
 - **Galvanizing.** Section 1105.02(s)
 - **Anchor Bolts, Nuts and Washers.** Section 1105.02(c)2.
 - **Wire Mesh.** Steel Wire, No. 10 gage, with 1.5-inch square opening.
- (d) **Temporary Orifice Plate Cover.** (Where indicated)
 - **Plywood.** 3/4-inch thick, Alkaline Copper Quat (ACQ) Pressure Treated, Spruce/Pine/Fir. Certify as specified in Section 106.03(b)3.
 - **Fasteners.** Of the type indicated. Certify as specified in Section 106.03(b)3.
 - **Sealant.** Silicone. Section 705.4(a)
- (e) **Class A Cement Concrete.** Section 704
- (f) **Mortar.** Section 705.6
- (g) **Zinc Chromate Primer.** Federal Specification TT-P-645. Certify as specified in Section 106.03(b)3.

875.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated, and as follows:

- Cement Concrete Structures – As specified in the applicable parts of Section 1001.3.

Fabricate trash rack(s) and galvanize as indicated.

Excavate for concrete outlet structure as required.

Place concrete foundations and walls monolithically, except if otherwise indicated.

Construct new concrete outlet structure walls and bottoms to accommodate the dimensions of outlet pipes, weirs, and orifices. Form bottom of new concrete outlet structure with Class A Cement Concrete to channel the flow toward the outlet pipe as indicated.

Attach trash racks to concrete outlet structure as indicated.

Set frames and top units in full mortar beds.

Set pipes flush with the inside structure face.

When constructing concrete outlet structure(s) in conjunction with existing pipes, provide for satisfactory connections, as specified for new construction of a similar type.

Backfill excavated spaces around the structure with acceptable embankment material, as specified in Section 206.3(b)4, unless otherwise indicated. Satisfactorily dispose of unsuitable and surplus material.

Coat all aluminum surfaces to be embedded in concrete with one coat of zinc chromate primer, or a coat of bituminous paint. Allow to dry completely before placing concrete.

When concrete outlet structure is to be used for temporary sediment trap or sediment basin riser:

- Attach temporary orifice cover plates as indicated. Seal plate to concrete outlet structure such that it is leak tight.
- Do not install orifice trash racks until temporary orifice cover plates have been removed.
- Core/drill holes, of the diameter and spacing indicated, through concrete outlet structure and/or temporary orifice cover plate.
- When temporary orifice cover plate(s) are no longer required, satisfactorily remove plates, fasteners and clean exterior face of structure. Satisfactorily dispose of materials. Seal all holes in structure that were installed for temporary purposes with non-shrinking mortar and/or silicone sealant. Attach permanent trash racks as indicated.

875.4 MEASUREMENT AND PAYMENT—Each

SECTION 900 TRAFFIC ACCOMMODATION AND CONTROL

SECTION 901—MAINTENANCE AND PROTECTION OF TRAFFIC DURING CONSTRUCTION

901.1 DESCRIPTION—This work is the furnishing, installing, maintaining, and relocating of traffic control devices. This work may include flagging and pilot car operation for guidance of traffic through the temporary traffic control zone and dust control.

901.2 MATERIAL—Furnish material and traffic control devices necessary for maintenance and protection of traffic, and as indicated on the TCP, according to Publication 212, Publication 213, and the MUTCD, and as follows:

- Temporary Barrier—Section 627.2
- Temporary Concrete Barrier, Structure Mounted—Section 643.2
- Temporary Concrete Median Barrier, Structure Mounted—Section 643.2
- Temporary Concrete Glare Screen Median Barrier, Structure Mounted—Section 643.2
- Temporary Impact Attenuating Devices—Section 696.2
- Reset Temporary Barrier—Section 628.2
- Temporary Concrete Barrier, Structure Mounted, Reset—Section 644.2
- Temporary Concrete Median Barrier, Structure Mounted, Reset—Section 644.2
- Temporary Concrete Glare Screen Median Barrier, Structure Mounted, Reset—Section 644.2
- Reset Temporary Impact Attenuating Devices—Section 697.2
- Painting Traffic Lines and Markings—Section 962.2
- Asphalt Tack Coat—Section 460.2
- Superpave Asphalt Mixture Design, Asphalt Wearing Course 4.75 mm, SRL L—Section 413.2 and as follows: PG 64S-22, <0.3 million ESALs, or as indicated or directed.
- Shadow Vehicle—A truck equipped with a flashing or revolving yellow light according to Publication 212, Publication 213, and the MUTCD.
- Truck Mounted Impact Attenuator and/or Arrow Panel—Installed on the shadow vehicle, according to Publication 212, Publication 213, and the MUTCD.
- Adhesive—Section 966.2(c)
- Temporary Traffic Control Signals—Section 958.2(b), 958.2(c), 958.2(d)
- Temporary Traffic Control Signals, Reset—Section 958.2

- Temporary Timing Adjustments to Existing Permanent Traffic Signal Controller—Section 958.2
- Temporary Modifications to Existing Permanent Traffic Signal—Section 958.2

Provide traffic line paint and glass beads or pavement marking tape as specified in Section 901.3(k). All temporary traffic control devices must be listed in Bulletin 15. Provide Temporary Type III barricades as shown on the Standard Drawings or be listed in Bulletin 15. Provide temporary portable ‘H’ base and ‘X’ base sign posts as shown on the Standard Drawings or be listed in Bulletin 15.

Certification Form CS-4171 is not required for temporary traffic control devices. However, temporary traffic control devices permanently incorporated as part of the project require Form CS-4171, unless otherwise specified in the contract.

901.3 CONSTRUCTION—

(a) General. According to Publication 212, Publication 213, and the MUTCD.

Install and maintain traffic control devices as indicated on the TCP, or an approved alternate plan submitted at the preconstruction conference. The Representative may revise the TCP in writing during construction. If unforeseen conditions arise or if revisions are made to the TCP by the Representative, install and maintain additional warning lights and traffic control signs on necessary mounting devices according to Publication 212, Publication 213, and the MUTCD, and at locations designated in writing by the Representative. Remove or cover existing traffic control devices that conflict with the TCP. When conflict no longer exists, erect or uncover them.

Temporarily remove or cover reduced regulatory speed limit signs when workers are not present, except as otherwise indicated on the TCP, approved alternate plan, or as directed.

Open any substantially completed section of roadway for the use and convenience of traffic, as directed, and as specified in Section 107.15. When work is completed, immediately remove temporary traffic control devices.

Maintain, clean, and properly operate the devices during the entire time they are in use. Traffic control devices must meet the acceptable or marginal standards according to PennDOT Publication 213, Appendix C ‘Quality Guidelines for Temporary Traffic Control Devices’. Where operations are performed in stages, keep only the necessary devices that apply to the present stage of construction in operation.

Cover or remove signs that do not apply to the existing conditions. Cover with rubber roofing material (EPDM) having a thickness of 0.045 inch (45 mils) or black vinyl coated polyester material having a minimum weight of 18 ounces per square yard and minimum thickness of 0.020 inch (20 mils). Cover the entire sign face including any supplemental plaques. All other materials, including burlap or open mesh materials, other signs, and trash bags are unacceptable. Covers with a color other than black are unacceptable. Stabilize and fasten this material to the sign with either plastic or wood to prevent any movement. Do not apply tape to face of sign. Do not deface or damage the sign face using this procedure.

Do not allow weeds, brush, trees, construction equipment, materials, and the like to obscure any traffic control device.

(b) Maintenance of Roadway and/or Structures. Continuously and effectively maintain existing roadways and/or structures within the limits of the project from the start of physical work until the date of project acceptance or until relieved of responsibility for further physical work and maintenance as specified in Section 110.08(a). Such maintenance includes, but is not limited to, the following:

- Picking up and disposing of trash and debris, including trash and debris not generated by construction activities. The Contractor is not responsible for picking up and disposing of dead animals;
- Keeping roadways clear of dust and soil, and cleaning up non-hazardous spills;
- Maintaining a safe and unobstructed passageway through or around the work zone for all traffic, including emergency pull-off areas at the edges of pavements;
- Maintaining surface drainage, including the removal of debris, ice, and snow from around inlets to ensure the drainage system is functioning as intended;
- Removal of ice and snow from bridge sidewalks and/or temporary walkways open to pedestrian traffic; and

- Maintaining access to devices associated with Intelligent Transportation Systems, including controllers and meter cabinets.

The Contractor is not responsible for the removal of ice and snow from roadways within sections of the project opened to traffic unless otherwise indicated.

Treat existing earth roads, or improved roads that have been graded, with calcium chloride or other approved dust control palliatives, as indicated or directed.

If the Contractor at any time fails to fully perform required maintenance, the Representative will provide immediate notification of the non-compliance and establish a date and time by which the maintenance work must be completed. If the Contractor fails to remediate the unsatisfactory maintenance condition within the established time frame, the Department will perform the required maintenance and deduct the cost of the work from money due or to become due the Contractor.

The Department reserves the right to enter upon a project and, at its own expense, perform routine maintenance of the existing roadway and/or structures. This maintenance will be during the life of the project, but it will not include those items that are the Contractor's responsibility as specified herein, and in Section 105.13 for the contract work and Section 901.3(e) for the accommodation of local traffic. The Department does not assume responsibility in any way for the maintenance and protection of traffic as a consequence of performing this routine roadway and/or structure maintenance.

(c) Snow Removal and Anti-Skid Material. The Department reserves the right to enter upon a project and, at its own expense, remove snow and/or place anti-skid material considered necessary for traffic protection. The Department does not assume responsibility in any way for maintenance of traffic as a consequence of removing snow or placing anti-skid material.

Remove the anti-skid material when necessary.

(d) Detours. For indicated detours, furnish, erect, maintain, and remove the detour signs, unless otherwise directed. Also, temporarily cover, revise, or remove existing permanent guide signs in the vicinity of the construction site and along the detour route if the messages on the guide signs conflict with the detour signs. Erect, maintain, and remove the detour signs and the modification of directional signs, as indicated, and as necessary for construction conditions. Restore original signs to their original state upon removal of the detour.

(e) Local Traffic Maintenance and Safety. Proceed with the work to ensure safety and the least inconvenience to local traffic. Maintain local traffic ingress and egress by use of existing or new roadways.

Provide and maintain local access to and from the nearest intersecting public road or street, unless otherwise directed. As directed, provide temporary approaches for local vehicular and pedestrian access to and from commuter service, residential, business, industrial, and other public and private facilities.

Also, provide and maintain adequate bridging over base and surface courses, trenches, or other construction, when directed.

(f) Equipment and Material Storage. According to Publication 213.

(g) Tubular Markers. As indicated, furnish and install tubular markers as shown on the Standard Drawings and the MUTCD.

As directed, replace the complete tubular marker or the tubular marker post only, as the case may be.

Remove all tubular markers when no longer necessary for traffic control or as directed.

(h) Existing Department Signs. Remove existing warning, regulatory, guide, and directional signs as required to accommodate construction operations. Do not remove Stop or Yield signs unless an alternate type of traffic control is provided such as flaggers, temporary traffic signals, etc. Continue the alternate traffic control until the Stop or Yield signs are replaced. Stake or mark sign locations or locate signs on construction drawings before removing any signs. Reinstall existing warning signs at appropriate locations within 4 hours of their removal. With the exception of Stop or Yield signs as herein noted, reinstall existing regulatory, guide and directional signs at appropriate locations within 24 hours of their removal.

Remove existing State Route and Segment markers that are likely to be damaged or disturbed as a result of construction operations. Provide survey ties for all such markers before the removal to facilitate replacement.

Replace all State Route and Segment markers that were removed at their exact longitudinal locations upon completion of the work.

(i) Not used.

(j) Drop-offs. The following conditions and treatments apply only to continuous and intermittent drop-offs created by construction, maintenance, or permit/utility operations. If the treatments in this Section cannot be met due to constructability-related issues, obtain approval of an alternate drop-off treatment method, in writing, from the Bureau of Project Delivery before implementation.

1. The following are not considered drop-offs:

- Drainage ditches.
- Compacted earthen embankments tapered at 3:1 or flatter.
- Any area ≤ 2 inches below grade AND > 12 feet away from active travel lane.
- Any area behind guide rail, barrier, or curb.
- Any area outside right-of-way.
- Open areas where workers are present and while work is in active progress.

2. General Conditions:

- The duration of the drop-off condition starts at the end of the shift in which the drop-off condition was created.
- Place all channelizing devices at the same grade as the travel lane and as close to the edge line as possible.
- As an option, an approved Type C steady burn light may be placed on each channelizing device throughout the drop-off condition unless otherwise specified in Condition 2.
- For intermittent drop-off conditions, place at least 3 channelizing devices or a Type III barricade transversely in front of each drop-off condition.
- When applicable, install Uneven Lane Signs (W8-11), Low Shoulder Signs (W8-9), or No Guide Rail Signs (W21-9A) at intervals not to exceed 1/2 mile throughout the drop-off condition.

Condition 1 – Drop-offs ≤ 2 inches below grade AND ≤ 12 feet away from active travel lane

Drop-off Location	Treatment
Between Active Travel Lane & Non-Active Travel Lane or Shoulder	<ul style="list-style-type: none"> • Place channelizing devices throughout drop-off condition. Space all channelizing devices at a maximum distance in feet, equal to two times the posted speed limit in miles per hour throughout a continuous or intermittent drop-off condition, unless otherwise directed.
Between Two Active Travel Lanes	<ul style="list-style-type: none"> • Install Longitudinal Notched Wedge Joint during paving operations in accordance with RC-28M and, during milling operations, mill a 3:1 wedge. For Temporary Overlay Transitions during paving and milling operations follow RC-28M except for the paving notch, and feather transition edge as much as mix will allow. <p style="text-align: center;"><u>OR</u></p> <p>End all lanes at the same grade longitudinally, install Temporary Overlay Transitions during paving and milling operations in accordance with RC-28M except for the paving notch, and feather transition edge as much as mix will allow.</p>

Condition 2 – Drop-offs > 2 inches below grade

Distance From Active Travel Lane	Duration Condition Exists	Drop-off Height		
		> 2 inches to ≤ 4 inches	> 4 inches to ≤ 2 feet	> 2 feet
		Treatment		
≤ 4 feet Away	≤ 48 Hours	(A) OR (B)(D)	(A) OR (B)(E) OR (C)	(A) OR (C)
	> 48 Hours		(C)	
> 4 feet to ≤ 12 feet Away	≤ 48 Hours	(D)	(E)	(A) OR (B)(E)(F) OR (C)
	> 48 Hours	(A) OR (B)(D)	(A) OR (B)(E)	
> 12 feet	≤ 48 Hours	(D)	(E)	(E)(F)
	> 48 Hours			

Footnotes:

- A. Place suitable material to grade and compact to non-movement.
- B. Install a 3:1 slope with suitable material and compact to non-movement.
- C. Install temporary barrier.
- D. Place channelizing devices starting at 120 feet in advance of the drop-off condition. Space all channelizing devices at a maximum distance in feet equal to two times the posted speed limit in miles per hour throughout a continuous or intermittent drop-off condition, unless otherwise directed.
- E. Place channelizing devices starting at 120 feet in advance of the drop-off condition. Space all channelizing devices at a maximum distance in feet equal to the posted speed limit in miles per hour throughout a continuous or intermittent drop-off condition, unless otherwise directed.
- F. Place an approved Type C steady burn light on each channelizing device throughout drop-off condition.

(k) Work Area Pavement Markings. Unless otherwise indicated in the TCP, furnish all material and install reflectorized pavement markings in work areas for all base course, flexible pavement, and rigid pavement construction operations as follows:

- **All Operations Except Seal Coat/Surface Treatment (Oil & Chip), Skin Patching, Slurry Seal, Heat Scarification, and Microsurfacing Operations.** Before terminating work each day, replace all lane lines and centerlines covered or destroyed during the day's operations with applicable pavement marking pattern, as shown on the Standard Drawings and the MUTCD.
- **Seal Coat/Surface Treatment (Oil & Chip) and Skin Patching Operations.** If lane lines or centerlines are covered or destroyed during the day's operations, install "No Pavement Markings" signs (W21-16) throughout the affected area, at the beginning and at intervals not exceeding 1/2 mile, before terminating work each day. In not less than 7 days or more than 14 days after completion of the operation, remove signs and replace all lane lines and centerlines covered or destroyed during the operation with the applicable pavement marking pattern, as shown on the Standard Drawings and the MUTCD.
- **Slurry Seal, Heat Scarification, and Microsurfacing Operations.** If lane lines or centerlines are covered or destroyed during the day's operations, install "No Pavement Markings" signs (W21-16) throughout the affected area, at the beginning and at intervals not exceeding 1/2 mile, before terminating

work each day. In not less than 3 days or more than 7 days after completion of the operation, remove signs and replace all lane lines and centerlines covered or destroyed during the operation with applicable pavement marking pattern, as shown on the Standard Drawings and the MUTCD.

For seal coat/surface treatment, skin patching, slurry seal, heat scarification, and microsurfacing operations, the Representative may waive the curing period specified in the above bulleted item for the asphalt paving material due to traffic conditions or special circumstances. In these cases, install the applicable standard pavement marking pattern before terminating work each day and eliminate the requirement for installation of “No Pavement Markings” signs.

Apply work area pavement markings as specified in Section 962. For temporary pavement markings placed at the Department’s direction and under conditions not meeting Section 962.3 (e), the requirements listed in Sections 962.3 (i), (j), and (k) will be waived. Temporary pavement markings installed under this condition will be paid by the Department.

Pavement markings to consist of 4-inch wide lines; except, lane lines for all multilane roadways are to be 6 inches wide. As an alternate to paint and glass beads, provide standard pavement markings consisting of temporary pavement marking tape or use nonplowable raised pavement markers, when directed, except for final markings. Use traffic line paint and glass beads for pavement markings meeting requirements in Publication 212, Publication 213, and the MUTCD, or temporary pavement marking tape from a manufacturer listed in Bulletin 15.

Place standard pavement markings in the same location as covered or destroyed pavement markings, unless otherwise indicated in the TCP or directed.

Remove any pavement markings improperly placed and install in the correct location at no additional cost to the Department.

If the roadway is to be closed to traffic until completion of the project, and standard pavement markings will be in place when the roadway is opened to traffic, then work area pavement markings, as specified above, are not required.

(l) Not used.

(m) Lateral Lane Restrictions. Provide, at the preconstruction conference, a written notification of construction activities that will create a physical lateral restriction to roadway width due to temporary barriers, barricades, drums, etc. Include a written schedule indicating the proposed times and widths of restrictions for the various phases of construction.

All restrictions are subject to Department approval.

Notify the Representative, in writing, at least 14 days before implementing or changing any lateral lane restriction, which provides less than 16 feet of pavement and shoulder in each direction for oversize vehicles. Notify the Representative, in writing, at least 7 days before removing the restriction.

(n) Temporary Highway Lighting. Provide temporary highway lighting as indicated on the TCP. Comply with local government, electric utility, and state codes or requirements; the electrical regulations of the Department of Labor and Industry; and applicable construction requirements of the NEC, NESC, and NBFU. Cooperate with electric utility company or agency furnishing power to the system and meet necessary service requirements.

Do not locate lighting fixtures to produce distracting or blinding glare for the driver.

Perform the Highway Illumination Test (Conv.) and record test data on Department Test Form CS-4225D. Correct any defects. Perform the test in the presence of an authorized representative of the Department.

Provide guide rail, crash cushions, or other devices, as indicated or directed, to protect vehicles from hitting poles or other temporary highway lighting appurtenances.

(o) Not used.

(p) Surveillance and Review of Traffic Control. Designate personnel to be responsible for and to be on-call continuously over traffic control operations. This designee shall always be available to respond to calls involving damage to temporary traffic control devices from causes such as vandalism, traffic accident, or weather. Provide to the Representative during the preconstruction conference the name and phone number of the designee providing the surveillance.

The Representative and the Contractor’s designee shall conduct periodic reviews of the traffic control devices throughout the duration of the project to ensure continuous compliance with the approved TCP. Conduct reviews during the day and night, adverse weather conditions, and active and inactive construction operations, as directed.

(q) Temporary Barrier. Blunt ends of temporary barrier or glare screen will not be allowed. Protect blunt ends by burying them in a cut slope or using an appropriate end treatment according to the pertinent parts of the following: Design Manual, Part 2, Section 696, and the Standard Drawings.

Provide, install, and maintain top-mounted and side-mounted delineators on temporary barriers, glare screen and bridge barrier as indicated on the TCP.

Clean or replace all delineators once per month or as directed. Clean in an approved method.

(r) Removal of Conflicting Traffic Lines and Markings. Remove conflicting pavement markings during any phase of construction and relocate as indicated. Remove as specified in Section 963.3. Do not remove traffic lines and markings without a paint truck present on the project site if repainting is required.

(s) Lifting of Construction Materials. Stop traffic during the placement or removal of any construction materials that are above open lanes of traffic, such as, but not limited to, lifting equipment, bridge components, signs, and overhead sign structure components as directed.

(t) Non-Compliance of Maintenance and Protection of Traffic. Work zone liquidated damages will be assessed in the event the Contractor neglects or refuses to correct a situation or condition of non-compliance with Maintenance and Protection of Traffic requirements (TCP, Publication 212, Publication 213, and the MUTCD, or other contract traffic control requirements).

When deficiencies are found, a copy of the Work Zone Traffic Control Compliance Checklist and Notification Form, CS-901, will be delivered to the Contractor to correct the deficiencies as soon as possible. After receiving this notification, the Contractor may be assessed work zone liquidated damages if deficiencies are not corrected within the maximum time frames established below.

- Traffic control devices for short term operations – 2 hours
- Traffic control devices for long term operations – 24 hours, except for the following:
 - Urgent
 - Three or more consecutive channelizing devices – 2 hours
 - Stop and Yield sign – 2 hours
 - Arrow panels – 2 hours
 - Attenuating devices – respond within 4 hours and complete repairs within 24 hours after notified the device is damaged

The base amount of work zone liquidated damages will be \$1,000.00.

For long-term operations (as defined in Publication 213), an additional \$100.00 assessment for each hour or portion thereof will be added to the \$1000 base amount until the deficiency is corrected.

For short-term operations (as defined by Publication 213), an additional \$100.00 for each hour or portion thereof will be added to the \$1000 base amount until the deficiency is corrected.

Assessment of work zone liquidated damages will end when the Representative concurs that the deficiencies have been corrected.

If the Contractor remains in violation of the Maintenance and Protection of Traffic requirements, the District Executive will direct Department forces to correct the deficiencies and charge the Contractor for labor, equipment, and material costs incurred by the Department or suspend work in accordance with Section 105.01(b) until the deficiencies are corrected.

(u) Temporary Nonplowable Raised Pavement Markers. Furnish, install, and maintain yellow or white, one- or two-direction temporary nonplowable raised pavement markers according to the locations, spacings, and configurations indicated or directed.

Install the markers in compliance with the manufacturer's recommendations. Markers may be attached by epoxy when the marker does not have to be removed at a later date.

Maintain the nonplowable markers in place for the period indicated or directed and remove them immediately thereafter. After removal, restore the pavement surface.

(v) Not used.

(w) Portable Changeable Message Sign (PCMS). Furnish, operate, and maintain three-line or full matrix portable, trailer mounted, changeable message signs for traffic control as indicated or directed. Have all locations,

messages, and times of operation approved by the District Traffic Engineer or authorized Representative according to PennDOT Publication 213 General Notes Section E.

For the duration of the project, provide a qualified technician familiar with the programming and operation of the changeable message sign. Designate the technician to be on call 24 hours a day, 7 days a week and to arrive on the project site within 3 hours of notification. Refer to Section 1231 for additional PCMS specifications.

(x) Temporary Traffic Control Signals, Temporary Timing Adjustments to Existing Permanent Traffic Signal Controller, and Temporary Modifications to Existing Permanent Traffic Signal. Section 958.3

(y) Flagger Training. Provide flaggers that successfully completed a flagger-training course within the last 3 years that complies with the Department's minimum flagger training guidelines described below. Assure that flaggers carry a valid wallet-sized training card containing the name of the flagger, training source, date of successful completion of training, and signature; or provide a roster of trained flaggers to the Representative before the start of flagging operations that contains the names of flaggers, training source, and date of successful completion of training. Minimum flagger training guidelines include the following:

1. Minimum Course Contents.

- Why flagging is important
- Fundamental principles of work zone traffic control
 - Component parts of the work zone
 - Channelization devices, spacing
 - Tapers
 - Buffer Space
 - Visibility to approaching drivers
- Human factors – driver attitude, expectation, reaction
- Qualifications of a flagger
- Clothing
- Flagger Operations
 - Setting up the flagger station
 - Signaling devices and when used
 - Hand signaling procedure
 - Communications
 - Two-flagger operations
 - Single flagger operations
 - Flagging in intersections
 - Nighttime flagging
 - Emergency situations
- Flagging in adverse weather conditions
- Sign requirements
- Practical exercise

2. Objectives. At the end of the course the student should be able to:

- Describe why flagging is important
- Describe flagger qualifications
- Ensure the flagger station complies with Publication 212, Publication 213, and the MUTCD
- Gather all necessary equipment
- Select the proper flagging station/position/location
- Control traffic using the stop/slow paddle
- Control traffic using the red flag
- Control two-way traffic in one lane of a highway
- Control traffic at an intersection
- Recognize and be able to control traffic in unique or special flagging situations
- Control traffic at night and recognize a safe nighttime flagging operation

- Communicate with co-workers and the public

3. Test. All students must take and pass a written, closed book, knowledge test consisting of a minimum of 20 questions. Passing is 70%.

4. Re-training. Re-training is required every 3 years.

(z) Shadow Vehicle. Load the truck according to the manufacturer's recommendations.

Place the shadow vehicle upstream of the construction area at the distance according to Publication 213 and the MUTCD, and as directed.

(aa) Speed Display Signs. Furnish, place, maintain, and relocate a speed display sign that is a portable, trailer mounted, solar powered radar speed monitor unit. Use an approved system listed in Bulletin 15 for speed display signs.

Have all locations and times of operation approved by the District Traffic Engineer or authorized Representative. Trim trees and vegetation and remove all obstructions at each placement site.

On interstate highway work zones with a project cost exceeding \$300,000, use a speed display sign on each approach to the work zone.

(bb) Existing Traffic Signal Adjustments. In the event it becomes necessary to turn off any existing signalization, provide flaggers, or other approved means, to direct traffic within the intersection during any period when the signals are not operating.

Obtain the approval of the Representative, the municipality, and District Traffic Engineer for any changes to the existing signalization, including timing, phasing, and operation adjustments. Obtain approval for planned changes at least 7 days before implementation, unless directed otherwise.

(cc) Conflicting Overhead Signs. Furnish a Type VI orange retroreflective vinyl roll-up sheeting material to cover the entire sign. When the size of the sign requires multiple sheets of material to be sewn together, provide a 2 inch overlap with double stitching of heavy duty 5-Cord nylon thread. Provide retroreflective symbols, shields, and other legends as indicated. Provide approved, black nonreflective vinyl letter characters. Provide an additional 3 inch minimum of sheeting material to be folded around edge of the sign. Place aluminum grommets spaced a maximum of 48 inches on center around perimeter of the sheeting with one grommet no further than 2 inches from each corner.

Field verify the size of the sign to be fitted prior to fabrication. Adjust the dimensions as necessary. Secure sign in place as recommended by the manufacturer. Cover and uncover the signs as directed. Repair at no additional cost to the Department retroreflective sheeting damage on the existing sign, as a result of covering.

901.4 MEASUREMENT AND PAYMENT—

(a) Maintenance and Protection of Traffic During Construction. Lump Sum

The Department will measure and pay for this item in a proportionate manner based on current estimates.

With the exception of the separate pay items as specified in Section 901.4(b), if an item or device is required for maintenance and protection of traffic, the cost of the item or device is incidental to the various 0901 Maintenance and Protection of Traffic During Construction Items.

(b) Separate Pay Items. The Department will separately measure and pay for the following items or devices, when indicated or required for maintenance and protection of traffic during construction:

- Arrow Panel—Each or Day.
Includes maintenance, fuel, and other operating costs for the payment indicated.
- Tubular Markers—Each.
- Changeable Message Sign—Each.
Includes maintenance, fuel, telecommunication service and other operating costs, relocating to other locations, and programming of messages as directed by the District Traffic Engineer or authorized

Representative.

- Temporary Traffic Control Signals—Section 958.4.
- Temporary Traffic Control Signals, Reset—Section 958.4.
- Temporary Timing Adjustments to Existing Permanent Traffic Signal Controller—Section 958.4.
- Temporary Modifications to Existing Permanent Traffic Signal—Section 958.4.
- Floodlights—Each or Day.
- Temporary Barrier—Section 627.4.
- Temporary Concrete Barrier, Structure Mounted—Section 643.4.
- Temporary Concrete Median Barrier, Structure Mounted—Section 643.4.
- Temporary Concrete Glare Screen Median Barrier, Structure Mounted—Section 643.4.
- Reset Temporary Barrier—Section 628.4.
- Temporary Concrete Barrier, Structure Mounted, Reset—Section 644.4.
- Temporary Concrete Median Barrier, Structure Mounted, Reset—Section 644.4.
- Temporary Concrete Glare Screen Median Barrier, Structure Mounted, Reset—Section 644.4.
- Painting Traffic Lines and Markings—Section 962.4.
- Pavement Marking Removal—Section 963.4.
- Temporary Nonplowable Raised Pavement Markers—Each.
- Temporary Asphalt Rumble Strips—Square Yard.
- Temporary Portable Rumble Strips—Each.
- Temporary Lane Separator Curb—Each.
- Temporary Impact Attenuating Devices—Section 696.4.
- Reset Temporary Impact Attenuating Devices—Section 697.4.
- Standard Pavement Markings, Paint & Beads—Linear Foot.
- Standard Pavement Markings, Tape—Linear Foot.
- Additional Warning Lights—Day.
For the type indicated.
Based on an accumulation of 24 hours when in place for one unit.
- Additional Traffic Control Channelizing Device—Each.
For the type indicated.

- Additional Traffic Control Signs—Square Foot.
Based on the minimum size sign for the necessary application as defined in Publication 212, Publication 213, and the MUTCD, unless otherwise directed.
- Temporary Highway Lighting—Lump Sum or Each.
As indicated.
- Sequential Warning Lights—Each.
- Shadow Vehicle—Each or Day.
Includes maintenance, fuel, relocations, and operating costs for the duration of the project.
- Speed Display Signs—Each or Day.
Includes maintenance, fuel and other operating costs, relocations, and programming.
- Roll-Up Vinyl Sign—Square Foot.
Based on the square foot of existing sign.
Includes, mounting hardware and 3 inches of material around perimeter of vinyl sign cover.

SECTION 902—MAINTENANCE AND PROTECTION DURING TEMPORARY SUSPENSION OF WORK

902.1 DESCRIPTION—This work is maintenance and protection of traffic on the project and the maintenance and protection of the project during a temporary work suspension.

902.2 MATERIAL—Section 901.2

902.3 CONSTRUCTION—Maintain and protect the project during suspension, as specified in Section 105.13(b), as directed, and as follows:

- Shape and maintain the existing roadway if existing roadway pavements are broken up and removed in advance of a reasonable paving schedule.
- Surface roadways, as directed, with acceptable commercial material or with acceptable local material secured beyond the project limits. If necessary, remove this material when project operation resumes.
- Apply a calcium chloride dust control solution or other approved dust control palliative in the manner and at the rate of application directed. If necessary, remove this material when project operations resume.
- Remove all protective signs and devices previously installed on the project.

If necessary, remove material placed by Department forces when operations resume.

Maintain and protect traffic during suspension, as specified in Section 901. The Department reserves the right to maintain traffic through the entire project or portions of the project and to perform necessary maintenance of traffic work. This Department work will be performed if agreement, as specified below, cannot be made upon a price, or if the Department work performed is in the interest of the State.

902.4 MEASUREMENT AND PAYMENT—

(a) Lump Sum Basis. Section 901.4

If this item is extra work, then the Department will pay for this item at a negotiated price as specified in Section 110.03(c).

(b) Acceptable Commercial and/or Local Material. Cubic Yard or Ton

If this material is extra work, then the Department will make payment as specified in Section 110.03(c).

(c) Calcium Chloride or Other Dust-Control Palliatives. Gallon or Ton

If these materials are extra work, then the Department will make payment as specified in Section 110.03(c).

(d) Removal of Material Placed by Department Forces. Cubic Yard

The Department will pay for this work as Class 1 Excavation.

SECTION 903—TEMPORARY BRIDGE AND APPROACHES

903.1 DESCRIPTION—This work is the design, furnishing, placement, maintenance, and removal of a temporary bridge and approaches of the type and method indicated, including required maintenance and protection of traffic.

903.2 MATERIAL—As indicated or as shown on the accepted detailed drawings.

903.3 CONSTRUCTION—

(a) **Two-Lane Construction.** If not otherwise indicated, design a temporary bridge and approaches to accommodate two lanes of traffic on a Department right of way or easement. Submit detailed drawings of the proposed bridge and approaches for the Representative's review and acceptance. Design the proposed temporary bridge for PHL-93 at the operating level, with a roadway width as indicated between curbs, guide rails, and with sidewalks, when directed. Conform to the alignment and grades indicated. If not indicated, submit a plan of a proposed alignment and grade.

Upon acceptance of the detailed drawings, construct the temporary bridge and grade, drain, and pave the approaches. Provide sidewalks and sidewalk protection when indicated.

If indicated, move the existing structure and use it as the temporary bridge. The method of moving, placing, and maintaining the structure will be subject to the Representative's review and acceptance.

When the temporary bridge and approaches are no longer needed, remove and dispose of them as directed. Grade and restore the entire disturbed area, as specified in Section 105.14.

(b) **One-Lane Construction.** Construct, as specified in Section 903.3(a), except:

Construct a one-lane temporary bridge having a roadway width between curbs of not less than 12 feet. Grade the one-lane approaches for a total width of not less than 18 feet and surface for a width of not less than 12 feet.

(c) **Maintenance and Protection of Traffic.** As specified in Section 901, maintain and protect traffic in the temporary area.

903.4 MEASUREMENT AND PAYMENT—

(a) **Method 1.** Lump Sum

(b) **Method 2.** Separate items, as follows:

- **Temporary Bridge and Approaches (Two-Lane or One-Lane).** Lump Sum
- **Maintenance and Protection of Traffic on Temporary Bridge and Approaches.** Lump Sum
- **Removal of Temporary Bridge and Approaches.** Lump Sum

SECTION 910—HIGHWAY LIGHTING

910.1 DESCRIPTION—This work is the furnishing, installation, erection, and wiring of the complete highway lighting system, including the electrical power supply and distribution system.

910.2 MATERIAL—

(a) Highway Lighting Material. Section 1101. Submit for approval, before purchase and at no cost to the Department, catalog cuts, certifications, photometric calculations, drawings, and manufacturer's specifications for all lighting material including lighting poles, luminaires, junction boxes, conduits, cables, and power supply components proposed for the project. Refer to the Project Office Manual for material information requirements.

(b) Other Material.

- Fine Aggregate, Type A or B—Section 703.1
- Coarse Aggregate, Type A or C—Section 703.2
- Class A Cement Concrete—Section 704
- Expansion Joint Filler—Section 705.1
- Reinforcement Bars—Section 709.1
- Non-shrink Epoxy Grout—Section 1080.2(g)
- Non-shrink Mortar—Section 1001.2(e)
- Caulking Compound—Section 705.7
- Precast Concrete Products—Section 714

(c) Certification and Warranties. Secure warranties or guarantees from the manufacturers for electrical and mechanical equipment. Submit these warranties or guarantees to the Department at project completion.

Submit material certification, as specified in Section 106.03(b)3.

For poles, submit a signed warranty from the manufacturer stating that specifications have been met.

910.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated, and as follows:

(a) General. Comply with local government, electric utility company, and State codes or requirements; the electrical regulations of the Department of Labor and Industry; and the construction requirements of the NEC and NESC. Cooperate with the electric utility company or agency furnishing power to the system and meet the necessary service requirements. Acquire permits as specified in Section 107.02. Furnish certificates of approval from appropriate agencies when required. Upon work completion, submit to the Department five copies of "as-built" drawings, as directed, showing the date, any changes from the indicated system made during construction, and any revised circuit diagrams. Upon receipt, "as-built" drawing copies will be supplied to the agency maintaining the system. The acceptance of drawings will not relieve Contractor responsibility for erroneous or inconsistent dimensions, notations, or omissions or for the proper installation and operation of the electrical systems.

(b) Excavation for Pole Foundations. Before placing forms, each foundation excavation will be inspected for the actual soil conditions encountered. Do not proceed with work until the foundation excavation is accepted. The foundation design may need to be revised based on the actual conditions encountered as determined by the Representative.

Obtain approval of the completed foundation forms before concrete placement. Remove water from the foundation holes before concrete placement.

(c) Trench Excavation and Backfill. Remove and store topsoil encountered in the excavation. Excavate trenches for conduit runs parallel to the roadway, or as indicated. The preferred location is off of the shoulder. Provide a minimum 18 inch clearance from all underground utilities. Backfill the same day if possible. Remove rock within the excavation unless an alternate layout is authorized. Remove and dispose unsuitable material and excess excavation as directed.

Place plastic marking tape within the last layer of backfill material for the entire length of the trench.

Provide bedding soil for conduits as specified in Section 206.2(a)1.a. Backfill the remaining portion of the trenches with suitable on-site material to match existing conditions as shown on the Standard Drawings. Do not use coarse aggregate, except within the subbase area or as directed. Compact trench material as specified in Section 601.3(f).

Stake trench alignments for inspection and acceptance before excavating when they deviate from the indicated location. Submit the layout for review and acceptance before proceeding if the alignments extend the overall indicated circuit length by more than 5%.

(d) Pole Foundations. Construct of Class A cement concrete, as specified in the applicable parts of Section 1001.3.

Before erection of high mast poles, mix, cure, and test samples of the foundation concrete according to Department procedures. Verify the ground elevation at the foundation location for all high mast pole foundations.

Provide and place anchor bolts perpendicular to the top plane of the foundation. Use suitable templates or forms to hold the anchor bolts in position while placing concrete.

Clean the exposed portion of anchor bolts and associated hardware.

Install the necessary number of conduit sweep elbows and orient them inside the foundation to avoid unnecessary bends in the conduit runs. Fasten elbows securely to prevent movement while concrete is being placed.

For high mast pole foundations, install a 1 inch conduit for the grounding electrode conductor. For all other types of poles, install ground rod in pole foundation. Connect No. 4 AWG copper grounding electrode conductor to the ground rod with an exothermic weld or bronze connector, extend the other end through the center of the foundation, and leave 30 inches coiled above the foundation. Test the resistance to earth ground before placing concrete. Install additional ground rods (a minimum of 6 feet apart) if the measured resistance between the ground rod and earth is greater than 25 ohms.

(e) Lighting Poles and Accessories. Install poles plumb. For other than high-mast, use aluminum shims with aluminum bases; and use stainless steel shims with other bases. Place shims under no more than three bolts of any base. Do not use shims on bridges, use leveling nuts. Orient the handhole in the direction of traffic, unless otherwise indicated.

Plumb high-mast poles, using the leveling nuts supplied with the anchor bolts.

Unless otherwise indicated, install bracket arms at right angles to the pavement edge with arms securely fastened to the pole shafts. Install luminaires according to the manufacturer's instructions or as indicated.

Fasten an identification plate and a Lighting Management System (LMS) key plate with stainless steel rivets to the roadway side of the pole 8 feet above the foundation or as directed.

Select one or more poles for the static load test, as specified in Section 1101.02 before erecting the remainder of the poles.

Use similar pole types and similar materials within the same general area.

Field-assemble two-piece pole shafts by overlapping bolted sections.

Do not field weld poles or accessories.

(f) Supervision (High-Mast Installations). Ensure that a manufacturer's representative is on site to assist in supervising the field assembly and erection of high-mast poles and to instruct Department personnel in the proper procedures for raising and lowering the luminaire ring and in the recommended maintenance care of the poles.

Check the pole section mating and alignment before the erection of the pole.

Request the electric utility company to be present during erection of poles within 200 feet of their aerial electric lines.

(g) Conduits. Support conduits firmly and rigidly in place in a manner to prevent dislodging, while placing concrete or while performing other operations. If possible, install conduits under roadways before placing the pavement. If this is not possible, install a 3-inch diameter rigid steel conduit for a sleeve. Jack, auger, or bore under pavements, shoulders, sidewalks, railway tracks, and other indicated areas. Do not water bore. Extend this sleeve

under the roadway approximately 24 inches beyond the outside paved edge. Place the lighting conduit through this sleeve.

Grind the cut ends of metallic conduit to remove rough edges. Do not use defective conduit. Thread steel conduit for couplings and fittings. Coat the threads as specified in Section 910.3(r).

Weld plastic conduit joints with solvent, according to the conduit manufacturer's recommendations.

Make conduit bends and offsets, either in the shop or in the field. Do not damage the protective coating when making bends and offsets. Do not reduce the interior diameter of the bend. Form the bend on a radius at least twelve times the conduit diameter, but not less than 18 inches. Use manufactured sweep bends whenever possible.

Seal the ends of partially installed conduit runs if conduit work is temporarily suspended. If it is necessary to open the ends for cleaning or testing, reseal them upon completion. Seal the conduits in control cabinets.

Install conduit expansion and deflection joint fittings at each structure expansion joint as shown on Bridge Standard Drawings.

Ground steel conduit and provide electrical continuity on structures, as specified in Section 910.3(q), as soon as possible after installation, and before energizing the system. Connect fittings, junction boxes, and other appurtenances to the conduit on a structure so electrical continuity is maintained. Provide conduit expansion joints with an external bonding jumper. Size the bonding jumper to match the equipment grounding conductor installed in the conduit.

Coat underground steel galvanized conduit with asphalt paint or other approved coating if placed in a corrosive area. Use hot-dipped galvanized coating for other areas.

Clean conduit runs after installation by pulling a stiff wire brush, the size of the conduit, through the conduit. Then test the conduit by pulling a ball mandrel that has a diameter of at least 85% of the inside diameter of the conduit, through each conduit run. Where the mandrel fails to pass, either clean the conduit without injury to the conduit walls or replace the conduit.

Fasten conduits to electrical equipment using code-approved devices. Use watertight conduit fittings to connect to watertight enclosures.

Attach conduit to wood poles with 1/8-inch thick hot-dipped galvanized steel straps and galvanized lag screws. Provide 5 feet maximum spacing between straps.

Do not install pull wires in the conduit, unless indicated.

Provide a 2-inch minimum direct burial conduit for underground circuits.

(h) Cable Installation. Do not damage the cable insulation. Manually remove the cable from the drum or reel. Notify the Representative when cable is to be placed. Do not proceed without the Representative being present.

Use cable grips to install the cable in the conduit. Simultaneously pull cables within a single conduit, but do not damage the cable by overpulling. Use a dynamometer if pulling other than by hand. Use pulling lubricant of a type recommended by the cable manufacturer if necessary. Use extreme care when pulling cable through handholes in pole shafts. Place a pad of firm rubber or other similar material around the bottom edges of the opening to protect the cables.

Clearly locate underground conduits with aboveground markers if guide rail or other surface features are to be constructed in the immediate area.

Provide enough slack cable in junction boxes and light pole bases to allow exterior splicing. Neatly arrange the spliced cables or coil in junction box or pole base.

Prevent the entry of moisture into the cable at all times during installation. Seal the ends of cable until final splices are made.

Make splices above grade in pole base or transformer base with pre-molded disconnectable connector kits rated for 600 V. Provide splices with a minimum watertight or splash proof seal using weatherproof boots and tape as required by the manufacturer; and when placed in junction boxes or other potentially wet areas, provide splices that are waterproof and submersible. For in-ground junction boxes use non-fusible splices, unless indicated otherwise. Use only breakaway type connectors for connections where breakaway bases are used. Line splice only at pole bases or junction boxes. Do not splice cables inside conduits.

Use seven-strand No. 10 AWG insulated wire for the line taps from the feeder cable to the ballast or luminaire terminal block for the phase and neutral wires. Provide taps to the feeder cables as specified for line splicing. Do not use wire nuts for cable taps. Provide adequate size connectors for the wire sizes involved. Provide individual fusing for all conventional lighting. Fuse the tap with a 6A to 10A fuse, midget size, 250 V rating. Fuse the phase wire only. Connect the insulated equipment grounding conductor routed with the circuit conductors to the grounding electrode conductor (from the pole foundation ground rod) with a split bolt connector and then connect to ground lug welded to the pole base. Coat all grounding connections with an approved corrosion inhibitor. Attach the cable to the J hook at the pole top with a cable grip that supports the weight of the cable.

Furnish and install circuit-identifying tags on control and distribution circuit cables where they connect to

equipment located in service cabinets and vaults and on cables in junction boxes and pole shafts. Use fiber or other acceptable nonconducting tags, not less than 3/4 inch in diameter, and not less than 1/32 inch thick. Legibly stamp identification markings on the tags using small tool dies or permanent, waterproof marker. Securely tie each tag to the proper conductor, using plastic or nylon cord.

Use underground cable in direct burial conduit for all underground installations. The minimum underground wire size is No. 8 AWG copper cable.

(i) Cable Duct. Use only if indicated. Install similar to conduits as specified in Section 910.3(g), and according to the manufacturer's instructions.

(j) Luminaires. Check the luminaires for the proper lamp socket position, according to the lamp distribution indicated, before placing on the pole top or arms. Uniformly adjust and level luminaires. Install photocontrol or shorting cap according to the manufacturer's instructions or as indicated.

Immediately before the illumination test, and after all dust-generating work has been completed, clean the light control surfaces according to the luminaire manufacturer's recommendations using a cleaner recommended by the manufacturer.

Provide luminaires with a weather resistant decal conforming to ANSI C136.15-2011 that shows the lamp wattage. Provide a decal that is visible from the ground.

(k) Service Pole Installation. Position the service pole inside the right of way, and where indicated. When required, mount a meter base on the pole according to the utility company's requirements. Coordinate the meter installation with the utility company.

Install poles, according to the current specifications and standards of NELA, EEI, and NESC. The minimum depth of holes for setting wood poles 30 feet to 40 feet in length is 6 feet measured from the low side on sloping ground. Dig holes with vertical sides and with a diameter large enough to permit use of a mechanical tamper around the pole. Ensure that each pole is inspected and accepted before backfilling. Deposit acceptable backfilling material around the poles and mechanically tamp in layers of not over 4 inches. Place backfill material around the pole to drain water away.

Guy service poles, if necessary. Install cone anchors 7 feet below ground level. After placing the anchor, backfill the hole with coarse aggregate for a depth of 24 inches above the anchor, then tamp during backfilling. Backfill the remaining hole with the excavated material, then thoroughly tamp. Obtain approval for the guys before the conductors are strung. Install a guy guard if the guy is adjacent to the roadway.

Install and tighten anchor bolts as specified in Section 948.

(m) Photoelectric Control Device. Use a plug-in device, for ease of replacement. Install the device with its detector area facing north.

(n) Enclosure Installation. Mount enclosures for housing the control equipment. Provide a separate service disconnect ahead of the control cabinet that is labeled 'suitable for use as service equipment'. The disconnect can be provided integral to the control cabinet if the cabinet is dead front and labeled as 'suitable for use as service equipment'. Padlock the enclosures. Key as directed. Provide enclosure ID tags as specified for pole ID tags. Provide the power supply number, the system voltage, and the LMS key number on the tags.

(p) Junction Boxes. Obtain acceptance of any change in box location before installation.

Excavate, then construct or install the box. Backfill around the box and dispose of excess or unsuitable material. Ground the junction box as required.

If using precast junction boxes with knockouts, remove the knockouts, then tightly grout the conduit or conduit sleeves in place with non-shrink mortar.

Ground exposed metal parts of junction boxes with a minimum No. 4 AWG grounding electrode conductor and a minimum 1/2-inch by 8-foot ground rod. Connect the grounding electrode conductor to the ground rod with either an exothermic weld or with a bronze connector clamp. Connection to an adjacent system ground rod is allowable.

(q) Grounding.

1. General. Install individual ground rods. Install additional ground rods a minimum of 6 feet apart as required if the measured resistance to earth is greater than 25 ohms. At the service entrance, install the first rod electrode (ground rod) inside a cast-in-place or precast junction box with lid and attach the ground rod to the grounding electrode

conductor with an exothermic weld or a bronze connector. Coat the connection(s) with approved corrosion inhibitor. Provide an equipment grounding conductor with all circuits. Do not connect the neutral to ground except at the service location. Provide an insulated equipment grounding conductor with the same insulation and size as specified for the circuit conductors.

2. Grounding on Structures. Ground lighting poles, underpass luminaires, and metal junction boxes on structures by the following methods:

- By connecting to the embedded or surface structure mounted steel conduit.
- By use of a continuous insulated equipment grounding conductor routed with the circuit conductors inside the conduit and connected to ground lugs installed inside the junction boxes.

If using embedded or surface structure mounted non-metallic conduit, use a continuous insulated equipment grounding conductor routed with the circuit conductors in the non-metallic conduit as the sole equipment grounding conductor for those portions of the circuit.

Provide one ground rod for structures up to 500 feet in length. Provide one ground rod at each end of structures over 500 feet in length. Provide a No. 4 AWG uninsulated copper grounding electrode conductor from the ground rod to the nearest structure-mounted junction box and attach to the ground lug inside the box. Attach the ground rod to the grounding electrode conductor with an exothermic weld or a bronze connector. Provide a separate insulated continuous equipment grounding conductor of the same size and material as routed with the circuit conductors for structures using either steel or non-metallic conduit.

(r) Galvanize Repair. Repair field damage to any galvanized finishes in accordance with ASTM A780.

(s) Power Supplies. Make arrangements with the local electric utility company for electrical service for the lighting system.

Furnish and install the specified number of wooden poles for the power supplies with the necessary auxiliary equipment (crossarms, brackets, meter base, transformers, cutouts, lightning arresters, conduit, insulators, switches, fuses, circuit breakers, lighting contactors, photoelectric controls, enclosures, weatherheads, service wire, guywire, and grounding) to provide complete electrical service for the entire lighting system.

(t) Buried Cable and Conduit Markers. Set the markers flush with the ground and directly over the trench. Place the marker directly under the guide rail when trench and guide rail cross.

(u) Tests. Perform the following tests as applicable and record the test data on the test forms. Use meters that bear a certification of calibration with the past year from a recognized testing laboratory. Provide the electrical energy and furnish personnel and equipment to complete the tests. Correct any defects disclosed by the tests and then retest the corrections. Perform the tests in the presence of an authorized representative of the Department.

Form	Title
CS-4225A	Ground Rod Test
CS-4225B	Conductor Insulation Resistance Test
CS-4225C	Circuit Performance Test
CS-4225D	Highway Illumination Test (Conventional)
CS-4225E	Sign Illumination Test
CS-4225F	High Mast Lighting Test
CS-4225G	Static Load Test (Conventional)

Satisfactorily demonstrate that circuits are continuous and free from short circuits and from unspecified grounds. Provide a resistance to earth-ground, for each ground rod location, of not more than 25 ohms. Supply and install additional ground rods, connected by a common grounding electrode conductor and installed a minimum of 6 feet apart, until this requirement is met or as directed.

The resistance to ground of conductors for underground cable is to be as shown in Table A at 60F, when measured with a 1000 V megger:

TABLE A
Insulation Resistance (Megohms- minimum, based on 1,000 feet)
Wire Size (AWG)

Cable Type	10-6	4-1	1/0-2/0
Cross-Linked Polyethylene RHW, RHH, USE	2,000	1,500	1,300
Cross-Linked Polyethylene XHHW	1,600	1,100	900
Rubber-Neoprene RHW	500	350	300
PVC THW	140	120	100

Take voltage readings, with load and without load, at the power supply side of the control cabinet main breaker. The readings with load must be within $\pm 5\%$ of nominal voltage (typically either 120 V or 240 V). Take voltage readings at the last light of each circuit. A voltage reading is acceptable if it is within 5% of the reading with load at the supply point.

Take current (ampere) readings with a full lighting load on the load side of each distribution breaker in the control cabinet. A current reading is acceptable if it does not exceed 75% of the breaker rating.

Energize and operate the lighting system, including automatic control(s), for 168 consecutive hours. At each control cabinet, supply a service voltage graphic record covering the test period, with the installed electrical equipment in normal operation (lights on at night and off in daytime).

After the lights have been energized for at least 100 hours burning time, and after dark, take horizontal footcandle readings at road level with the light meter leveled. Use a light meter conforming to the following:

- Lowest full scale not exceeding 2.0 footcandles or equivalent sensitivity.
- Cosine correction, filtered or adjusted to match the CIE response curve and calibrated for the light source.
- Accuracy: $\pm 3\%$ reading $\pm 0.5\%$ full-scale (< 929 footcandles)
- Resolution: 0.001 footcandles
- Calibrated within the last 12 months by an independent testing company.

Take footcandle readings, where directed. Give particular attention to points where low illumination is most likely to occur, usually midway between luminaires.

Complete the static load tests specified in Section 1101.02(a)1.

Lower and raise the ring assembly of all high mast poles to ensure proper operation.

(v) Data Gathering. Determine the GPS location and LMS keys for all existing and new highway lighting assets within the contract limits. Enter the data electronically in the Highway Lighting Asset Numbering spreadsheet and provide the updated spreadsheet electronically to the Bureau of Maintenance and Operations – Maintenance Technical Leadership Division (BOMO-MTLD) Highway Lighting group.

(w) Guarantee. Guarantee the in-service operation of all mechanical and electrical equipment, and related components of the entire lighting system including lamps, for a period of 180 days. The guarantee begins the day after the lighting system is fully operational, as determined by the Representative, after completion of all lighting system related work and completion of the 168-hour performance test specified in Section 910.3(u).

The energizing cost during the guarantee period will be borne by the owner, under the terms of the agreement (where agreements are applicable). Perform the following at the onset of and during the guarantee period:

- Execute the in-service guarantee notification Form CS-4225H, provided by the Department.
- Commence repairs within one calendar day following notification to the person designated on Form CS-4225H.
- Guarantee all repairs and material replacements for the balance of the guarantee period, or 30 days, whichever is the longer period.

- Repair work not performed within the guarantee period, or any extension periods, will be considered latent defects as specified in Section 107.16(b).

Repairs that are the direct result of external causes will be performed by others. Examples of external causes are lightning strikes, vehicular impact, objects driven through the underground circuit, trenching through installed circuits, etc.

Issuance of certificate of acceptance or final settlement of the contract is not consequential to the in-service guarantee period described herein. The guarantee period is not a part of the contract time.

910.4 MEASUREMENT AND PAYMENT—

(a) Junction Boxes. Each, for the type indicated.

The price includes the ground wire, ground rod, ground clamp, and necessary excavation and backfill.

(b) Poles (Conventional). Each, for the type and height indicated.

The price includes either frangible or breakaway base (when indicated) and arm.

(c) Poles (High-Mast). Each, for the height indicated.

The price includes the lowering device and wiring from the line splice to the luminaire ring.

The winch drive unit is incidental to the total number of poles constructed.

(d) Arms. Each, for the length indicated.

The price includes complete installation.

(e) Luminaires (Conventional). Each, for the wattage and mounting indicated.

The price includes integral ballast or driver and complete wiring from luminaire ballast or driver to line splice.

(f) Luminaires (High-Mast). Each, for the wattage indicated.

The price includes integral ballast or driver and complete wiring from the luminaire-ring terminal board to the luminaire ballast or driver.

(g) Luminaires (Underpass). Each, for the wattage and mounting indicated.

The price includes integral ballast or driver and complete wiring, conduit, and necessary mounting provisions from the line splice at the junction box to the luminaire.

(h) Ballast. Each, for the wattage indicated.

The price includes mounting and wiring, as directed.

(i) Pole Foundations. Each, for the type indicated.

The price includes excavation, concrete, anchor bolt assemblies, reinforcement bars, conduit, ground rod(s), ground rod clamp(s), grounding electrode conductor, backfilling, and satisfactory disposal of surplus material.

(j) Cable and Conduit Markers. Each

The price includes excavation, concrete, backfilling, and satisfactory disposal of surplus material.

(k) Conduit. Linear Foot

The price includes fittings, expansion/deflection fittings, joints, bends, grounds, protective coatings, and appurtenances. Does not include conduit in pole foundations.

Unless otherwise authorized, no allowance will be made for additional conduit lengths as a result of deviation from the indicated conduit location.

(m) Cable. Linear Foot

No allowance will be made for coiling or looping cable slack lengths inside pole bases or junction boxes, when additional lengths of cable are necessary for splicing. An allowance will be made for cable entry into each pole base from the trench to the handhole.

Unless otherwise authorized, no allowance will be made for additional cable lengths, or cable size, as a result of deviation from the indicated cable location.

The ground rods specified for structures are incidental to the circuit cables. Splices and fuses are incidental to the circuit cables.

(n) Trenches. Linear Foot

The price includes excavation, backfilling, temporary and permanent plastic trench markers, and surplus material disposal. No allowance will be made for rock excavation or for any other subsurface condition encountered.

Unless otherwise authorized, no allowance will be made for additional trench lengths as a result of deviation from the indicated trench locations.

(o) Complete Power Supply System. Each

The price includes service pole and all necessary power supply equipment.

(p) Testing of Entire Lighting System. Lump Sum

The price includes furnishing personnel, equipment, and electrical energy necessary for tests.

(q) Conduit Sleeve. Linear Foot

The price includes all work necessary to install the conduit sleeve as specified in Section 910.3(g). The price does not include circuit conduit passing through the sleeve.

(r) Asset Numbering System Update Effort. Lump Sum

The price includes furnishing personnel and equipment necessary to gather accurate information and to provide updated documentation in electronic spreadsheet format.

(s) Remote Monitoring and Control System. Lump Sum

(t) Luminaire Control Node. Each

(u) Segment Controller. Each

SECTION 920—SIGN LIGHTING

920.1 DESCRIPTION—This work is the furnishing and installation of a complete electrical distribution, control, and lighting system for the illumination of indicated signs.

920.2 MATERIAL—Section 1102. Certification and warranties, as specified in Section 910.2(c).

920.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated, and as follows:

(a) **General.** Section 910.3(a) and as follows:

Do not alter sign structure members to attach electrical items, unless indicated. When necessary, drill during structural fabrication.

(b) **Trench Excavation and Backfill.** Section 910.3(c)

(c) **Service Pole Installation.** Section 910.3(k)

(d) **Photoelectric Control Device.** Section 910.3(m)

(e) **Enclosure Installation.** Section 910.3(n)

(f) **Luminaires.** Attach the luminaires to the supports. Install a lamp in each luminaire. Clean the luminaires as specified in Section 910.3(j). If the luminaire is provided with a remote ballast, mount the remote ballast over the shoulder. Submit mounting method and materials for approval.

(g) **Junction Boxes.** Section 910.3(p)

(h) **Conduit Installation.** Section 910.3(g) and as follows:

Unless another method is specified, attach exposed conduits to sign structures using galvanized or stainless steel supports and U-bolts or two-hole straps with spacers and expansion bolts, and attach the conduit to sign columns and shafts with clamping bands and bolts.

(i) **Cable Installation.** Section 910.3(h)

Deviation from the indicated layout may be allowed if it is necessary to overcome obstacles during construction, provided that drawings showing the deviations are submitted for approval.

Extend cables from the breakers of each sign structure mounted lighting panel to each ballast and sign lighting fixture.

Attach exposed cable runs to the structures using 1/2-inch stainless steel straps or black plastic tie straps, as directed, at intervals not exceeding 3 feet.

(j) **Cable and Conduit Markers.** Section 910.3(t)

(k) **Grounding.** Install grounding electrode conductors, ground rods, connectors insulated equipment grounding conductors, bonding jumpers, and necessary devices to limit the voltage to earth on the exposed normally non-current carrying metal parts of the entire electrical system and sign structure.

At the power supply, connect one end of the No. 4 AWG grounding electrode conductor to the breaker panel ground bus and the other end to the ground rod at the service pole.

At each sign structure install a ground rod and install a No. 6 AWG grounding electrode conductor through the sign column shaft and attach to the grounding lug accessible from the handhole. Connect the ground wire to the ground rod with an exothermic weld or a bronze clamp. Do not ground the system neutral conductor. Ground the equipment grounding conductor and enclosure using a connection on the grounding lug in the column shaft. Drive the ground rod vertically into the ground a horizontal distance of 1 foot from the foundation and opposite the roadway side of the shaft.

(m) Tests. Section 910.3(u), except as follows:

1. Circuit Tests. Make voltage readings at the power supply side of the service pole equipment or at the supply side of the highway sign lighting circuit, and make readings at ballasts. Provide a voltage drop not exceeding 5% of the rated voltage at the service point when under full load at the lamp ballast.

Take current readings on the load side of each main breaker and neutral circuit. Take current readings at nighttime and at daytime with the lighting systems in normal operation.

2. Performance Test. As directed, take footcandle readings at several points on the sign face.

(n) Guarantee. Section 910.3(w)

920.4 MEASUREMENT AND PAYMENT—Lump Sum

The price includes furnishing personnel, equipment, and the costs of electrical energy for the tests.

SECTION 930—POST MOUNTED SIGNS, TYPE A

930.1 DESCRIPTION—This work is furnishing and installation of fabricated aluminum signs of the type indicated on steel S or W beam posts and breakaway system.

930.2 MATERIAL—As shown on the Standard Drawings and as follows:

(a) Extruded Aluminum Channel Signs, Posts, and Miscellaneous Material.

- Extruded Aluminum Channel Signs—Section 1103.02
- Steel S or W Beam Posts and Breakaway System—Section 1103.07
- Galvanized Steel Hex Head Bolts, Nuts, Lock-Washers; Aluminum Post-Clips, Auxiliary Supports for Exit Panels, 1/8-inch Rivets—Section 1103.11

(b) Flat Sheet Aluminum Signs with Stiffeners, Posts, and Miscellaneous Material.

- Flat Sheet Aluminum Signs with Stiffeners—Section 1103.03
- Steel S or W Beam Posts and Breakaway System—Section 1103.07
- 1/8-inch and 3/16-inch Aluminum Rivets; Stainless Steel Bolts, Nuts, Washers, Post-Clips; Twist-In Toggle and Buckle Straps; Butting Plates; Auxiliary Supports for Exit Panels—Section 1103.11

(c) Foundations.

1. Cast-In-Place Foundation.

- Class A Cement Concrete—Section 704
- Reinforcement Bars—Section 709.1

2. Steel Finned-Pipe Foundation. From a manufacturer listed in Bulletin 15.

930.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) General. Erect posts plumb using a method that does not twist, bend, or otherwise deform the posts. Before erection, correct twisted, bent, or deformed posts. Erect signs by a method that does not twist, bend, or otherwise deform the signs. Level, correctly align, and then center signs on the posts and properly fasten. Exercise extreme care when using hoisting cables on the sign to avoid damage to the reflective sheeting. Repair or replace damaged posts and signs.

Fasten the signs to the posts with the necessary hardware as detailed in TC 8700 Standard Series.

(b) Location. The indicated location of sign installations is approximate with the exact location established at the site. Mark longitudinal and lateral location by stakes or paint marks with an identifying symbol.

On tangent sections of roadway, locate and erect posts to allow signs to face away from roadway at an angle of 93 degrees from the pavement edge. On curves, locate and erect the posts perpendicular to the sight line, where the sight line is an imaginary line connecting the center of the near traffic lane. The length in feet from the sign to the center of the near traffic lane is equal to 40 times the letter height of the smallest legend in inches, but not less than 300 feet. For example: 50-inch x 12-inch letter equals a 600-foot sight line.

(c) Removal of Existing Signs. Remove existing signs or sign installations as indicated. Existing signs or sign installations that are permanently removed shall become the property of the Contractor unless indicated otherwise. Remove foundations to a minimum 12 inches below final grade.

(d) Clearing and Grubbing. When directed, and as specified in Section 201.3, remove material, brush, trees, or branches, which obstruct the clear view of signs being placed.

(e) Restoration of Site. Restore the site to its original condition, including the disposal of excess or unsuitable materials.

(f) Motorist Service Signs. Provide and install symbols, legends, and borders, with the exception of business logo signs, as indicated.

(g) Posts and Foundations.

1. Posts. Submit a sketch for acceptance for each plan location before post fabrication, showing the following:

- location of sign by plan station;
- lateral offset from pavement edge to sign edge;
- sign size (width and height);
- exit panel sign size (width and height);
- number of post supports and sections;
- post heights, measured from bottom of post base plate to post top;
- measured distance from reference line elevation at pavement edge to foundation top;
- steel finned pipe foundation design; or
- footing base type design and reinforcing steel; and
- bracket identification number and quantity.

Replace galvanized parts or members damaged in transition or erection with new material having properly galvanized surfaces. Repair damage to galvanized surfaces that does not exceed 2% per linear foot of the total surface area according to ASTM A 780 and as specified in Section 910.3(r).

2. Foundations.

2.a Cast-in-Place Foundations. Excavate for the foundation, then position the posts and connections with the post flange faces aligned in the same plane. Place concrete against undisturbed earth, as specified in the applicable parts of Section 1001.3. Form the top 12 inches of foundations.

2.b Steel Finned-Pipe Foundations. Install foundation and provide installation report prepared by Technical Assistant, according to the drawing and manufacturer's recommendations.

- **Technical Assistant.** Provide a certified designer/installer to be present at the project site to assist the Contractor and Representative in the event that unusual problems or special circumstances arise. Furnish evidence of the designer/installer's certification from the steel finned-pipe foundation supplier to the Representative before the start of work.

(h) Erection. Install nuts on post clips with a torque wrench for extruded aluminum channels. Apply 225 inch-pounds of torque to each galvanized nut with the threads dry, clean, and unlubricated.

Attach the sign to posts with twist-in toggle and buckle straps or stainless steel post-clips for flat sheet aluminum. Apply 225 inch-pounds of torque to each stainless steel nut with the threads dry, clean, and unlubricated.

Clean signs after erection, removing any accumulation of oil, grease, dirt, or foreign material.

Brace the panel with one or more auxiliary supports if exit panels cannot be supported by two sign posts.

930.4 MEASUREMENT AND PAYMENT—

(a) Post Mounted Signs, Type A. Square Foot of sign

The unit price includes removal of existing signs, one breakaway system per post and erection of posts, but not furnishing and galvanizing posts.

(b) Steel S or W Beam Posts. Pound

(c) Breakaway System Replacement. Each

The price includes all breakaway hardware for a single post and all necessary machining.

SECTION 931—POST MOUNTED SIGNS, TYPE B

931.1 DESCRIPTION—This work is furnishing and installation of flat sheet signs on breakaway steel posts.

931.2 MATERIAL—As shown on the Standard Drawings and as follows:

- Flat Sheet Signs—Section 1103.04
- Breakaway Steel Posts—From a manufacturer listed in Bulletin 15, and as specified in Section 1103.08.
- Aluminum Bolts, Aluminum Nuts, and Anti-Theft Hardware—Section 1103.11
- Packaged Dry Concrete—Section 624.2(b)

931.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in Sections 930.3(a), (b), (d), and (e) and as follows:

(a) General. Drive anchors into undisturbed earth with anchor top a maximum of 4 inches above lower slope side.

Drill concrete if posts are to be located in concrete areas.

Drive square anchor into undisturbed earth and place concrete if square steel posts are used in concrete. Complete installation after concrete is cured a minimum of 72 hours.

Fasten STOP and YIELD signs, and other signs if indicated, to posts with anti-theft hardware.

Permanently scribe 1-inch numerals on back of sign indicating the month and year of installation.

(b) Removal of Existing Signs. Remove existing signs or sign installations, only when indicated or directed.

Return aluminum and steel removed from existing sign installations to the Department unless indicated otherwise. Sort and band removed items by type of material onto separate wooden pallets. Prevent additional damage or deterioration of the sign materials, particularly aluminum sign blanks, during storage, bundling, and delivery. Give 3 working days notice to arrange delivery to the Department as indicated.

931.4 MEASUREMENT AND PAYMENT—Square Foot of sign

The unit price includes removal of existing signs.

SECTION 932—POST MOUNTED SIGNS, TYPE C

932.1 DESCRIPTION—This work is the furnishing and installation of flat sheet signs on wood posts.

932.2 MATERIAL—As shown on the Standard Drawings and as follows:

(a) Signs, Posts, Supports, and Miscellaneous Material.

- Flat Sheet Signs—Section 1103.04
- Treated Wood Posts—Section 1103.09
- Aluminum Bolts, Aluminum Nuts, and Lag Screws—Section 1103.11
- Shims and Bars—Section 1105.02(a)2
- Brackets—Section 1105.02(f)2

(b) Foundations.

- Class A Cement Concrete—Section 704
- Sleeves—Section 1105.02(j)1

932.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in Sections 930.3(a), (b), (d), and (e), Section 931.3(b), and as follows:

Excavate for the post foundation. Place the post, with shim plates and bars attached, in the sleeve in the excavated foundation. Carefully set the sleeve, using the temporary framing to ensure proper location.

Place foundation concrete, as specified in the applicable parts of Section 1001.3, against undisturbed earth. Finish the foundation tops flush and in the same plane as the adjacent ground, except trowel the concrete surface and shape to prevent water standing against the posts.

Drill or form the hole if posts are to be located in concrete such as divisors or islands.

Limit field cutting of posts to a minimum. Field treat the cut area with the original post preservative.

Where multiple sign assemblies on the same installation require larger posts than shown on the Standard Drawings, refer to the Standard Drawings for post mounted signs, Type E.

Permanently scribe 1-inch numerals on back of sign indicating the month and year of installation.

932.4 MEASUREMENT AND PAYMENT—Square Foot of sign

The price includes removal of existing signs.

SECTION 933—POST MOUNTED SIGNS, TYPE D

933.1 DESCRIPTION—This work is the furnishing and installation of flat sheet aluminum signs with stiffeners on steel pipe supports, fastened to fabricated structural steel mounting brackets.

933.2 MATERIAL—As shown on the Standard Drawings and as follows:

- Flat Sheet Aluminum Signs with Stiffeners—Section 1103.03
- Twist-In Toggles and Buckle Straps; Anchors—Section 1103.11
- Steel Brackets, Bars, Pipes, Shapes, and Plates (Supports)—Section 1103.12

933.3 CONSTRUCTION—As shown on the Standard Drawings and as specified in Sections 930.3(a) and (b), and Section 931.3(b), except insert the word “support” for the word “post.”

Permanently scribe 1-inch numerals on back of sign indicating the month and year of installation.

933.4 MEASUREMENT AND PAYMENT—Square Foot of sign

The unit price includes furnishing and erecting fabricated structural steel mounting brackets.

SECTION 934—POST MOUNTED SIGNS, TYPE E

934.1 DESCRIPTION—This work is the furnishing and installation of fabricated aluminum signs of type indicated on wood posts or composite posts, including the removal of existing signs.

934.2 MATERIAL—As shown on the Standard Drawings, and as follows:

(a) Extruded Aluminum Channel Signs, Posts, Supports, and Miscellaneous Material.

- Extruded Aluminum Channel Signs—Section 1103.02
- Treated Wood Posts—Section 1103.09(a)
- Composite Posts—Section 1103.09(b)
- Galvanized Steel Hex Head Bolts, Nuts, Lock-Washers; Aluminum Post-Clips, Auxiliary Supports for Exit Panels, Rivets—Section 1103.11
- Angles (Supports)—Section 1103.12(g)
- Shim Bars and Plates (Supports)—Section 1105.02(a)2

(b) Flat Sheet Aluminum Signs with Stiffeners, Posts, and Miscellaneous Material.

- Flat Sheet Aluminum Signs with Stiffeners—Section 1103.03
- Treated Wood Posts—Section 1103.09(a)
- Composite Posts—Section 1103.09(b)
- Rivets—Section 1103.11(e)
- Stainless Steel Bolts, Nuts, Washers, Post-Clips; Twist-In Toggles and Buckle Straps; Butting Plates; Auxiliary Supports for Exit Panels—Section 1103.11
- Angles (Support)—Section 1103.12(g)
- Shim Bars and Plates (Supports)—Section 1105.02(a)2

(c) Foundations.

- Class A Cement Concrete—Section 704
- Sleeves—Section 1105.02(j)1
- Steel Pipe—Section 1103.12(e)

934.3 CONSTRUCTION—If indicated, remove existing signs.

(a) Wood Posts. Section 932.3

(b) Composite Posts. As shown on the Standard Drawings, as specified in Sections 930.3(a), (b), and (e), Section 931.3(b), and as follows:

Excavate for the post foundation. Place the post in the sleeve in the excavated foundation. Set the sleeve, using the temporary framing to ensure proper location.

Place foundation concrete against undisturbed earth, as specified in the applicable parts of Section 1001.3. Finish the foundation tops flush and in the same plane as the adjacent ground, except trowel the concrete surface and shape to prevent water standing against the posts.

Drill or form the hole if posts are to be located in concrete such as divisors or islands.

Place protective plastic cap over top end of post.

Permanently scribe 1-inch numerals on back of sign indicating the month and year of installation.

934.4 MEASUREMENT AND PAYMENT—Square Foot of sign

The unit price includes removal of existing signs.

SECTION 935—POST MOUNTED SIGNS, TYPE F

935.1 DESCRIPTION—This work is the furnishing and installation of signs of the type indicated on existing posts or poles installed for other purposes including the vertical portion of any traffic signal support, luminaire support, or sign structure support.

935.2 MATERIAL—As shown on the Standard Drawings for the corresponding type post and as follows:

- Flat Sheet Signs—Section 1103.04
- Brackets and Bars (Supports)—Section 1103.12
- Extruded Aluminum Channel Signs—Section 1103.02
- Flat Sheet Aluminum Signs with Stiffeners—Section 1103.03
- Galvanized Steel Hex Head Bolts, Nuts, Lock-Washers; Aluminum Post-Clips; Lag Screws; Rivets; Anti-Theft Sign Hardware—Section 1103.11
- Internally Illuminated Signs—Sections 950.2 and 1103.03(g).
- School Zone Speed Limit Flashing Warning Signs—Sections 950.2, 954.2, 955.2(c), and 1103.03(h) or as indicated.
- Flashing Warning Signs—Sections 950.2, 954.2, 955.2(c), and 1103.03(i) or as indicated.
- Light Emitting Diode (LED) Blank-Out Signs—Sections 950.2, 954.2, and 1103.03(j) or as indicated.
- LED Border Lit Signs—Sections 950.2, 954.2, and 1103.03(k) or as indicated.
- Permanent Speed Display Signs—Sections 950.2, 954.2, 956.2(c)3, and 1103.03(m) or as indicated.
- Temporary Speed Display Signs—Sections 950.2, 954.2, 956.2(c)3, and 1103.03(n) or as indicated.
- Rectangular Rapid Flashing Beacon Assembly (or Assemblies)—Sections 950.2, 954.2, 956.2(c), 956.2(d), and 1103.03(o) or as indicated.

935.3 CONSTRUCTION—Attach signs to supports, for post mounted signs, Type A, B, C, D, or E or traffic signal support or luminaire supports, as shown on the Standard Drawings.

Remove existing signs if indicated. Signs that are removed become property of PennDOT unless otherwise indicated.

When mounting as a secondary sign below another sign, install sign at a minimum height of 5 feet on conventional highways in rural areas; at 7 feet on conventional highways, on business, commercial, and residential streets where parking or pedestrian movements are likely to occur, or where other obstructions exist; and at 5 feet on expressways and freeways. Height is measured as the difference in elevation between near roadway edge surface and sign bottom.

Erect signs in a level position, set on sign brackets, and attach mounting hardware as shown on the Standard Drawings or as indicated.

Erect signs by a method that does not twist, bend, or deform the signs. Repair or replace damaged signs.

Permanently scribe 1-inch numerals on the back of sign indicating the month and year of installation.

Install Internally Illuminated Signs as specified in Sections 950.3 and 1103.03(g) or as indicated.

Install School Zone Speed Limit Flashing Warning Signs as specified in Sections 950.3, 954.3, 955.3(b), and 1103.03(h) or as indicated.

Install Flashing Warning Signs as specified in Sections 950.3, 954.3, 955.3(b), and 1103.03(i) or as indicated.

Install LED Blank-Out Signs as specified in Sections 950.3, 954.3, 955.3(b), and 1103.03(j) or as indicated.

Install LED Border Lit Signs conforming to the MUTCD and as shown in the Standard Drawings. Install as specified in Sections 950.3, 954.3, and 1103.03(k) or as indicated.

Install Permanent Speed Display Signs as specified in Sections 950.3, 954.3, 956.3(a)3, and 1103.03(m) or as indicated.

Install Temporary Speed Display Signs as specified in Sections 950.3, 954.3, 956.3(a)3, and 1103.03(n) or as indicated.

Install Rectangular Rapid Flashing Beacon Assemblies as specified in Sections 950.3, 954.3, 956.3(a), 956.3(b), and 1103.03(o) or as indicated.

935.4 MEASUREMENT AND PAYMENT—

(a) Post Mounted Signs. Square Foot of sign.

The unit price includes removal of existing signs and mounting hardware.

(b) Internally Illuminated Sign. Each.

Includes sign assembly and all necessary connections, wiring, weather-tight wire entrance junction box, photoelectric cells, swing brackets, strapping, bolts, washers, and associated hardware to make the signs fully operational.

(c) School Zone Speed Limit Flashing Warning Signs. Each.

Includes sign assembly and LED indications, NEMA rated enclosure contained controller assembly, time clock, solar components (if applicable), wireless/cellular communication (if applicable), wiring, and associated hardware to make the sign fully operational.

(d) Flashing Warning Signs. Each.

Includes sign assembly and LED indications, controller assembly, time clock, solar components (if applicable), wiring, and associated hardware to make the sign fully operational.

(e) LED Blank-Out Sign. Each.

Includes sign assembly and all necessary connections, wiring, photoelectric cells, brackets, strapping, bolts, washers, and associated hardware to make the signs fully operational.

(f) LED Border Lit Sign. Each.

Includes sign assembly with LED border, controller assembly, time clock, wiring, solar components (if applicable), detector (if applicable), controller communications (if applicable), and associated hardware to make the sign fully operational.

(g) Permanent Speed Display Sign. Each.

Includes sign assembly with dynamic display panel, speed measuring detector, controller assembly with programmable schedule option, light sensor, “Your Speed” sign (if applicable), solar components (if applicable), controller communications (if applicable), wiring, and associated hardware to make the sign fully operational.

(h) Temporary Speed Display Sign. Each.

Includes sign assembly with dynamic display panel, speed measuring detector, controller assembly with programmable schedule option, light sensor, “Your Speed” sign (if applicable), solar components (if applicable), controller communications (if applicable), wiring, and associated hardware to make the sign fully operational.

(i) Rectangular Rapid Flashing Beacon Assembly. Each.

Includes crossing sign(s), NEMA rated enclosure contained controller assembly, controller assembly, wireless communication system, rapid flashing beacon unit, pedestrian confirmation light, backplate (optional), push button, push button sign, passive pedestrian detection (if applicable), solar components (if applicable), wiring, and associated hardware to make the sign assembly fully operational.

SECTION 936—STRUCTURE MOUNTED SIGNS

936.1 DESCRIPTION—This work is the furnishing and installation of signs of the type indicated, mounted on the horizontal portion of overhead structures including span wires and mast arms.

936.2 MATERIAL—As shown on the Standard Drawings and as follows:

- Extruded Channel Signs and Miscellaneous Material—Section 930.2(a).
- Flat Sheet Aluminum Signs with Stiffeners and Miscellaneous Material—Section 930.2(b).
- Flat Sheet Signs—Section 1103.04.
- Other Miscellaneous Material:
Angles—Section 1103.12(g).
Angles—Section 1105.02(a)2, galvanized as specified in Section 1105.02(s).
- Internally Illuminated Signs—Sections 950.2 and 1103.03(g).
- School Zone Speed Limit Flashing Warning Signs—Sections 950.2, 954.2, 955.2(c), and 1103.3(h) or as indicated.
- Flashing Warning Signs—Sections 950.2, 954.2, 955.2(c), and 1103.03(i) or as indicated.
- Light Emitting Diode (LED) Blank-Out Signs—Sections 950.2, 954.2, and 1103.03(j) or as indicated.
- LED Border Lit Signs—Sections 950.2, 954.2, and 1103.03(k) or as indicated.
- LED Red Signal Ahead Signs—Sections 950.2, 952.2, 953.2, 954.2, and 1103.03(l) or as indicated.
- Rectangular Rapid Flashing Beacon Assembly (or Assemblies)—Sections 950.2, 954.2, 956.2(c), 956.2(d), and 1103.03(o) or as indicated.

936.3 CONSTRUCTION—Attach signs to structure as shown on the Standard Drawings, as specified in Section 930.3(h) and as follows:

Remove existing signs only if indicated. Signs that are removed become property of PennDOT unless otherwise indicated.

Submit to the Department all street name sign layout sheets for review and approval before fabrication.

Erect signs level on sign brackets, and attach with mounting hardware as shown in the Standard Drawings.

Erect signs by a method that does not twist, bend, or otherwise deform the signs. Repair or replace damaged signs.

Verify that the lowest point of any sign over the roadway is not less than 17 feet above the roadway surface unless otherwise indicated.

Inscribe 1-inch numerals on the back of sign indicating the month and year of installation.

Install Internally Illuminated Signs as specified in Section 950.3 and 1103.03(g) or as indicated.

Install School Zone Speed Limit Flashing Warning Signs as specified in Sections 950.3, 954.3, 955.3(b), and 1103.03(h) or otherwise indicated.

Install Flashing Warning Signs as specified in Sections 950.3, 954.3, 955.3(b), and 1103.03(i) or as indicated.

Install LED Blank-Out Signs as specified in Sections 950, 954.2, and 1103.03(j) or as indicated.

Install LED Border Lit Signs conforming to the MUTCD and as shown in the Standard Drawings. Install as specified in Sections 950.3, 954.3, and 1103.03(k) or as indicated.

Install LED Red Signal Ahead Signs as specified in Sections 950.3, 952.3, 953.3, 954.3, and 1103.03(l) or as indicated.

Install Rectangular Rapid Flashing Beacon Assemblies as specified in Sections 950.3, 954.3, 956.3(a), 956.3(b), and 1103.03(o) or as indicated.

936.4 MEASUREMENT AND PAYMENT—

(a) **Structure Mounted Signs.** Square Foot of sign.

The unit price includes removal of existing signs and mounting hardware.

(b) Internally Illuminated Sign. Each.

Includes sign assembly and all necessary connections, wiring, weather-tight wire entrance junction box, photoelectric cells, swing brackets, strapping, bolts, washers, and associated hardware to make the signs fully operational.

(c) School Zone Speed Limit Flashing Warning Signs. Each.

Includes sign assembly, LED indications, NEMA rated enclosure contained controller assembly, time clock, solar components (if applicable), wireless/cellular communication (if applicable), wiring, and associated hardware to make the sign fully operational.

(d) Flashing Warning Signs. Each.

Includes sign assembly, LED indications, controller assembly, time clock, solar components (if applicable), wiring, and associated hardware to make the sign fully operational.

(e) LED Blank-Out Sign. Each.

Including all Blank-Out sign assembly and necessary connections, wiring, photoelectric cells, brackets, strapping, bolts, washers, and associated hardware to make the signs fully operational.

(f) LED Border Lit Sign. Each.

Includes sign assembly with LED border, controller assembly, time clock, wiring, solar components (if applicable), detector (if applicable), controller communications (if applicable), and associated hardware to make the sign fully operational.

(g) LED Red Signal Ahead Sign. Each.

Includes sign assembly and all necessary connections, wiring, photoelectric cells, brackets, strapping, bolts, washers, and associated hardware to make the signs fully operational. Signal integration is incidental to the sign.

(h) Rectangular Rapid Flashing Beacon Assembly. Each.

Includes crossing sign(s), NEMA rated enclosure contained controller assembly, controller assembly, wireless communication system, rapid flashing beacon unit, pedestrian confirmation light, backplate (optional), push button, push button sign, passive pedestrian detection (if applicable), solar components (if applicable), wiring, and associated hardware to make the sign assembly fully operational.

SECTION 937—DELINEATION DEVICES

937.1 DESCRIPTION—This work is the furnishing, installation, and removal of delineation devices of the type and color indicated.

937.2 MATERIAL—Provide delineation devices of the type and color indicated in the Standard Drawings and as listed in Bulletin 15. Certify materials as specified in Section 106.03(b)3. Delineation devices are incidental for temporary barrier. Refer to Section 627.

(a) **Barrier Mount.** Provide delineation devices with an anchoring system of pressure-sensitive or epoxy adhesive as recommended by the manufacturer for anchoring the delineation device to the top or side of the barrier.

(b) **Guide Rail Mount.** Provide delineation devices with an anchoring system as recommended by the manufacturer for anchoring to the face or top of the strong or weak post guide rail.

(c) **Post Mount.** Provide delineation devices mounted on flexible posts meeting NCHRP 350 crash test criteria.

1. **Ground Mount.** Provide a ground mount anchoring system for installing flexible delineator posts in the ground or in proposed pavement, median or island.

2. **Surface Mount.** Provide a surface mount anchoring system for installing flexible delineator posts to existing pavements.

937.3 CONSTRUCTION—

(a) **General.** Locate delineation devices as indicated, by type and color. Remove and install devices as shown on the Standard Drawings. Verify that the reflective surface of all delineation devices is visible to approaching traffic. Remove and dispose of delineators not being replaced, as indicated.

(b) **Barrier Mount.** Install barrier-mount delineators with a pressure-sensitive adhesive or epoxy as recommended by the manufacturer on a section of barrier that is clean and dry.

(c) **Guide Rail Mount.** Install guide rail mounted delineators as indicated for the particular type. Be certain the delineators are securely attached to the face of the guide rail or the top of the guide rail post as recommended by the manufacturer.

(d) **Post Mounts.** Check each post to be certain it is plumb.

1. **Ground Mount.** Drive flexible delineator post soil anchors until the top is flush with the ground. Place soil anchors in proposed pavement, median or island for in-pavement mount. Insert post and secure as recommended by the manufacturer.

2. **Surface Mount.** Install surface mount base anchors on the existing pavement and insert post and secure as recommended by the manufacturer.

937.4 MEASUREMENT AND PAYMENT (permanent barrier only) —

(a) **Delineator.** Each
The unit price includes removal of existing delineation devices.

(b) **Delineator Removal.** Each

SECTION 938—DISTANCE MARKERS

938.1 DESCRIPTION—This work is furnishing and installation of distance markers on breakaway steel posts or distance marker supports.

938.2 MATERIAL—As shown on the Standard Drawings and as follows:

- Aluminum Blanks—Section 1103.04(a)
- Breakaway Steel Posts—Section 1103.08
- Anti-Theft Hardware—Section 1103.11(j)
- Brackets, Bars, Clamps, Straps and Gussett Plates (Supports)—Section 1103.12(i)

938.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

The location of an initial marker will be established by the Representative.

Locate the markers in order along both main roadway sides, beginning as directed. Measure to accurately establish the marker locations, in 11-mile increments, along the outside pavement edge of the northbound or eastbound roadway only. Locate markers on the southbound or westbound roadway, opposite the marker locations established on the northbound or eastbound roadway.

Drive posts or erect supports, where necessary, and mount markers. After mounting markers, tighten anti-theft nuts and bolts to ensure a snug fit.

Erect markers facing traffic on distance marker brackets if a marker location is on a structure.

938.4 MEASUREMENT AND PAYMENT—Each

The price includes posts and supports.

SECTION 939—POST MOUNTED SIGNS, TYPE M

939.1 DESCRIPTION—This work is furnishing and installation of flat sheet signs on posts attached to concrete median barrier.

939.2 MATERIAL—As shown on the Standard Drawings, and as follows:

- Flat Sheet Signs—Section 1103.04
- Breakaway Steel Posts – From a manufacturer listed in Bulletin 15 and as specified in Section 1103.08.

939.3 CONSTRUCTION—As shown on the Standard Drawings and as specified in Section 930.3(a) and Section 931.3(b).

Permanently scribe 1-inch numerals on back of sign indicating the month and year of installation.

939.4 MEASUREMENT AND PAYMENT—Square Foot of sign

The unit price includes fabrication and installation of sign support, and removal of existing signs.

SECTION 940 – RESET POST MOUNTED SIGNS, TYPE A

940.1 DESCRIPTION—This work is the removal of existing extruded aluminum channel signs or flat sheet signs, posts, anchors, foundations, and associated hardware and resetting the existing signs as indicated with new posts, anchors, foundations, and associated hardware.

940.2 MATERIAL—Section 930.2(a), except delete the first bullet; Section 930.2(b), except delete the first bullet; and Section 930.2(c).

940.3 CONSTRUCTION—Section 930.3 and as follows:

Remove existing signs, posts, anchors, and associated hardware as indicated. Remove existing foundations to a minimum depth of 12 inches below final ground surface, and backfill any holes as specified in Section 206.3(b)4.

Stockpile signs for reuse. Dispose of existing anchors and associated hardware outside the right-of-way.

If specified or indicated, store existing posts for Department pickup. Otherwise, dispose of existing posts outside the right-of-way.

Provide new posts, anchors, foundations, and associated hardware to be set at the specified locations. Reset the existing signs.

Avoid damage to existing signs during the removal and stockpiling operations. Replace any sign lost or damaged as a result of any of the resetting operations, at no additional expense to the Department.

940.4 MEASUREMENT AND PAYMENT—Each

SECTION 941 – RESET POST MOUNTED SIGNS, TYPE B

941.1 DESCRIPTION—This work is the removal of existing flat sheet signs, posts, anchors, and associated hardware and resetting the existing flat sheet signs as indicated with new posts, anchors, and associated hardware.

941.2 MATERIAL—Section 931.2, except delete the first bullet.

941.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in Section 930.3(a), (b), (d), and (e), and as follows:

- Remove existing signs, posts, anchors, and associated hardware as indicated.

- Stockpile signs for reuse. Dispose of existing anchors and associated hardware outside the right-of-way.

- If specified or indicated, store existing posts for Department pickup. Otherwise, dispose of existing posts outside the right-of-way.

- Provide new breakaway steel posts, anchors, and associated hardware to be set at the specified locations. Reset the existing signs.

- Avoid damage to existing signs during the removal and stockpiling operations. Replace any sign lost or damaged as a result of any of the resetting operations, at no additional expense to the Department.

941.4 MEASUREMENT AND PAYMENT—Each

SECTION 942 – RESET POST MOUNTED SIGNS, TYPE C

942.1 DESCRIPTION—This work is the removal of existing signs, wood posts, foundations, and associated hardware and resetting the existing signs as indicated with new wood posts, foundations, and associated hardware.

942.2 MATERIAL—Section 932.2(a), except delete the first bullet; Section 932.2(b).

942.3 CONSTRUCTION—Section 932.3 and as follows:

Remove existing signs, wood posts, foundations, and associated hardware as indicated. Backfill any holes as specified in Section 206.3(b)4.

Stockpile signs for reuse. Dispose of existing associated hardware outside the right-of-way.

If specified or indicated, store existing posts for Department pickup. Otherwise, dispose of existing posts outside the right-of-way.

Provide new treated wood posts, foundations, and/or associated hardware as directed to be set at the specified locations. Reset the existing signs.

Avoid damage to existing signs during the removal and stockpiling operations. Replace any sign lost or damaged as a result of any of the resetting operations, at no additional cost to the Department.

942.4 MEASUREMENT AND PAYMENT—Each

SECTION 943—RESET POST MOUNTED SIGNS, TYPE D

943.1 DESCRIPTION—This work is the removal of existing flat sheet aluminum signs with stiffeners, steel pipe supports, and associated hardware and resetting the existing flat sheet aluminum signs with stiffeners as indicated with new steel pipe supports, fastened to fabricated structural steel mounting brackets.

943.2 MATERIAL—As specified in Section 933.2, except delete the first bullet.

943.3 CONSTRUCTION—As shown on the Standard Drawings, as specified in Section 933.3, and as follows:

Remove existing signs, supports, anchors, and associated hardware as indicated.

Stockpile signs for reuse. Dispose of existing anchors and associated hardware outside the right-of-way.

If specified or indicated, store existing supports for Department pickup. Otherwise, dispose of existing supports outside the right of way.

Provide new steel pipe support, fasteners, and fabricated structural steel mounting brackets to be set at the specified locations. Reset the existing signs.

Avoid damage to existing signs during the removal and stockpiling operations. Replace signs lost or damaged as a result of the resetting operations, at no additional cost to the Department.

943.4 MEASUREMENT AND PAYMENT—Each

SECTION 944 – RESET POST MOUNTED SIGNS, TYPE E

944.1 DESCRIPTION—This work is the removal of existing signs, posts, foundations, and associated hardware and resetting the existing signs as indicated with new posts, foundations, and associated hardware.

944.2 MATERIAL—Section 934.2(a), except delete the first bullet; Section 934.2(b), except delete the first bullet.

944.3 CONSTRUCTION—Section 932.3 and as follows:

Remove existing signs, posts, foundations, and associated hardware as indicated. Backfill any holes as specified in Section 206.3(b)4.

Stockpile signs for reuse. Dispose of associated hardware outside the right-of-way.

If specified or indicated, store existing posts for Department pickup. Otherwise, dispose of existing posts outside the right-of-way.

Provide new posts, foundations, and/or associated hardware as directed to be set at the specified locations. Reset the existing signs.

Avoid damage to existing signs during the removal and stockpiling operations. Replace any sign lost or damaged as a result of any of the resetting operations, at no additional cost to the Department.

944.4 MEASUREMENT AND PAYMENT—Each

SECTION 945 – RESET POST MOUNTED SIGNS, TYPE F

945.1 DESCRIPTION – This work is the removal of existing signs and associated hardware and resetting the existing signs as indicated on existing posts or posts installed for other purposes.

945.2 MATERIAL – Section 935.2, except delete the first, third, and fourth bullets.

945.3 CONSTRUCTION –Section 935.3 and as follows:

- Remove existing signs and associated hardware as indicated.

- Stockpile signs for reuse. Dispose of existing associated hardware outside the right-of-way.

- If specified or indicated, store existing posts for Department pickup. Otherwise, dispose of existing posts outside the right-of-way.

- Reset the existing signs at the specified locations. Provide new associated hardware as directed.

- Avoid damage to existing signs during the removal and stockpiling operations. Replace any sign lost or damaged as a result of any of the resetting operations, at no additional cost to the Department.

945.4 MEASUREMENT AND PAYMENT – Each

SECTION 948—STEEL SIGN STRUCTURE

948.1 DESCRIPTION—This work is the construction of overhead steel sign structures of the type indicated.

948.2 MATERIAL—

(a) Cantilever, Centermount, Monopipe, or Span with Single Plane Truss.

1. Pipe Columns, Struts, and Truss Chords. Provide supplemental CVN testing (Zone 2, non-fracture critical in accordance with AASHTO Specifications) for all pipe with nominal wall thicknesses greater than 1/2 inch.

The actual yield strength for all pipe, per mill test report, is not to exceed 65,000 pounds per square inch.

1.a ASTM A 53/A 53M, Grade B, Type E or S; or ASTM A 500, Grade B; or ASTM A 106, Grade B

1.b API 5L, Grades B, X42 or X52; PSL2 with the following characteristics:

- No jointers permitted
- Do not use thermomechanical rolled or thermomechanical formed (grade suffix M) pipe on monopipe structures.
- Process of manufacture: seamless, electric resistance welded, or longitudinal seam, submerged arc welded.

2. Truss Webs and Truss Verticals. As specified in Section 948.2(a)1 for tubular members; or Section 1105.02(a)2 for structural shapes.

3. Steel Angle, Shapes and Plates. Section 1105.02(a)2

4. Press-Break Columns. Section 1105.02(a)2, unless otherwise specifically approved by the Department.

Provide supplemental CVN testing (Zone 2, non-fracture critical, in accordance with AASHTO Specifications) for columns with nominal wall plate thicknesses greater than 1/2 inch.

Provide a minimum internal surface (concave) bend radius at each press-break that is five times the wall thickness or 1 inch, whichever is larger. (Bends are parallel to direction of mill rolling).

The dimension across the flats on fabricated press-break columns may not vary by more than 2% from the specified dimension. The fabricator is responsible for all fabrication adjustments that may be necessary to accommodate any dimensional variation.

(b) Span with Tri-Chord or Box-Shaped Truss. As specified in Sections 948.2(a)1 through 948.2(a)4.

(c) Tapered Tube Structures.

1. Chord and Column Members. Section 1105.02(a)2. Provide supplemental CVN testing (Zone 2, non-fracture critical, in accordance with AASHTO Specifications) for tube wall thickness greater than 1/2 inch. If press-break columns are used, provide a minimum internal (concave) surface bend radius that is five times the wall thickness or 1 inch, whichever is larger. (Bends are parallel to direction of mill rolling).

2. Steel Angles, Shapes, and Plates. Section 1105.02(a)2

(d) Fabricated Structural Steel. Section 1105, except identify on the shop drawings weld locations, type, size, process, and nondestructive testing. Shielded Metal Arc Welding (SMAW), Submerged Arc Welding (SAW), Gas Metal Arc Welding (GMAW), and gas-shielded Flux Cored Arc Welding (FCAW) are approved. Galvanize as specified in Section 1105.02(s). If necessary, perform one time weld repair of column to base plate, column to splice plate, chord to splice plate, and/or circumferential butt welds in chords and columns. If the initial repair fails, seek

approval of the Chief Structural Materials Engineer before making any further repairs at the previously repaired location. Column base plates must meet a Class C flatness tolerance, as specified in Section 1111, for structures erected directly on a pre-finished concrete foundation using bridge shoe bedding material. Perform and evaluate all non-destructive testing according to cyclically loaded non-tubular tension criteria.

1. Perform the following minimum ultrasonic testing of Complete Joint Penetration (CJP) groove welds:

1.a On monopipe structures, 100% of the length of all CJP groove welds; on other structures, 25% of the length of the length of each weld connecting columns to base plates, cords to splice plates connection plates to columns and chords, welds on truss seat plates, and longitudinal seam welds on cantilever and center-mount sleeves.

- If a rejectable defect is found on a partially tested weld, then test 100% of the CJP weld length on that plate or sleeve.

1.b 100% of the groove weld length on at least 25% of the number of similar type connections of web members to the truss chords.

- If any rejectable defect is found, double the testing frequency until no rejectable defects are discovered.

2. Perform the following minimum magnetic particle inspection (MT) of fillet welds and Partial Joint Penetration (PJP) groove welds.

2.a Intermediate member connections: MT 100% of the weldment length on at least 25% of the total number of connections on trusses and towers, respectively.

- If any rejectable defect is found, double the testing frequency until no rejectable defects are discovered.

2.b Welds on truss seat plates, base plates, cantilever and center-mount sleeves, and alternate press-break members and fillet welds connecting backing rings to base plates and flange splice plates: MT a minimum of 25% of the total length of each weld.

- If a rejectable defect is found, then test 100% of the weld on that element.

2.c Welds attaching handhole frames to columns: MT 100% of the length of each weld.

2.d All other connections: MT 100% of the weldments on at least 10% of the total number of connections

- If any rejectable defect is found, double the testing frequency until no rejectable defects are discovered.

3. Perform 100% radiographic inspection of complete penetration longitudinal seam welds on tapered tube structures and on all press-break columns.

4. The Department's plant inspector will select weld locations and weldments to be tested when less than 100% of weld length is required to be tested.

5. Backing rings for full penetration welds must be continuous or butt welded with a full penetration weld. Perform 100% ultrasonic inspection (UT) of butt welds in rings 5/16-inch and thicker. Perform 100% MT on rings less than 5/16-inch thick.

(e) Anchor Bolts, Nuts, and Washers. Section 1105.02(c)3, except anchor bolts shall conform to Grade 55 only.

(f) Class A Cement Concrete. Section 704

(g) Mortar. Section 1001.2(d), with a 1-day compressive strength equal to or greater than 3,750 pounds per square

inch.

(h) Reinforcement Bars. Section 709.1

(i) Stainless Steel U-Bolts and Washers. ASTM A 276, Type 304. Maximum allowable diameter for stainless steel U-bolts is 3/4 inch Condition B.

(j) Stainless Steel Nuts. ASTM F 594, Alloy Group 1

(k) High Strength Bolts. Section 1105.02(d)

- Furnish bolts, nuts, and washers for testing purposes and test as specified in Section 1050.3(c)7.b.
- U-bolts, other than stainless steel, shall conform to ASTM A 449.
- Stainless Steel U-bolts as specified in Section 948.2(i) may be substituted for ASTM A 449 U-bolts for bolt diameters of 3/4 inch and smaller.

(m) Bedding Material for Bridge Shoes. Section 1113.03(h)

(n) Pre-Assembly of Field Connections. Before galvanizing, preassemble field connections of chord trusses and chord sections to verify geometry and camber. If distortion occurs after galvanizing, re-verify.

(o) Certification. Section 106.03(b)3

948.3 CONSTRUCTION—As indicated, as shown on the Standard Drawings, and as follows:

(a) General. Submit detailed shop drawings for review and acceptance. Submit erection drawings as directed by the Structure Control Engineer conforming to Section 105.02. Material and workmanship not previously inspected will be inspected on the work site. Remove rejected material from the work site. Restore the site to its original condition, including the disposal of excess or unsuitable material.

(b) Foundations. Excavate and construct the foundations of Class A cement concrete, as specified in the applicable parts of Section 1001.3.

Use steel templates provided by the fabricator to accurately set tower base anchor bolts to the correct elevation and alignment. Securely brace the bolts against displacement before concrete is placed. Provide conduit sweeps when required.

After constructing the concrete foundations, backfill the excavation around the foundation using acceptable material, in uniform loose layers, not exceeding 4 inches in depth. Compact to the necessary density by means of mechanical tampers.

(c) Bearing Areas. Construct the column base bearing areas of concrete pedestals, in a true and level position. Provide full bearing under bases. Place bedding material for bridge shoes, if indicated.

(d) Cantilever and Centermount Structures. Adjust cantilever and centermount structures, after the sign panels and lighting are installed, to make the signs level.

(e) Column Installation and Anchor Bolt Pretensioning. Install sign structure columns, and pretension the anchor bolts in strict conformance with the following procedure:

1. Remove all dirt or other foreign material from the top of the concrete pedestals or caissons. Clean top and bottom surfaces of column base plates to the satisfaction of the Representative; remove any burrs or excessive surface galvanizing in the area of the anchor bolt holes that would prevent proper seating of the washers in the snug tightened condition.
2. Verify that a test nut can be turned onto each anchor bolt to a point below the elevation corresponding

to the bottom of each in-place leveling nut, and can then be backed off the bolt by the effort of one person using a 12-inch long wrench or equivalent without employing a pipe extension on the wrench.

3. Clean and lubricate the exposed threads of all anchor bolts. Clean and lubricate the threads and bearing surfaces of all nuts. Re-lubricate the anchor bolts and the nuts if more than 24 hours has elapsed since earlier lubrication, or if the bolts or nuts have become wet since they were first lubricated.
4. Turn the leveling nuts onto the anchor bolts and align the nuts to their approximate final elevation. Place one hardened washer on top of each leveling nut.
5. Install column. Column must fit freely over the anchor bolts; do not force column onto anchor bolts. Support the column with the crane as necessary, and adjust leveling nuts to align the column into its proper upright position. Bring all leveling nut washers into contact with the bottom of the base plate.

NOTE: Upon subsequent completion of any column installation and the tightening of all nuts, the clear dimension between the bottom of each leveling nut and the top of the concrete pedestal or caisson shall not exceed approximately 1 inch as shown on the Standard Drawings. In no case shall this clear dimension ever exceed the diameter of the anchor bolt unless substantiated by design bending calculations for the bolts.

6. Place one hardened washer onto each anchor bolt on top of the base plate, and turn the top nuts onto the anchor bolts and into contact with the washers on the base plate.

NOTE: If for any reason, the slope of an anchor bolt from vertical, or the slope of the base plate from horizontal, results in a deviation of greater than a 1:40 slope at the bolt/plate intersection, or if a nut cannot be brought into full contact with the base plate after final tightening, a fabricated-to-fit beveled washer must be used in place of a flat washer under each nut at that location.

7. Tighten the top nuts to a snug-tight condition using a star tightening pattern. Snug-tight is defined as the maximum nut rotation resulting from the full effort of one person using a 12-inch long wrench or equivalent (no pipe extensions). A star tightening pattern is one in which the nuts on opposite or near opposite sides of the bolt circle are successively tightened in a pattern resembling a star.
8. Tighten the leveling nuts to a snug-tight condition using a star tightening pattern as stipulated for top nuts. At this point, verify that the clear distance between the bottom of each leveling nut and the top of the concrete is compliant with maximum allowable requirements.
9. Before final turn-of-nut tightening of the top nuts, mark the reference position of each top nut in its snug-tight condition with a suitable marking on one flat, and a corresponding reference mark on the base plate at the same location. Then, using a star tightening pattern and at least two tightening cycles (passes), incrementally turn the top nuts until achieving the total required nut rotation as specified in the table below. After tightening is completed, verify proper rotation at each nut by observing the reference marks, and verify that the nut and washer are in full contact with the top surface of the base plate.

Top Nut Rotation Beyond Snug Tight	
Anchor Bolt Diam. (in.)	F1554 Grade 55
≤ 1 1/2	1/3 Turn
> 1 1/2	1/6 Turn
Note: The top nut rotation tolerance is -0, +20 degrees (1/18 turn) from the specified value.	

10. Install jam nuts to a snug-tight condition, and burr the threads of each anchor bolt immediately above the jam nut.
11. Install the rodent screen on the base plate.
12. Verify bolt/nut tensioning no sooner than 48 hours, and no later than 7 days after final/complete

installation, as follows:

- a. Remove the rodent screen.
 - b. Using a 12-inch long wrench, apply a snug-tight force to each top nut (not jam nut) and then to each leveling nut as stipulated in Paragraphs 7 and 8 above. If any nut rotates by any amount, carefully document the location and approximate degree of rotation of that nut, in writing, and report the information to the Chief Structural Materials Engineer as soon as possible upon completion of the verification.
 - c. Apply a snug-tight force to each jam nut, and replace the rodent screen.
- (f) **Expansion.** Provide a 1 1/4-inch clearance for expansion of structures mounted between concrete walls. Hand-tighten the nuts on the U-bolts at expansion points on such structures, and then install jam nuts.
- (g) **Connections Using High-Strength Bolts.** Section 1050.3(c)7

948.4 MEASUREMENT AND PAYMENT—

- (a) **Steel Sign Structures.** Lump Sum
The price includes removal of existing signs.
- (b) **Class 3 Excavation.** Section 204.4
- (c) **Class A Cement Concrete.** Section 1001.4
- (d) **Reinforcement Bars.** Section 1002.4

SECTION 950—TRAFFIC SIGNALS-GENERAL

950.1 DESCRIPTION—This work is the furnishing and installation of traffic signals.

950.2 MATERIAL—

(a) Traffic Signal Components. Traffic signal and traffic signal system installations are comprised of the following equipment and materials components. Provide catalog cuts to the Representative for approval before ordering any traffic signal component planned for use. Submit catalog cuts through the PennDOT Project Collaboration Center (PPCC), or as directed.

1. Traffic Signal Supports. Traffic signal supports for the mounting of traffic control devices, signs and luminaires as specified in Section 951.2.

2. Controller Assembly. Traffic signal controller assembly as specified in Section 952.2.

3. Traffic Signal Systems and Communications. System and communication equipment for the control of multiple traffic signals that are part of a coordinated system as specified in Section 953.2.

4. Electrical Distribution. Electrical service and material components for the control and illumination of traffic signals as specified in Section 954.2.

5. Signal Heads. Illuminated vehicular, pedestrian, or lane-control signal heads for the control of traffic as specified in Section 955.2.

6. Detectors. Devices that detect the presence or passage of vehicles or pedestrians as specified in Section 956.2.

7. Adaptive Signal Systems. Adaptive traffic control signal system consisting of special software and hardware that allows signal timing and coordination based upon actual traffic demands as specified in Section 957.2.

(b) Temporary Traffic Control Signals. During stationary construction or maintenance operations, temporary traffic control signal equipment and materials may be required as part of a temporary traffic control plan. Depending upon the individual temporary traffic control plan needs, various types of temporary signal configurations and equipment may be specified as indicated below. Temporary Traffic Control Signal equipment and material must conform to Publication 213, Part 4 of the MUTCD, and as specified in Sections 958.2.

1. Temporary Traffic Control Signals on Fixed Supports. These temporary fixed support signals are comprised of the same traffic signal components (equipment and materials) that are used on permanent signals. Provide temporary signal system on fixed supports as specified in Section 958.2(b).

2. Temporary Traffic Control Signals on Pedestal-Mounted Portable Traffic Control Signal Systems. These temporary portable signals are complete manufactured signal systems. Provide each pedestal-mounted portable traffic control signal system as specified in Section 958.2(c).

3. Temporary Traffic Control Signals on Trailer-Mounted Portable Traffic Control Signal Systems. These temporary portable signals are complete manufactured signal systems. Provide each trailer-mounted portable traffic control signal system as specified in Section 958.2(d).

4. Temporary Timing Adjustments to Existing Permanent Traffic Signal Controller. These temporary timing modifications and restorations are at existing permanent traffic signals affected by construction-related traffic. Provide materials as required to complete the timing adjustment work as specified in Section 958.2(e).

950.3 CONSTRUCTION—

(a) Standard Construction Practices. As specified in Sections 910.3(a) and 1105, as shown on the Standard Drawings, and as follows:

- Existing traffic signals are to remain in operation until the new traffic signal equipment and devices are in place and operable unless indicated otherwise. If it becomes necessary to turn off the existing system of signalization, obtain the District Traffic Engineer's approval, municipal concurrence, and provide flaggers or other approved means to direct traffic within the intersection during periods when the traffic signals are not operating. Place temporary poles to support existing traffic signals, as indicated or directed. Provide certification to the Department for temporary poles.
- Revise the existing traffic signal system, as indicated or directed.
- Before ordering any traffic signal or sign support poles, or performing excavations for these poles, perform the following preparatory activities:
 - Perform required actions according to the provisions of PA One Call, "Pennsylvania Underground Utility Line Protection Law Act 50".
 - Locate and mark existing underground utilities in the field. After completing the location and marking of the known utilities, field review the proposed pole locations with the Representative to ensure that no utility conflicts exist.
 - Adjust pole locations as necessary to avoid utility conflicts and provide documentation so the final as-built plans can reflect the changes.
 - Schedule and perform this preparatory work considering the time duration for pole orders to be fulfilled.
- For existing traffic signal supports labeled for removal on the plans, removal includes attached traffic signals, flashing warning devices, lane control signs and signal equipment.
- Removed traffic signal equipment is owned by the municipality or permittee, as indicated. Store removed traffic signal equipment on the project site. Maintain removed controller assemblies as a unit. Do not damage items during removal and storage. Prepare a list of the removed traffic signal equipment and provide the list to the municipal owner or permittee. For equipment wanted by the municipal owner or permittee, deliver the equipment to their storage area. Dispose of all removed equipment not wanted by the municipal owner or permittee.
- Abandon underground conduit, conductors, and detectors not interfering with new construction. Remove foundations and junction boxes that are designated to be abandoned and are located in an "off traveled roadway" area, to 1 foot below final grade, and dispose of removed materials. Fill, compact, and landscape the resulting hole, including topsoil if necessary, by the particular planting.
- Repair damage to galvanized finishes.
- Restore areas damaged by construction.
- Identify vegetation that is blocking the visibility of traffic signals or signs. After obtaining approval from the Representative, remove or relocate vegetation that is blocking visibility. Removal or relocation of vegetation is incidental to the work specified in Sections 951, 952, 953, 954, 955, 956, 957, and 958.
- If not notified by the Representative, notify the Representative as soon as it is recognized that a utility facility is causing, or will cause, an obstruction to visibility.
- Before the initial turn-on, verify for the Representative that all traffic signals are working properly. Make the initial turn-on to flashing mode and full operation in the presence of a representative of the District Traffic Unit, municipality, and manufacturer(s) between the hours of 9 AM and 2 PM, Tuesday through Thursday except holidays, or the day before or after a holiday. Under special circumstances, where necessary to ensure the safety of the motoring public, the Representative may grant exceptions to this rule. Notify the District Traffic Unit a minimum of 7 calendar days before the initial turn-on. For locations presently unsignalized, flash signals for a period of 3 to 7 days before full operation. If approved, the duration of flashing operation may be 3 to 5 days provided that it includes a minimum of 2 weekdays before beginning the normal stop-and-go mode of operation.
- The modification, alteration, removal and storage of existing traffic signal material, the restoration of areas damaged by construction, and testing are incidental to the work specified in Sections 951, 952, 953, 954, 955, 956, and 957.

- Cabinet field termination and wiring shall be neat and orderly. Cables shall be labeled on both ends for future identification consisting of labeling by signal head number, detectors by phase and lane, fiber strand origin/destination. Projects involving signal modification or upgrades to an existing signal installation shall ensure that added, new wiring is labeled, or if already labeled, that existing labels are updated to meet field conditions.
- Remove all abandoned wiring and/or fiber optic cable in conduits.
- Permanently seal all abandoned conduits.
- During construction, a plan set shall be maintained, in either hard copy or electronic format, to track required field changes for ease of providing as-built plans.

(b) Traffic Signal Components.

1. **Traffic Signal Supports.** Section 951.3.
2. **Controller Assembly.** Section 952.3.
3. **Traffic Signal Systems and Communications.** Section 953.3.
4. **Electrical Distribution.** Section 954.3.
5. **Signal Heads.** Section 955.3.
6. **Detectors.** Section 956.3.
7. **Adaptive Signal Systems.** Section 957.3.

(c) Temporary Traffic Control Signals. Section 958.3.

(d) Traffic Signal Testing and Compliance.

1. Controller Assembly Bench Testing.

1.a Manufacturer Bench Test. Provide results of manufacturer's bench test that is conducted after production of a traffic controller assembly. The physical and functional bench test shall verify the controller assembly's continuous and satisfactory operation and include:

- A test duration of a minimum of 7 calendar days, according to industry standards.
- Provide 300W loads for signal circuit and simulated inputs for detectors, and interconnection.
- Demonstrate and provide written documentation that the conflict monitor, or malfunction management unit will cause transfer of the signals to a flashing operation upon sensing all possible conflicting signal indications.
- Certify that the equipment operates as indicated.
- Submit results from bench tests to the Representative according to the standards for the applicable controller type as follows:
 - NEMA TS1 Standard "Traffic Control Systems" (for existing traffic control equipment)
 - NEMA TS2 Standard "Traffic Controller Assemblies with NTCIP Requirements"
 - Type 2070 Industry Standard

1.b Project Simulation Bench Test. Provide results of manufacturer/supplier's project simulation bench test that is conducted after the selection of the specific controller assembly(ies) to be used on the project, by model/serial (identification) number. The physical and functional project simulation bench test shall verify the controller assembly's satisfactory operation and include:

- A working simulation utilizing project time settings as indicated. Simulation will demonstrate random inputs for detectors, interconnection, and preemption.
- A bench test with preemption equipment installed and fully working.
- Notify the District Traffic Engineer, in writing, of the dates, time, and place of bench testing a

minimum of two weeks in advance of the actual testing.

- Schedule and conduct the bench test Monday through Friday except holidays.
- Submit results from bench tests to the Representative.

2. Electrical Testing & Commissioning. Test traffic signal power and control wiring circuits after installation of the electrical distribution system, before connecting to traffic signal operating equipment, and in the presence of the Service representative. Test as specified in Section 954.3(j).

3. Conflict Monitor/MMU Testing and Controller Testing. As specified in Section 952.3, and as follows:

Connect the conflict monitor or malfunction management unit to function as specified in Section 952.2(c). When the controller assembly becomes operational, and during initial turn-on, demonstrate that the conflict monitor, or malfunction management unit will cause transfer of the signals to flashing operation upon sensing all possible conflicting signal indications. Conduct the demonstration, as directed, in the presence of the Representative. The 30-day system test shall not begin until the conflict monitor or malfunction management unit is functioning properly.

4. Vehicular Detection Testing. As specified in Section 956.3(a), provide field validation that the detector equipment is properly working.

5. Pedestrian Detection Testing. As specified in Section 956.3(b):

- Pushbuttons - Field-test the operation by activating the pushbutton and performing a visual check of the controller indicator lights and a timing check of the pedestrian phase or phase extension.
- Accessible Pedestrian Signals (APS) - Field-test the operation by activating the pushbutton and performing a visual check of the controller indicator lights and a timing check of the pedestrian phase or phase extension.

6. Preemption System Testing. As specified in Section 956.3(c), test complete system at the intersection with an emergency vehicle.

7. Emergency Generator Power / Uninterruptible Power Supply (UPS) Testing.

- Generator – As specified in Section 954.3(l), in the presence of a representative of the municipality and District Traffic Unit, or other Department representative, demonstrate operation of the traffic signal for a minimum of five minutes using a municipal generator and a provided cord that is compatible with the municipal generator. Test the electrical automatic relay switch over.
- UPS – As specified in Section 954.3(m), initiate a 30-day test only after the total system is running and functional. Install and test the UPS according to the manufacturer's recommendations.

8. 30-Day Testing (each individual intersection). As specified in Section 952.3, and as follows:

- After the traffic signal installation becomes operational, conduct a continuous, 24-hour operating test for not less than 30 consecutive calendar days. Correct failures during the test period by repairing or replacing malfunctioning parts or equipment or faulty work regardless of the cause in less than 24 hours as directed. After correcting failures caused by defective equipment, material, or faulty work, re-conduct the 30-day test.
- During the 30-day test period, change, adjust, or reinstall controller settings, time-based coordination settings, master controller settings, central office monitor settings, and Unified Command and Control Systems settings as directed at any time. Adjust or revise initial signal timing parameters, as directed, to optimize signal operation due to actual traffic flows and field conditions. Provide opportunity for municipal employees, Department personnel and municipal traffic signal maintenance contractor to observe timing setting adjustments during controller, time-based coordinator, master controller, central or Unified Command and Control system office monitor setup and subsequent timing adjustments. Accomplish initial turn-on of the controller assembly in the presence of a representative of the District Traffic Unit, municipality, and manufacturer(s). If signal timing adjustments are performed remotely at the direction of the municipality or Department, provide either electronic or hardcopy documentation of adjustments to the municipality and Department. During this time period, power and communication

costs associated with maintaining the operation of the traffic signal will be the responsibility of municipality or other party that currently (or will ultimately) assume ownership or maintenance of the installation.

- In addition to the provisions as specified in Sections 105.10 and 107.10, those Department, Federal, and municipal personnel and agencies, as well as public and private interests, that are involved with the signal installation, have jurisdictional control over the installation or adjacent facilities, or will ultimately assume ownership or maintenance of the installation, will at the discretion of the Department, be allowed to observe signal turn-on, installation of initial timing parameters and any subsequent adjustment, and inspection before completion of 30-day test.
- Before completion of the 30-day test, provide as-built plans to the municipality and Department documenting all field changes made during construction. As-built plans shall show redlined field changes and be provided in either a hardcopy or electronic format.

9. 30-Day Testing System. As specified in Section 953.3, and as follows:

- For traffic signal systems, conduct a separate 30-day test on the system and communications after the completion of all individual intersections' 30-day tests. Test the entire system for the indicated operation, including proper operation and communication between local controller assemblies, master controller assemblies, and other necessary remote control or monitoring equipment.

10. 180-Day Operational Support Period. Guarantee the in-service operation of mechanical and electrical equipment, related components, and the controller assembly for a period of 180 days from the date of completion of the required 30-day field test.

For new traffic signal installations, Contractor is responsible for all traffic signal equipment and components through completion of the 180-day operational support period.

For retrofits of existing permanent traffic signals, Contractor is responsible for all newly installed traffic signal equipment and components through completion of the 180-day operational support period. Contractor shall assume responsibility for traffic signal cabinet and contents if new equipment or components are installed within the cabinet. Municipality or municipal signal maintenance contractor is responsible for all other traffic signal equipment and components.

During this period:

- Maintain equipment in the controller cabinet, as necessary. Use additional locks, as necessary, to prevent entry by others.
- Repair faulty work, repair or replace defective materials or equipment and correct malfunctions in the controller cabinet within 48 hours after starting repairs.
- Start repairs no later than the working day following notification of failures or malfunctions.
- Guarantee repairs or replacements for the balance of the 180-day guarantee period, or 30 days, whichever is the longer period.
- Repair or replacement work not performed within the guarantee period, or any extension period, will be considered latent defects as specified in Section 107.16(b).
- Provide the Representative with the name and telephone number of the person to be notified in the event of failures or malfunctions during the guarantee period.
- Issuance of a 30-day test acceptance certificate or final settlement of the Contract does not in any respect relieve the Contractor of responsibility for the in-service guarantee period described in these Specifications.

(e) Traffic Signal Operational Training/Technical Support. As specified in Sections 953.3(Traffic Signal Systems and Communications), 957.3(Advanced Traffic Signal Technology), and as follows:

- Contractor must require that the signal supplier technical representative be on site during construction signal installations and turn-ons. The technical representative must be knowledgeable in the operation and maintenance of the signal hardware.

(f) Integration with Department Regional Traffic Management Centers (TMCs).

- If required by the contract, traffic signal installation(s) must be integrated into the Regional TMC system for monitoring of operations as specified in Section 953.3(n).

(g) Signal Maintenance/Repair Responsibilities During Construction.

- **New Traffic Signal Installations.** Contractor is responsible for all traffic signal equipment and components through completion of the 180-day operational support period.
- **Retrofits of Existing Permanent Traffic Signals.** Contractor is responsible for all newly installed traffic signal equipment and components through completion of the 180-day operational support period. For temporary modifications to existing permanent traffic signals as specified in 958.3(f), Contractor is responsible for all newly installed traffic signal equipment and components for the duration of the temporary signal modifications.
 - Contractor shall assume responsibility for traffic signal cabinet and contents if new equipment or components are installed within the cabinet.
 - Municipality or municipal signal maintenance contractor is responsible for all other traffic signal equipment and components.

(h) Traffic Signal Asset Management System (TSAMS) Updates. Perform updates to the Department's required TSAMS data elements to capture the revised traffic signal equipment, operations, and conditions resulting from the project implementation changes.

- **TSAMS Access.** Contractor may request access to TSAMS before notice to proceed or may make revisions through a guest login.
- **TSAMS Guidelines.** Request the most recent release of the TSAMS guidelines from PennDOT before notice to proceed. Perform data updates according to the most recent release of the Department's TSAMS guidelines in Publication 191.
- **TSAMS Update Timeframe.** Perform data updates according to the timeframes identified in the most recent release of the Department's TSAMS guidelines in Publication 191.

(i) Documentation Submittals. Furnish, as specified in Sections 951, 952, 953, 954, 955, 956, 957, 958, and as follows:

- Provide three copies of warranties, guarantees, instruction manuals, cabinet wiring diagram, traffic signal equipment wiring diagram, approved plans, parts' lists with each different type material, and manufacturer's timing plan for each controller assembly, according to the approved signal construction drawings.
- Provide within each controller assembly cabinet, accessible manufacturer's instructions for each controller unit, time clock, coordination unit, software programming, timing charts, wiring diagrams, and parts list. These instructions may be provided by a combination of methods such as equipment help menus, USB drive, paper copy, etc. Provide this documentation in a clear protective envelope within each controller assembly cabinet.
- All equipment which requires a separate device to set, adjust, or read the timing intervals, provide plans or programs with one of these devices for each ten units or fraction thereof
- Upon completion of the 30-day test, if there were any changes that would affect a change to these documents, provide three new copies of each.

(j) Warranties and Guarantees. Furnish a transferrable manufacturer's warranty of at least 5 years for all traffic signal equipment which is to be furnished and installed as indicated unless otherwise specified in Sections 950, 951, 952, 953, 954, 955, 956, 957, 958, or 1103. The warranty period shall start when the signal equipment is energized and placed in operation. The warranty shall be transferred to the signal owner within 30 days of the final acceptance of the 180-day test.

Contractor shall provide all labor for the portion of the warranty period that extends through completion and acceptance of the 180-Day Operational Support Period, as specified in Section 950.3(b)10. The warranty shall service all defects in material, faulty design, and component failures. The manufacturer shall replace free of charge any part or component that fails in any manner by reason of defective material or design within the warranty period. The warranty for the replacement part or component shall be at least 5 years or as specified in Sections 950, 951, 952, 953, 954, 955, 956, 957, 958, or 1103. The manufacturer is responsible for all shipping costs to repair or replace equipment under warranty.

The manufacturer shall not be responsible for damage caused by negligence, vehicle strikes, severe weather acts such as lightning, submerged equipment due to flooding, significant wind event, ice/snow loading, etc., or use of equipment in a manner not originally intended during the warranty period. Warranty shall cover precipitation and

typical wind loading as equipment shall have the durability and sealing to successfully prevent damage over the minimum 5-year lifespan of the equipment.

Provide a certificate of warranty and sticker on all major pieces of equipment as directed, identifying manufacturer, contractor, date of installation, and date of energization. Document in TSAMS the date of installation, energization/placed in operation, and duration of manufacturer's warranty for each piece of signal equipment.

(k) Traffic Signals Materials Acceptance. Before the submission of a bid proposal, verify that Bulletin 15 approved products issued by the Department, for traffic signal equipment, as provided in 67 PA Code, Chapter 212.

At least 3 weeks before their installation, submit to the Representative, for review and acceptance, a tabulation of all project traffic signal materials. Include the type of material, manufacturer's name, model number, and the Department's Certificate of Approval number for each item to be supplied. According to Publication 46, obtain the listing of traffic signal items that require Bulletin 15 approval. Provide catalog cuts for further clarification of the material, as specified in Section 950.2(a).

(l) Certification. Section 106.03(b)3.

(m) Unforeseen Traffic Signal Work. Unforeseen traffic signal work is additional work, or additional utility fees, that is beyond the scope of work for plan locations. The Department will identify unforeseen work. As directed, perform unforeseen work utilizing the applicable item as specified in Section 950.4(e). Unforeseen work may include, but not be limited to, replacement of damaged conduit, repair of damaged existing signal equipment, or trimming of trees for signal head visibility.

950.4 MEASUREMENT AND PAYMENT—

(a) Traffic Signal Components. Installations are as specified below. Removal of existing signal equipment as specified in Section 950.3, and as indicated, is incidental to the installed equipment as specified in the below sections.

- **Traffic Signal Supports.** Section 951.4.
- **Controller Assembly.** Section 952.4.
- **Traffic Signal Systems and Communications.** Section 953.4.
- **Electrical Distribution.** Section 954.4.
- **Signal Heads.** Section 955.4.
- **Detectors.** Section 956.4.
- **Adaptive Signal Systems.** Section 957.4.

(b) Temporary Traffic Control Signals. Section 958.4.

(c) TSAMS Updates.

Labor required for TSAMS Updates are incidental to the measurement and payment as specified in Sections 951.4, 952.4, 953.4, 954.4, 955.4, 956.4, and 957.4.

(d) Traffic Signal Intersection Removal. Each.

Full and complete removal of signal equipment at a signalized intersection when in-kind replacement is not performed. Intersections where full signal upgrade is proposed, removal of existing signal equipment as specified in Section 950.3 and as indicated is incidental to the equipment installed as specified in sections 951.4, 952.4, 953.4, 954.4, 955.4, 956.4, and 957.4.

(e) Unforeseen Traffic Signal Work. Dollar.

The contract item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount. Due to the contingent and unpredictable nature of the work being performed, the provisions as specified in Section 110.02(d) are not applicable to this item.

Measured and paid for under Unforeseen Traffic Signal Work item as follows:

1. Negotiated Price – At price agreed upon with the Department before performing the work. If applicable, agreement is also required with FHWA.
2. Force Account Basis – Section 110.03(d)

SECTION 951—TRAFFIC SIGNAL SUPPORTS

951.1 DESCRIPTION—This work is the furnishing and installation of complete and operational traffic signal supports for the mounting of traffic control devices, signs, and luminaires.

951.2 MATERIAL—

(a) General.

- Traffic Signals-General—Section 950.2
- Certification—As specified in Section 106.03(b)3.

(b) Foundation.

- Class A and AA Cement Concrete—Section 704
- Pre-molded Expansion Joint Filler—Section 705.1
- Reinforcement Steel—Section 709.1
- Conduit—Section 954.2(b)
- Non-shrink Mortar—Section 1001.2(e)
- Metal screening—Section 1101.02
- Ground Rod—Section 1101.11(j)

(c) Supports.

1. Structural Supports—General.

1.a Design and Acceptance. Design according to Publication 149 and LRFD Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals. Submit shop drawings according to Publication 149, including calculations for all special structures, for review and acceptance.

1.b Structural Material. Fabricate traffic signal structural material as specified in Section 1105.03, according to AWS D1.1 , AWS D1.2 , and according to the AASHTO M 270 (ASTM A709); Do not apply water to the base metal during plasma arc cutting. Bulletin 15 listing and shop inspection is required. Provide an AWS certified welding inspector (CWI) for welded steel or aluminum pole products as specified in Section 1105.01(g)3. Bulletin 15, shop inspection, and Section 1105 do not apply to painting of aluminum poles and for the following non-welded items: cast aluminum poles, cast steel poles, and cast-iron poles.

The Charpy V-Notch toughness test is required for load carrying tension members greater than 1/2-inch in thickness, as required for Zone 2, non-fracture critical criteria, according to the applicable AASHTO specifications.

Provide steel poles that are either round or multi-sided with a minimum of eight sides.

Provide testing and test methods according to AWS D1.1 or AWS D1.2 and as determined by the BDTD SMS.

Provide non-destructive testing on 100% of full penetration groove welds and a random 25% of partial penetration groove welds of longitudinal seams on steel poles and arms. When inspecting full penetration seam welds, use radiographic test methods on material less than 5/16-inch in thickness, and use radiographic or ultrasonic test methods on material 5/16-inch and greater in thickness. Use magnetic particle inspection on partial penetration seam welds.

Provide non-destructive testing by ultrasonic test methods on random 25% of all pole to base plate and arm to arm plate full penetration groove welds. For tube material less than 5/16-inch in thickness, have the fabricator submit a detailed ultrasonic testing procedure, including acceptance criteria, to the BDTD SMS for review and approval before testing.

For all other welds on steel traffic poles, perform magnetic particle inspection on a minimum of 25% of the length of each weld. Provide inspection for the full length of the weld when less than 6 inches in length.

For mast arm connections, perform testing of bolts, nuts, and washers, including initial rotational-capacity testing of assemblies, as specified in Section 1105.02(d)7.

For aluminum traffic pole structures, perform fabrication and non-destructive testing as specified in Section 1101.01.

Where less than 100% of the weld is non-destructively tested, and a rejectable defect is found, test 100% of the length of the weld.

Where applicable, the Representative will select portions of welds to be tested.
Perform and evaluate all non-destructive testing according to cyclically loaded non-tubular tension criteria.

1.c Support Shafts and Arms. Fabricate shafts and arms in any of the following shapes and styles:

Round Tapered.

- One longitudinal seam, continuously welded, and ground or rolled flush.
- Transverse butt welds are not acceptable.
- Uniform wall thickness.
- Uniform taper, 0.14-inch maximum and 0.07-inch minimum per foot of length.

Round Stepped.

- Round pipe sections, each with not more than one longitudinal seam continuously welded and ground or rolled flush. Join sections by a hot-swaged shrink fit continuously seal-welded to prevent entrance of water.
- Uniform wall thickness for each section.
- Maximum change in diameter between stepped sections not to exceed 2 1/8-inches.

Round Untapered.

- Maximum of one longitudinal seam, continuously welded, and ground or rolled flush.
- Uniform wall thickness and diameter.
- Transverse butt welds are not acceptable

Multi-Sided Tapered.

- Maximum of two longitudinal seams, continuously welded, and ground or rolled to a maximum bead height of 1/8-inch.
- Transverse butt welds are not acceptable.
- Uniform wall thickness.
- Uniform taper, 0.14-inch maximum and 0.07-inch minimum per foot of length.
- Minimum of eight sides.

1.d Additional items.

Cable Support.

- Weld a cable support to the inside top of the shaft.

Grounding.

- Weld a UL-Listed grounding lug, capable of accommodating a No. 6 AWG stranded copper cable, to the inside of the shaft adjacent to the handhole.

Handholes.

- Provide handholes in the shaft of the poles, as shown on the Standard Drawings.
- Reinforce the area to develop the minimum guaranteed yield strength of the shaft.
- Furnish a cover and keeper chain for each handhole.

Wire Inlets.

- Provide a wire inlet at each signal head or at each electrically operated sign location.
- Weatherproof each inlet with an insulated grommet.
- Provide a deburred hole, 2 1/2-inch minimum diameter, in the flange plate and shaft, which serves as a wire entrance into the arm from inside the shaft.
- Provide Type LB access fittings from Type II mounted controller cabinet into pole shaft and in pole shafts for pedestrian pushbuttons.

Anchor Bases.

- Fabricate the base clean, smooth, and of the dimensions necessary for adequate pole mounting and

structural support.

- Provide holes for anchor bolts.
- Fabricate the base to telescope over the shaft and be secured in place by welding.

Galvanizing. Section 1105.02(s) and as follows:

- Galvanize steel shafts and arms, including those manufactured of high strength and corrosion resistant steels, according to ASTM A123 (AASHTO M 111).
- Galvanize accessories and hardware according to ASTM A153 (AASHTO M 232).

2. Overhead Supports. As shown on the Standard Drawings and as follows:

- Shaft and Arms—AASHTO M 270/ASTM A709, Grade 36 or Grade 50, ASTM A36, ASTM A53, ASTM A572 Grade 50, ASTM A501 and A595.
- Luminaire Mounting Arms—Section 1101.03.
- Anchor (Base) Plates, Flange Plates, and Gusset Plates—AASHTO M 270 (ASTM A709), Grade 36. ASTM A36, ASTM A572 Grade 50.
- Miscellaneous Shapes, plates and bars—AASHTO M 270 (ASTM A709), Grade 36. ASTM A36, ASTM A572 Grade 50 and ASTM A992.
- Flange Plate Assembly Bolts, Nuts and Washers—ASTM F3125 Grade A325, ASTM 563 and ASTM F436. Mechanically galvanize according to ASTM B695. Furnish bolts, nuts, and washers for testing purposes and test as specified in Section 1050.02(c)7.b.
- Shaft and Arm Caps—Galvanized steel (C-coat) cast iron or cast aluminum.
- Handhole CH and hole Cover Plates—AASHTO M 270 (ASTM A709), Grade 36. ASTM A36, ASTM A572 Grade 50 and ASTM A1011.
- Pipe Caps—AASHTO M 270 (ASTM A709), Grade 36. ASTM A36, ASTM A572, ASTM A1011 or ASTM B26
- Galloping Mitigation Device, as shown on the Standard Drawings.

3. Pedestal Supports. As shown on the Standard Drawings and as follows:

3.a Aluminum.

- Support—One length, 4 1/2-inch minimum outside diameter aluminum pipe, Schedule 40, ASTM B210, or B221, Alloy 6063-T6.
- Bases—Cast aluminum, ASTM B26, or B 108, Alloy 356-T6; aluminum plate, ASTM B209, Alloy 6061-T6.
- Pole Tops—Aluminum.

3.b Steel.

- Support—One length, 4 1/2-inch minimum outside diameter steel pipe, Schedule 40, ASTM A53, Type F.
- Base—Steel casting, ASTM A27, Grade 65-35; gray iron casting, ASTM A126, Class 26; steel plate, AASHTO M 270 (ASTM A709), Grade 36.

4. Pedestrian Stub Poles. As specified in Section 951.2(c)3 except having a fixed length of 60 inches and a rounded top cap to minimize injuries.

5. Anchor Bolts. As shown on the Standard Drawings and as follows:

- Anchor Bolts—ASTM F1554.
- Hex Nuts—ASTM A563M/A 63.
- Washers—ASTM F436.

Provide bolts and all associated hardware that are galvanized as specified in Section 1105.02(s), ASTM A153, or by another acceptable method conforming to the coating thickness, adherence, and quality requirements of ASTM A153. Provide anchor bolts that are galvanized to the top 8 inches of the bolts. Furnish template prints for setting anchor bolts with each support.

6. Wood Support Poles. If used for temporary signal installations, certify sawn material, both rough and dressed by the mill as to grade and mark as specified in the grading rules and basic provisions of the American Lumber Standards (PS-20-70) by a lumber grading or inspection bureau or agency. If dressed, the grade mark shall be applied after dressing.

7. Span Wire. ASTM A475, Class A, Siemens-Martin, or ASTM B416.

8. Tether Wire. ASTM A475, Class A, Common Grade.

9. Lashing. As shown on the Standard Drawings for attaching cable to span wire.

10. Powder Coating. Provide supports with powder coating using Urethane or Triglycidyl Isocyanurate (TFIC) Polyester Powder finish for pedestrian stub poles, pedestals, mast arms, and strain poles. Provide a sample and corresponding Federal Color Number, that conforms to the color specified, to Municipality and Representative for approval at least 60 days before ordering the traffic signal support poles. Clamps, brackets, banding, strapping, and/or connections placed on powder coated supports shall match the color of supports.

Powder coated supports are to be galvanized with surfaces mechanically etched by brush blasting followed by preheating of the zinc coated substrate to a temperature of 450F for a minimum of one hour in a gas fired convection oven. Apply powder coating electrostatically and cure in a gas-fired convection oven by heating the zinc coated substrate to a minimum temperature of 350F and a maximum temperature of 400F. Provide thermosetting powder resin that provides both intercoat as well as substrate fusion adhesion that meets 5A or 5B according to ASTM D3359.

Supports are to be wrapped in 3/16-inch thick ultra-violet inhibited plastic-backed foam and cradled in a 1.0-inch thick rubberized foam base for transportation. Provide painted matching hardware for all powder coated supports.

951.3 CONSTRUCTION—Section 950.3, and as follows:

(a) Excavation. Before forming and placing concrete, each foundation excavation will be inspected for the actual soil conditions encountered. Do not proceed with the work until the excavation is accepted. If necessary, revise the foundation design based on the soil conditions encountered. Before submitting the revised design for approval, obtain the signature and seal of a Professional Engineer registered in the State. Foundation locations may be changed to avoid underground obstructions, with written permission of the Representative.

(b) Foundations. Install reinforcement steel, anchor bolts, conduit sweeps, and ground rods with ground wire clamps. Orient the anchor bolt template to obtain the proper angle of the mast arm. Place concrete as specified in the applicable parts of Section 1001.3. Place concrete to the finish height. Place Class AA concrete for pedestrian stub pole foundations that are integrated into curb as specified in Section 676.3.

Backfill around the foundation in 6 inch layers with selected on-site material, then compact mechanically to the density of the undisturbed earth. Dispose of excess or unsuitable material. Place 1/2-inch pre-molded, expansion joint filler between the foundation and existing concrete sidewalks and pavements.

After placing concrete, do not install supports for a minimum of 72 hours and the concrete meets compressive strength requirements for Class A as specified in Section 704.

(c) Traffic Signal Supports. Install supports, of the type indicated, on the foundation. Use leveling nuts on the anchor bolts to adjust the vertical support rake to provide a vertical set when the load is added.

Connect the ground wire to the grounding lug.

After installing supports, tighten anchor nuts as specified in Section 948.3(e) and Section 1105.03(j). Place non-shrink mortar or metal screening, providing a drain hole in the mortar or screening. Place mortar or screening vertically at the outside edge of the base plate.

1 Mast Arms. Install mast arm to column using high-strength bolts. Thread-in-place traffic signal support connections are not allowed. Check for vertical alignment of the mast arm after signals, brackets, signs, luminaires, and signal cable are in place. Adjust leveling nuts to correct alignment as needed.

2 Strain Poles. Install span and tether wires on all strain poles. Both span and tether wires are required on all new, retrofitted, and updated strain poles. All new mounting hardware is required to attach span and tether wires to the signal supports, including span wire clamps and dead-end, feed-thru strand vises with stainless steel bails. Provide equipment certifications and sources of supply to the Department for approval before installation.

Allow enough span wire and tether wire length to make sag adjustments after fastening. After installing signal cable, signal heads, and signs, adjust sag of span wire. Check for vertical alignment of strain pole and adjust leveling nuts as needed to correct alignment.

3 Pedestrian Stub Poles.

3.a Foundation Mounted Stub Poles. Place Class A concrete for cast-in-place foundation. Install exposed conduit as shown in the Standard Drawings.

3.b Curb Mounted. Place Class AA concrete curb, including blister if applicable, as specified in Section 630.3. Install exposed conduit as shown in the Standard Drawings.

3.c. Sidewalk Mounted. Place Class A concrete as specified in Section 676.3. Install exposed conduit as shown in the Standard Drawings.

4 Powder Coating. Install all powder coated supports with nylon slings to preserve the integrity of the coating. Pad and handle all components during loading, unloading, and installation. If the coating becomes chipped, scratched, blistered, or otherwise damaged, it must be repaired according to the coating manufacturer's recommendations at no additional cost to the Department.

951.4 MEASUREMENT AND PAYMENT—

- (a) **Traffic Signal Support.** Each.
- (b) **Pedestrian Stub Pole.** Each.
- (c) **Span Wire Replacement.** Linear Foot.
- (d) **Tether Wire Replacement.** Linear Foot.

SECTION 952—CONTROLLER ASSEMBLY

952.1 DESCRIPTION—This work is the furnishing and installation of a traffic signal controller assembly of the type indicated.

952.2 MATERIAL—

(a) General.

- Class A Cement Concrete—Section 704
- Caulking Compound—Section 705.8(b)
- Traffic Signals-General—Section 950.2
- Traffic Signal Systems and Communications—Section 953.2
- Electrical Distribution—Section 954.2
- Signal Heads—Section 955.2
- Certification—Section 106.03(b)3

(b) Controller Assembly-Type of Operation.

1. High Resolution Controller Event Logging.

- Provide high resolution controller event logging conforming to the Indiana Traffic Signal Hi Resolution Data Logger Enumerations
- Allow log files to be retrievable by a remote connection or a local connection. Provide and enable functionality to automatically back up the log files to Universal Serial Bus (USB) flash drive or Secure Digital (SD) card. Log files shall be retained within the controller's local memory for a minimum of 24 hours and archived on external storage within the cabinet for a minimum of 365 days. Log files shall be provided in comma separated text (CSV) format containing the event timestamp, event code and event parameter on each line. If the log files are in a different format, the manufacturer shall provide a translator tool which converts the log files to CSV format. The translator tool shall be able to be run from the command line for files to be batch converted.

2. Operational Requirements.

- Current NTCIP 1202—Object Definitions for Actuated Traffic Signal Controllers (ASC)
- Signal Circuits—12 minimum or as indicated.

(c) Controller Assembly- Controller Unit.

1. NEMA Controller Unit.

1.a Standards.

- TS 1, Section 2, Environmental Standards and Test Procedures.
- TS 1, Section 13, Interface Standards.
- TS 1, Section 14, Solid-State Traffic Signal Controller Units.
-
- TS-2, Section 2, Environmental Standards and Test Procedures.
- TS-2, Section 3, Controller Standards and Coordination.
- TS-2, Section 5, Interface and Electrical Standards.
- TS-2, Section 8, Bus Interface Unit Requirements.
- NEMA Standards Publication TS 2-“Current Edition”.

1.b Controller Requirements.

- All hardware and software must be according to NEMA TS-1, TS-2 standards, and as directed.
- All cabinets require a plug-in hand control with cord and a method of switching the signal controller between automatic and manual control.
- Include ability to accept a contact closure or open controller output to reset clock on controller at a predetermined hour each day .
- Provide communication equipment as indicated and as specified in Section 953.2.
- Controller shall be IP/Ethernet enabled for communications on IP networks.

1.c Conflict Monitor/Malfunction Management Unit.

- TS 1, Section 6, Conflict Monitor.
- TS 2, Section 2.3, Malfunction Management Unit Test.
- TS 2, Section 4, Malfunction Management Unit.
- Conflict monitor shall monitor absence of red indications and be compatible with Flashing Yellow Arrow permitted left turn operation.
- IP/Ethernet enabled for communications on IP networks.

A minimum of one input channel for each load switch socket as specified in Section 952.2(c)1.e.

1.d Flasher Unit.

- TS 1, Section 8, Solid State Flasher.
- TS 2, Section 2.6, Flasher Tests.
- TS 2, Section 6.3, Solid-State Flasher.

1.e Load Switches.

- TS 1, Section 5, Solid-State Load Switches.
- TS 2, Section 2.5, Load Switch Tests.
- TS 2, Section 6.2, Three-Circuit Solid State Load Switch
- Operational Features: Provide Light Emitting Diode (LED) indicators to display operation. Isolate signal load from load switch input using optic couplers. Furnish a minimum of one load switch for each of the following active controller unit functions:
 - Vehicle Phase.
 - Overlapping Vehicle Phase.
 - Pedestrian Phase.

1.f Cabinet. Furnish a weatherproof controller cabinet, large enough to suitably house the traffic signal controller unit and auxiliary equipment, and conforming to the following requirements:

1.f.1 Enclosure.

- Material—Sheet or cast aluminum.
- Wall Thickness—1/8-inch minimum, reinforced where required.
- Minimum Size—As shown on the Standard Drawings and as follows:
Position equipment in the cabinet to provide access to all terminal strips and equipment from the front without removing other equipment. Provide an unobstructed view of all equipment having visual indicators. Place all equipment in an upright position and not on top of other equipment.

Provide Department approved controller cabinet with adequate room for all necessary equipment and cable. Provide stainless steel 5/8-inch handle designed for the door(s) and a full height, continuously welded, piano hinge. Continuously weld all joints of the cabinet. Provide a pull-out shelf to double as a storage container for wiring diagrams, plans, and timing sheets.

Provide a twist lock receptacle and transfer switch for power provided by an emergency generator during power outages. Access to the twist lock receptacle and the transfer switch thorough the use of a locked police door using a No. 2 key or standard police key.

Provide generator adaptor kit as specified in Section 954.2(i).

Provide door with continuous stainless-steel door hinge on right side, door stop at 90 degrees and 180 degrees, ± 10 degrees, for all doors over 22 inches wide, auxiliary door for access to police panel, pocket for prints.

- Type I Cabinet Extension – The cabinet shall be provided with a base extension of not less than 18 -inches nor more than 36 -inches or as indicated. If an Uninterruptible Power Supply is to be provided include a shelf for the Uninterruptible Power Supply unit and associated batteries.
- Auxiliary Cabinet - At locations where traffic signal equipment is to be installed in an existing controller assembly where physical space constraints preclude installation in the existing cabinet, provide auxiliary cabinet assembly, either:
 - Attached to existing Ground Mounted Controller cabinet with bottom of auxiliary cabinet resting on top of existing cabinet foundation; or
 - Pole-mounted, located adjacent to the existing pole-mounted cabinet.

Provide cabinet that meets or exceeds applicable specifications herein for a traffic signal controller assembly.

- Hardware—Vandal and corrosion resistant.
- Finish—Natural with external welds free of irregularities and a maximum bead height of 1/8-inch.
- Gaskets—Neoprene, attached with an oil resistant adhesive.
- Mountings—As indicated, pole or foundation.
- Locks—Brass, tumbler type for main door and standard police lock for auxiliary door; two keys for each lock.
- Latching Mechanism—One point-through mechanism for doors less than 22 -inches in width; three point-through mechanism for doors -22 inches or wider.
- Interior—Shelf-mounted equipment, unless rack or panel-mounted.
- LED light/bar with in-door switch.
- Spring-loaded door switch in the upper right corner of cabinet opening for use as a door open alarm. If the controller cabinet is connected to a RTMC or central system, the door open alarm shall place a notification to the RTMC or central system.
- Test Pushbutton Panel—One pushbutton to each input for simulated detector operation of vehicles and pedestrians with type and phase permanently labeled on panel. Mount panel on inside of door.
- Back panels, wiring and terminals shall accommodate at a minimum 8 phases Actuated. There shall be a minimum of 12 to 16 Load Switch Sockets, with a minimum of 2 unused sockets per unit.

1.f.2 Fan and Ventilation.

- Fan and vent system providing 200 cubic feet of free air delivery per minute (CFM), 2x100 CFM fans, for type I or dark painted controller assemblies or 100 CFM for type II controller assemblies.
- Vents equipped with standard-size, replaceable fiberglass filters.
- Vents that prohibit the entrance of rain and snow.

- Cabinet equipped with an adjustable thermostat connected to control the fans.
- Manually adjustable thermostat with a calibrated scale. Thermostat adjustable within the range of at least 55F to 140F.
- Thermostat with contacts rated for at least eight amperes at 120 volts AC.
- Thermostat capable of turning the fan on at the set temperature and turning the fan off when the temperature is 5F below the set temperature. The activation temperature shall be set by the cabinet manufacturer based on their recommendations.
- A temperature sensor shall provide an alarm for cabinet overheating. Activate the alarm at 150F. If the controller cabinet is connected to an RTMC or central system, the temperature alarm shall place a notification to the RTMC or central system.

2. Type 2070 Controller Unit.

2.a Standards. Comply with current Type 2070 controller industry standards.

2.b Controller Requirements.

- Program module as approved
- Communications module as approved
- Processor module as approved
- Power supply module as approved
- The 2070 microcomputer is to have a vertical board design with separate input and output boards.
- Include ability to accept a contact closure or open controller output to reset clock on controller at a predetermined hour each day .
- Equip the controller with four serial communication ports and one Ethernet port, each capable of communicating at speeds up to 9600 bits/sec. The port assignments are to be as follows:
 - Port 1: Internal Modem
 - Port 2: PC Laptop Connection
 - Port 3: Conflict Monitor Communication
 - Port 4: Future Use
 - Port 5: Ethernet
- Provide 2070-1E or 2070-1C prom module.
 - Data retention in the absence of Controller Voltage (Vcc).
 - Data is automatically protected during power loss.
 - Directly replaces 8K x 8 volatile static RAM or EEPROM.
 - Unlimited write cycles.
 - Low-power CMOS.
 - Over 50 years of data retention.
 - Standard 28-pin JEDEC pin out.
 - 200 ns read access time.
 - Read cycle time equals write cycle time.
 - Lithium energy source is electrically disconnected to retain freshness until power is applied for the first time.
 - Industrial temperature range of -40F to 185F.
- Furnish all controller assemblies so that the controller returns to normal operation from time clock flash automatically.
- All cabinets require a plug-in hand control with cord and a method of switching the signal controller between automatic and manual control.
- Provide for automatic return to flashing operation when lost electrical service has been restored.
- The "Flash Sense", "Stop Time", and "Cabinet Door Open" functions to be optically isolated but capable of operating without a Model 242 DC isolator.
- Provide pre-wired input file with a minimum of eight inputs and equipped with Model 242 Two-Channel DC isolators. Supply the required number of Model 242 DC isolators, plus one spare, for each intersection. Also, provide slots and internal wiring for two future model 224 four- channel

- loop sensing units.
- Provide Fiber Modem for the communication between local controller and master controller. Clean and connect fiber-optic cable to the new controller using procedures described in current Department and industry guidelines –FOA.
- Provide software as directed by special provision unless provided by the municipality.
- Controller shall be IP/Ethernet enabled for communications on IP networks

2.c Conflict Monitor. Provide Model 2070 Malfunction Management Unit. Exception: If mounted in a 336 cabinet, provide conflict monitor using serial datalink communication line (SDLC) interface.

Equip the conflict monitor with a programmable SDLC interface capable of communicating with the 2070 Microcomputer. The conflict monitor, if polled by a system compatible 2070 Microcomputer, is to return information including, but not limited to, the status of all monitored inputs and events stored in non-volatile memory. Also monitor the absence of a red indication along with normal conflicts, and perform all the functions required by a conflict monitor, including the following features:

- Monitoring the absence of signal on any channel.
- Include three preemption inputs to disable red monitoring.
- Include red signal monitoring interface through front panel connector.
- Detect simultaneous display of Green and Yellow on a channel.
- Detect simultaneous display of Green and Red on a channel.
- Detect minimum Yellow display following a Green on a channel.
- Store of up to 64 events.
- Inform 2070 controller of a resetting via a communication port.
- Monitor incoming line voltage.
- Conflict monitor shall monitor absence of red indications and be compatible with Flashing Yellow Arrow permitted left turn operation.
- IP/Ethernet enabled for communications on IP networks.

A minimum of one input channel for each load switch socket as specified in Section 952.2(c)3.e.

2.d Flasher Unit.

- TS 1, Section 8, Solid State Flasher.
- TS 2, Section 2.6, Flasher Tests.
- TS 2, Section 6.3, Solid-State Flasher.

2.e Load Switches.

- TS 1, Section 5, Solid-State Load Switches.
- TS 2, Section 2.5, Load Switch Tests.
- TS 2, Section 6.2, Three-Circuit Solid State Load Switch.
- Provide compatible Load Switches or Packs.
- Provide a minimum of 12 pre-wired switch positions as indicated.
- Provide a load switch is to be of a repairable, modular type construction.
- Provide a minimum of four flash transfer relays.
- Operational Features: Provide LED indicators to display operation. Isolate signal load from load switch input using optic couplers. Furnish a minimum of one load switch for each of the following active controller unit functions:
 - Vehicle Phase.
 - Overlapping Vehicle Phase.
 - Pedestrian Phase.

2.f Cabinet. Furnish a weatherproof controller cabinet, large enough to suitably house the traffic signal controller unit and auxiliary equipment, and conforming to the following requirements:

2.f.1 Enclosure.

- Material—Sheet or cast aluminum.

- Wall Thickness—1/8-inch minimum, reinforced where required.
- Minimum Size—As indicated and as follows:
Position equipment in the cabinet to provide access to all terminal strips and equipment from the front without removing other equipment. Provide an unobstructed view of all equipment having visual indicators. Place all equipment in an upright position and not on top of other equipment.

Provide Department approved Type 2070 controller cabinet with adequate room for all necessary equipment and cable. Provide a stainless steel 5/8-inch handle designed for the door(s) and a full height, continuously welded, piano hinge. Continuously weld all joints of the cabinet. Provide a pull-out shelf to double as a storage container for wiring diagrams, approved plans, and timing sheets.

Provide a twist lock receptacle and transfer switch for power provided by an emergency generator during power outages. Access to the twist lock receptacle and the transfer switch through the use of a locked police door using a No. 2 key or standard police key.

Provide generator adaptor kit as specified in Section 954.2(i).

The latching mechanism will be a three-point draw roller. Equip the large cabinet door with a spring lock, which can be opened only by a key. Equip the smaller compartment door with a similar spring lock, which can be opened only by a standard police box key.

An approved plug-in hand control is required in all cabinets and a method to switch the signal controller from automatic to manual control.

- Type I Cabinet Extension – The cabinet shall be provided with a base extension of not less than 18 -inches nor more than 36 inches or as indicated. If an Uninterruptible Power Supply is to be provided include a shelf for the Uninterruptible Power Supply unit and associated batteries.
- Auxiliary Cabinet - At locations where traffic signal equipment is to be installed in an existing controller assembly where physical space constraints preclude installation in the existing cabinet, provide auxiliary cabinet assembly, either:
 - Attached to existing Ground Mounted Controller cabinet, with bottom of auxiliary cabinet resting on top of existing cabinet foundation; or
 - Pole-mounted, located adjacent to the existing pole-mounted cabinet.

Provide cabinet that meets or exceeds applicable specifications herein for a traffic signal controller assembly.

- Hardware—Vandal and corrosion resistant.
- Finish—Natural with external welds free of irregularities and a maximum bead height of 1/8 -inch.
- Gaskets—Neoprene, attached with an oil resistant adhesive.
- Mountings—As indicated, pole or foundation.
- Locks—Brass, tumbler type for main door and standard police lock for auxiliary door; two keys for each lock.
- Police Panel—Furnish with the following switches:
 - Auto—Flash
 - Lights (On—Off)
 - Auto—Manual
 - Provide 12-inch hand control cable in panel. The police panel shall be large enough to adequately store the hand control cable.

- LED light/bar with in-door switch.
- Spring-loaded door switch in the upper right corner of cabinet opening for use as a “door open” alarm. If the controller cabinet is connected to an RTMC or central system, the “door open” alarm shall place a notification to the RTMC or central system.
- Test Pushbutton Panel—One pushbutton to each input for simulated detector operation of vehicles and pedestrians with type and phase permanently labeled on panel. Mount panel on inside of door.

2.f.2 Fan and Ventilation.

- Fan and vent system providing 200 CFM, 2x100 CFM fans for type I or dark painted controller assemblies or 100 CFM for type II controller assemblies.
- Vents equipped with standard-size, replaceable fiberglass filters.
- Vents that prohibit the entrance of rain or snow.
- Cabinet equipped with an adjustable thermostat connected to control the fans.
- Manually adjustable thermostat with a calibrated scale. Thermostat adjustable within the range of at least 55F to 140F.
- Thermostat with contacts rated for at least eight amperes at 120 volts AC.
- Thermostat capable of turning the fan on at the set temperature and turning the fan off when the temperature is 5F below the set temperature. The activation temperature shall be set by the cabinet manufacturer based on their recommendations.
- A temperature sensor shall provide an alarm for cabinet overheating. Activate the alarm at 150F. If the controller cabinet is connected to an RTMC or central system, the temperature alarm shall place a notification to the RTMC or central system.

3. Advanced Transportation Controller Unit

3.a Standards. Provide a controller cabinet assembly that includes an Advanced Transportation Controller(ATC) timer unit and a cabinet meeting the specifications as described below:

- For the purposes of interfacing with the Department's unified command and control system, provide one of the following:
 - The complete Management Information Bases (MIB) for the controller firmware to ensure compatibility of both ends of the communications link. Notify PennDOT when new MIBs are released and provide them when requested for the life of the controller at no additional cost to the Department. Controller manufacturer shall retain ownership of the MIB and grant PennDOT and its contractors a license to use the MIB for interfacing with the controller through the unified command and control system. PennDOT will keep the MIB confidential, proprietary, and will not redistribute or reuse the MIB for other purposes.
 - MIBs which match the objects provided by the Department’s unified command and control system. Controller manufacturer shall provide validation testing of the MIB mapping to the unified command and control system.
 - Future controller firmware updates must be submitted to PennDOT for testing with the unified command and control software prior to being installed on controllers.
- Provide functionality to back up the controller database to USB flash drive or SD card after any programming change.
- Obtain IP address as required by the latest PennDOT Traffic Signal Remote Communication Policy and Guidance Document.
- 4GB (minimum) USB drive with tether or SD card.

3.b Controller Requirements.

- Program module as approved.
- Controller unit meets ATC 5201 v06.25 according to AASHTO/ITE/NEMA.
- Provide the following minimum memory:
 - Minimum of 128 megabyte (MB) of dynamic random-access memory (DRAM) for application and Operating System (OS) program execution.
 - Minimum of 64 MB of Flash memory for storage of OS software and user applications.
 - Minimum 1MB of static random-access memory (SRAM) for non-volatile parameter storage.
 - Rack- mounted configuration
 - Display model, serial number, and program information on exterior in an easy to find location.
- USB Ports.
 - Minimum of two USB 2.0 ports to be used for updating software, uploading or downloading configurations, or uploading logged data via USB flash drives.
- Label the IP address on the timer unit according to ANSI/TIA-606-B standard as a guideline and the following:
 - Laminated
 - High strength
 - Resistant to extreme environmental conditions such as UV fading, high temperature fluctuations, and high humidity
 - Adheres to aluminum, polycarbonate, and other materials standard in roadside cabinet environment
 - Text is bold, legible (Arial font, 24 pt. minimum), and fade resistant
- Firmware Options.
 - Provide the ability for peer-to-peer communication once per second minimum between controllers of the same model type using Ethernet protocol communication.
 - Such communication will not require the use of any external device or software and will not require routing to or from any external program.
 - Configuration and saving of peer to peer setup information will not require restart of the controller to take effect.
 - Provide controller capable of acting as either the source or the destination of Boolean & Peer statements.
 - Provide a minimum of 24 peer to peer statements available to the user at each controller.
- Connected Vehicle Requirements.
 - Provide a controller that generates signal phasing and timing (SPaT) status in NTCIP 1202 format every 1/10 of a second to a user-configurable IP address via a user-configurable UDP port.
 - Provide necessary hardware to broadcast signal phasing and timing in SPaT format according to SAE J2735 messaging or provide firmware to be installed on a Dedicated Short-Range Communication (DSRC) Roadside Unit (RSU) to translate the message into J2735 format. Do not use an additional component between the controller and DSRC RSU for the purpose of SPaT data translation. If SPaT format is used directly from the controller, map the phases to lanes via the controller's menu-driven interface or external program running on a PC.
- Railroad Preemption Requirements.
 - Provide the railroad preemption operation as indicated. Before approval of controller catalog cuts for the project, any controller unit proposed for use on a PennDOT contract project is required to be bench-tested along with the PennDOT Traffic Unit representative for any traffic signals with railroad preemption. The controller proceeds immediately to railroad preemption operation upon receiving call without any delay.

- Provide interface and/or interconnect as specified in Section 953.2(l).

3.c Cabinet. Final cabinet design shall be agreed upon by the District Traffic Engineer or designee, as specified in Section 952.2(c)2.f. and as follows:

- AASHTO/ITE/NEMA ATC 5301 v02.02 or latest approved version.
- LED light bars, 800 lumens minimum.
- Provide a stainless steel 5/8-inch handle designed for the door(s) and a full height, continuously welded, piano hinge. Continuously weld all joints of the cabinet.
- Sliding aluminum “laptop shelf” with piano hinged lid capable of holding the cabinet manuals and intersection condition diagram.
- IP-addressable Cabinet Monitor Unit (CMU) compatible with Flashing Yellow Arrow permitted left turn operation.
- One NEMA L5-30P receptacle for external generator connection.
- An automatic transfer relay to engage the generator power.
- Component and cable labels conforming to the following:
 - Laminated
 - High in strength
 - Manufactured for extreme environmental conditions with respect to UV, temperature, and humidity.
 - Capable of adhering to all types of surfaces
 - Bold, legible and fade resistant text
 - Band or flag type
- Clear plexiglass cover/protection on any open area with live electrical feed.
- One rack-mounted IP-addressable rear-facing six-outlet (minimum) power strip with 120V 15-amp, capable of resetting upon failed IP ping or via remote web interface.
- A rack-mounted test button panel that allows calls to be placed on each individual vehicle and pedestrian phase.
- Auxiliary Display Unit.
- 16 channel output minimum.
- 24 channel input minimum.
- One front-facing duplex convenience receptacle (120V, 15amp), or two receptacles integrated to the front of the power supply.
- Full cabinet electrical schematic(s) including all location-specific field terminal connections.
- Copy of the PennDOT traffic signal permit drawing for the intersection and for the system (if applicable). Detector mapping information to indicate which detector is on which channel and phase.
- A police cord of at least twelve feet in length in the police switch compartment.
- Type I Cabinet Extension – The cabinet shall be provided with a base extension of not less than 18 -inch nor more than 36 -inch or as indicated. If an Uninterruptible Power Supply is to be provided include a shelf for the Uninterruptible Power Supply unit and associated batteries.
- Provide generator adaptor kit as specified in Section 954.2(i).
- **Fan and Ventilation.**
 - Fan and vent system providing 200 CFM, 2x100 CFM fans.
 - Vents equipped with standard-size, replaceable fiberglass filters.
 - Vents that prohibit the entrance of rain or snow.
 - Cabinet equipped with an adjustable thermostat connected to control the fans.
 - Manually adjustable thermostat with a calibrated scale. Thermostat adjustable within the range of at least 55F to 140F.
 - Thermostat with contacts rated for at least eight amperes at 120 volts AC.
 - Thermostat capable of turning the fan on at the set temperature and turning the fan off when the temperature is 5F below the set temperature. The activation temperature shall be set by the cabinet manufacturer according to their recommendations.
 - A temperature sensor shall provide an alarm for cabinet overheating. Activate the alarm at 150F. If the controller cabinet is connected to an RTMC or central system, the temperature

alarm shall place a notification to the RTMC or central system.

(d) Controller Assembly-Hardware.

1.Relays.

1.a Light Duty Relay. Mounted in a clear, plastic cover, permanently marked to indicate coil voltage rating, and as follows:

- Usage—Logic, Preemption or Interconnection.
- Voltage—115 V (ac) or 24 V (dc).
- Switch Type—TPDT or DPDT.
- Contact Rating—2 A.
- Contact Material—Fine Silver or Silver Alloy.

1.b Heavy Duty Relay. Mounted in a clear, plastic cover, permanently marked to indicate coil voltage rating, and as follows:

- Usage—Continuous Duty-Transfer of signal indications from normal operation to flashing and the reverse.
- Voltage—95V to 135 V (ac), 57 Hz to 63 Hz.
- Switch Type—DPDT.
- Contact Reading—20 A.
- Contact Material—Fine Silver or Silver Alloy.
- Standard Socket—8 Pin, Jones Type.

2. Cable Terminal/Harness Assembly. For wiring the cabinet, including connections to the electrical load center, police panel switches, signal load switches, signal cable terminals, controller unit, conflict monitor, detectors, and relays, and as follows:

- Wiring—Arrange and lace or enclose in a raceway or in plastic tubing.
- Terminal Blocks—Barrier-type, with marker strips and nickel-plated brass screws, 8-5/16-inch minimum for detector leads, 10-5/16-inch minimum for signal leads, rated for 20 A at 1000 V(rms).

3. Electrical Load Center.

3.a Breakers and Receptacles.

- Circuit Breakers—15 A minimum, flashing circuit and duplex receptacle. 15 A minimum, traffic control equipment.
- Duplex Receptacle—National Electrical Code (NEC)-Type, Ground Fault Interrupter, with test buttons. 15 A minimum.

3.b Radio Frequency Interference (RFI). UL-Listed, RFI filter, according to NEMA standard testing procedures, TS-2 chapter 5, and as follows:

- Line Voltage—95 V to 135 V (ac).
- Line Frequency—200kHz to 75MHz with minimum attenuation of 50dB.
- Line Current—125% of the total connected load, 30 A minimum.
- Operating Temperature— -29F to 165F.
- Insulation Resistance—6,000 megaohms.
- Line to Ground Rating—1500 V (ac), one minute.
- Line to Line Rating—1450 V (dc), one minute.
- Humidity Range—5 % to 95 %, relative.
- Overload—360 A, for 8 minutes.

3.c Surge Protection. Provide serial surge protection that has multi-strike capability, UL listed, and line to neutral clamping voltage to be no more than 395 V at 20,000 amps. Provide model that is plug interchangeable with wired-in based with plug removable arrester. Provide terminals for AC Line, AC Neutral, AC Equipment In, AC

Equipment Out, neutral equipment out, and ground. Filtering surge protector is not to exceed 5.0 -inches x 3.5 -inches x 7.5 -inches, not including studs or mounting flange. Spark gap arrestors are not allowed. All surge protection devices must be approved. The cabinet and content must, as an assembly, pass all NEMA TS-2 voltage spikes test for the AC line.

- Total Peak Current (8 x 20ms) 40,000 Amps
- Life Test 5% Change
- (Voltage clamp before and after 25 surges of 20 kA waveshape)
 - Clamp voltage 395 V type @ 20kA
 - Response time less than 5.0 nS
 - Continuous Service Current (120 VAC, 20 Amps Maximum 60 Hz)
 - Operating Temperature -40F to 185F

Provide surge suppressor that is UL listed and has dual pair (four wire) module implementing three stage hybrid technology or equivalent type as approved, for communications cable to 10 kA (2500 A per line).

- Peak Surge Current (10 times):
 - 8 x 20 ms 50 kA
 - 10 x 700 ms 500 A per line
- Life Expectancy:
 - 8 x 20 ms >100 occurrences
 - 10 x 700 ms
- Response time < 1 nanosecond
- Technology SAD Hybrid
- Operating Temperature -40F to 185F

Provide composite Transient Voltage Surge Suppression (TVSS) for all pedestrian pushbutton circuits, each load switch. And on the detector panel for all loop lead-ins.

3.d Grounding Requirements. Provide each controller with its own grounding rod in addition to the other grounding requirements for signal supports. Grounding and Grounding Rods will be installed as shown on the Standard Drawings and as follows:

Place a minimum of two grounding rods at the base of the controller, the grounding system is required to provide 8 ohms or less to the earth as a system. Test all grounding rods used for controllers, mast arms, and supports for their resistance to ground in accordance with the NEC; with resistance less than 25 ohms. For grounding rods failing the above-mentioned test, relocate grounding rod(s) to a suitable location or install additional grounding rods at locations as approved.

When suitable, place a grounding grid utilizing shielded copper wire and grounding rods at each corner, around the intersection. Documentation regarding grounding resistance and as-built plans of grounding grid must be verified by the Representative.

4. Police Panel. Furnish with the following switches:

- Auto—Flash
- Lights (On—Off)
- Auto—Manual

Provide 12” hand control cable in panel. The police panel shall be large enough to adequately store the hand control cable.

5. Auxiliary Cabinet

As specified in Sections 952.2(c)1.1.f and as follows:

Provide an auxiliary cabinet assembly, either:

- Attached to an existing ground mounted controller cabinet; or
- Ground-mounted, located adjacent to the existing ground-mounted cabinet; or
- Pole-mounted, located adjacent to the existing pole-mounted cabinet

Refer to the traffic signal plans for specific lock and key instructions.

6. Time Clock, GPS.

A system consisting of a GPS receiver and base unit (if necessary) with an easy to read high contrast Liquid-crystal Display (LCD) screen for mounting in the traffic controller enclosure. The base unit shall indicate the GPS time and other configuration settings on the LCD screen.

The system must have a contact closure or open controller output to reset the controller clock. The GPS receiver shall be connected directly to the contact closure and continuously reset the controller clock. However, if the controller limits this ability, the base unit shall reset the controller clock at a predetermined hour each day (typically 3:00 AM).

The system must have a Daylight Savings Time (DST) adjustment and zone adjustment entries as well as time setting. The GPS must maintain the accuracy of the controller clock within 1 microsecond of Universal Time, Coordinated/Greenwich Mean Time (UTC/GMT).

The system shall have an environmental temperature range of -68F to +158F, power requirements of 5-40 volts DC, 100 mA, and be capable of monitoring a minimum of eight channels.

952.3 CONSTRUCTION— Sections 950.3, as shown on the Standard Drawings, and as follows:

(a) Controller Assembly. Install the controller assembly with internal time-based coordination, as indicated. For base-mounted controller assemblies, construct the foundation as specified in Sections 951.3(a) and (b) and seal all conduits as specified in Section 954.3(c). Place cabinet to provide full access to all doors and to not obstruct vehicle sight distances or block pedestrian facilities. Connect field wiring for signals, interconnect, and preemption. Connect service to the input/output terminals of the controller assembly. Neatly bundle, tie-wrap, and organize all loose wiring. Connect to the equipment safety ground.

Ground loop detector lead-ins in cabinet only. Terminate all spare signal conductors collectively and cover with electrical tape. Label all detector lead-ins appropriately and map into timer unit to collect appropriate data.

Install one LED light/bar inside the top of the cabinet at each door. If a two-door cabinet (one front and one rear) provide two lights/bars. If a four-door cabinet (two front and two rear) provide four light/bars. Install the lights/ bars such that the center of the light/bar is in front of and illuminating the component faces. Illuminate the lights with door-open switch.

Provide switches, controls, and indicators that are operable without the use of tools. Clearly and permanently identify the switches, controls, and indicators. Label the load switch sockets and cable connectors for detector amplifiers, in the controller assembly, according to function.

When the signal controller becomes operational, and during initial turn-on, demonstrate that all functions are operating in accordance with all the design documents and the applicable standards for the installed unit. Conduct the demonstration, as directed, in the presence of the Representative. Upon successful demonstration that all functions are operating properly the controller will be subject to a 30-day system test. If a fault occurs during the 30-day test period correct the problem and restart the test. Once the 30-day period has expired with no recordable system faults and meets the approval of the Representative the system will be considered for final acceptance.

Connect the conflict monitor or malfunction management unit to function as specified in Section 952.2(c). When the controller assembly becomes operational, and during initial turn-on, demonstrate that the conflict monitor or malfunction management unit will cause transfer of the signals to flashing operation upon sensing all possible conflicting signal indications. Conduct the demonstration, as directed, in the presence of the Representative. The 30-day system test shall not begin until the conflict monitor or malfunction management unit is functioning properly.

Before or during the initial turn-on, connect output from shutdown relay to the output and power input of the signal load switches. Connect relay to controller assembly to provide flashing operation with the traffic signal controller unit installed or removed. Provide activation of the shutdown relay from any of the following sources:

- Removal of controller voltage, when indicated
- Police panel switch
- Output from conflict monitor or Malfunction Management Unit

Label IP address on all devices in the cabinet that are assigned an IP address. Provide surge suppression for any Ethernet cable leaving the cabinet. Provide municipality with the name and telephone number of the person to be notified in the event of failures or malfunctions during the guarantee period as specified in Section 950.3(d)10.

Place all schematics, plans, detector mapping information and any other provided paperwork in the sliding drawer.

Mount the exhaust fan(s) in such a way that it does not protrude to the outside of the cabinet and can be easily removed for servicing.

Connect systems and communication control equipment as specified in Section 953.3 and as indicated. Before the 30-day system test, field test for the indicated operation as specified in Section 953.3(r).

1. Advanced Transportation Controller Unit.

- Configure the cabinet as follows from top to bottom:
 - Fiber patch panel
 - Auxiliary Display Unit
 - Controller unit
 - Laptop shelf
 - Input file(s)
 - Output file(s)
 - Battery back-up and batteries (if specified).
 - Ethernet switch (if specified) mounted to DIN rail on wall of cabinet in rear and accessed through rear door.
 - Power supply
- Provide cabinet documentation and labeling as follows:

For signal controller, fiber optic cable, sensor devices, ITS, communications, connected vehicle, and any additional components provide interconnection diagram showing cable and port connections. Label all components and cables using the ANSI/TIA-606-B standard as a guideline and the following:

 - Label each component with an identifier that corresponds to the interconnection diagram.
 - Label cables at both ends. Provide information on each cable end to indicate the near and far end connections.
 - The cable end with the label is considered the near end; the opposite cable end is considered the far end.
 - Label all detector lead-ins as per the PennDOT Automated Traffic Signal Performance Measures (ATSPM) Detector Mapping Guidelines and map into timer unit to collect appropriate data.
 - Label text:
 - Indicate the near end component identifier and port connection on the first line.
 - Indicate the far end component identifier and port connection on the second line.
 - Indicate the system or network title on the third line.
 - Abbreviations are acceptable if they are consistent between the interconnection diagram and the component identifier.
 - Submit for approval any adjustments or modifications to labeling convention.
 - Install the IP-addressable power strip in the rear rack. Plug the following auxiliary devices into the IP-addressable outlets and other components as directed:
 - Communications equipment (e.g. Ethernet switch, cell modem, router/firewall, etc.)
 - Detection equipment (e.g. video, radar)
 - Adaptive system processor
 - Install test button panel in the front rack.

- Operate SDLC Port 1 on Serial Bus #2 as needed.
- Provide and program a spring-loaded door switch in the upper right corner of the cabinet opening for use as a “door open” alarm. If the controller cabinet is connected to an RTMC or central system, the “door open” alarm shall place a notification to the RTMC or central system.
- Provide a spare SIU and a spare high-density switch pack.
- Tether USB drive to a shelf or other permanent piece of the cabinet.

(b) Signal Timing Adjustments. Perform timing changes, as directed, within 24 hours of notification. Record the existing timing of each controller. Make two copies placing one in the controller cabinet while retaining the other. The record consists of a copy of the timing and phasing diagram and includes the date, the change made, the name of the person authorizing the change, and the name of the person making the change. Before making a timing change, check the existing timing settings and verify that they are as indicated on the most recent record. Notify the Representative if unauthorized timing changes have been made. Provide a copy of each change of record.

(c) Time Clock, Global Positioning System (GPS). Install the GPS receiver on top of the traffic signal controller cabinet using a waterproof sealant. Install the time clock base unit (if needed) in the controller cabinet and connect to input/output terminals to the controller according to the manufacturer’s recommendations. Connect to the equipment safety ground. Program the controller as needed to receive the GPS signal and reset the controller clock a minimum of once per day. Field test for indicated operation.

(d) Connector Harness. Provide a separate harness and connector that meets NEMA Standards and is wired for the maximum phase capability of the controller unit.

(e) Cable Connections (NEMA TS-1 & TS-2) and Type 2070-ATC.

1. Copper Cables. Connect the traffic signal cable and interconnection cable to the proper color-coded controller terminals as directed by the Representative. Crimp-type connectors are not to be used for traffic control cable or interconnection cable. All wiring and cable connections are to be neat and with all such cables tie-wrapped. Spare conductors of signal cable and interconnection cable are to be neatly wrapped in the cabinet and of the same length as the active conductors. Connect all communication cable conductors to the terminal block. Mount on the inside of the lower left cabinet wall a communication cable terminal block. The terminal block is to have a sufficient number of connections to splice two 12-pair communication cables together. If applicable, mount on this panel an RS-232 interface for connecting a portable PC to the 2070 Microcomputer. The RS-232 interface is to consist of a shielded cable with a DB9 connector at one end, and a 2070 C2 type connector at the other. Plug the DB9 connector into the C2 port of the 2070 controller.

2. Fiber Optics. Route all fiber optic cables entering the controller cabinet through a 1 1/4 -inch internal diameter conduit as specified in Section 954. Run a continuous conduit segment from the base of the pole, through the bottom entry hub of the junction box, and into entry hub in the bottom of the Controller Cabinet. Place conduit to maintain the minimum bend radius of fiber optic cable. The conduit from the cabinet to the closest junction box or manhole is incidental to this item.

The cabinet is to have the means to hold service loops, each 20 feet in length, of each of the jacketed fiber optic cables entering and leaving the cabinet. Secure each service loop to the bottom of the lowest rack in the cabinet in such a way as to ensure the minimum bend radius of the cable(s) and prevent interference of any kind. However, the service loops are to be easily removed and reattached during fiber maintenance. Carefully route the fiber optic cable(s) to the patch panel for termination.

The cabinet is to have a patch panel as necessary, mounted on an easily removable aluminum panel, to house all internal fiber splices; mount the aluminum panel in an appropriate location inside the cabinet. Secure the fiber optic cable(s) to the panel before entering the patch panel. Terminate all field fibers in the cabinet as specified in Section 953.3(i). If applicable, mount on this panel an RS-232 interface for connecting a portable computer to the 2070 microcomputer. The RS-232 interface is to consist of a shielded cable with DB9 connect at one end, and a 2070 C2 type connector at the other. Mount the DB9 connector on the panel for easy access, and the C2 type connector plugged into the C2 port of the 2070 controller.

(f) Auxiliary Cabinet. Power supplemental cabinet and equipment through use of existing signal controller power supply according to NEC requirements.

If applicable, pour the new concrete foundation for the supplemental cabinet against the existing controller cabinet foundation and/or connect the supplemental cabinet to the existing controller cabinet with rigid galvanized 3 inch steel conduit and fittings sufficiently sized to accommodate all associated equipment cables, and to ensure that cables will not fray. Seal conduit between supplemental cabinet and existing controller cabinet with waterproof sealer. Ensure that the cabinet does not interfere with access to the existing controller cabinet.

(g) Advanced Transportation Controller Unit Spare Parts. Provide all parts as indicated and store the parts at location either as indicated or as specified by the District Traffic Engineer. Parts shall be stored in a secure location in the manufacturer's approved packaging. The parts shall be sheltered from weather/environmental conditions. Warranty begins on the turn-on date for the ATC Assembly that the parts serve.

952.4 MEASUREMENT AND PAYMENT—

(a) Controller Assembly. Each.

The price includes required controller assembly with controller unit, detector card rack assembly (if necessary), generator adapter kit, police panel, cabinet extensions and concrete foundation for Type I assemblies, and all required controller assembly hardware for a fully operational system. Also includes time for manufacturer representative to be on site for the initial controller assembly setup and for any changes needed during the 30-day test. 50 percent paid on installation. 35 percent paid upon energize and controller turn-on. 15 percent paid on completion of the 30-day test or end of system test.

(b) Controller Modification, Retiming. Each.

The price includes programming new timings as indicated and on field timing adjustment as necessary in the existing controller unit.

(c) Controller Modification, Controller Upgrade. Each.

The price includes required materials and labor to add a new controller to an existing cabinet. Also includes time for manufacturer representative to be on site for the initial controller setup and for any changes needed during the 30-day test. Removal of the existing controller and applicable wiring connection is incidental.

(d) Controller Modification. Each.

The price includes all necessary material and labor, including programming new timings, to modify existing controller assembly to provide operation as indicated.

(e) Auxiliary Cabinet with Fan. Each.

The price includes the cabinet, cabinet fan, mounting hardware, concrete foundation (if applicable), and additional items necessary to connect the auxiliary cabinet to the existing cabinet and/or traffic signal pole, as well as any modifications required to existing cabinet and/or traffic signal pole to support the supplemental cabinet.

(f) Auxiliary Cabinet without Fan. Each.

The price includes the cabinet and mounting hardware. Price includes any mounting hardware and additional items necessary to connect the auxiliary cabinet to the existing cabinet and/or traffic signal pole, as well as any modifications required to existing cabinet and/or traffic signal pole to support the supplemental cabinet.

(g) Advanced Transportation Controller Unit Spare Parts. Each.

The price includes all equipment identified as spare parts as indicated. The cost shall include all necessary packaging and transporting of the equipment to the approved specified location.

(h) Time Clock, GPS. Each.

The price includes mounting hardware, cable/harness assembly, power supply, receiver, and controller programming.

SECTION 953—TRAFFIC SIGNAL SYSTEMS AND COMMUNICATIONS

953.1 DESCRIPTION—This work is the furnishing and installation of the system equipment for the control of traffic signals and the furnishing and installation of equipment necessary to provide communication between controller and assemblies and other components that form a system, as indicated on the approved plans.

953.2 MATERIAL—

(a) General.

- Class A Cement Concrete—Section 704
- Caulking Compound—Section 705.8(b)
- Controller Assembly—Section 952.2
- Electrical Distribution—Section 954.2
- Signal Heads—Section 955.2
- Traffic Signals-General—Section 950.2
- Certification—Section 106.03(b)3

(b) Time-Based Coordinator Unit.

1. Type. Internal to controller unit or as required to interface with controller unit not having internal time-based coordination capability. If being placed in an existing traffic signal system, make compatible with the existing time-based coordinators in that system.

2. NEMA Standards.

- TS 1-2.1.1, Operating Voltage, Frequency, and Power Interrupt.
- TS 1-2.1.2, Voltage.
- TS 1-2.1.3, Frequency Range.
- TS 1-2.1.5, Temperature and Humidity.
- TS 1-2.1.6, Transients, Power Service.
- TS 1-2.1.12, Vibration.
- TS 1-2.1.13, Shock.
- TS 1-13.2, Electrical Limits of Input/Output.

3. Provisions for Timing Plans.

- Storage Capability (minimum)—Nine, settable, timing programs; one dedicated free-operation program; and three control programs.
- Settable Program Positions (minimum)—One Offset; One Cycle; One Split
- On/Off Output Switch—One per control program.
- Program Assertion—Turn-off previous settable or free programs at the assertion of any of the settable or free, operational programs.

4. Cycle.

- Number—Three, minimum.
- Duration—Settable range of at least 30 to 250 seconds.
- Increments—5 second maximum.

5. Clock/Calendar.

- Resolution—1 second.
- Selectable Programs—Day of week/hour/minute/second
- Number of Changes—50 minimum per day.
- Daylight Savings Time—Automatic transfer.
- Accuracy— ± 0.005 (50 ppm)% of clock calendar time, with respect to real time.

6. Display. A type providing the functionality of programming and obtaining the following: day of week, hour, minute, second, program in effect, and setting stored or entered for storage.

7. Uninterruptible Power Supply (UPS). Section 954.2(j).

8. Inputs.

- Power Requirements—95 voltage alternating current (VAC) to 135 VAC, 57 hertz (Hz) to 63 Hz.
- Minimum Number and Type—Eight green-signal inputs at 24 voltage direct current (VDC), negative true.
- Keyboard—Front panel mount.
- Transfer Function—Input program from other unit.

9. Outputs. Section 953.2(c)

10. Program Transition. Pretimed Controller Units

- Dwell in coordinated phase walk.
- Dwell not to exceed 25% of operating cycle.
- Dwell in called-cycle when cycle transfer occurs due to program change.
- Program transfer, not to exceed four cycles.

(c) Master Controller Assembly. As specified in Section 952 and as follows:

1. Master Controller Unit (Solid-State, Pretimed). Capable of functioning as either an intersection controller or as a master controller to supervise other intersection controllers and as follows:

- Output Circuits—Ground true.
- Time Switch—For functions.
- Manual Pushbutton—For sync function with master removed.

2. Conflict Monitor. Section 952.2(d).

3. Flasher. Section 952.2(d).

4. Relays. Section 952.2(d).

5. Load Switches. Section 952.2(d).

6. Cable Terminal/Harness Assembly. Section 952.2(d).

7. Electrical Load Center. Section 952.2(d).

8. Police Panel. Section 952.2(d).

9. NEMA Cabinet. Section 952.2(d).

(d) Coordination Unit. As specified in Section 952.2 and as follows:

1. Solid-State. Capable of coordination up to an eight-phase, dual-ring, solid-state, actuated controller unit and as follows:

1.a Cycle.

- Length—As indicated, in 1-second increments.
- Force-Off—Ensure the force-off command is directed to correct phase.
- Cycle and Split Transfer—At 0% point in local cycle.
- Offset Transfer—With pedestrian control, transfer in “green/walk” interval. With non-pedestrian control, transfer in “green.” Transfer to occur in a maximum of three cycles with no

more than 17% change in any one cycle.

1.b Interface. NEMA TS 1, Section 13.

1.c Environment. NEMA TS 1, Section 2.

(e) Radio Communications System. Radio communication system consisting of a transmit/receive radio unit, coaxial cable, coaxial cable surge protection, antennas, mounting hardware, and antenna grounding kit. Use unlicensed frequency bands for radio units unless a licensed band has been preapproved by the Representative. Provide all necessary antennas, cables, jumpers and lightning protection, but not be limited to the following requirements:

- Provide omni antennas having a minimum gain of 8dbi and directional antennas 12dbi unless stated higher in the approved drawings. Provide antennas having 50 ohms impedance and voltage standing wave ratio (VSWR) less than 1.5:1.
- Provide coaxial cable having 50 ohms impedance. Provide a minimum 1/2-inch coaxial cable with N-type connections. Smaller 1/4-inch flexible jumpers are allowed inside enclosures. Provide external antenna connectors that are weatherproofed with an approved rubber mastic tape.
- Provide a minimum data throughput of 115 kilobits per second (kbps) for serial radio units and 1 megabits per second (Mbps) for Ethernet radio units. Use radio units having built-in setup and diagnostic capabilities. Have a minimum receiver sensitivity -106 decibels per milliwatt (dDm) for serial radio units and -92dBm for Ethernet. Output impedance of 50 ohms on all radio units. Provide radio units meeting the following approval agencies: FCC, IEC, ANSI, and UL.

(f) Cable.

1. Control Cable. Furnish control cable for field devices not requiring shielded conductors conforming to IMSA Specification 19-1 or 20-1 for cable in conduit and IMSA Specification 20-3 for aerial cable. Provide stranded conductors, 14 AWG, minimum.

2. Communication Cable. Furnish communication cable for signal controller telecommunications conforming to IMSA Specification 19-2 or 20-2 for cable in conduit and IMSA Specification 20-4 for aerial cable. Provide as indicated, stranded conductors, 19 AWG, minimum.

3. Instrument Cable. Provide IMSA certified shielded cable, for field devices requiring immunity to frequency interference, with three solid 20 AWG conductors and one drain wire and as follows:

- Insulation—Moisture and heat resistant (167F) polyethylene conforming to ASTM D1248, Type I, Class B, Category 5, Grade E4, 600 V rating applied concentrically about the conductor.
- Color Code—(1) yellow, (1) blue, (1) orange.
- Shield—Mylar/aluminum tape shielding, applied with a nominal overlap of 20%, with the aluminum side in contact with the drain wire.
- Jacket—Polyvinyl chloride, having an average wall thickness of 0.045 inch, conforming to IMSA Specification 19-1, and rated at 176F.
- Electrical—dc resistance of each conductor, less characteristics than 11 ohms per 1,000 feet. Capacitance between each insulated wire and all other less than 48 picofarad (pF) per foot.
- Finished outside diameter—Less than 0.300 inch.

(g) Cellular Communications System: Cellular communication system consisting of a cellular modem, communication cables, antenna, and surge protection. Furnish all necessary materials necessary to provide a complete and functioning cellular interconnect system including but not limited to the following requirements:

- One cellular modem is provided at the master controller location and at each local controller location as indicated.
- Communication cables from the controller to the cellular modem.
- Omni antennas as indicated. Size the antenna to match the cellular modem used and the strength of the cellular signal for each location.
- Provide surge protection for the cellular modem at all locations and connect to the grounding electrode

system.

- Provide all product information and warranties for all equipment.

(h) Wireless Broadband Communication System. Provide an integrated broadband radio system capable of a 5.8 gigahertz (GHz) frequency and a minimum of 54 Mbps for communication between the local traffic signal controllers. Provide radios that are configurable and monitored using network monitoring software. Software must include a complete toolset to assist in advanced network monitoring and radio configuration. Provide certification that system equipment is licensed by the Federal Communications Commission (FCC) to meet the FCC regulations on wireless operation according to parts 15.247 and 15.249 of the Code of Federal Regulations and has been approved for indoor and outdoor applications.

Provide all necessary antennas, cables, jumpers and lightning protection, but not be limited to the following requirements:

- Provide Omnidirectional, Yagi, Dish, Grid, Integrated, or Sectorized type antennae with point-to-point or point-to-multipoint configurations as recommended by the manufacturer. Provide antennae with a minimum gain of 18 decibel isotropic (dBi) for point-to-point configuration.
- Provide a cast aluminum NEMA-4X/IP66 enclosure with a minimum of one weatherproof power connector, two N-type antenna connectors, and up to three weatherproof Ethernet connectors. Provide enclosure with system light emitting diodes (LEDs) for power, status, and mesh. Provide enclosure that can withstand an operating temperature range between -40F and 176F, relative humidity of 95% (noncondensing), and wind loading of 125 miles per hour (mph). Provide an enclosure that is weather-, water-, and dust-proof.
- Provide a power over Ethernet (PoE) injector, pole mounting hardware, Category 5e industrial outdoor rated cable with weatherproof connector, Ethernet cable, and surge protection.
- Provide an Ethernet switch with up to two Auto MDI-X 10/100/1000 Mbps ports.
- Provide sufficient cable to connect the antenna back to the local traffic signal controller as indicated.
- Provide equipment with an operating temperature range between -40F and 176F.

(i) Restore Underground Electrical and Fiber Optic Facilities.

- Electrical splice materials. Use material appropriate for facilities that are required to be disconnected and reconnected.

(j) Data Level Protocols for Serial or Ethernet Communications. According to TIA/EIA-568-b, ANSI/TIA/EIA-232, ANSI/TIA/EIA-485 or compatible standards-based protocol for, but not limited to, the following:

- Data Capacity ("Bandwidth").
- Required Turnaround Time.
- Allowable Latency.
- Allowable Bit Error Rates.
- Data-Level Protocols.
- Testing, including requirements and test plans.

(k) Managed Network Switch

1. Managed Network Switch

- Provide one of the following as indicated:
 - Field Switch Type A with a minimum of two Gigabit-Ethernet small form-factor pluggable (SFP) sockets and a minimum of eight 10/100Tx RJ-45 ports
 - Comnet Model CNGE3FE8MS
 - Etherwan Model EX73921-OVB
 - B&B Electronics Model BB-SE510-2SFP-T
 - Or approved equal
 - Field Switch Type B with a minimum of four Gigabit-Ethernet SFP sockets and a minimum of four 10/100Tx RJ-45 ports
 - Comnet Model CNGE8MS
 - Etherwan Model EX73921-OVB

- B&B Electronics Model BB-SE512-4SFP-T
 - Or approved equal
 - Provide switch SFP transceivers when fiber optic communication is used; the SFP transceivers must be selected to provide optics for the proper cable medium, proper optical levels according to the manufacturer's tolerances and network attenuation characteristics.
 - Provide switch meeting the following minimum-security requirements:
 - Ability to configure static MAC addresses access.
 - Ability to disable automatic address learning per ports.
 - Trap and alarm and shut down upon any unauthorized media access control (MAC) address request. Shutdown will require administrator to manually reset the port before communications are allowed.
 - Password manageable.
 - Full implementation of Simple Network Management Protocol (SNMP) v1 and SNMPv2c.
 - Full implementation of Remote Network Monitoring (RMON) statistics, history, alarms, and event objects.
 - Ability to mirror any port to another port with switch. Provide switch that complies with the following minimum requirements:
 - Ability to operate between -29F to +165F. Fans are not permitted.
 - Ability to operate from 10% to 90% humidity.
 - Power Indicators: On, Off
 - Network Status Indicator per port: Transmit, Receive, Link, Speed
 - Status Indicators shall be LED.
2. Fiber Optic Patch Cables:
- LC-style connectors that are constructed of a composite material with ceramic ferrule.
 - Simplex, unless existing constraints require duplex.
 - Insertion Loss: 0.15 decibel (dB) typical.
 - Reflectance: $\leq -58\text{dB}$.
 - Durability: $< 0.1\text{ dB}$ loss over 200+ insertions.
 - Operating Temperature: -40F to 167F.
 - Duplex connectors must have a removable clip and connectors must be different colors to easily identify mating connectors on each end.
 - Length—must be of sufficient length according to application/location; excessively long cables are unacceptable.
 - Provide Lucent Connector (LC) patch cables made of 9/125 single mode optical fiber, tight-buffered, surrounded with a combination of high tensile strength dielectric yarns, and housed within an impermeable outer plastic jacket. Provide patch cables that are plenum rated.
 - Provide patch cables that conform to the TIA/EIA-568-A and ISO/IEC 11801 standards.
3. Network Patch Cables:
- ANSI/EIA/TIA requirements for Category 6 4-pair unshielded twisted pair cabling with stranded conductors and RJ45 connectors.
 - Factory-assembled, pre-terminated patch cords with mechanical cable strain relief and protective boots and that are fully tested to Category 6 requirements.

(l) Layer 3 Network Switch:

1. Layer 3 Network Switch

- Provide one of the following
 - Comnet RLXE4GE24MODMS
 - Etherwan EX77964-8VC
 - Cisco: IE-5000-16S12P
 - Or approved equal
- Provide switch SFP transceivers; the SFP transceivers must be selected to provide optics for the proper cable medium, proper optical levels according to the manufacturer's tolerances and network attenuation characteristics.

2. Fiber Optic Patch Cables:

- LC-style connectors that are constructed of a composite material with ceramic ferrule.

- Simplex, unless existing constraints require duplex.
 - Insertion Loss: 0.15 dB typical.
 - Reflectance: ≤ -58 dB.
 - Durability: < 0.1 dB loss over 200+ insertions.
 - Operating Temperature: -40F to 167F.
 - Duplex connectors must have a removable clip and connectors must be different colors to easily identify mating connectors on each end.
 - Length – must be of sufficient length according to application/location; excessively long cables are unacceptable.
 - Provide LC patch Cables made of 9/125 single mode optical fiber, tight-buffered, surrounded with a combination of high tensile strength dielectric yarns, and housed within an impermeable outer plastic jacket. Provide patch cables that are plenum rated.
 - Provide patch cables that conforms to the TIA/EIA-568-A and ISO/IEC 11801 standards.
3. Network Patch Cables:
- ANSI/EIA/TIA requirements for Category 6 4-pair unshielded twisted pair cabling with stranded conductors and RJ45 connectors.
 - Factory-assembled, pre-terminated patch cords with mechanical cable strain relief and protective boots and that are fully tested to Category 6 requirements.

(m) Railroad Interconnect.

Provide either a NEMA TS2 Type 1 Controller or an Advanced Transportation Controller (ATC), Management Information Bases (MIBs), and 4GB (minimum) USB drive with tether as specified in Section 952.2.

1. Software Requirements

- Provide high resolution controller event logging conforming to Indiana Traffic Signal Hi Resolution Data Logger Enumerations. Allow log files to be retrievable by a remote connection or a local connection. Provide functionality to automatically back up the log files to USB flash drive or SD card. Log files shall be retained within the controller's local memory for a minimum of 24 hours. Log files shall be provided in comma separated text (CSV) format containing the event timestamp, event code and event parameter on each line. If the log files are in a different format, the manufacturer shall provide a translator tool which converts the log files to CSV format. The translator tool shall be able to be run from the command line in order for files to be batch converted.
- Provide functionality to back up the controller database to universal serial bus [USB] flash drive or secure digital [SD] card after any programming change.
- Complete the Department's "Traffic Signal Unit IP Address Request Form" to request a block of Commonwealth specific internet protocol (IP) addresses. Request a minimum of ten IP addresses per intersection and crossing. Coordinate with the Representative to determine if additional intersections and crossings within a corridor are expected to be connected to the Commonwealth network within the next three to five year timeframe. If there are multiple corridors (which are not interconnected) in a project, submit one IP address request form for each of the corridors.

2. Controller Requirements

- Provide a shelf-mounted controller unit that conforms to ATC 5201 v06.25 as published by AASHTO/ITE/NEMA. Display model, serial number, and program information on exterior in an easy to find location.
- Provide a minimum of 128 MB of dynamic random-access memory (DRAM) memory for application and operating system (OS) program execution, a minimum of 64 MB of FLASH memory for storage of OS software and user applications, and a minimum of one gigabyte (1GB) of static random-access memory (SRAM) memory for non-volatile parameter storage.
- Provide a minimum of two USB 2.0 ports to be used for updating software, uploading or downloading configurations, or uploading logged data via USB flash drives.
- Label the IP address on the timer unit using the ANSI/TIA-606-B standard as a guideline and with the following:
 - Laminated
 - High strength

- Resistant to extreme environmental conditions such as ultraviolet (UV) fading, high temperature fluctuations, and high humidity
- Adheres to aluminum, polycarbonate, and other materials standard in roadside cabinet environment
- Text is bold, legible (Arial font, 24 pt. minimum), and fade resistant
- Provide the ability for peer-to-peer communication at a minimum of once per second between controllers of the same model type using Ethernet protocol communication. Such communication will not require the use of any external device or software and will not require routing to or from any external program. Configuration and saving of peer-to-peer setup information will not require restart of the controller to take effect. Provide controller capable of acting as either the source or the destination of Boolean & Peer statements. Provide a minimum of 24 peer-to-peer statements available to the user at each controller.
- Provide a controller that broadcasts signal phasing and timing status every 1/10 of a second to a user-configurable IP address via a user-configurable user datagram protocol (UDP) port. Broadcast in signal phasing and timing (SPaT) format using SAE J2735 messaging or provide firmware to be installed on a dedicated shortrange communications (DSRC) roadside unit (RSU) to translate the message into J2735 format. Do not use a third-party component between the controller and the DSRC RSU. If SPaT format is used directly from the controller, map the phases to lanes via the controller's menu-driven interface or external program running on a personal computer (PC).
- The controller provides the railroad pre-emption operation as indicated on the drawings. Before approval of controller catalog cuts for the project, any controller units proposed for use on a Department contract project is required to be bench-tested in the presence of the Representative for all traffic signals with railroad pre-emption. The controller proceeds immediately to railroad pre-emption operation upon receiving call without any delay.

3. Controller Cabinet

- Provide a cabinet, sized as following:
 - Type 1 mounted local controller assembly: cabinet size 6 (44"W x 52"H x 24"D)
 - Type 1 mounted local controller assembly with on-street master and/or battery back-up: cabinet size 7 (44"W x 72"H x 24"D)
 - Type 2 mounted local controller assembly: cabinet size 5 (30"W x 48"H x 16"D).
- Provide a cabinet with a twelve-position back panel (as a minimum).
- Provide an LED light bar in the top of the cabinet that automatically illuminates when the cabinet door is open.
- Provide a sliding aluminum "laptop shelf" with piano hinged lid capable of holding the cabinet manuals and intersection condition diagram.
- Provide a spring-loaded door switch in the upper right corner of cabinet opening for use as a "door open" alarm.
- Provide an IP addressable Malfunction Management Unit (MMU).
- Provide one additional bus interface unit (BIU) and one additional load switch. Place on shelf.
- Provide a cabinet with two exhaust fans mounted on the roof and suitably screened exhaust vents to permit the flow of air for which the fan is rated. Provide a roof assembly that is formed in such a way to facilitate air exhaust to escape via the fans. Provide a vent area at a minimum of 100 square inches; equipped with standard-size, replaceable fiberglass filters; and that prohibit the entrance of rain or snow. Provide a cabinet equipped with a manually adjustable thermostat connected to control the fans and a calibrated scale with the range between 55F and 140F, with contacts rated for at least eight amperes at 120 VAC, and capable of turning the fan on at the set temperature and turning the fan off when the temperature is 5F below the set temperature.
- Provide a manual transfer switch for generator power on the outside of the cabinet but not on the door that is compatible with the generator cord connectors used by the Owner. Provide a switch with a weather-tight cover or enclosure. Provide an automatic transfer relay to engage the generator power. Emergency generator connection does not void the equipment warranty guaranteed by the equipment supplier.
- Provide a police cord of at least twelve feet in the police switch compartment.
- Provide labeling for all components and cabling that is laminated; high in strength; manufactured

for extreme environmental conditions with respect to UV, temperature, and humidity; capable of adhering to all types of surfaces; bold, legible and fade resistant text; and of a band or flag type.

- Provide a clear plexiglass cover or protection for any open area with live electrical feed.
- All components to have a five-year minimum manufacturer's warranty.
- Optional powder coating of exterior of cabinet
 - Provide cabinet with powder coating using Urethane or Triglycidyl Isocyanurate (TFIC) Polyester Powder finish. Provide a sample and corresponding Federal Color Number, that conforms to the color specified on approved plans, to Municipality and Representative for approval at least 60 days before ordering the cabinet. Police door, meter socket, service disconnect cabinet, clamps, brackets, and connections placed on powder coated cabinet shall match the color of cabinet.
 - Apply powder coating electrostatically and cure in a gas-fired convection oven by heating the substrate to a minimum temperature of 350F and a maximum temperature of 400F. Provide thermosetting powder resin that provides both inter-coat as well as substrate fusion adhesion that meets 5A or 5B according to ASTM D3359.
 - Cabinet is to be wrapped in 3/16 -inch thick ultra-violet inhibited plastic-backed foam and cradled in a 1.0 -inch thick rubberized foam base for transportation. Provide painted matching hardware.

4. Railroad Preemption Interface

- Provide an interface that consists of a minimum of one 9-conductor #14 AWG wire and associated equipment for the configuration indicated. Circuits identified on the plan communicate from the railroad crossing bungalow to the traffic signal cabinet and function as follows:
 - Advance Preemption with Supervision. This circuit notifies the traffic signal controller of an approaching train before the operation of the active warning devices. Two relays are required for each circuit. The railroad returns a normally open and a normally closed circuit. Preemption is initiated when the normally closed circuit opens. The normally open circuit closes when preemption is initiated indicating the proper functioning of the supervision circuit.
 - Simultaneous Preemption (XR) with Supervision. This circuit notifies the traffic signal controller of an approaching train at the point the active warning devices begin their operation. Two relays are required for each circuit. The railroad returns a normally open and a normally closed circuit. Preemption is initiated when the normally closed circuit opens. The normally open circuit closes when preemption is initiated indicating the proper functioning of the supervision circuit.
 - Simultaneous Preemption (XR) without Supervision. This circuit notifies the traffic signal controller of an approaching train at the point the active warning devices begin their operation. One relay is required for each circuit. The railroad returns a normally closed circuit which opens when the railroad warning devices begin to operate.
 - Gate Down. This circuit notifies the traffic signal controller when the gate(s) controlling access to the track(s) is lowered to within 5 degrees of horizontal. One relay is required for each circuit. The railroad returns a normally open circuit which closes when the gate(s) controlling access over the crossing approaching the intersection is lowered.
- Provide an interface panel with outputs for the operation of LED Blank-Out Signs. The interface panel consists of 4-pin, Single Pole/Single Throw, Normally Open (SPST-NO), solid state relay with 10 ampere (A), 24-140VAC Load, 3-32VDC input rating mounted on the interface panel or unused load switch element to illuminate the LED Blank-Out Signs.
- Provide railroad equipment relays that operate at 24 VDC.
- Provide a 24 VDC isolated NEMA TS-2 power supply, capable of providing enough current to simultaneously energize all of the relays and illuminate all of the indicators at maximum temperature plus a 20 percent de-rating, and capable of providing a carryover of 50 milliseconds (ms) at full load.
- Provide 24 VDC, square base, plug-in relays that have a Triple Pole/Double Throw (3PDT) contact configuration, 10A rating, 470ohm coil resistance, with a locking test button and internal LED indicator and top and side flange covers.
- Provide relay sockets which are 11-pin, Din rail/Panel mount, 15A, 300 volt rating with red plastic

- locking clip and screw terminals and clamping plates that accept stripped wire or ring terminals.
- Provide stainless steel mating hold down clips, compliant with the Restriction of Hazardous Substances (RoHS) Directive, for safely securing each relay to its corresponding socket.
- Provide adequate terminals, numbered or labeled, and identified on the wiring diagram for all field connections and all internal connections.
- Provide labels on the interface panel wiring diagram for all nomenclature and terminals. Provide “cage-clamp” design terminals, such as manufactured by WAGO Corporation, Phoenix (Contact, Allen Bradley), or approved equal. Terminals which provide “side swipe” connections or set screws are not acceptable. Provide a harness (MS D, C11, or other) appropriate for connecting the specific controller unit to the preemption interface panel (TS1 controller only).
- Provide a preemption input test switch panel with a minimum of five test switches, mounted in a convenient location within the controller cabinet. Provide switches with a 0.25-inch green indicator light for down position and 0.25-inch red indicator light for up position for each test switch as indicated. Provide aircraft style toggle switches with integrated spring-loaded snap action switch flip covers to prevent accidental actuation of the toggle switch and to protect it from damage as follows:
 - PE Test – Provide this switch as Triple Pole/Single Throw (TPST).
 - PE Fail Test – Provide this switch as Triple Pole/Single Throw (TPST)
 - Sup Fail Test – Provide this switch as Triple Pole/Single Throw (TPST)
 - Sim Test – Provide this switch as Triple Pole/Single Throw (TPST)
 - Sim Fail Test – Provide this switch as Triple Pole/Single Throw (TPST)
 - Sup Fail Test – Provide this switch as Triple Pole/Single Throw (TPST)
 - Gate Down Test – Provide this switch as Triple Pole/Single Throw (TPST)
- Provide an 8.5”x11” controller cabinet warning label made of adhesive backed, retro-reflective material.

(n) Networking of School Zone Flashers: Provide networked school zone flasher system consisting of a cellular modem, data plan, and application software meeting but not limited to the following requirements.

- A daily default program or calendar used for controlling on/off times (flash periods) typically used Monday through Friday during a normal school week but any combination of days may be selected including Saturday and Sunday. The user must be able to program start and end date for the default or calendar programs to run during the year.
- The application software must allow for exception day programming with unique flash period times allowing the user to operate a local school flasher unit(s) with flash periods different than the default program. Exception day programming would take precedence over default programming.
- From a central location the operator must be able to verify the on/off status of a local school flasher unit(s) networked on the central operating system. The user must be able to confirm the success or failure of data transfer from the central software or server to the local school flasher unit.

(o) Ethernet Bridge: Provide a pair of transmitter/receiver radios with power over ethernet injectors and supplemental ethernet surge protection at the locations specified on the drawings, meeting the following requirements:

- Minimum bandwidth of 120 Mbps throughput is required.
- Frequency of 4900 to 5920 MHz operation is required.
- Category 5e or Category 6 cable is required.
- Static IP address.
- Controller equipment must be compatible with the service and service hardware provided by Others. Provide appurtenances that may be necessary to ensure a fully functional interface with the controller equipment and the provided service.

953.3 CONSTRUCTION— Sections 950.3(Traffic Signals General) and 954.3(Electrical Distribution), as shown on the Standard Drawings and as follows:

(a) **Time Based Coordinator Unit.** Section 952.3.

(b) **Master Controller Assembly.** Section 952.3.

(c) **Coordination Unit.** Section 952.3.

(d) **Radio Communications System:** Furnish all necessary antennas, cables, jumpers, and lightning protection as necessary to provide a complete and functioning wireless interconnect system to include but not be limited to the following:

- One radio unit at the master controller location and at each local controller location as indicated.
- Communication cable from the controller to the radio unit.
- Omni and directional antennas as indicated.
- Coaxial cable assembly with length and size as indicated.
- Coaxial lightning suppressors at all locations and grounded to the grounding electrode system.
- Supply antenna grounding kits at all locations and connected to the grounding electrode system.
- Provide each radio unit with repeater capabilities.
- Provide all product information and warranties for all equipment.

Neatly install all equipment meeting all FCC, TIA/EIA requirements and all state and local codes.

Upon completion of the radio system installation conduct the following tests in the presence of the Representative to ensure the installation is functioning adequately.

- Perform cable frequency sweep testing with appropriate test equipment. Test cables and connectors over cable manufacturer's entire certified frequency range.
- Report cable Voltage Standing Wave Ratio (VSWR) performance in graphical format.
- Perform time-domain reflectometer (TDR) testing to identify point faults. Report in graphical format.
- Test all ground system interconnections. Report impedance measurements.
- Repair or replace any cables and connectors that do not meet manufacturer's published performance standards. Retest any such cables.
- Tune and configure system to maximize performance of radio link.
- Report actual VSWR, Received Signal Strength Indicator (RSSI), and signal-to-noise (S/N) ratio.
- Utilize radio manufacturer's diagnostic system software to assist in analysis and configuration.
- Log and submit printed diagnostic software results.
- Visually inspect all installed system components. Restore or replace all components found to be in less than perfect condition.
- Adjust Effective Isotropic Radiated Power (EIRP) to within FCC allowable limits.

Upon successful completion of the testing requirements the Representative will provide the contractor with final approval that the system is complete.

(e) **Cable.** Install instrument, control, and communication cables and hardware as required. Do not splice cables, except at terminal strips. Test the cables, as specified in Section 954.3(j), as applicable.

(f) **Cellular Communications System.**

Neatly install all equipment meeting all FCC requirements and all state and local codes. Facilitate the cellular modem authorizations with the Service Representative and ensure that all cellular contracts are turned over to the proper responsible parties.

Upon completion of the cellular system installation, demonstrate to the Representative that the installation is functioning properly as indicated.

(g) **Fiber Optic Communications System:** Fiber optic (FO) communication system consisting of a fiber optic network switch, patch panel, communication cables, and surge protection. Furnish all necessary materials necessary to provide a complete and functioning FO interconnect system including but not limited to the following requirements:

- One FO network switch is provided at the master controller location and at each local controller

location as indicated.

- Communication cables from the controller to the FO network switch.
- Provide FO cable between each location as indicated.
- Provide FO patch panel for terminating each FO cable at an enclosure.
- Provide inner duct in all underground conduit installations as specified in Section 954.3(a), (b), (c).
- Provide all product information and warranties for all equipment.

Standards: Unless specified otherwise provide all FO cables and installation methods meeting the following standards:

- EIA FOTP-25 for requirements on impact resistance of FO cable
- EIA FOTP-33 for requirements on tensile resistance of FO cable
- EIA FOTP-41 for requirements on crush resistance of FO cable
- EIA FOTP-892 for requirements on moisture resistance of FO cable
- EIA FOTP-104 for requirements on flexibility of FO cable

Provide fiber optic cables over 60 feet long with minimum 12 fiber count, except as indicated. Terminate all spare fibers with LC-type connectors and connect the patch panel.

Provide FO patch cords exceeding 60 feet long with minimum 4 spare fibers or 20% of used fiber count (whichever is the greatest), except where indicated.

Install each FO cable run as one continuous length; no splicing in the conduit system is allowed; fusion splicing for FO lines longer than 1,000 feet is allowed but only in designated splice trays inside designated splice enclosures. Test all fiber strands including spare fibers for continuity and submit documentation.

Ensure that pulling strength of the cable is not exceeded during installation.

Ensure that the minimum bend radius of the cable is not exceeded during installation.

Install aerial FO cables according to the manufactures recommended installation methods and components and be loose tube design.

Ensure that the maximum installation tension (Span Tensioning) is not exceeded during the installation of aerial FO cables.

Provide a tracer wire of single 24 AWG (minimum) thermoplastic heat and water-resistant nylon-coated (THHN) copper cable. The tracer wire is only required for underground installations.

Do not exceed 0.75 dB insertion loss per mated connector pair. Where the installed FO connector assembly to terminate onto a connector at a FO device and the said mating device connector is not separable from the device, then the insertion loss of the single installed FO connector assembly will be less than 0.35dB.

Perform optical power tests before and after splice for attenuation on the spliced FO line longer than 1,000 feet.

Do not exceed 0.3dB insertion loss for each splice. Document results and submit to the Representative.

Use LC-style connector for a FO strand. In cases where LC-style connector is not available for the related device, obtain written permission for the use of manufacturer's standard connector type before finalizing procurement/supply of affected item(s). Fabrication tolerances and quality of the connector shall be such that the limitation on installed insertion loss of the connector is achievable.

Provide FO patch cables as indicated. FO patch cables must be provided from the connectors on the FO cross patch panel to the connectors on the FO network switch.

Provide single mode fibers consisting of (single-mode, 8.3-10/125 μ m) cable, 900 μ m loose tube gel-filled with fibers, aramid yarn strength members, yellow flexible flame-retardant jacket, round duplex configuration, UL type optical fiber, nonconductive, riser (OFNR). Provide a cable with a maximum attenuation of 0.5 dB/km @ 1310 nm and 0.4 dB/km @ 1550 nm.

Install all equipment in a neat and professional manner meeting all installation requirements and all state and local codes. Install all conduit and trenches as specified in Sections 954.3(a), (b), (c). For aerial FO installations, coordinate any utility pole attachments or provide service poles for attachment if indicated. Provide service poles as specified in Section 1101.11(a).

Upon completion of the FO system installation, demonstrate to the Representative that the installation meets the operational limits as specified in Section 952. Demonstrate to the Representative that the installation is functioning as indicated.

(h) Wireless Broadband Communication System.

Install the equipment according to the manufacturer's instructions and requirements. Configure the radio

transceivers and mount them to the pole or structure as required. Adjust the orientation for a clear line of sight between the intended signal propagation locations. Ensure optimum system performance is achieved. Configure the radios to utilize the 5.8 GHz bandwidth. Connect the system components with outdoor rated Ethernet Category 5 or Category 6 communications network cables, Power over Ethernet (PoE) cables, coax cables, etc. that are suitable for the application.

Category 5e or Category 6 Ethernet cables and any other required cables are to be pulled through existing and/or proposed conduits and junction boxes from the mounting locations on poles and mast arms to the indicated cabinets. Splicing of Category 5e cables is not permitted for runs under 320 feet in length. Obtain instructions from the manufacturer regarding alternate architecture, such as weather-sealed Ethernet repeaters and/or switches when the length of a single run of Category 5e cable exceeds 320 feet. All cables to be terminated and connected to the wireless antennas and other devices including but not limited to switches, repeaters, power injectors, etc. with the appropriate weatherproof terminations.

All auxiliary equipment and processes necessary for safe and reliable installation of the wireless antennas, including but not limited to mounting brackets, pole extensions, screws, washers, etc. must be provided and installed. All other devices including but not limited to repeaters, power injectors, etc. required for installation and operation of the wireless antenna must also be provided and installed.

Shelf or rack mount the wireless transceiver in the controller or mount on the traffic signal support pole in a weatherproof NEMA 4X enclosure. Install moisture-resistant sealers to protect the attachment of antenna and coaxial cable.

(i) Restore Existing Underground Electrical and Fiber Optic Facilities.

Reconnect or repair the existing underground facilities to existing condition with like materials or approved alternate by the Representative. Complete a full test of the system to ensure that the integrity of the facility is fully restored.

When disconnection of the facility is required for repair or reconnecting, make arrangements with the facility owner to provide necessary jumpers to ensure continuity of operation. Provide those jumpers in a manner approved by the facility owner and the Representative, in advance of performing the work.

When the work is completed, remove any jumpers, reconnect, and test the system to the satisfaction of the Representative, demonstrating that the integrity of the facility is fully restored. Do not begin this work without notifying the facility owner and the Representative at least three days in advance.

(j) Managed Network Switch

- Submit a network diagram plan depicting the switch connection, before any switch installation. Include the following information:
- IP information.
- Any virtual local area network (VLAN) or protocol information.
- Indicate the port interconnections between switches.
- Allow only manufacturer trained personnel to configure and install the network switch(es).
- Install network switch(es) according to the manufacturer's recommendations.
- Connect the network switches in a ring configuration.
- Coordinate with the Department's Traffic Unit for synchronous optical networking (SONET). port assignment to establish connectivity to the RTMC.
- Coordinate all work, including the exact switch configuration information, with the Representative and the Department's Information Technology resources.
- Follow all Department network configuration standards including but not limited to all security implementations.
- Provision the network switch(s) for communications for all network devices as needed. Typical switch configuration:
 - Link Layer Discovery Protocol (LLDP) enabled
 - Rapid Spanning Tree Protocol (RSTP) enabled
 - VLAN enabled and configured if required
 - All other protocols disabled
- Complete the Department's "Traffic Signal Unit IP Address Request Form" to request a block of Commonwealth specific IP addresses. Request a minimum of ten IP addresses per intersection and crossing. Coordinate with the Representative to determine if additional intersections and crossings

within a corridor are expected to be connected to the Commonwealth network within the next three to five year timeframe. If there are multiple corridors (which are not interconnected) in a project, submit one (1) IP address request form for each of the corridors.

- Label the device as follows:
 - Label IP address.
 - Label with identifier which corresponds to the interconnection diagram.
 - Use the ANSI/TIA-606-B standard as a guideline.
 - Provide labels conforming to the following:
 - Laminated
 - High in strength
 - Manufactured for extreme environmental conditions with respect to UV, temperature, and humidity.
 - Capable of adhering to all types of surfaces.
 - Bold, legible and fade resistant text.
 - Submit for approval any adjustments or modifications to labeling convention.
- Test system as specified in Section 953.3(d)2.
- Set up redundant ring utilizing Rapid Spanning Tree Protocol as per splicing diagram.

(k) Layer 3 Network Switch: Install all equipment according to the manufacturer's recommendations, as indicated and as follows:

- Provide trained personnel from the switch manufacturer to configure and install the Layer 3 Network Switch(s).
- Install all components according to manufacturer's guidelines and requirements.
- Install equipment in cabinets or racks as indicated.
- Coordinate all work, including the exact switch configuration information, with the Representative and the Department's Information Technology resources.
- Follow all Department network configuration standards including but not limited to all security implementations.
- Provision the Network Switch(s) for communications for all network devices,
- Real-time Transport Protocol (RTP)/ RTSP, and quality of service.
- Obtain IP address from the Department's Traffic Unit.
- Label the device as follows:
- Label IP address.
- Label with identifier which corresponds to the interconnection diagram.
- Use the ANSI/TIA-606-B standard as a guideline.
- Provide labels conforming to the following:
 - Laminated
 - High in strength
 - Manufactured for extreme environmental conditions with respect to UV, temperature, and humidity.
 - Capable of adhering to all types of surfaces.
 - Bold, legible and fade resistant text.
- Submit for approval any adjustments or modifications to labeling convention.
- Test system as specified in Section 953.3(d)2.

(l) Unified Command and Control (UCC) Integration

Provide the work described herein to integrate all applicable traffic signals into the Department's Unified Command and Control (UCC) software on the Department's UCC server:

- Intersection Configuration – configure intersection name, street names, notes field, and other fields according to Department guidelines.
- Graphics – configure color intersection graphics for each signalized intersection that accurately depicts intersection lane configuration, phase assignments, detector locations and detection assignments.
- Alarms
 - Program alarms within local controllers as directed by the Representative during system setup. At a minimum, include intersection flash, door open, communications failure, detector failures, UPS

- failure, and UPS activation.
- Program the system to immediately report the following events, at a minimum:
 - Traffic Signal Conflict/MMU Flash
 - External Start (restoration of AC power after power outage)
- Program the system to log the following events within the system database and provide a banner notification on the screen:
 - Door open to intersection controller cabinet
 - Detector failure (system and/or local)
 - Communication failure
- Detector Logging
 - Program all local controllers and central system to log the data of all detectors during system setup. Field verify that detectors are labeled correctly in the controller cabinet and in the central system monitor.
 - Program all controllers for all system detectors to log during system setup. Designate lane group direction (NB Left, NB through, NB right, etc.) in the detector report.
 - Program all system detectors and enable volume/occupancy logging at the intervals indicated.
- Communications
 - Complete the Department's Traffic Signal Unit IP Address Request Form to request a block of Commonwealth specific IP addresses. Request a minimum of ten IP addresses per intersection and crossing. Coordinate with the Representative to determine if additional intersections and crossings within a corridor are expected to be connected to the Commonwealth network within the next 3 to 5 year time frame. If there are multiple corridors which are not interconnected in a project, submit one IP address request form for each of the corridors.
- Security
 - Work with the UCC administrator within the Department's District Traffic Unit to obtain secure access for users from each municipality within the project limits.

Perform tabletop exercise on RTMC floor to demonstrate the full functionality of controller unit with Unified Command and Control software before submission of shop drawings for review and approval. Provide cabinet documentation and labeling for single, multi-bay, and the Department's RTMC equipment room cabinet equipment installations as follows:

- For standard prewired cabinets, provide detailed wiring diagrams showing all active and passive components, wiring, and terminations. Wiring labels from the manufacturer to correspond to the wiring diagrams provided.
- For signal controller, sensor devices, ITS, communications, and any additional components provide interconnection diagram showing cable and port connections. Label all components and cables using the ANSI/TIA-606-B standard as a guideline and the following:
 - Label each component with an identifier that corresponds to the interconnection diagram.
 - Label cables at both ends. Provide information on each cable end to indicate the near and far end connections.
 - The cable end with the label is considered the near end; the opposite cable end is considered the far end.
 - Label all detector lead-ins as per the Department's Automated Traffic Signal Performance Measures (ATSPM) Detector Mapping Guidelines and map into timer unit to collect appropriate data.
 - Label text:
 - Indicate the near end component identifier and port connection on the first line.
 - Indicate the far end component identifier and port connection on the second line.
 - Indicate the system or network title on the third line.
 - Abbreviations are acceptable if they are consistent between the interconnection diagram and the component identifier.
 - RTMC equipment room or multi-bay cabinets; additional information is needed when connecting to equipment in multiple locations of a room or cabinet(s):
 - Indicate cabinet identifier, rack unit(s), interface card slot if component has multiple slots and

port connection on the first and second line.

- Submit for approval any adjustments or modifications to labeling convention.
- Neatly bundle, tie-wrap, and organize all loose wiring.
- Label IP address on all devices in the project that are assigned an IP address.
- Provide Owner with the name and telephone number of the person to be notified in the event of failures or malfunctions during the guarantee period as specified in Section 950.3(d)10.

Complete the system setup before beginning the 30-day system test. Test system as specified in Section 953.3(r). Halt system test if there is a failure in communications. Determining the communication problem is the responsibility of the contractor. If the communications problem was the result of a device supplied by the Contractor, restart the 30-day system test entirely upon correction of communications.

(m)Railroad Interconnect.

Perform tabletop exercise as specified in Section 953.3(m).

Submit channel mapping in cabinet detector rack and in signal controller to the Department for review and approval including direction, lane, and phase assignment at the time of shop drawing submission. Verify the assignment in the presence of Department's representative during shop test. Turn on high resolution data logger in the timer unit. Demonstrate the performance measures reporting on the Department's Measures of Effectiveness (MOE) software module during the Systems Test.

For powder coated cabinet, install with nylon slings to preserve the integrity of the coating. Pad and handle all components during loading, unloading, and installation. If the coating becomes chipped, scratched, blistered, or otherwise damaged, it must be repaired according to the coating manufacturer's recommendations with no additional cost to the Department.

Install the two-gang electrical outlets inside the cabinet, one on each cabinet side wall (two total). Install LED light bar inside the top front and one side the top rear of the cabinet. Illuminate the lights with door-open switch. Install test button panel. Install hinged cover for test buttons, such that the cover stays up upon raising for use of test buttons. Tether USB drive to a shelf or other permanent piece of the cabinet. Install the warning label on the interior of the controller cabinet door indicating the interconnection of the two systems. Contact the Department's District Traffic Unit for an electronic copy of the label for printing.

Install the Preemption Input Test Switch Panel as follows:

- Connect the railroad circuits through the test switch panel to directly simulate the input from the railroad. Label each switch exactly as indicated below by use of a silk-screened legend. Rub-on, adhesive or other markings which are not permanent are not acceptable.
- PE Test. Arrange such that the up position is test and the down position is normal. Label the switch "PE" for the up position and "Norm" for the down position. Label "PE Test" at the bottom of the individual switch panel.
 - When up, the advance preemption normally closed circuit opens, and the advance preemption normally open supervised circuit closes. The red indicator light is on, and the green indicator light is off.
 - When down, the two advance preemption circuits from the railroad pass through the test switch. The green indicator light is on, and the red indicator light is off.
 - The red indicator light is on, and the green indicator light is off during actual railroad pre-emption.
- PE Fail Test. Arrange such that the up position is test and the down position is normal. Label the switch "PE Open" for the up position and "PE Closed" for the down position. Label "PE Fail Test" at the bottom of the individual switch panel.
 - When up, the advance preemption circuit from the railroad is open. The red indicator light is on, and the green indicator light is off.
 - When down, the advance preemption circuit passes through the test switch. The green indicator light is on, and the red indicator light is off.

- The red indicator light is on, and the green indicator light is off during actual railroad pre-emption.
- Sup Fail Test. Arrange such that the up position is test and the down position is normal. Label the switch “SUP Closed” for the up position and “SUP Open” for the down position. Label “Sup Fail Test” at the bottom of the individual switch panel.
 - When up, the advance preemption supervised circuit from the railroad is closed. The red indicator light is on, and the green indicator light is off.
 - When down, the advance preemption supervised circuit from the railroad passes through the test switch. The green indicator light is on, and the red indicator light is off.
 - The red indicator light is on, and the green indicator light is off during actual railroad pre-emption.
- Sim Test. Arrange such that the up position is test and the down position is normal. Label the switch “Sim” for the up position and “Norm” for the down position. Label “Sim Test” at the bottom of the individual switch panel.
 - When up, the simultaneous preemption (XR) circuit from the railroad is open. The red indicator light is on, and the green indicator light is off.
 - When down, the simultaneous preemption (XR) circuit from the railroad passes through the test switch. The green indicator light is on, and the red indicator light is off.
 - The red indicator light is on, and the green indicator light is off when the simultaneous preemption (XR) circuit is open during actual railroad pre-emption.
- Sim Fail Test. Arrange such that the up position is test and the down position is normal. Label the switch “Sim Open” for the up position and “Sim Closed” for the down position. Label “Sim Fail Test” at the bottom of the individual switch panel.
 - When up, the advance preemption circuit from the railroad is open. The red indicator light is on, and the green indicator light is off.
 - When down, the advance preemption circuit passes through the test switch. The green indicator light is on, and the red indicator light is off.
 - The red indicator light is on, and the green indicator light is off during actual railroad pre-emption.
- Sup Fail Test. Arrange such that the up position is test and the down position is normal. Label the switch “Sup Open” for the up position and “Sup Closed” for the down position. Label “Sup Fail Test” at the bottom of the individual switch panel.
 - When up, the advance preemption circuit from the railroad is open. The red indicator light is on, and the green indicator light is off.
 - When down, the advance preemption circuit passes through the test switch. The green indicator light is on, and the red indicator light is off.
 - The red indicator light is on, and the green indicator light is off during actual railroad pre-emption.
- Gate Down Test. Arrange such that the up position is test and the down position is normal. Label the switch “GD” for the up position and “Norm” for the down position. Label “Gate Down Test” at the bottom of the individual switch panel.
 - When up, the gate down preemption circuit from the railroad is closed. The red indicator light is on, and the green indicator light is off.
 - When down, the gate up preemption circuit from the railroad passes through the test switch. The green indicator light is on, and the red indicator light is off.
 - The red indicator light is on, and the green indicator light is off when the gate down preemption circuit is closed during actual railroad pre-emption.

Connect the NEMA TS-2 power supply to the preemption isolation panel assembly to power the relays and indicator lights. Do not connect the power supply outputs to any other voltage source or common such as logic ground, alternating current (AC) neutral, or earth ground. Appropriately fuse the input and the output of the power supply and fully isolate with no grounded conductors. Install 24 VDC square base plug-in relays in appropriate sockets. Mount the relays and terminals on a suitable aluminum panel located in an area accessible for inspection and connection.

If applicable, connect the appropriate harness (MS D, C11 or other) from the controller unit to the preemption interface panel.

(n) Networking of School Zone Flashers: Configure the cell modem to the requirements of owner. The vendor must be required to set-up all components of the networked school flasher system and demonstrate a

functioning system for a test period of 30 days.

(o) Traffic Signal System Testing. Conduct a separate 30-day operations test on the system and communications. Test the entire system for the indicated operation, including proper operation and communication between local controller assemblies, master controller assemblies, and other necessary remote control or monitoring equipment. System test includes hardware and software used for control, communication, or monitoring. Change inputs, outputs, and programming controls, and adjust or revise initial signal timing parameters, as directed

(p) Ethernet Bridge.

Install and configure transmitter/receiver radios.

Before performing field communication tests, contractor shall complete the following:

- Develop a test plan for field communications and point to point wireless ethernet bridge communications.
- Obtain approval for field communication testing from the Department.
- Obtain approval for point to point wireless ethernet bridge communication testing from the Department.
- Schedule point to point wireless ethernet bridge testing date with the Department.
- Do not perform test until all intersections within an interconnected system have been upgraded as indicated.

Perform test of field communication system following the approved test plan. This test does not take the place of the Traffic Signal System Test as specified in Section 953.3(r).

Perform a test of the point-to-point wireless Ethernet bridge communication system following the approved test plan to demonstrate the proper remote operation of the service connection. This test does not take the place of the System Test as specified in Section 953.3(r).

953.4 MEASUREMENT AND PAYMENT—

(a) Master Controller Assembly. Each.
For the type indicated.

(b) Radio Communications System. Lump Sum.
Includes all antennas, cable, transmitter/receivers, protective devices, mounting hardware, and testing and diagnostic work for a complete system.

(c) Cellular Communications System. Lump Sum.
Includes all antennas, cable, modems, mounting hardware, and protective devices, to make a complete and functional cellular communications system.

(d) Fiber Optic Communications System. Lump Sum.
Includes all cable, modems, mounting hardware, and protective devices, to make a complete and functional fiber optic communications system.

(e) Wireless Broadband Communication System. Lump Sum.
Includes transceivers, antennas, cables, power over Ethernet injectors, enclosures, mounting hardware, wiring, testing and diagnostic work for a complete and operational system.

(f) Restore Underground Electrical and Fiber Optic Facilities. Dollar.
The proposal will include an item and a predetermined amount of money for Restore Underground Electrical and Fiber Optic Facilities.
The contract item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the contingent or unpredictable nature of the work being performed, the provisions as specified in Section 110.02(d) are not applicable to this item.

(g) Managed Network Switch. Each.

The price includes all labor, materials, cabling, ancillary components, configuring, integrating, and testing of Managed Network Switch(s) installed under this item. All network and fiber optic patch cables are considered incidental to this item.

(h) Layer 3 Network Switch. Each. This work includes all labor, materials, cabling, ancillary components, configuring, integrating and testing of Layer 3 Network Switch(s) installed under this item.

(i) UCC Integration Lump Sum. Paid on completion of 30-day system test.

(j) Railroad Interconnect Each.

80% paid on installation. 20% paid on completion of the 30-day System Test.

(k) Networking of School Zone Flashers Lump Sum. Paid on completion of 30-day system test.

(l) Ethernet Bridge. Each. This work includes all labor, materials, cabling, ancillary components, configuring, integrating and testing of Ethernet Bridge(s) installed under this item.

SECTION 954—ELECTRICAL DISTRIBUTION

954.1 DESCRIPTION—This work is the furnishing and installation of the electrical distribution for the control and illumination of traffic signals.

954.2 MATERIAL—

(a) General.

- Traffic Signals-General—Section 950.2
- Poles and Bases—Section 1101.02
- Certification—Section 106.03(b)3

(b) Conduit.

1. **Rigid Steel Conduit.** Section 1101.09, except may be used for direct burial, and UL-6 Listing for rigid metallic conduit, galvanized inside and outside.

2. **Rigid Polyvinyl Chloride Conduit.** Section 1101.09 with UL-651 Listing for rigid nonmetallic conduit, and UL-514 Listing for fittings.

3. **Cable Pulling Lubricant.** Section 1101.13(c).

4. **Conduit Sealant.** Electrical putty or approved sealant as recommended by the signal cable or conduit manufacturer.

5. **Stainless Steel Wool.** Grade 3 or 4 stainless steel wool.

(c) Wire and Cable.

1. **Signal Cable.** 14 AWG minimum, stranded conductors; conforming to IMSA Specification 19-1 or 20-1.

2. **Service Wire.** 8 AWG minimum wire, Type USE conforming to UL-854 Listing and ASTM B3 and B8 for soft, annealed copper.

3. **Ground Wire.** Bare or insulated copper wire, 8 AWG, conforming to ASTM B3.

4. **Cable Tags.** Provide cable tags that are permanent, UV resistant, and weather resistant. Semi-permanent tags such as tape will not be allowed unless used for temporary applications such as during construction.

5. **Cable Ties.** Provide cable ties that are permanent, UV resistant, and weather resistant.

6. **High-Density Polyethylene (HDPE) Conduit.** NEMA TC7 Standards and Schedule 40.

7. **Polyester Pull Tape.** Rated 900 pounds.

8. **Cable Supports.** For span wire installations utilize insulated cable rings and saddles, or other acceptable type support, to secure cable to span wire.

9. **Ethernet Cable.** Provide shielded outdoor rated Category 5e/6 100BASE-TX Ethernet cable. The jacket is to be UV resistant polyethylene and contain water blocking gel or dry gel tape for water resistance. Provide weathertight RJ45 connectors on all exposed ends.

(d) **Junction Box.** Furnish the type as shown on the Standard Drawings, as indicated, and as follows:

- Provide junction box cover with “Traffic Signal” wording on the surface, as shown on the Standard Drawings.
- Precast Junction Box—Section 714.
- Steel or Cast-Iron Junction Box—steel or cast-iron conforming to the requirements for cast-iron junction box, as specified in Section 1101.10.
- Reinforced Plastic Mortar Junction Box—Provide heavy duty junction box with nonskid surface and a watertight connection to the housing. Provide a minimum design load 15,000 pounds with a test load of 22,500 pounds.

(e) **Electrical Service.**

1. **Service Pole.** Section 1101.11(a).
2. **Service Head.** UL-Listed weatherproof service head, for applicable conduit type.
3. **Meter Socket.** As specified by the utility company.
4. **Service Disconnect.**

4.a **Enclosure.** Galvanized steel, aluminum, or stainless steel, with a hinged door having provisions for a padlock and no external handles or switches; conforming to the NEMA Standard for Type 3R, Type 3S, or Type 4 Provide a brass padlock for outdoor use, with two keys. All padlocks shall be keyed alike.

4.b **Main Disconnect.** Provide a means for disconnecting the service conforming to NEC and local utility requirements where applicable.

4.c **Fuses.** UL-Listed Type K-1, 30 A minimum.

4.d **Fuse Block.** UL-Listed for K-1 fuses.

4.e **Power Line Surge Protector.** UL-Listed, rated for a maximum permissible line to ground voltage of 175 V (rms). Clamping voltage not to exceed 250 volts. Provide model with LED to indicate proper functioning of protection and device failure for each line.

(f) **Wire Connectors.**

1. **Wire Nuts.** Insulated, UL-Listed, with spring insert for applicable wire size and rating of wire insulation.

2. **Waterproof Resin Sealer.** Insulated, UL-Listed for wire nuts.

3. **Terminal Blocks.** UL-Listed with twelve-sets minimum to two terminals each, screw-type, rated at a minimum of 600 V, and suitable for the applicable wire size. Connect each set of terminals by means of a removable link. Separate each set of terminals by a molded barrier. Provide a marker strip for terminal identification.

4. **Insulated Locking Spade Terminals.** An acceptable type.

(g) **Grounding Bushings and Lugs.**

1. **Bushings.** UL-Listed for applicable conduit type and size.

2. **Lugs.** UL-Listed for applicable materials.

(h) Ground Rods With Clamp. Section 1101.11(j).

(i) Generator Adaptor Kit. Facilitate connection to an external power source, a 110 V AC generator.

1. Disconnect Enclosure. Section 954.2(e)4.a. Access to the automatic switch relay through the use of a locked police door using a No. 2 key or standard police key.

2. Transfer Switch. Capable of disconnecting the permanent utility power source and connecting to the emergency power source. Provide system capable of automatic switch over between AC line utility and generator power.

3. Connector Cable Assembly. Provide cord with sufficient length to allow the attachment of an external power source according to the latest NEC, that is compatible with the municipal generator, and has neoprene all weather flexible protective boots on each end.

4. Surge Protection. Protect the signal controller assembly with line to neutral clamping voltage of no more than 250 V at 20,000 A.

5. Indicator Light. Provide 1 inch diameter red and green LED indicator lights mounted to the cabinet on the street side of the cabinet and visible from the center of the intersection. The indicator lights will be field located and connected to the cabinet with watertight connections to prohibit water intrusion into the cabinet. The red LED indicator light is to be wired to the load side of the transfer switch and is to be illuminated whenever the signals are operating under generator power. The green LED indicator is to be wired to the AC Line In and is to be illuminated at all other times.

(j) Uninterrupted Power Supply (UPS). Furnish a Battery Backup System (BBS) and full-time double conversion power conditioner UPS or line-interactive true UPS (stand-by UPS will not be allowed), compatible with the controller assembly and the following:

- Provide a UL-listed BBS for use with traffic signal equipment.
- Provide UPS with ethernet port for laptop connection for information downloads.
- Provide BBS capable of having a transfer time of 8 milliseconds (1/2 the sine wave) or less.
- Provide BBS with full-time line conditioning.
- Provide BBS with surge protection compliant with IEEE/ANSI C.62.41 Category A and B.
- Provide BBS with automatic transfer switch and manual override, compatible with UPS, manufacturer rated at 120VAC/30A.
- Provide BBS capable of automatic switch over between AC line and UPS Power. Transfer switch should also be capable of bypassing the UPS for safe removal of the UPS unit for maintenance by way of manually operated UPS supply breaker.
- All connectors shall be finger safe and all transfer relay contact wiring shall be according to the national electric code.
- The BBS system is to be monitored and controlled using readily available terminal emulation software. Proprietary application software is not allowed. Web-based software is allowed.
- Provide BBS with intelligent staged charger with control system. The integral intelligent system shall use temperature compensation. The charging system shall compensate over a range of 2.0 to 6.0mV/°C per cell, user-adjustable when required. Batteries when charged shall not exceed a battery temperature of 50 °C. Battery shall not be recharged when battery temperature exceeds 122F. Temperature probe shall be included with UPS.
- Provide batteries that are deep cycle or float cycle, scaled prismatic lead-calcium based Absorbed Glass Mat/Valve Regulated Lead Acid (AGM/VRLA) or Nickel Zinc based.
- Provide red and green LED indicator lights (1.0 inch diameter) mounted to the cabinet on the street side of the cabinet and visible from the center of the intersection. The indicator lights will be field located and connected to the cabinet with watertight connections to prohibit water intrusion into the cabinet. The red LED indicator light is to be wired to the load side of the transfer switch and is to be

illuminated whenever the signals are operating under battery back-up power. The green LED indicator is to be wired to the AC Line In and is to be illuminated at all other times.

- Provide a system with minimum 8-hour backup operation at minimum 450-watt load.
- Provide all warranty information to the Representative at final acceptance.
- Provide auxiliary cabinet as necessary to accommodate the required number of batteries and Automatic Transfer Switch as specified in 952.2(c)1.1.f as necessary and as indicated.

(k) Service Receptacle. Provide one duplex Ground Fault Circuit Interrupter (GFCI) receptacle that is only used by service technicians working on the signal controller system. No other internal equipment is to be connected to the service receptacle. Minimum rating 20A.

954.3 CONSTRUCTION—Sections 910.3(a) and 950.3, as shown on the Standard Drawings, and as follows:

(a) Conduit Trench and Backfill. Excavate and backfill as specified in Section 910.3(c). Cut existing pavement only if indicated. If applicable for Type II trench and backfill, require full slab sidewalk replacement as specified in Section 676.3.

Restore existing pavement. For flexible pavement, use asphalt material of a type equal to the existing pavement, as determined by the Representative. For rigid pavement, use High Early Strength Cement Concrete as specified in Section 704.1 and installed as specified in Section 516.

(b) Directional Boring. Install and maintain all erosion and sediment pollution control measures, as indicated on plans, before the start of directional boring. The depth of directional borings should be below the existing roadway subgrade, below the existing pavement base drain, and as shown on the Standard Drawings. Conduct utility test pits according to applicable PA One Call laws. Do not deform the pavement. Guide the boring. Pneumatic hammers are not allowed. Keep boring pits at least 2 feet from the edge of pavement unless otherwise authorized in writing. Do not use water or drilling fluids to the extent that the pavement might be undermined, or subgrade softened. Maintain drilling fluid in bore hole to increase stability of the surrounding soil. Angle the entry/exit holes so that the curvature of the entry/exit holes does not exceed the allowable bending radius of the traffic signal conduit. Cover the boring pits with adequate planking if the drilling operation must be left overnight. Refill and compact boring as specified in Section 206.3(b).

(c) Conduit. Install as specified in Section 910.3(g) and as follows:

If allowed by the Representative, indicated conduit runs may be changed to avoid underground obstructions.

Install conduit as indicated. Maintain at least a 12 inch separation between conduit and other underground utilities. Install high-impact, plastic spacers a maximum of 8 feet on center, if more than two rigid, nonmetallic conduits are to be installed in a common trench.

After installing all related cables, seal all conduits within junction boxes and foundations, including all spare or abandoned conduits, with electrical putty or an approved sealant as recommended by the cable or conduit manufacturer. Insert grade 3 or 4 stainless steel wool at a minimum of 2 inches in the conduit before the sealant.

When installing conduit to an existing foundation, do not compromise the integrity of the foundation. Restore any concrete loss to the foundation. Exposed conduit accessing an existing foundation shall be rigid metal as specified in Section 954.2(b)1.

(d) Bonding and Grounding. Bond and ground all electrical equipment as indicated, as shown on the Standard Drawings, as specified in Section 910.3(q), and as follows:

Provide a continuous mechanical and electrical grounding system from the controller assembly through the electrical distribution system.

Bridge grounding bushings on rigid metallic conduit.

Thread bonding bushings on the free ends and lock in place with stainless steel set screws, lug mountings, and binding screws.

Provide bushings on all conduit ends entering enclosures.

(e) Signal Cable and Wire.

- 1. General.** Install indicated cable to form a continuous circuit between the proper equipment

terminals. Install cables inside supports and brackets.

Insert cable in conduit using lubricant. If new cable is to be installed in conduit with existing conductors, remove the existing cable, clean the conduit, as specified in Section 910.3(g), and then insert both old and new cable into the conduit as a unit. Replace existing cable damaged during removal process as directed. If existing cable is being abandoned and not reused, permanently remove the old cable. If the new cable is replacing the old cable, permanently remove the old cable.

Use insulated, locking, spade terminals for conductor terminations. Neatly arrange conductors and tie with cable ties within fixtures. Attach cable tags at splices, indicating signal head number, within all junction boxes, pole bases, and cabinets.

Terminate all spare signal conductors collectively with a pressure-type mechanical lug and cover with electrical tape. Ground spare conductors in controller cabinet only.

Attach conductor terminations in controller cabinets to barrier-type terminal blocks with no more than one conductor per screw, otherwise use pressure-type mechanical lugs to accommodate the number of conductors being terminated. Identify and mark blocks.

Terminate on grounding bus and identify spare and reserved conductors.

Provide enough slack cable in pole bases, controller cabinets, and junction boxes to allow for proper wiring connections. For pole mounted signals and pedestrian pushbuttons, install signal cable inside pole to the terminal block of the signal or pushbutton.

For span wire installations, lash cable to the span wire, or secure using cable rings and saddles.

Provide drip loops at wire entrances to poles and signal heads. Secure drip loops with outdoor-type, self-locking cable ties.

2. Conductor Color Codes.

2.a Pedestrian Pushbutton.

Cable	1 Black	—Spare*
	2 White	—Logic Ground
	3 Red	—Pedestrian Call Detector

2.b Pedestrian Signal.

5/C Cable	1 Black	—Walking Person (Walk)
	2 White	—Neutral
	3 Red	—Upraised Hand (Don't Walk)
	4 Green	—Reserved
	5 Orange	—Spare*
7/C Cable	1 Black	—Walking Person (Walk 1)
	2 White	—Neutral 1 and 2
	3 Red	—Upraised Hand (Don't Walk 1)
	4 Green	—Reserved
	5 Orange	—Walking Person (Walk 2)
	6 Blue	—Upraised Hand (Don't Walk 2)
	7 White/Tracer	—Spare*

2.c Vehicular Signal.

5/C Cable	1 Black	—Green Ball/Arrow
	2 White	—Neutral
	3 Red	—Red Ball/Arrow
	4 Green	—Reserved
	5 Orange	—Yellow Ball/Arrow
7/C Cable	1 Black	—Green Ball

2 White	—Neutral
3 Red	—Red Ball/Arrow
4 Green	—Reserved
5 Orange	—Yellow Ball/Arrow
6 Blue	—Green Arrow
7 White/Tracer	—Yellow Arrow/Flashing Yellow Arrow/Spare*

* Or as indicated.

(f) Electrical Service. Install the conduit and service wire where indicated and consistent with the service type. Perform necessary circuit connections to complete service to the controller assembly as shown on the Standard Drawings.

Install power service outlets in cabinet as specified in Section 954.2(k) and the NEC.

Install service pole as specified in Section 910.3(k) and as shown on the Standard Drawings.

Verify with the utility company the location of the service conduit on the service pole or to the service manhole.

Notify the utility company of service requirements. Ensure that service is inspected as required by the utility contractor responsible to ensure that electrical service is initially set up in the name of the municipal traffic signal owner. Reimburse the municipal traffic signal owner for all utility fees incurred during construction.

(g) Splicing. Splice wires and cables as indicated and at the following locations:

- Ground wires within junction boxes.
- Signal wires and cables in pole bases.

When splicing signal cables within pole bases, perform splices according to National Electric Code (NEC) wet environments.

(h) Junction Box. Section 910.3(p).

(i) Ground Rods. Install ground rods and ground wire clamps as shown on the Standard Drawings.

(j) Testing and Commissioning. Test traffic signal power and control wiring circuits after installation of the electrical distribution system, before connecting to operating equipment, and in the presence of the Service Representative. Complete testing as follows:

- No electrical energy is to be applied to any equipment or components before system testing. The Contractor's service engineer must initiate operation of the equipment.
- All grounding electrodes are adequately installed and individual ground rod(s) at each signal support including the cabinet measure 25 ohms or less to earth and the entire grounding system as shown on the Standard Drawings measure 8 ohms or less to earth.
- The Contractor's Representative must verify that instruments, have been properly installed, configured, and meet the manufacturer's qualifications for warranty.
- Submit a certificate from the manufacturer, or from the Service Representative, stating that the installed equipment has been inspected, adjusted, approved, and certified to be satisfactory before field testing.
- Correct and recheck any equipment not functioning correctly. Provide corrective measures to remove any ground loops found during start-up.
- Immediately correct any defects and malfunctions with approved methods and materials.
- Include in the testing, but not limited to, taking all variables to their limits (simulated or actual process) to verify all alarms, failure interlocks and/or transfers, and operational interlocks.

(k) Submittals. Submit three copies of documentation to the Representative for all components. Include the following information on the documentation as a minimum:

- Product Data: For each component, include manufacturers descriptive literature; product

specifications; published details; technical bulletins; performance and capacity rating curves, charts, and schedules; catalogue data sheets; and other submittal materials as required to verify that the proposed products conform to the quality and functionality as required for the installation.

- Identification: Clearly indicate by an arrow on submissions covering more than one product type or style exactly which product is being submitted for approval.
- Equipment Characteristics: Size, location, weight, and electrical requirements.
- Manufacturer: Include the catalogue name, company name, address, and telephone number for each product submitted.
- Arrangement Drawings: Provide Arrangement Drawing for all signal controller cabinets showing the external front panel, and internal side and rear mounting sub-panels. Provide Bill of Materials, on Arrangement Drawing, identifying equipment shown and all software.
- Reference equipment by a numerical item number. Include the following information:
 - Item
 - Identity
 - Quantity
 - Description
 - Manufacturer
 - Catalog Number
- Provide wiring diagrams for each signal controller cabinet illustrating the power connections to each internal device and all field connections. Display all wiring in a ladder diagram format.

(l) Generator Adaptor Kit.

- Submit shop drawings/catalog cuts of the adaptor kit, as specified in Section 954.2(i), before installation. Provide and attach to the signal controller cabinet after approval.
- Test in the presence of the municipality and District Traffic Engineer or other Representative. Demonstrate operation of traffic signal for a minimum of 5 minutes using a municipal generator and provided cord. Test the electrical automatic relay switch over.

(m) Uninterruptible Power Supply (UPS). As specified in Section 954.2(j), and as follows:

- Provide true-online double conversion or line-interactive true UPS.
- Initiate a 30-day test only after the total system is running and functional.
- Install and test the UPS according to the manufacturer's specifications.
- Mount UPS display in the cabinet and label the indications for easy visibility by service personnel.
- Controller cabinet auxiliary receptacle shall be wired to AC Line.
- Locate and mount batteries on risers such that batteries will not come in contact with water from rain or snow/ice melt events.
- UPS installed using auxiliary cabinet, where cabinet assembly already exists, shall place the UPS inside existing cabinet assembly, if space allows, with batteries placed in auxiliary cabinet.
- UPS battery placement with use of an auxiliary cabinet shall be installed as follows:
 - Pole Mounted. Auxiliary cabinet shall be mounted to the pole. Auxiliary cabinet shall not be mounted to side of existing pole mounted cabinet.
 - Ground Mounted. Auxiliary cabinet may be attached to side of existing signal cabinet. Set auxiliary cabinet on the top of the existing cabinet foundation.

954.4 MEASUREMENT AND PAYMENT—

(a) Conduit. Linear Foot.

For the type indicated. The unit price includes stainless steel wool and conduit sealant.

(b) Trench and Backfill. Linear Foot. For the type indicated.

(c) Directional Boring. Linear Foot. For the type indicated. The unit price includes utility test pits as necessary according to applicable PA One Call laws.

(d) Signal Cable. Linear Foot.

The unit price includes cable, identification tags, cable lashing, and any removal of existing cable. Replacement of existing cable damaged during the process as specified in 954.3(e)1 is incidental to this item.

(e) Junction Box. Each. For the type indicated.**(f) Electrical Service.** Each.

For the type indicated. The price includes service pole, ancillary wood poles, service head, meter socket, service disconnect, power line surge protector, exposed conduit, conduit fittings, service wire, generator adaptor kit, ground rod, ground wire, municipal coordination, and utility fees.

(g) Uninterruptible Power Supply (UPS). Each.

The price includes all necessary hardware, components, and logic or circuitry to make the system operational and functional with the controller assembly.

(h) Cement Concrete Sidewalks. Section 676.4.**(i) Generator Adaptor Kit Retrofit.** Each.

The price includes all necessary material and labor to add generator adaptor kit to existing controller assembly. A generator adaptor kit provided on a new controller assembly installation is incidental to controller assembly item as specified in Section 952.4.

(j) Installation of Conduit to Existing Traffic Signal Support. Each.

The price includes all necessary material and labor to add conduit to an existing traffic signal support.

SECTION 955—SIGNAL HEADS

955.1 DESCRIPTION—This work is the furnishing and installation of assemblies for the control and illumination of vehicular traffic signals, pedestrian signals, or lane control signals, which includes the appropriate housing and mounting hardware.

955.2 MATERIAL—

(a) General.

- Traffic Signals-General--Section 950.2.
- Certification--Section 106.03(b)3.

(b) Vehicular Signal Heads.

1. Housings.

- Plastic—Opaque polycarbonate resin molding, conforming to ASTM D3935. Federal yellow in color, except the inside of the visor, will have a non-reflective black finish.

- Aluminum—Finish exterior of aluminum housings as follows:

Clean and coat surfaces of the signal housing, door, and visor, with an infrared, oven-baked, iron-oxide backing primer, conforming to Federal Specification TT-P-1757B and Federal Specification SSPC-Paint 25.

Coat finished surfaces, except the inside of the visor, with infrared, oven baked, highway yellow exterior enamel according to Federal Standard No. 595B. Finish the inside of the visor with phthalic anhydride, black, synthetic baking enamel, with zero gloss reflectance and conforming to MIL-E-5557 Enamel Heating Resisting Glyceryl Phthalate, Type 4, Instrument Black.

Requests for black traffic signal housing require the Bureau of Maintenance and Operations approval.

2. Reflectors. Polycarbonate or aluminum. When the reflector is attached to the door, provide a means by which opening the door disables the indication.

3. Backplates. Furnish backplates that conform to the following:

- One-piece aluminum with a minimum thickness of 0.06 inch.
- Powder coated dull black (Federal Standard 595-37038) on both the front and back sides.
- Top, bottom, and sides that measure from 5 to 8 -inches in width.
- Rounded outside corners.
- Louvers with no louvers closer than 0.5 inch from the inner edge or 2.5 inches from the outer edge. Orient the louver so it is vertical on sides and horizontal on top and bottom.
- A minimum of four corner mounting attachment points per section head. Ensure attachment points do not interfere with the operation of the section head doors.
- Passivated stainless-steel type 316 or 304 screws, washers, and other installation hardware required to mount securely.
- Permanently marked manufacturer name, part/model number and date of manufacture on the back side.
- Universal backplates that fit all applicable PennDOT approved products.
- A minimum two inch fluorescent yellow, Type IX retroreflective border, placed flush with the outer edge of the backplate and placed no closer than 0.5-inch from all louvers.
- No sheeting is allowed over any louvered area.

4. Miscellaneous. Furnish visors as indicated, unless otherwise directed. Furnish louvers as indicated, with a non-reflective black finish.

5. Warranty. Provide all warranty documentation to the Representative at final acceptance.

(c) LED Vehicular Signal Head Modules. Indications as indicated and conforming to the following:

- ITE Standard for “Vehicle Traffic Control Signal Heads, Light Emitting Diode (LED) Circular Signal Supplement”
- ITE “Vehicle Traffic Control Signal Heads – LED Vehicle Arrow Traffic Signal Supplement”
- MUTCD

Conform to the regulations, and as follows:

1. Housings. Section 955.2(b)1

2. Miscellaneous. Section 955.2(b)4

3. Warranties. Provide all warranty documentation to the Representative at final acceptance.

(d) Optically Programmed Signal Heads.

1. Optical. Incorporate an optical system, using LED modules for the green, yellow, and red signal indications, that limits the visibility zone internally and optically, without the use of hoods or louvers. The projected signal may be visible or selectively veiled anywhere within 15 degrees of the optical axis.

2. Sections. Provide an integral means for the incremental tilting of each section, from 0 degrees to 10 degrees above and below the horizontal. Unless directed otherwise, assemble vertically mounted signals with a 4-degree tilt below the horizontal. Provide couplers, serrated locking rings, flanges, gaskets, and other hardware necessary to mate optically programmed signal sections together or to mate with non-optically programmed sections, all in a secure and weathertight manner. Shop-join the sections. Use corrosion resistant internal hardware.

3. Painting. Section 955.2(b)1.

4. Electrical. Use copper, brass, nickel-plated brass, or phosphor-bronze, electrical-conducting hardware. Furnish lamps that provide luminous intensity of 950 beam candlepower, conforming to the traffic signal manufacturer's specification, rated at a minimum of 6,000 hours. Color code the internal wiring. Provide a breaker that disables the indication when the lamp door is opened.

Provide an integral means within each signal face for regulating its luminous intensity between limits, in proportion to the individual background illumination, but not less than 97% of uncontrolled intensity at 1,000 foot-candles; and reduce to $15\% \pm 2\%$ of maximum intensity at less than 1 foot-candle, proportionally and instantaneously.

5. Miscellaneous. Furnish visors as indicated, unless otherwise directed. Furnish optical programming material and instructions. Within each section, affix a permanent, conspicuous warning label, advising of possible eye damage and fire hazard from the sun.

6. Warranty. Provide all warranty documentation to the Representative at final acceptance.

(e) Pedestrian Signal Housing. Conforming to the ITE Standard for “Adjustable Face Pedestrian Signal Heads,” the regulations, and as follows:

1. Housings. Section 955.2(b)1.

2. Reflectors. Section 955.2(b)2.

3. Miscellaneous. Furnish visors as indicated, unless otherwise directed.

(f) Pedestrian Signal Heads-LED Pedestrian Signal Modules. Conforming to ITE Standard for “Pedestrian Traffic Control Signal Indications –Part 2: Light Emitting Diode (LED) Pedestrian Traffic Signal Modules” and the MUTCD. Provide verification from independent laboratory test results.

Conform to the regulations, and as follows:

1. Housing. Section 955.2(b)1.

2. Electrical. Section 955.2(d)4.

3. Luminous Intensity. Meet or exceed the illumination values for the maintained minimum luminous intensity listed in the ITE Standard for “Pedestrian Traffic Control Signal Indications – Part 2: LED Pedestrian Traffic Signal Modules,” Section 3 “Photometric Requirement,” Subsection 4.1.1.

4. Warranties. Provide all warranty documentation to the Representative at final acceptance.

(g) Pedestrian Signal Heads—LED Countdown Pedestrian Signal Modules. Conforming to the ITE Standard for Pedestrian Traffic Control Signal Indications -Part 2: Light Emitting Diode (LED) Pedestrian Traffic Signal Modules and the MUTCD. Provide verification from independent laboratory test results.

Conform to the regulations, and as follows:

1. Housings. Section 955.2(b)1.

2. Electrical. Section 955.2(d)4.

3. Design and Operation. Furnish double overlay or side-by-side message capable of displaying the symbols (Don’t Walk and Walk), and a countdown timer consisting of 2, 7-segment digits constructed of LEDs.

Provide numeric display either integral to, or separate from, the LED countdown pedestrian signal. If the numeric display is a separate component, the message display unit and the LED countdown numeric display unit must be approved as one system.

Provide Upraised Hand and Walking Person symbols as solid, steady figures. Countdown digit indications shall remain steady throughout the duration of the countdown interval.

4. Countdown Timer Module. Discontinue and make the LED countdown pedestrian signal display go dark immediately if the pedestrian change interval is interrupted or shortened as part of a transition into a preemption sequence. The LED countdown pedestrian signal shall be replaced with a solid, steady Upraised Hand indication.

- Equip the LED countdown pedestrian signal with a screen, visor, or other device to eliminate all phantom conditions.
- Furnish visors if the LED countdown pedestrian signal display will be visible to motorists stopped at a red traffic signal indication facing perpendicular to the display of the LED countdown pedestrian signal.
- Equip the LED countdown pedestrian signal timer to monitor the pedestrian change intervals and automatically adjust for any changes made at the controller.
- Provide a LED countdown timer module with an internal conflict monitor to prevent any possible conflicts between the Upraised Hand / Walking Person signal indications and the time display. When the steady Upraised Hand is illuminated, make it impossible to display any number other than zero.

5. Warranties. Provide all warranty documentation to the Representative at final acceptance.

(h) LED Lane-Use Traffic Control Signal Heads.

- ITE Standard for “Lane-Use Traffic Control Signal Heads”.
- MUTCD.
- ITE Standard for Vehicle Traffic Control Signal Heads, Part 2: LED Vehicle Traffic Signal Modules, Sections 3, 5, and 6. Exclude Sections 6.3.2 and 6.4.2, Maintained Minimum Luminous Intensity.

1. Housings. Section 955.2(b)1.

2. Warranties. Provide all warranty documentation to the Representative at final acceptance.

(i) Mounting Assembly and Hardware. Furnish signal mounting assemblies and hardware of a type and design that adequately supports the loading indicated and as shown on the Standard Drawings.

955.3 CONSTRUCTION—Section 950.3, as shown on the Standard Drawings, and as follows:

(a) General. Arrange and display traffic signal heads as indicated. Variations to the permit should not be completed without approval of the District Traffic Engineer.

Securely mount signal heads, using signal mounting brackets, where indicated, and according to the regulations.

Install signal heads over roadways with the top of the housings at the same elevation and as shown on the Standard Drawings. If vehicular and pedestrian signals are to be installed on the same support, separate the assemblies. Aim vehicular signal heads, as directed, toward a point approximately 150 feet in advance of the stop line and in the center of the traveled traffic approach. Install louvers where it is necessary to restrict the view of the signal indications from an adjacent approach as specified in Section 955.3(c). Aim pedestrian signals to the far side of the crosswalk they are to control.

Install backplates as specified in Section 955.2(b)3 and install visors as indicated. If installing a new retroreflective border to a backplate, ensure the backplate surface is clean and apply the retroreflective border at a pressure greater than or equal to 20 pounds per square inch above 50F .

Securely cover signals with an opaque material that covers and hides signal indicators from the view of traffic until the signal is put into operation. Use material that is sufficiently opaque to hide any lighted signal face indication. Burlap may be used as a hood material if the signal indications are not lighted and will not be until the hood is removed. Maintain the hood and replace or repair the hood if it becomes loose, torn, or removed.

(b) LED Modules. Install, or retrofit into existing signal heads, according to manufacturer’s instructions.

(c) Optically Programmed Signals. According to the manufacturer's instructions, program each signal head to restrict signal visibility to the area indicated.

955.4 MEASUREMENT AND PAYMENT—

(a) Vehicular Signal Heads. Each. For the type indicated.

The price includes, when indicated, traffic signal housing, louvers, backplates, and mounting hardware.

(b) Optically Programmed Signal Heads. Each. For the type indicated.

The price includes, when indicated, traffic signal housing, tunnel visors, louvers, backplates, and mounting hardware.

(c) Pedestrian Signal Heads. Each. For the type indicated.

The price includes, when indicated, traffic signal housing, louvers, and mounting hardware.

(d) Lane-Use Traffic Control Signal Heads. Each

(e) Backplate Retrofit. Each.

The price includes material and labor for addition of backplates to existing signal heads.

SECTION 956—DETECTORS

956.1 DESCRIPTION—This work is the furnishing and installation of devices to sense the presence or passage of vehicles or pedestrians.

956.2 MATERIAL

(a) General.

- Traffic Signals-General—Section 950.2.
- Certification—Section 106.03(b)3.
- Luminaire Arms—Section 910.2.

(b) Detectors-General.

1. Sealant. Furnish a non-shrinking, flexible sealant for the encapsulation of loop or magnetometer sensor and as follows:

- Number of Components—One or two.
- Application Temperature—32F to 100F, unless otherwise specified by manufacturer.
- Tack Free—1-hour maximum.
- Maximum Curing Time—30 hours.
- Permanent Flexibility—to -20F.
- Chemically Resistant To: De-Icing Chemicals, Gasoline, Calcium Chloride (5%), Motor Oils, and Hydraulic Brake Fluid.

2. Detector Lead In Cable. 14 AWG minimum conforming to IMSA Specification 50-2.

3. Card Rack Assembly.

3.a. Power Supply. Furnish a switching-type power supply and as follows:

- Input Voltage—95 V to 135 V (ac), 57 Hz to 63 Hz.
- Output Voltage—24 V \pm 0.3 V (dc).
- Minimum Output Voltage—22.8 V (dc).
- Efficiency—70% minimum.
- Full Load Current—3 A minimum.
- Line Regulation—0.1% over entire input range.
- Load Regulation—0.2% from no load to full load.
- Ripple Noise—40 mV (p-p) typical, 75 mV (p-p) at full load.
- Environmental—NEMA TS 1, Part 2.

Provide a front panel incorporating a pilot lamp, test points for monitoring output voltage, and a circuit breaker or fuse. Ground all exterior metal surfaces to the chassis safety ground.

3.b. Card Rack. A standard EIA, 19 -inch rack for mounting the detector amplifier units, as follows:

- Aluminum front rails drilled and tapped (10-32), with EIA spacing.
- Aluminum chassis supporting angles, 10 inches deep and 3 -inches wide, for mounting on the sides of the controller cabinet.
- Aluminum connector panels, with connector mounting holes, tapped (4-40) on 0.200 -inch centers, then mounted to form a cage 19 inches wide, 5 1/4 -inches high, and 6 1/2-inches deep.
- Nonmetallic guides and Cinch-Jones No. 50-44A-30M rear connectors, mounted at 1.200-inch spacings.

4. Re-Enterable Splice Kit. Reusable molded body, internal and external hardware, clear polyurethane compound. Provide an appropriate size to accommodate in-line, wye, “x,” butt, and dead-end splicing of cables rated at 1000 V or less, with outside diameters from 0.25 inch through 2.50 inches. Supply with the following components:

- Two-part transparent mold body of PVC construction, with tongue-and-groove seams and built-in spacer web.
- Two flexible end caps, each with double-stepped cable entry ports to accommodate the many possible splicing configurations.
- Snap-in caps to cap off the fill ports, after compound pouring.
- Strain bars with insulator sleeves.
- Four shield connectors to provide shield continuity, with strain bars for shielded cables.
- Stainless steel base clamps to secure splice body, end caps, and strain bars.
- Re-enterable electrical insulation and sealing compound, capable of continuous operation at 194F, with an emergency overload temperature rating at 266F, a viscosity of approximately 1,100 centipoise at 79F, a gel time of approximately 20 minutes at 73F, and zero growth fungus resistance, according to ASTM G21.
- An instruction booklet, showing proper installation and re-entry techniques.

(c) Vehicular Detection.

1. Loop Detection.

1.a. Loop Sensor. 14 AWG minimum conforming to IMSA Specification 51-5. Prefabricated loop and lead-in assembly with wire insulation and cable jackets constructed of Cross-linked Polyethylene (XLPE). Polyethylene backer rod.

1.b. Loop Amplifier, Shelf-Mounted. Self-tuning, loop amplifier, shelf-mounted, enclosed in a shock-proof housing with relay output and one or two channels as indicated, allowing for the operation as indicated in addition to a pulse vehicle output when directed, conforming to NEMA TS 1, Section 7. Loop amplifier must be capable of displaying the loop frequency, change of inductance, and call strength when a vehicle is present. All indications and operational settings shall be clearly visible via LEDs or on a backlit LCD.

1.c. Loop Amplifier with Timers, Shelf-Mounted. Self-tuning, loop amplifier, shelf-mounted enclosed in a shock-proof housing with relay output and one or two channels as indicated, allowing for the operation as indicated in addition to a pulse vehicle output when directed conforming to NEMA TS 1, Section 11. Loop amplifier must be capable of displaying the loop frequency, change of inductance, and call strength when a vehicle is present. All indications and operational settings shall be clearly visible via LEDs or on a backlit LCD.

Unit must have delay and extension timers for each channel.

1.d. Loop Amplifier with Timers, Shelf-Mounted, Count Output. Self-tuning, loop amplifier, shelf-mounted enclosed in a shock-proof housing with relay output and one or two channels as indicated, allowing for the operation as indicated in addition to a pulse vehicle output when directed conforming to NEMA TS 1, Section 11. Loop amplifier must be capable of displaying the loop frequency, change of inductance, and call strength when a vehicle is present. All indications and operational settings shall be clearly visible via LEDs or on a backlit LCD. Unit must be able to count a standard licensed vehicle entering a loop while other standard licensed vehicles occupy loop.

Primary output - Normal detector output with delay and extension timers.

Count output - Provides an individual pulse output for each vehicle on the same loop at the same time.

Unit to have delay and extension timers for each channel.

Unit to have three selectable modes per channel: pulse, presence, and count.

1.e. Loop Amplifier, Rack-Mounted. Self-tuning, loop amplifier, mounted on an edge-connected, printed circuit board with an electrically isolated solid-state output and two or four channels as indicated, allowing for the operation as indicated in addition to a pulse vehicle output when directed conforming to NEMA TS 1, Section 7. Loop amplifier must be capable of displaying the loop frequency, change of inductance, and call strength when a vehicle is present. All indications and operational settings shall be clearly visible via LEDs or on a backlit LCD.

1.f. Loop Amplifier with Timers, Rack-Mounted. Self-tuning, loop amplifier, mounted on an edge-connected, printed circuit board with an electrically isolated solid-state output and two or four channels as indicated, allowing for the operation as indicated in addition to a pulse vehicle output when directed conforming to NEMA TS 1, Section 11. Loop amplifier must be capable of displaying the loop frequency, change of inductance, and call strength when a vehicle is present. All indications and operational settings shall be clearly visible via LEDs or on a backlit LCD.

Unit to have delay and extension timers for each channel.

1.g. Loop Amplifier with Timers, Rack-Mounted, Count Output Self-tuning, loop amplifier, mounted on an edge-connected, printed circuit board with an electrically isolated solid-state output and two or four channels as indicated, allowing for the operation as indicated in addition to a pulse vehicle output when directed conforming to NEMA TS 1, Section 11. Loop amplifier must be capable of displaying the loop frequency, change of inductance, and call strength when a vehicle is present. All indications and operational settings shall be clearly visible via LEDs or on a backlit LCD. Unit must be able to count a standard licensed vehicle entering a loop while other standard licensed vehicles occupy loop.

Unit to have delay and extension timers for each channel.

Unit to have three selectable modes per channel: pulse, presence, and count.

2. Video Detection.

2.a. Video Detector.

Provide video detection that meets FCC Title 47, Part 15 Class A & B, IEC 61000-4-4, IEC 60000-4-5, and NEMA TS-2 Environmental, Terminals & Facilities, and Auxiliary Devices Standards.

Provide a model approved by the Representative, that is IP/Ethernet enabled for communications (IPv4/v6) on IP networks as indicated and as follows:

Provide all equipment, power supplies, surge protection, communication interface panel, connections, cables, cards/racks, software, mounting hardware, etc. as necessary to provide a fully functional vehicular video detector capable of detecting vehicles in the zones as indicated.

Remove or disable all video recording capabilities. All units shall have an Ethernet port, serial datalink communication link (SDLC) port, and be enabled for communications on IP networks.

Provide cabling, coaxial, 18 AWG 3 conductor wire conforming to IMSA Specification 19-1 or 20-1, or Cat5e/6 cables, as recommended by the Manufacturer. If Cat5e/6 is used, provide shielded outdoor rated Category 5e/6 100BASE-TX Ethernet cable. The jacket is to be UV resistant polyethylene and contain water blocking gel or waterproof tape for water resistance. Provide weathertight RJ45 connectors on any exposed ends.

Cat5e/6 cable shall meet the following requirements:

Table 1: Cat5e/6 Cable Requirements

	Category 5e	Category 6
Frequency	100 MHz	250 MHz

Attenuation	24 dB (Min. at 100 MHz)	36 dB (Min. at 250 MHz)
Characteristic Impedance	100 ohms \pm 15%	115 ohms \pm 15%
NEXT	35.3 dB (Min. at 100 MHz)	38.3 dB (Min. at 250 MHz)
PS-NEXT	32.3 dB (Min. at 100 MHz)	36.3 dB (Min. at 250 MHz)
ELFEXT	23.8 dB (Min. at 100 MHz)	19.8 dB (Min. at 250 MHz)
PS-ELFEXT	20.8 dB (Min. at 100 MHz)	16.8 dB (Min. at 250 MHz)
Return Loss	19 dB (Min. at 100 MHz)	15.6 dB (Min. at 250 MHz)
Delay Skew	45 ns (Max. per 100 m)	45 ns (Max. per 100 m)

As necessary, provide multiple units per approach if multiple zones are required and a single unit cannot provide adequate coverage.

Adjust and realign the video detector and detection zone(s) as directed by the Representative to achieve the required operations during the 30-day intersection test at no additional cost to the Department. The video detector shall be capable of being programmed and updated from a laptop computer. Provide video software that uses the most current version of Microsoft Windows operating system. Provide all software installation disks for the video software to the municipality and provide and install software updates for 1 year after acceptance by the Department.

Manufacturer's representative is to be on-site for initial detector setup.

Provide contrast loss detectors that monitor the quality of the video image that is being processed.

Fail-safe mode sends outputs to traffic controller.

Vehicle presence detection accuracy of 95% minimum.

2.a.1. Video Camera Lens.

- Continuous focus zoom
- Integrated color camera.
- H.264, MPEG-4 video, NTSC
- Minimum 2X zoom and provide adequate camera lens for the manufacturer's recommended field of view angle to completely cover the detection zone(s) as indicated.
- Provide normal video compression techniques to produce near live video image of five frames per second minimum.

2.a.2. Housing and Sunshield.

- Sealed waterproof, dust-tight NEMA-4 housing.
- Provide Sunshield for each detector.

2.a.3. Environmental.

- Capable of operating during all hours and under all weather conditions.
- Temperature -29F to 140F.
- Relative Humidity 0 to 95 percent, non-condensing.

2.a.4. Communication.

- Video vehicle detector sensor must include a minimum of one serial or Ethernet communications interface.
- All wireless communication must be secure.
- Wireless devices must be FCC certified and FCC identification number must be displayed on an

- external label.
- All detectors must operate within their FCC frequency allocation.

2.a.5. Electrical.

- Power is to be provided from the traffic controller cabinet and is to be compatible with 2070, NEMA TS1, NEMA TS2, ATC cabinets.
- Surge protection devices as recommended by the manufacturer are to be included both in the sensor and in the traffic cabinet to protect the cabinet electronics. Sensor will automatically recover from a power failure after resumption of normal power.

2.a.6. Cables and Mounting Hardware.

- According to manufacturer's recommendations.

2.a.7. Detection Zones.

- Minimum of four separate detection zones per camera and capable of detecting vehicles in multiple lanes.
- Capable of determining which direction of travel, presence calling, pulse calling, delay, extension, sensitivity settings, and channel output.

2.b. Video Detector with Internal Heater.

As specified in Section 956.2(c)2.a and as follows:

Provide an internal heater capable of heating the camera lens to allow for continued detection operations and clear lens during snow; ice; and below freezing, 32F, weather conditions.

2.c. Thermal Video Detector.

As specified in Section 956.2(c)2.a and as follows:

Provide a thermal sensor that utilizes Vanadium Oxide uncooled focal plane arrays microbolometer detection technology to detect heat signatures. The minimum spectral detection range shall be 8 to 13 microns.

Provide video detection with an internal heater capable of heating the camera lens to allow for continued detection operations and clear lens during snow; ice; and below freezing, 32F, weather conditions.

Thermal sensor detection shall be capable of delay and extend vehicle calls.

2.d. Omni-View Video Detector System.

An Omni-view video detector(s) that utilizes a 360-degree lens to track, detect, classify, and count pedestrians, bicycles, and motor vehicles for the entire intersection as indicated. A detector system that is IP/Ethernet enabled for communications (IPv4/v6) on IP networks and provides an internet interface over the cloud to view and adjust detection zones.

The Omni-view Video Detector system shall have the capabilities to provide outputs of the count data as well as advanced signal performance metrics. Provide counting and reporting of advanced signal performance metrics as indicated. The detector system shall have the capability, whether in-house or third party compatible, to collect and report WiFi Mac Address travel time and origin-destination data. The WiFi Mac Address processor shall scramble the incoming data to provide anonymous data securely and have a minimum 10% capture rate. Provide WiFi travel time processor/package add-on as indicated.

The camera shall have high definition-color resolution output with minimum 2560x1920 pixels and provide horizon to horizon view, including center of intersection. Provide camera(s), processor, boosters, repeaters, software and all mounting hardware, cables and wiring, and any additional equipment recommended by the manufacturer to provide vehicular detection for all locations as indicated. Luminaires are a separate pay item.

Video detection cameras as specified in Sections 956.2(c)2.a through 956.2(c)2.c may be utilized to supplement limitations of the omni-view video detector as indicated and approved by the District Traffic Engineer. Provide supplemental video detection as indicated.

Ground and provide surge protection to all components as recommended by the manufacturer.

Processor and camera shall be by the same manufacturer where the processor mounting shall be compatible with the signal controller cabinet.

Provide applicable software and provide one day of training to Department personnel, municipal personnel, municipal consultant engineers and municipal maintenance providers on the setup, operation, and maintenance of the system.

Provide software updates to the processors and video detector(s) for the life of the equipment at no additional charge to the Department or the Municipality if detection system is connected to the internet. For installation without internet connection, provide software updates for 1 year after acceptance by the Department.

The Omni-View video detector system shall be vision-based tracking allowing the system to track bicycles, pedestrians, cars, trucks, and motorcycles through the intersection.

- Capable of operating during all hours and shall be weather sealed to prevent water and moisture damage. IP66 and IP67 rated.
- Operating Temperature Range of -29F to 140F and Relative Humidity 0 to 95 percent
- Detection shall have Delay/Extend function.
- The system shall be capable of having a minimum of 48 detection zones and be able to be adjusted via the cloud through an internet connection.
- The detector shall resort to hyperactivity, place call for all phases, during failure events.
- Internal heater capable of heating the camera lens to allow for continued detection operations and clear lens during snow; ice; and below freezing, 32F, weather conditions.

2.e. Monitor and Keyboard/Mouse for Video Detection.

Provide one 7-inch monitor and integrated Universal Serial Bus (USB) keyboard/mouse. The keyboard shall have key spacing (center to center) of 0.75 inches with a minimum 84 keys. The monitor and keyboard/mouse shall allow full monitoring and configuration of the video detection system. The monitor shall have a minimum resolution of 1024 x 768. Upon final configuration of the video detection system, place the monitor and keyboard/mouse in the controller cabinet at an intersection directed by the District Traffic Engineer.

Provide all cables and connectors necessary to connect a video monitor and keyboard to the vehicle video detection at the controller cabinet. All equipment shall be fully compatible and interfaced with the detectors. The monitor and keyboard shall be able to setup the detection zones and verify if the detectors are working correctly. Install equipment at the location as indicated.

2.f. Video Detection System.

As specified in Sections 956.2(c)2.a through 956.2(c)2.e that meets the video detection and detection zones requirements of the entire intersection as indicated.

Provide all equipment, power supplies, communication interface panel, connections, cables, cards/racks, software, mounting hardware, etc. as necessary to provide a fully functional video detection system capable of detecting vehicles for all locations in the zones as indicated.

As necessary, provide multiple units per approach if multiple zones are required and a single unit cannot provide adequate coverage.

3. Radar Detection.

3.a. Radar Detector.

Provide radar detection conforming to FCC Title 47, Part 15 Class A & B, IEC 61000-4-4, IEC 60000-4-5, and NEMA TS-2 Environmental, Terminals & Facilities, and Auxiliary Devices Standards.

Provide an approved model, that is IP/Ethernet enabled for communications (IPv4/v6) on IP networks as indicated and as follows:

Provide all equipment, power supplies, surge protection, communication interface panel, connections, cables, cards/racks, software, mounting hardware, etc. as necessary to provide a fully functional vehicular radar detector capable of detecting vehicles in the zones as indicated.

Provide shielded outdoor rated Category 5e/6 100BASE-TX Ethernet cable as specified in Section 956.2(c)2.a.

The radar detector shall have a method for automatically calibrating the detection device; this method will be executed in the radar detector's internal processor. This auto-calibration method shall automatically determine detection thresholds.

Adjust and realign the radar detector and detection zone(s) as directed to achieve the required operations during the 30-day intersection test at no additional cost to the Department. The sensor shall be capable of being programmed and updated from a laptop computer. Provide radar software that uses the most current version of Microsoft Windows operating system. Provide all software installation disks for the radar software to the municipality and provide and install software updates for 1-year after acceptance by the Department.

Manufacturer's representative is to be on-site for initial detector setup.

The input file card shall also provide failsafe operation, so that in the event of failure of communication from the sensor, a constant call shall be placed on all contact closure channels.

Provide the type of radar detection as indicated.

- Stop-Bar Detection shall be non-intrusive and detect vehicles from 6 feet up to 140 feet. Detection shall provide real-time presence data for intersection control, cover multiple lanes per approach, and track vehicles entering the intersection. The sensor is to be mounted in a forward fire and/or side-fire position. Provide detection zones that shall only detect vehicles in one direction. Each detector is to be capable of providing system detectors for the approach.
- Advanced Detection shall be non-intrusive and detect vehicles from 6 feet up to a minimum of 450 feet. Detection shall track the speed and range of all vehicles as they approach the stop bar and calculate on a continuous basis, whether dynamically tracking the speed or assuming the entrance speed over time, which vehicles are within the predetermined dilemma zone and place a call to the controller. Detection shall be capable of identifying gaps within the dilemma zone, so the corresponding phase call will be dropped, and the phase safely terminated.

3.a.1. Housing.

- Sealed, waterproof, dust-tight NEMA-4 housing.

3.a.2. Environmental.

- Capable of operating during all hours and under all weather conditions. IP66 and IP67 rated.
- Operate without degradation in performance under temperature range of -40F to 165F and relative humidity 0 to 95 percent, non-condensing, without auxiliary heating or cooling.

3.a.3. Communication.

- Radar vehicle detector sensor must include a minimum of one SDLC and Ethernet

communications interface.

- All wireless communication must be secure.
- Wireless devices must be FCC certified and FCC identification number must be displayed on an external label.
- All detectors must operate within their FCC frequency allocation.

3.a.4. Electrical.

- Power is to be provided from the traffic controller cabinet and is to be compatible with 2070, NEMA TS1, NEMA TS2, ATC cabinets.
- Operating frequency: 10.525 GHz \pm 25 megahertz or another FCC approved spectral band.
- Must comply with limits of a Class A digital device pursuant to part 15 of the FCC rules or the appropriate spectrum management authority and must not interfere with any adjacent equipment.
- Power: 89 – 135 V(ac), 15W.
- Radiated energy must not exceed 10 milliwatts.
- Relay contacts: Form C, rated at 5 amps.
- Surge protection devices as recommended by the manufacturer are to be included both in the sensor and in the traffic cabinet to protect the cabinet electronics. Sensor will automatically recover from a power failure after resumption of normal power.

3.b. Radar Detection System.

As specified in Section 956.2(c)3.a and as follows:

Provide all equipment, power supplies, communication interface panel, connections, cables, cards/racks, software, mounting hardware, etc. as necessary to provide a fully functional radar detection system capable of detecting vehicles for all locations in the zones as indicated.

As necessary, provide multiple units per approach if multiple zones are required and a single unit cannot provide adequate coverage.

4. Radar and Video Detection System.

Furnish and install a detection system as indicated. All equipment shall be compatible with all the video or radar detector(s) utilized within the system as well as with the controller. Any change in detection from the indicated type shall require approval from the District Traffic Engineer. The system shall meet the video detection and video detection zone requirements as specified in Sections 956.2(c)2.a through 956.2(c)2.e and shall meet the radar detection and radar detection zone requirements as specified in Sections 956.2(c)3.a and 956.2(c)3.b.

5. Magnetometer Detection.

5.a. Magnetometer Sensor. As indicated and as follows:

- Physical Size—Cylindrical housing, nonferrous, moisture-proof, suitable for direct burial in roadway pavement, with no damage due to subsurface stresses, and with a lead-in cable of proper length for hookup.
- Operational—No moving parts and compatible with the magnetometer detector amplifiers furnished.

5.b. Magnetometer Amplifier, Shelf-Mounted. Enclosed in a shock-proof housing and as follows:

- Operation—Solid-state design with two independent detection channels in each unit, designed so the sensing element of one channel has no effect on the other.
- Bimodal—Pulse mode—Provides an output closure of 125 ms \pm 25 ms duration for each vehicle entering the detection area.
- Bimodal—Presence mode—Continually indicates the presence of a vehicle, until the vehicle leaves the area of detection, at which time the indication is to cease within 100 ms.
- Sensing Elements—One to six magnetometer sensors per channel capability at a distance of up to

3,000 feet between sensor and amplifier.

- Indicators and Switches—Provide on front panel: an LED indicator, sensitive to vehicle detection; fused or circuit breaker overcurrent protection; mode switch, calibration controls; and switch or switch position per channel for disabling the output of a channel and placing a call on a channel.
- Output—Optically isolated Darlington—An opto-isolated, NPN open collector capable of sinking 50 mA at 30 V (dc).
- Connector—MS-3106A20-29P, 17-pin connector with the following pin assignments:

Table 2: 17-pin Connector Pin Assignment

		Channel 1		Channel 2
	White	D		T
	Black	E		N
Probe Sets	Red	P		J
	Green	R		S
	Common (-)	B		K
Output	Detect (+)	G		M
	Neutral		A	
ac Power	High		C	
	Chassis Ground		H	

- Power Requirements—Maximum 11 V·A at 105 V to 125 V (ac), 57 Hz to 63 Hz without originating, nor being susceptible to, electrical transients in excess of the NEMA, TS 1, Section 2.
- Environment—NEMA TS 1, Section 2.

5.c. Magnetometer Amplifier, Rack-Mounted. Mounted on an edge connected, printed circuit board for rack-mounting and as follows:

- Physical—Provide a hand pull to facilitate insertion and removal from the rack.
- Operation—Section 956.2(c)5.b
- Modes—Section 956.2(c)5.b
- Sensing Elements—Section 956.2(c)5.b
- Indicators and Switches—Section 956.2(c)5.b excluding overcurrent protection.
- Output—Section 956.2(c)5.b
- Connector—Cinch Jones Number 50-40-A-30M, 22-pin edge connector, with the following pin assignments:

Pin Function

A	dc Ground
B	+24 V (dc)
C	Reset
D	Sensing Element #1 Input
E	Sensing Element #1 Input
F	Control Unit Output #1 (Collector)
H	Control Unit Output #1 (Emitter)
J	Sensing Element #1 Excitation
K	Sensing Element #1 Excitation
L	Equipment Ground
M	Reserved
N	Reserved
P	Sensing Element #2
R	Sensing Element #2
S	Control Unit Output #2 (Collector)
T	Control Unit Output #2 (Emitter)
U	Sensing Element #2 Excitation

V	Sensing Element #2 Excitation
W	NA
X	NA
Y	NA
Z	NA

Connector—Slotted for keying (Between Pins B&C and Pins M&N).

- Power Requirements—Maximum current 300 mA from 33 V to 28 V (dc).
- Environmental—NEMA TS 1, Section 2.

6. Magnetic Detection.

6.a. Magnetic Sensor.

- Physical—Cylindrical case, nonferrous, moisture-proof, suitable for burial within rigid nonmetallic conduit, and with a lead-in of sufficient length.
- Operation—No moving parts and compatible with the magnetic-detector amplifier furnished.

6.b. Magnetic Amplifier, Shelf-Mounted.

Shelf-mounted, enclosed in a shock-proof housing, and as follows:

- Operation—Solid-state design, with one channel in each unit.
- Sensing Elements—One or more magnetic sensor capability at a distance of up to 1,000 feet between the sensor and amplifier.
- Indicators and Switches—Provide on front panel: indicator for detection of a vehicle, fused or circuit breaker overcurrent protection, calibration controls, and a switch or switch position for disabling the output and placing a call.
- Output—Section 956.2(c)5.b
- Connector—Relay output—MS3106A-18-1S, Solid-State (Isolated)—MS3106A-8-15W.
- Power Requirements—Maximum power consumption of 2 W at 120 V (ac) and 60 Hz.
- Environmental—NEMA TS 1, Section 2.

6.c. Magnetic Amplifier, Rack-Mounted.

Mounted on an edge-connected, printed circuit board for rack-mounting and as follows:

- Physical—With a hand pull to facilitate insertion and removal from the rack. The four-channel, magnetic-detector amplifier in the front panel space of two, two-channel magnetic-detector amplifiers.
- Operation—Solid-state design with two or four independent detection channels in each unit, as indicated, designed that the sensing element of one channel has no effect on the other.
- Sensing Element—One or more magnetic sensors per channel, capable of sensing at a distance of up to 1,000 feet between the sensor and amplifier.
- Indicators and Switches—Section 956.2(c)5.b excluding overcurrent protection.
- Output—Section 956.2(c)5.b.
- Connector—Cinch-Jones Number 50-40-A-30M, 22-pin edge connector, with the following pin assignments:

Pin Function

A	dc Ground
B	+24 V (dc)
C	Not Connected
D	Detector #1 Element
E	Detector #1 Element
F	Detector #1 Output (C)
H	Detector #1 Output (E)

J	Detector #2 Element
K	Detector #2 Element
L	Chassis Ground
M	Reserved
N	Reserved
R	Detector #3 Element
S	Detector #3 Output (C)
T	Detector #3 Output (E)
U	Detector #4 Element
V	Detector #4 Element
W	Detector #2 Output (C)
X	Detector #2 Output (E)
Y	Detector #4 Output (C)
Z	Detector # 4 Output (E)

Connector—Slotted for keying

(C)—Collector

(E)—Emitter

- Power Requirements—Maximum of 60 mA per channel from a 24 V (dc) power supply.
- Environmental—NEMA TS 1, Section 2.

6.d. Rigid, Nonmetallic Conduit. Section 954.2(b)

(d). Pedestrian Detection.

1. Pedestrian Pushbutton. Capable of completing a momentary circuit closure as indicated and as follows:

- General—Furnish a tamper and weatherproof assembly with pushbutton contacts, entirely insulated from the housing and buttons. Use a pushbutton with 2-inch diameter +/- 0.1-inch, audio signal actuation confirmation, Americans with Disabilities Act (ADA) compliant, 303 or 316 stainless steel non-moving pushbutton and a maximum force of 5 pounds. Furnish sign and mounting assembly as indicated. Conform to the regulations for the sign legend and as specified in Section 1103.04 for the fabrication. Use stainless steel tamper resistant hardware to mount the pushbutton assembly.
- Housing—Die-cast aluminum alloy housing, with a curved back or a flat back as required to conform to the mounting surface. Powder coat the assembly highway yellow, as specified in Section 955.2(b)1. Provide a rear cable entry.
- Electrical—Provide a solid-state switch mechanism consisting of a direct push-type button, with a piezo driven switch, contacts rated at 10 A minimum, 125 V (ac) for operation at 24 V (dc) with an operating life of greater than 100 million operations.
- Latching LED—provide light emitting diode (LED) light with luminous intensity greater than 1200 mcd in ultra-bright red color and a viewing angle of 160 degrees that activities only during non-walk phases upon pedestrian actuation and stays on until the beginning of the walk phase. Include latching push button isolator card suitable for NEMA or 2070 style controller cabinet, 120 V (ac) or 24 V (dc), capable of managing four phases and 16 push buttons.

2. Accessible Pedestrian Signals (APS). Must meet ADA, MUTCD, NEMA TS 2, IEC, and FCC requirements and the following:

- Functionality – MUTCD.
- Temperature and Humidity – NEMA TS 2.
- Transient Voltage Protection – IEC 61000-4-4, IEC 60000-4-5.
- Transient Suppression – NEMA TS 2.
- Electronic Noise – FCC Title 47, Part 15 Class A & B.
- Mechanical Shock – NEMA TS 2.

- Vibration – NEMA TS 2.
- PBS Enclosure – NEMA 250 – Type 4x.
- Central Control Unit – NEMA 250 – Type 1.
- Electrical Reliability – NEMA TS 4.
- Bluetooth Specifications – Bluetooth Special Interest Group (SIG).

2.a. Pedestrian Pushbutton and Station

- Pole Base Station: Cast aluminum, powder coated.
- Sign: MUTCD, Publication 236, and as indicated.
- Pushbutton: ADA compliant, aluminum or stainless steel, powder coated, with vibrotactile arrow. For exclusive pedestrian phases, provide either no arrow or bi-directional arrow as indicated.
- LED Operation: Latching LED lights when the button is pushed and remains lit until the next walk phase as specified in Section 956.2(d)1.
- Operating life: Greater than 100 million operations.
- The button shall be designed so that it cannot be made to "stick on".
- The button shall "move" when pressed.
- All sounds must automatically adjust to ambient noise levels.
- The type of WALK indication as specified (tone or speech).
- The button shall be capable of the "extended button press" function.
- The pushbutton unit or sign shall have the street name in Braille or raised print when indicated.
- The system shall be 2-wire, 3-wire, or 4-wire as indicated.
- The system shall have no sharp edges.
- All hardware shall be stainless steel.

2.b. Central Control Unit

- Audio File Updates: via Ethernet or Bluetooth connection.
- Ethernet Interface: 10/100BASE-T, server built in with password protection.

(e) Preemption Systems. As specified in Sections 950, 951, and 952.2, as indicated, and as follows:

1. Optical Preemption. Include preemption devices, mounting and controller hardware, software, connectors, and cables as specified by manufacturer, to provide a functional system.

Provide optical detector(s) responsive at a minimum distance of 500 feet. Arrange for demonstration, as directed.

2. Acoustic Preemption. Provide a siren-activated Emergency Vehicle Preemption System. Include all necessary controller unit connectors, panel wiring, and miscellaneous hardware needed with the control cabinet. Provide field confirmation of detection at a minimum distance of 500 feet.

Certify that no false detection can occur. Arrange for demonstration, as directed.

3. Global Positioning System (GPS) Based Preemption. Provide GPS units with a minimum 500 feet radio range at intersections as indicated, to gain preemption or priority. Provide all hardware and software necessary to provide a functional GPS-Based Preemption System with secure radio communications. Arrange for demonstration, as directed.

(f) CCTV for Signalized Intersection. Furnish and install a functional CCTV for the use of a traffic signal or traffic signal system as specified in Sections 1210.2(b) and 1210.2(c)

956.3 CONSTRUCTION—Section 950.3, as shown on the Standard Drawings, and as follows:

(a) Vehicular Detection.

If replacing existing detection, remove any other non-obtrusive conflicting detectors or detection system, including bracket hardware and wiring as directed. Plug or patch any holes not being used where existing detection hardware was removed in a suitable manner as approved.

1. Loop Detection. Saw cut slots in the pavement for the sensor, as indicated on the plans and standard construction drawing. Rotary drill a hole for the conduit at curb. Ensure the slot and hole are free of moisture and debris. Install the conduit. Install the number of turns of wire for each loop detector at a minimum as shown on the Standard Drawings and according to the manufacturer's recommendations to obtain the inductance required to achieve proper operation, without splices, kinks, or curls, and without straining or stretching around the corners of the slot. Use a blunt nonmetallic tool to seat the sensor in the bottom of the slot. Check for slack, raised portions, and tightness. Correct if necessary. Install backer rod that tightly fits into the slot to prevent the loop sensor from rising. Insert the two leads from the loop, twisted together a minimum of 3 turns per foot, in the conduit leading to the junction box. Test leakage resistance, series resistance, and inductance before sealing the sawcut slot. Leakage resistance greater than 10 megohms is necessary when tested at 375 V(dc) minimum. Series resistance is not to exceed 2.6 ohms per 1,000 feet. Inductance is to be between 50 microhenries and 700 microhenries. Seal the conduit with duct seal. Seal the hole and slots with sealant, according to the manufacturer's instructions. Do not apply the sealant if the air temperature is below 32F, unless otherwise specified by manufacturer, or during precipitation. Fill the slot to within 1/8-inch of the pavement surface and ensure that there are no voids. Do not allow traffic on the slot until the sealant is cured. Remove excess sealant from adjacent road surfaces, but do not use solvents.

When resurfacing occurs over any area of loop sensor, install the sensor in the existing pavement structure or in the binder course before placement of the wearing course. Do not install the top course of pavement before the sealant is cured.

Splice the sensor wires to the lead-in cable as shown on the Standard Drawings. Encapsulate the splice with sealant to prevent water from penetrating the splice. Connect the sensor to each lead-in pair, as indicated. Band all excess loop sensor/lead-in cable in the junction box to prevent movement resulting in false calls. Extend the lead-in cable to the terminal strip in the controller cabinet, without splices. Measure inductance of loop and lead-in. Inductance is to be between 50 microhenries and 700 microhenries. Place a record of the inductance readings in the controller cabinet. Connect to the loop detector amplifier. Adjust the amplifier, according to the manufacturer's recommendations, to obtain the necessary sensitivity. Provide field validation that the detector equipment is properly working.

2. Video Detection. Install and mount according to the manufacturer's instructions to provide area(s) of detection, counting, and operation as indicated without detecting conflicting movements. Install risers and luminaire arms as directed. Secure detectors using mounting brackets as required by the manufacturer. Adjust and realign video detector as necessary to obtain optimal field of view and required detection zones. Provide video cameras to process vehicle presence, pulse, passage, and system detector zones as indicated. Relocation and calibration of video cameras, conduit, and cable required for detecting presence, pulse, passage, and system zones are incidental to the cost of this item. Connect detector outputs to appropriate controller phases as indicated in the phasing, timing and color sequence chart. Draw detection zones as indicated. Provide appropriate grounding and surge protection. Remove any conflicting detector(s) or detection system and associated wiring. Provide service technician from the supplier of the video detector equipment during the turn-on.

For applications that require remote monitoring of the traffic signal video, provide a reduced frame rate connection. Transmit remote monitoring of the video at the direction of the District Traffic Engineer or as indicated. Equip intersection with a remote connection as indicated. If detection is connected to the internet or network, obtain IP addresses from the District Traffic Engineer or Central Office IT. Compress images before transmitting and adjust frame rates to meet the bandwidth requirements. Provide all material, support, and coordination necessary to ensure the remote video access is functioning properly and providing real time video to the required locations. Provide field validation that the detector equipment is properly working.

If applicable, install monitor and keyboard/mouse in the controller cabinet with the appropriate cabling and connections to the video detector(s).

3. Radar Detection. Install, mount, and provide surge protection according to the manufacturer's recommendations to provide area(s) of detection and operation as indicated without detecting conflicting movements. Install detectors on traffic signal supports or luminaire arms as necessary for proper operation. Secure detectors using mounting brackets according to the manufacturer's recommendations. Adjust and realign detectors as necessary to

obtain optimal field of view and required detection zones. Provide detectors to process vehicle presence, pulse, passage, and system detector zones as indicated. Connect detector outputs to appropriate controller phases as indicated in the phasing, timing and color sequence chart. Draw detection zones as indicated. Provide appropriate grounding and surge protection. Remove any conflicting detector(s) or detection system and associated wiring. Provide service technician from the supplier of the video detector equipment during the turn-on.

Equip intersection with a remote connection as indicated. If detection is connected to the internet or network, obtain IP addresses from the District Traffic Engineer or Central Office IT. Provide all material, support, and coordination necessary to ensure the remote access is functioning properly. Provide field validation that the detector equipment is properly working.

4. Magnetometer Detection. Before installation, conduct the manufacturer's test to determine if the earth's magnetic flux at the point of installation is sufficient for the detector to operate. Rotary drill a hole in the pavement for the sensor. Saw cut slots for the lead, as indicated. Rotary drill a hole for the conduit at curb. Ensure the holes and slot are free of moisture and debris. Install the conduit. Insert the sensor vertically in the hole. Then insert the lead wire in the slot and in the conduit leading to the junction box. Use a blunt nonmetallic tool to seat the wires in the bottom of the slot. Test leakage resistance and series resistance. Leakage resistance greater than 10 megohms is necessary. Series resistance is not to exceed 2.6 ohms per 1,000 feet. Backfill the sensor hole, then seal the holes and slot with sealant, according to the manufacturer's instructions. Do not apply the sealant if the air temperature is below 32F, or during precipitation.

Complete the installation for the magnetometer detector, as specified in Section 956.3(a)1.

5. Magnetic Detection. Bore a tunnel, with boring pit as necessary, without disturbing the pavement, from the junction box to a point approximately 2 feet beyond the centerline of the detection zone. Bore a diameter only large enough to insert the conduit. Repair any damage to the roadway or pavement base drain caused by boring. Insert the capped, rigid, nonmetallic conduit in the tunnel, using a proper lubricant if necessary. Insert the sensor within the conduit. Test leakage resistance and series resistance. Leakage resistance greater than 10 megohms is necessary. Series resistance is not to exceed more than 2.6 ohms per 1,000 feet.

Complete the magnetic detector installation, as specified in Section 956.3(a)1. Adjust the location of the sensor to obtain proper operation.

(b) Pedestrian Detection.

1. Pushbuttons. Install the pedestrian pushbutton and indicated sign, using stainless steel vandal-resistant, machine screws, rivets, or stainless-steel banding taking care not to impair the message on the sign. Install according to Publications 13M, 148, and as indicated. Ensure that the pushbutton and sign is right side up. Drill and tap mounting holes of the size and pattern specified by the manufacturer. Drill and deburr the cable entrance hole. Install the latching push button isolator card in the controller cabinet. Connect the pushbutton according to the manufacturer's instructions, as indicated, and as shown on the Standard Drawings. Provide sealant above pushbutton where it abuts connecting support.

Field-test the operation by activating the pushbutton and performing a visual check of the controller indicator lights, latching function, and a timing check of the pedestrian phase or phase extension.

2. Accessible Pedestrian Signals (APS). Sections 950.3, 956.2, and 956.3(b)1, the Standard Drawings, the MUTCD, and as follows:

Install the APS pushbutton, speaker and vibrotactile device, and any applicable pushbutton sign within 10 feet of the extension of a crosswalk line, and reachable from the level landing of the curb ramp. Orient the arrow parallel to the direction of the crosswalk. Where an exclusive pedestrian phase exists, install a pushbutton with either no arrow or a bi-directional arrow as indicated.

Install the latching push button isolator card and central control unit in the controller cabinet. Attach any external speakers directly to the traffic signal supports and not to pedestrian signal heads. Adjust volumes of the pushbutton locator tone and ambient sound, except when audible beaconing is provided in response to an extended pushbutton press.

The button shall provide a location tone and extended pushbutton press feature as indicated. All operations and tone or speech messages shall comply with the MUTCD.

A raised/vibrating directional arrow shall be incorporated as part of the pushbutton and shall vibrate for the duration of the Walk message. In cases of an exclusive pedestrian phase, the pushbutton shall vibrate for the duration

of the Walk message.

The system shall provide an auxiliary message during emergency vehicle preemption.

Each time the pushbutton is pressed the user shall receive an acknowledgement in the form of a single audible "tick" as well as single momentary vibrating pulse. In addition, an LED shall turn on and latch until the walk signal is displayed. The LED shall latch for all pushbutton stations on that crossing.

In the event the pushbutton station loses power, the system shall automatically place a constant call to the traffic controller.

Field-test the operation of all features by activating the pushbutton and performing a visual check of the controller indicator lights, latching function, and a timing check of the pedestrian phase or phase extension.

Equip intersection with a remote connection as indicated. If device is connected to the internet or network, obtain IP addresses from the District Traffic Engineer or Central Office IT. Provide all material, support, and coordination necessary to ensure the remote access is functioning properly. Provide field validation that the APS device is properly working.

(c) Preemption Systems. According to the MUTCD and as follows:

Install according to the manufacturer's and supplier's recommendations to provide for a complete and operational system. Install each preemption detector cable with a single home run of cable from the detector to the controller cabinet without splices. Review each detector location in the field with a Service Representative and a representative of the District Traffic Unit before installation in order to provide optimum operation.

Coordinate with local municipality and emergency services to test the complete system including optical detectors at the intersection with an emergency vehicle. Adjustment to the preemption system pending the field test is incidental.

(d) Closed Circuit Television Camera for Signalized Intersection. As specified in Section 1210.3 and as follows:

Configure camera with PTZ functions to return automatically to related "Home" viewing position. Configure the subtitle or sector for each camera view position and preset. Display subtitles with the associated video image. Include the road the camera is on, camera number, and any other information as directed.

956.4 MEASUREMENT AND PAYMENT—

(a) Detector Lead-In Cable. Linear Foot.

(b) Detector Card Rack Assembly. Each.
Unless provided as part of new controller assembly.

(c) Detector Card. Each.
Unless provided as part of new controller assembly.

(d) Loop Sensors. Linear Foot.
Measured along sawcut to where it enters conduit, includes the number of turns as indicated. The sensor in conduit is incidental to the payment for conduit. Backer Rod is incidental if applicable.

(e) Loop Amplifiers. Each.
For the type indicated.

(f) Video Detector. Each.
The price includes camera, cables, surge protection, controller interface, video monitor for setting up detection zone(s), mounting hardware, all software with updates for complete installation, removal of any conflicting detector and wiring, and plugging any holes not being used where existing detection hardware was removed. Also includes time for manufacturer representative to be on site for the initial detector setup, training, and for any changes needed during the 30-day test.

(g) Video Detector with Internal Heater. Each.
The price includes camera, cables, surge protection, controller interface, video monitor for setting up detection

zone(s), mounting hardware, all software with updates for complete installation, removal of any conflicting detector and wiring, and plugging any holes not being used where existing detection hardware was removed. Also includes time for manufacturer representative to be on site for the initial detector setup, training, and for any changes needed during the 30-day test.

(h) Thermal Video Detector. Each.

The price includes camera, cables, surge protection, controller interface, video monitor for setting up detection zone(s), mounting hardware, all software with updates for complete installation, removal of any conflicting detector and wiring, and plugging any holes not being used where existing detection hardware was removed. Also includes time for manufacturer representative to be on site for the initial detector setup, training, and for any changes needed during the 30-day test.

(i) Omni-view Video Detector System. Each.

The price includes camera(s), processor, surge protection, boosters/repeaters, software with updates, all mounting hardware, cables and wiring, removal of any conflicting detector(s) and wiring, plugging any holes not being used where existing detection hardware was removed, and additional equipment recommended by the manufacture to provide vehicular detection for the entire intersection as indicated. Also includes time for manufacturer representative to be on site for the initial detector setup, training, and for any changes needed during the 30-day test.

Additional traffic count and advance signal performance reports shall be included as indicated. The additional WiFi Mac Address processor and data collection shall be included only if indicated. The cost of any additional data collection or reports shall be included if indicated.

(j) Monitor and Keyboard/Mouse for Video Detection. Each.

The price includes cable, controller interface, video monitor for setting up detection zone, mounting hardware, and all software for complete installation.

(k) Video Detection System. Each.

The price includes cameras, cable, surge protection, controller interface, video monitor for setting up detection zones, mounting hardware, all software with updates for complete installation, removal of any conflicting detector(s) and wiring, and plugging any holes not being used where existing detection hardware was removed. Also includes time for manufacturer representative to be on site for the initial detector setup, training, and for any changes needed during the 30-day test.

(l) Radar Detector. Each.

The price includes radar detector, cables, surge protection, controller interface, mounting hardware, all software with updates for complete installation, removal of any conflicting detector and wiring, and plugging any holes not being used where existing detection hardware was removed. Also includes time for manufacturer representative to be on site for the initial detector setup, training, and for any changes needed during the 30-day test.

(m) Radar Detection System. Each.

The price includes radar detectors, cables, surge protection, controller interface, mounting hardware, all software with updates for complete installation, removal of any conflicting detector and wiring, and plugging any holes not being used where existing detection hardware was removed. Also includes time for manufacturer representative to be on site for the initial detector setup, training, and for any changes needed during the 30-day test.

(n) Radar and Video Detection System. Each.

The price includes radar and video detectors, cables, surge protection, controller interface, mounting hardware, all software with updates for complete installation, removal of any conflicting detector(s) and wiring, and plugging any holes not being used where existing detection hardware was removed. Also includes time for manufacturer representative to be on site for the initial detector setup, training, and for any changes needed during the 30-day test.

(o) Magnetometer Sensor. Each.

(p) Magnetometer Amplifiers. Each.

For the type indicated.

(q) Magnetic Sensors. Each.

(r) Magnetic Amplifiers. Each.
For the type indicated.

(s) Pedestrian Pushbuttons. Each.
The price includes signs, latching card, extension (if necessary), and mounting hardware.

(t) Accessible Pedestrian Signal. Each.
The price includes signs, latching card, control unit, extension bracket (if necessary), and mounting hardware.

(u) Preemption System. Each.
For the type indicated.
Includes all material required for the installation of an intersection emergency preemption system including detector units, preemption cable, preemption power source cable, boosters, optical detectors, and failsafe lamps. Includes labor for installation, testing, and adjustment pending field test of the preemption System.

(v) CCTV for Signalized Intersection. Each.
The price includes camera, lens, encoders, decoders (as required), wires, connectors, grounding rod, conductor, installation, training, and integration work for a complete subsystem.

SECTION 957—ADVANCED TRAFFIC SIGNAL TECHNOLOGY

957.1 DESCRIPTION—This work is the furnishing and installation of advanced traffic signal technology for the purpose of improving traffic operations and enabling communication between vehicles and infrastructure.

957.2 MATERIAL—

(a) General.

- Traffic Signals-General—Section 950.2.
- Certification—Section 106.03(b)3.

(b) Warranty and Support.

- Provide a five-year technical support, hardware, and software warranty as applicable to the installed system.
- Include a five-year repair or replace guarantee including labor on defective hardware at no additional cost to the Department or traffic signal owner.
- Include five years of technical support available 24/7, 365 days of the year and five years of free software updates.
- Maintain an ongoing program of technical support for the Advanced Traffic Signal Technology.
- Provide on-site technical support services by telephone or personnel sent to the installation site upon a service request.
- Maintain an adequate inventory of parts to support maintenance and repair of the Advanced Traffic Signal Technology.
- Replacement parts shall be available for delivery within 30 days of an order.
- Guarantee support and replacement parts for up to 10 years for the Advanced Traffic Signal Technology.
- Provide replacement parts at no additional cost to the Department when the system is under the technical, hardware, and software support period.

The five-year warranty commences at the later of the two dates; the hardware is energized or the date of software installation/Department and Municipality training.

(c) Adaptive Signal System.

Must be compatible with the controller and vehicle detection system installed at all intersections within the system.

The Adaptive Signal System shall have a fallback state that allows coordination using a common cycle length for all intersections in the system. The Adaptive Signal System shall have a fallback state that allows individual intersections to operate in a vehicle-actuated, isolated mode in the event of failures of the adaptive software or hardware, detectors, or communication.

The Adaptive Signal System shall be capable to optimize no less than every five minutes and shall provide updates to the adaptive software at a minimum of every four cycles to monitor performance and track the changes made to the splits, offsets, cycle lengths, and phasing sequences.

The Adaptive Signal System software shall be capable of remote monitoring and configuration via a web interface locally and over an Ethernet network on an authorized computer and shall be password protected. The Adaptive Signal System shall be connected to the Commonwealth Network to allow PennDOT to monitor the operation of the system to ensure the operational goals are met. The Adaptive Signal System shall allow access by PennDOT and all parties authorized by the District Traffic Engineer.

The Adaptive Signal System shall collect and store accessible real-time traffic data such as vehicle counts, stop delay and queue information per lane for a minimum of 4-weeks or as indicated. Real-time and historical statistical

information shall be available in graphical or tabular form or both via a web browser. This data shall be available to all parties authorized by the District Traffic Engineer.

In the event of a detector, communications, or adaptive hardware or software failure, the Adaptive Signal System shall immediately trigger an alarm and at a minimum automatically send alphanumeric messages (short messaging service (SMS)/text messaging) to cellular telephones and email addresses to the specified parties as directed by the District Traffic Engineer.

In the event of detection failure, the Adaptive Signal System shall either revert to time of day, utilize other system detectors, or vehicle recall settings or use historic system data from a similar time period to account for the approach or movement demand or utilize adjacent or reliable downstream detection to account for vehicular demand.

The Adaptive Signal System shall not prevent access to the local signal controller database, monitoring or reporting functions by any installed signal management system.

The Adaptive Signal System shall have the ability to be operated and monitored from a TMC if applicable.

The Adaptive Signal System shall function with these minimum operation requirements:

- The Adaptive Signal system shall be capable of real-time corridor optimization, including dynamic adjustment of cycle length or timing pattern selection and coordination offsets with minimal transition period, the lesser of four cycles or five minutes
- The Adaptive Signal System shall handle real time incidents and traffic shifts by modifying the splits and offsets of the traffic pattern to adapt to increases and decreases in traffic flows on the facility it is managing. The Adaptive Signal System shall detect additional traffic and provide additional green time and adjust offsets as needed.
- Selection of timing pattern, cycle length, offset, and split calculation shall be based on achieving the objective of the adaptive system and be based on the detection evaluation of queues, wait times, and/or vehicle data.
- All timing pattern, cycle length, offset, and split thresholds shall be authorized by the District Traffic Engineer.
- Provide an Adaptive Signal System that can function in an actuated-coordinated mode or adaptive mode selectable by time of day and day of week.
- If pedestrian actuation and detection is applicable, the system shall accommodate pedestrian actuations.
- If preemption is applicable, the system shall allow all preemption phases to override the system, operate according to the approved preemption sequencing without impedance from the system, and resume adaptive operation upon completion of the preemption phases with minimal transition, lesser of four cycles of five minutes.
- If queue preemption is applicable, the system shall accommodate queue preemption.
- If railroad or transit preemption is applicable, the system shall accommodate railroad or transit preemption.
- If priority is applicable, the system shall allow all priority phases to override the system, operate according to the approved priority sequencing without impedance from the system, and resume adaptive operation upon completion of the priority with minimal transition, less than two cycles.
- The system shall be able to reservice side street phases while operating in its coordinated phase.
- When the system has a detection failure, it shall be capable of utilizing optimized signal splits based on historical split information or use other capable system detectors to maintain adaptive operations.

1. Hardware Adaptive Signal System

As specified in Sections 957.2(b), 957.2(c), and as follows:

Provide all hardware necessary at each intersection for the installation of the Hardware Adaptive Traffic Signal System including the following:

- Adaptive Traffic Signal Processor.

- Equipment.
- Spare equipment.
- Web-based/adaptive system application/adaptive signal system interface and setup (if applicable).

1.a. Adaptive Traffic Signal Processor

- The system shall provide equipment as necessary to communicate between the detection system(s) and the traffic adaptive components of the system.
- The system shall automatically send all necessary information to processors at neighboring intersections in order to optimize the phasing sequence, duration, and initiation of movements along the corridor.
- The system shall be capable of passing all vehicle detection inputs through to the controller to allow the intersection to operate without adaptive control by manual command, time of day, or in the event of an adaptive processor failure.
- When the controller loses communication with the processor, the controller shall default to using existing time-of-day timings in conjunction with the vehicle detectors. To accomplish this, all vehicle detection shall be passed through to the controller in the event of adaptive processor failure or a need to disable adaptive operation in the future. The system shall not operate in “free mode” due to a loss of communication between the controller and the processor unless directed.
- The system shall have a “free mode” contact closure pin wired in the cabinet so if communication is lost between the hardware adaptive system and the controller, the intersection will revert to a prior time of day plan and generate an alarm, SMS text message or email, to inform TMC/system operators.

1.b. Equipment.

- Provide a minimum 10/100 plug-and-play Ethernet connection with static IP.
- For systems that connect detection into the adaptive signal system processors, include a lightning arrestor and fuse block to protect the power leads to the vehicle detectors.
- Allow power to be remotely cycled to the vehicle detectors.
- Provide one 7-inch monitor and integrated Universal Serial Bus (USB) keyboard/mouse for the entire system. The keyboard shall have key spacing center-to-center of 0.75 inches with a minimum 84 keys. The monitor and keyboard/mouse shall allow full monitoring and configuration of the adaptive system at each controller cabinet. The monitor shall have a minimum resolution of 1024 x 768. Upon final configuration of the adaptive system, place the monitor and keyboard/mouse in the controller cabinet at an intersection directed by the District Traffic Engineer.
- Provide a minimum 2 GB re-imaging flash drive for each intersection containing all the programming details at each intersection. Each flash drive is to be labeled and shall remain in the cabinet.

1.c. Spare Equipment.

- Provide the number of spare systems as indicated. Each spare system shall include one processor, four vehicle detectors that match the detection system installed under the project, and one equipment panel if required. If no detection system is installed under the project, spare detection is not required. Deliver the spare system to the locations directed by the District Traffic Engineer.

2. Software Adaptive Signal System

As specified in Sections 957.2(b), 957.2(c), and as follows:

Provide all necessary components for the installation of the Software Adaptive Traffic Signal System including the following:

- Controller setup/programming/keys at each intersection

- Software license/setup by system or intersection
- Central System if applicable or licenses that connect and configure with already established Department Central System agreements.
- Web-based/adaptive system application/adaptive signal system interface and setup
- Off-site computer/keyboard/monitor and setup with the adaptive signal system manufacturer's minimum system requirements if applicable as indicated.

In the event of a minor communication failure or detection failure, the Software Adaptive Signal System shall utilize comparable historic data to develop splits, offsets, and cycle lengths or use other capable system detectors to maintain adaptive operations. The Adaptive Signal System shall immediately trigger an alarm and send a message, SMS/text message or email, to the specified parties as specified in Section 957.2(b).

In the event of a major communication or system failure, the Software Adaptive Signal System shall revert to time of day timing plans. The Adaptive Signal System shall immediately trigger an alarm and send a message, SMS text message or email, to the specified parties as specified in Section 957.2(b).

3. Intersection Adaptive System Vehicle Detection System

Each intersection shall be furnished with a vehicle detection system that meets and as specified in Sections 910.2, 950.2, 954.2, 956.2, and as follows:

The detection warranty shall be governed as specified in Section 950. Warranty requirements as specified in Section 957.2(b) do not apply for Section 957.2(c)3.

The detection system shall be 100% compatible with the Adaptive Signal System installed and shall have the following functional requirements:

- Sense the presence or passage of vehicles by lane. This can be accomplished using one camera/sensor or multiple cameras/sensors.
- Detect at minimum the detection zones as indicated.
- Built-in external RJ-45 port and power connector.
- If video detection is used, Video output shall be H.264, MJPEG, or MPEG-4.
- Minimum video resolution of 720 x 576 streaming on any modern web browser (HTTP).
- Each intersection shall be equipped with at least one camera capable of providing video imagery of the entire intersection that is streamed remotely. The video shall encompass all approaches at the intersection and provide the user with real-time traffic observations. This camera may double as a vehicle detection camera. Video output in h.264, MJPEG, or MPEG-4. Minimum video resolution of 720 x 576 streaming on HTTP.
- Detection sensor shall be in detector mode before implementing the adaptive system.

The mounting hardware shall include all clamps, wiring harnesses, and remaining hardware necessary to mount and operate the vehicle detection system according to the manufacturer's recommendations. Specific mounting hardware is dependent on the vehicle detection system selected for this project and shall be compatible with both strain pole/span wire and mast arm signal supports. If recommended by the manufacturer, install luminaire arms on strain pole signal supports to obtain proper detector placement and visibility. Luminaire arms, if determined necessary, shall be incidental to the vehicle detection system and considered part of the mounting hardware.

957.3 CONSTRUCTION—

(a) Adaptive Signal System.

As specified in Section 950.3 and as follows:

Request IP addresses for all IP-addressable components of the adaptive system according to the Traffic Signal

Remote Communication Policy.

Before installation, provide catalog cuts, proof of adaptive system concept detailing the satisfaction of each core functional requirement, and shop testing documentation to the District Traffic Unit for approval.

After installation, the Adaptive Signal System shall be configured according to the core functional requirements and for optimal operation of the network considering the objectives as indicated. Traffic flow and anomalous traffic conditions are to be programmed into the Adaptive Signal System. All phase sequencing shall be verified by the municipality and the District Traffic Engineer before final approval.

Before the initial turn-on, verify with the Representative that all systems are working properly. Notify the District Press Office two weeks in advance of the initial system turn-on.

The signal shall operate with uninterrupted existing operations including time of day plans and detection during non-working times. Refer to temporary traffic control plans or existing permit plans for operations of existing detection system. Proposed detection should be used to provide uninterrupted service if existing detection is disabled. Any extended duration of the interruption service outside of working hours shall be approved by the District Traffic Engineer before interruption of service.

1. Training.

Shall provide training to the Department personnel, municipal personnel, municipal consultant engineers and municipal maintenance providers on the setup, operation, and maintenance of the Adaptive Signal System. Training shall be provided for the number of days indicated.

Training shall include the following topics:

- Accessing the adaptive signal system remotely to the adaptive signal system through the web interface locally or over an Ethernet network on an authorized computer.
- Accessing historic data.
- Testing system failures and identifying problems and applicable troubleshooting techniques.
- Adjusting and monitoring the adaptive signal system settings.
- Reporting and analyzing.

2. Hardware Adaptive Signal System.

As specified in Section 957.3(a) and as follows:

All equipment shall be labeled based on the provided IP addresses and installed.

Install the Adaptive Signal System in the controller assembly or auxiliary cabinet according to the manufacturer's recommendations and as indicated.

3. Software Adaptive Signal System.

As specified in Section 957.3(a) and as follows:

If there is applicable hardware, there shall be a five-year warranty, as specified in Section 957.3(a).1. Shall install all applicable components of the Software Adaptive Signal System to be fully operational according to the Adaptive Signal System's manufacturer requirements.

If applicable, the installation shall include modifying the controller setup and/or programming and/or installing adaptive keys at each intersection, establishing the Central System and configuring the adaptive signal system into the Central System, obtaining and activating the software license for the system or intersections, setup the web-based/adaptive system application/adaptive system interface, and set up the off-site computer/keyboard/monitor, setup with the adaptive signal system manufacturer's minimum system requirements, and any additional setup requirements.

4. Intersection Adaptive System Detection System.

As specified in Sections 910.3, 950.3, 954.3, 956.3, and as follows:

Install and mount the vehicle detection system according to the manufacturer's recommendations to provide minimum area of detection and operation as indicated without detecting conflicting movements. Secure detectors using appropriate mounting brackets according to manufacturer's recommendations.

Connect the Ethernet cable and power cable according to the manufacturer's recommendations from each vehicle detector back to the controller assembly. Provide repeaters and enclosures if vehicle detectors are over 300 feet from the cabinet. Provide field validation that the detector equipment is properly working.

All vehicle detection shall be passed through to the controller in the event of adaptive processor failure or a need to disable adaptive operation in the future. The system shall not operate in "free mode" due to a loss of communication between the controller and the processor unless directed.

Shall provide a copy of any necessary software to the Department, municipality, municipal consultant engineers, and municipal maintenance upon request.

957.4 MEASUREMENT AND PAYMENT—

(a) Hardware Adaptive Signal System. Each.

The price includes all required hardware and configuration for a complete and functional system. 50 percent of the contract price will be paid upon delivery of equipment. 35 percent will be paid when all the equipment has been installed, configured, and is a fully functional system. 15 percent will be paid upon successful completion of the 30-day testing requirements.

All applicable training, 5-year technical, hardware, and software warranty, and spare hardware for all intersections in the adaptive system is included the system cost.

(b) Software Adaptive Signal System. Each.

75 percent of the contract price will be paid upon setup of software and installation of any hardware. 25 percent will be paid upon successful completion of the 30-day testing requirements.

All applicable training, 5-year technical, hardware, and software warranty, and software/license fee for all intersections in the adaptive system is included the system cost.

(c) Intersection Adaptive System Detection System. Each.

The price includes controller interface/processor, mounting brackets, conduit, trenching, boring, junction boxes, splicing, luminaire arms, banding, cabling, setting up detection zones, software, and field adjustments for a complete installation at one intersection.

Exposed or Buried Conduit, Trenching, Boring, Junction Boxes, Splicing, Mounting Hardware, Ethernet Cable are incidental and shall be provided with the vehicle detection system as indicated and according to the manufacturer's recommendations.

SECTION 958—TEMPORARY TRAFFIC CONTROL SIGNALS

958.1 DESCRIPTION— For new temporary traffic signals, this work is the furnishing and installation of complete and operational temporary traffic control signal systems for stationary operations; work includes installing, maintaining, relocating, resetting, and removing these temporary traffic control signals.

For existing permanent traffic signals, this work is the temporary modification and restoration of existing permanent traffic signals to address congestion resulting from traffic volume shifts due to construction-related traffic or to accommodate temporary modifications to roadway geometry.

958.2 MATERIAL—

(a) General.

- Traffic Signal-General—Section 950.2
- Compliance Certification of Bulletin Material—Section 106.03(b)3
- Conform to Publication 213 and MUTCD Part 4.

(b) Temporary Traffic Control Signals On Fixed Supports.

1. Design. Provide temporary signal system on fixed supports. Furnish, install, maintain, and remove all items required to provide a temporary signal system as indicated.

Conform to Publication 213, field conditions, and as indicated for long-term stationary operations using temporary fixed support systems.

Do not use temporary fixed support signals for short-term, stationary operations. For short-term, stationary operations, use requirements as specified in Sections 958.2(c) and 958.2(d).

2. Signs. Sections 931.2, 935.2, 936.2, 1103, and as follows:

- Provide signs and devices according to Publications 149, 213, and 236, as indicated, and as required based on actual site conditions and as directed.

3. Pavement Markings. Section 961.2.

4. Controller Assembly. Sections 952.2 and as follows:

- Provide a controller with minimum 3-cycle operation, auto-manual switch and a manual control button with flexible cord.

5. Electrical Distribution. Sections 910.2(Highway Lighting) and 954.2.

6. Signal Heads. Section 955.2.

7. Detection. Section 956.2 and as indicated.

8. Support Poles. Section 951.2 and as follows:

- Provide signal poles of wood, galvanized steel, or painted steel. Steel poles may be provided instead of wood poles at no additional cost to the Department to eliminate encroachments on adjacent properties.
- Provide certification that the signal poles are designed to withstand the anticipated loading.
- Provide guy wires as indicated.

9. Traffic Signal Systems and Communications. Section 953.2.

(c) Temporary Traffic Control Signals On Pedestal-Mounted Portable Traffic Control Signal Systems.

1. System Configuration and Application. Furnish each pedestal-mounted portable traffic control signal

system as indicated, and as follows:

Conform to Publication 213, field conditions, and as indicated for short-term stationary operations using pedestal-mounted signals.

Do not use pedestal-mounted portable signals for long-term, stationary operations.

In addition to work areas, pedestal-mounted portable signals may also be authorized for use by the Department on special events and applications conforming to the requirements in Publication 213, and as indicated. Manufacturers must advise users of their systems of these Department requirements and procedures.

2. Pedestal Units.

2.a. Structural Adequacy. Provide a structurally adequate unit to support all pedestal-mounted equipment. Furnish units with adequate structural integrity to enable lifting and placing them as required.

2.b. Stability. Provide units with acceptable stability and a suitable means for ballasting.

2.c. Assembly Mechanisms. Equip each unit with tires and retractable handles to facilitate deployment, relocation, and removal. Mount signal heads on a retractable vertical upright equipped with a manual hand crank.

2.d. Labels. Mark the manufacturer, serial number, and emergency phone number permanently on each using a decal, metal plate, or other method approved by the Representative.

3. Signal Displays.

3.a. Number and Location. Furnish each pedestal-mounted portable traffic control signal system consisting of a minimum of two pedestal-mounted signal head units for each approach or as indicated.

3.b. Vertical Clearance. Mount the bottom of the housing of a signal at least 8 feet but not more than 15 feet above the sidewalk. If there is no sidewalk, measure the mounting height above the pavement grade at the center of the roadway.

3.c. Size and Orientation. Mount each signal head vertically with indications 12 inches in diameter.

3.d. Signal Head Design. Furnish yellow signal head housings as specified in Section 955.2(b)1. Provide signal heads with visors having a minimum depth of 9-1/2 inches. Equip all signal heads with backplates as specified in Section 955.2(b)3.

3.e. Approved Material Types. Furnish all signal heads with light emitting diode (LED) modules. Provide all LED modules and signal housings as specified in Section 955.2(c).

3.f. Supplemental Signal Indicator Lamps. Provide lamps on the back side of each unit for a visual status of the signal indications. The lamp should display red to indicate oncoming traffic is provided with a green indication and the indication should remain off if oncoming traffic is provided with a red indication.

4. Environmental Requirements. Provide a portable traffic control signal system capable of operating over an ambient temperature range of -30F to 165F, and a relative humidity range of 0 to 95%.

5. Power Supply. Provide a battery-powered, portable traffic control signal system. Furnish a power supply with sufficient capacity to power each unit for 7 days at 72F without charging. Equip each unit with batteries and a battery charger for use with a 110 V power source. Furnish a visual display of the battery charge status. Enclose the batteries and battery charger in a lockable, weatherproof compartment. Key all locks alike for each unit in a system. Provide a system capable of running via existing commercial power. Equip unit with a generator connector for power loss conditions.

6. Communication. Interconnect all portable traffic control signal systems used for operations via wireless radio link or overhead hardwire to ensure fail-safe operation and proper functioning. Interconnect the units to function as a

master/slave system. Ensure radio communications conform to applicable FCC requirement.

7. Modes of Operation.

7.a. Required Modes. Provide each system to operate via manually controlled, fixed-time, traffic-actuated, and flashing modes.

7.b. Manually Controlled Operation. Furnish manual control with wireless remote. Provide a manual control mode prohibiting the operator to interrupt any preprogrammed all-red and/or all-yellow clearance time in a manner that would create a conflict.

7.c. Fixed-Time Operation. Provide a system capable of accommodating a minimum of five timing patterns per 24-hour period.

7.d. Traffic-Actuated Operation. Use detection systems as specified in Section 956.2(c).

7.e. Flashing Operation. Provide a system capable of both flashing red and flashing yellow operations in programmed flash and cabinet flash modes.

7.f. Emergency Preemption. As an option, provide a system, as specified in Section 956.2(e), capable of accommodating an optical, radio, or sound-based preemption system to provide a green indication for a properly equipped, approaching emergency vehicle.

7.g. Railroad Preemption. Due to the complexity and variation involved with railroad crossings, this operation will require a district special provision.

8. Timing Parameters.

8.a. Programmable Timing Patterns. Allow users of the system to program coordinated signal timings for green periods and cycle lengths to the nearest 1 second, over a range of values from 3 seconds to 250 seconds. Phase timings, including minimum green, green extension, yellow clearance, and red clearance must be programmable to the nearest 1 second. Minimum green times must be programmable over a range of 0 to 25 seconds. Green extension times must be programmable over a range of 0 to 10 seconds. Maximum green times must be programmable for each phase to the nearest second and must be programmable over a range of 3 to 250 seconds.

8.b. Minimum Number of Phases. Furnish system capable of a minimum of six-phase traffic signal operations.

8.c. Manual Programming. Allow users of the system the ability to program pre-selected timing patterns.

8.d. Timing Algorithms. If the system has software to automatically determine timing patterns based on certain input data, submit a complete description from the manufacturer of the logic behind the timing algorithm for the Representative's review and approval.

9. Conflict Monitoring. Provide a system capable of preventing or detecting the display of conflicting signal indications according to the conflict monitoring provisions of the NEMA Standards. If a conflicting display is detected, provide a system causing a transfer of the signals to flashing red.

10. Training and Documentation. Have the manufacturer provide training and documentation to users of the portable traffic control signal system. Submit technical documentation to the Representative that describes all necessary information regarding system operations, service procedures, and parts. Submit training documentation to the Representative showing that the trained personnel are knowledgeable of the signal system's operation and function.

(d) Temporary Traffic Control Signals On Trailer-Mounted Portable Traffic Control Signal Systems.

1. System Configuration and Application. Furnish each trailer-mounted portable traffic control signal system as indicated, and as follows:

Conform to Publication 213, field conditions, and as indicated for short-term stationary operations using trailer-mounted portable signals.

Conform to Publication 213, field conditions, and as indicated for long-term, stationary operations using trailer-mounted portable signals.

In addition to work areas, trailer-mounted portable signals may also be authorized for use by the Department on special events and applications that conform to the requirements in Publication 213, and as indicated. Manufacturers must advise users of their systems of these Department requirements and procedures.

2. Trailer.

2.a. General. Provide trailer capable of accommodating a vertical upright and a horizontal mast arm.

2.b. Structural Adequacy. Provide trailer with welded steel construction and with structural adequacy to support all trailer-mounted equipment, and adequate structural integrity to enable lifting and placing vertical upright and horizontal mast arm as required.

2.c. Stabilizers. Equip trailer with at least four leveling jacks, pads, or feet, one at each corner of the trailer, for maintaining the trailer in a level, stabilized position and capable of locking in position.

2.d. Licensing. Equip trailer with all required lighting and other features to legally transport on the public highway system. Provide trailer and all its components with sufficient strength and rating to operate safely upon the public highway system at legal speeds without bending, cracking, bottoming, premature wear, or other damage.

2.e. Lifting and Assembly Mechanisms. Provide all lifting and other assembly mechanisms for simplicity and quick operation to keep set up and take down time to a minimum and to enable operation by one person. Equip lifting mechanism with a locking device to secure the assembly in a raised position; with a horizontal, lowered position for transport; and with a raised, vertical position, facing rearwards from the trailer, for operation.

2.f. Vandal-Resistant Features. Furnish trailer and its components to help ensure continued proper placement and to forestall vandalism. Provide trailer with adequate vandal-proof housings for all equipment. Provide removable trailer tires and hitch. Provide lockable battery enclosures, crank mechanisms for horizontal arms, and other mechanisms for adjusting placement or operation to eliminate tampering by unauthorized personnel. Key all lockable items alike. Equip the trailer drawbar with a swing-away, screw-type jack.

2.g. Reflective Markings. Place reflective tape or reflectors at each corner on the front, rear, and sides of the trailer.

2.h. Labels. Mark the manufacturer, serial number, and emergency phone number permanently on each trailer using a decal, metal plate, or other method approved by the Representative.

3. Signal Displays.

3.a. Number and Location. Furnish each trailer with a minimum of two signal heads or as indicated. Mount at least one signal head overhead on the mast arm, except as indicated where two overhead signal heads are required on the mast arm. Provide horizontal mast arm capable of extending a minimum distance of 9 feet from the edge of the trailer. Locate signal faces apart a minimum horizontal distance of 8 feet measured between centers of signal faces along a line perpendicular to the centerline of the approach.

3.b. Vertical Clearance. Suspend the bottom of the housing of a signal face over the roadway a minimum of 15 feet, but not more than 19 feet, above the pavement. Mount the bottom of the housing of a signal face not over the roadway at least 8 feet, but not more than 15 feet, above the sidewalk. If there is no sidewalk, measure the mounting height above the pavement grade at the center of the roadway.

3.c. Size and Orientation. Mount each signal head vertically with indications 12 inches in diameter and

capable of rotating 180 degrees horizontally. Provide reversible mountings to allow for placing a trailer on both sides of the roadway.

3.d. Signal Head Design. Section 958.2(c)3.d.

3.e. Approved Material Types. Section 958.2(c)3.e.

3.f. Supplemental Signal Indicator Lamps. Section 958.2(c)3.f.

4. Environmental Requirements. Section 958.2(c)4.

5. Power Supply. Section 958.2(c)5.

6. Communication. Section 958.2(c)6.

7. Modes of Operation. Section 958.2(c)7.

8. Timing Parameters. Section 958.2(c)8.

9. Conflict Monitoring. Section 958.2(c)9.

10. Training and Documentation. Section 958.2(c)10.

11. Work Zone Luminaire. When required by the contract, furnish a work zone luminaire designed to fit onto the portable trailer-mounted unit. The function of the Work Zone Luminaire is to illuminate the portable trailer signal and surrounding work area during periods of low visibility. Photocell sensors will automatically activate the light at dusk. The luminaire will be comprised of LEDs for its light source and powered by the portable trailer unit's battery system.

(e) Temporary Timing Adjustments to Existing Permanent Traffic Signal Controller. Sections 950.2, 952.2, 954.2, and as follows:

- Provide materials as required to complete the timing adjustment work.

(f) Temporary Modifications to Existing Permanent Traffic Signal. Sections 950.2, 951.2, 952.2, 953.2, 954.2, 955.2, 956.2, 957.2, and as follows:

- Provide materials as required to complete the signal modification work.

958.3 CONSTRUCTION—

(a) General.

- According to Publication 213 for required operations, submit a completed Application for Permit to Operate Temporary Traffic Control Signals (Form TE-952P) with an approved PennDOT Temporary Traffic Control Signal Permit (Form TE-964P) being required before usage of these temporary signals.
- Install according to Publication 213, Part 4 of the MUTCD, and as indicated. Remove all items required to provide a temporary signal system as indicated.
- Own, operate, maintain, and repair all temporary traffic control signals, as indicated. Replace temporary traffic signals that can't be repaired.
- All temporary signal equipment must be within public right of way. If guy wires cannot be located on public right of way, written permission from property owners is required.
- Initial flashing period is required for previously unsignalized locations, if temporary construction field conditions and situations allow, and as approved by a representative of the District Traffic Unit. Flash signals for a period of 3 to 7 days before full operation. If approved, the duration of flashing operation may be 3 to 5 days provided that it includes a minimum of 2 weekdays before beginning the normal stop-and-go mode of operation. Make initial turn-on to flashing mode in the presence of the Representative. Notify the District Traffic Unit, a minimum of 7 calendar days before the initial turn-

on to flashing operations.

- Turn on signals to full operation of stop and go traffic between the hours of 9 AM and 2 PM, Tuesday through Thursday, except holidays, or the day before or after a holiday. Under special circumstances involving safety of motoring public, the Representative may grant exceptions to this rule. Make turn-on to full operations in the presence of the Representative. Notify the District Traffic Unit, a minimum of 7 calendar days before the initial turn-on to full operations, and each new construction phase.
- Perform all necessary timing adjustments. Timing adjustments and/or other approved plan modifications are incidental to the temporary traffic control signal work.
 - Submit any Contractor proposed signal timing changes to the Representative for approval before implementation.
 - Make timing adjustments as approved and directed and update the Plans accordingly.
 - Contractor will implement timing changes within 2 calendar days of Department notification.
- As field conditions allow and as approved by a representative of the District Traffic Unit, complete all required temporary traffic control features before the temporary traffic signal is turned on. This work includes but is not limited to pavement markings, signing and barrier.
- Emergency response for temporary signals
 - Provide the Department and the local or state police providing enforcement with the name and telephone number of an emergency contact person who is available 24 hours a day, 7 days per week.
 - Provide immediate response to emergency calls from any representative of the Department, local police, state police, or municipality.
 - The emergency contact person must be able to be on site within 2 hours of notification and must be knowledgeable in the operation and maintenance of the signal hardware.
- Repair surface areas disturbed by the installation of portable signals as directed and approved.
- When not in operation, signal heads shall be removed from the view of traffic or be hooded with a material that covers the signal indications from the view of traffic. All temporary traffic signal related signs shall also be removed, covered, folded, or turned so that they are not readable by oncoming traffic when the portable traffic control signal is not in operation.
- Remove temporary traffic control signals after completion of construction phases/stages requiring them, as indicated. Removal is incidental to the temporary traffic control signal work.
- Document training or proficiency regarding the operation of the devices.

(b) Temporary Traffic Control Signals On Fixed Supports.

This work is the complete setup of a temporary fixed support signal system, including all required materials and work. Install temporary traffic control signals on fixed supports as specified in the following sections:

- Signs—Sections 931.3, 935.3, 936.3 and 1103.
- Pavement Markings—Section 961.3.
- Support Poles—Section 951.3, and as follows:
 - Install signal poles of wood, galvanized steel, or painted steel. Steel poles may be used in lieu of wood poles at no additional cost to eliminate encroachments on adjacent properties.
 - Provide certification that the signal poles are designed to withstand the anticipated loading.
 - Install the poles to provide transverse and vertical clearance as indicated and as shown on the Standard Drawings.
 - Install tether wire for temporary signal installations that use wood or steel strain poles.
- Controller Assembly—Section 952.3.
- Traffic Signal Systems and Communications—Section 953.3.
- Electrical Distribution—Sections 910.3 and 954.3, and as follows:
 - Establish an electrical service agreement with the appropriate power company to furnish and install electrical service to the signal.
 - Follow all power company procedures and specifications for obtaining the agreement and providing power to the system.
 - Provide any additional materials required to provide electrical service.
- Signal Heads—Section 955.3.

- Detection—Section 956.3, or otherwise indicated.
- Traffic Signals-General—Section 950.3.
- System Testing—Section 950.3.

(c) Temporary Traffic Control Signals On Pedestal-Mounted Portable Traffic Control Signal Systems.

Install portable temporary traffic control signals on pedestal-mounted system according to the manufacturer's recommendations, Publication 213, and as indicated.

(d) Temporary Traffic Control Signals On Trailer-Mounted Portable Traffic Control Signal Systems.

Install portable temporary traffic control signals on trailer-mounted system according to the manufacturer's recommendations, Publication 213, and as indicated.

(e) Temporary Timing Adjustments to Existing Permanent Traffic Signal Controller.

If the Department determines that traffic congestion has worsened at signalized intersections along detour routes, or non-detour routes within close proximity to the construction project, the Department will direct the Contractor to implement temporary timing adjustments at specified, existing signalized intersections.

This work involves timing adjustments only and does not include physical modifications to an existing permanent signal installation. For existing permanent signals that require physical modifications use the requirements as specified in Section 958.3(f). Provide a qualified signal technician to make the following timing adjustments to signalized intersections as directed. This work will be as specified in Sections 950.3, 952.3, 954.3, and as follows:

- Before making any changes, document the existing signal controller settings and verify that they are as indicated on the latest signal permit change. Notify the Inspector-in-Charge if unauthorized signal controller settings have been made.
- Perform signal controller changes - phasing, interval, timing, and coordination settings – as provided, or approved, by the District Traffic Unit. Perform changes within 24 hours of Department notification. This work includes all necessary modifications to the controller cabinet, back panel, and/or cabinet wiring.
- For each affected controller cabinet, keep a record of the existing controller settings and a record of the temporary changes made to the controller cabinet. Keep a copy of the documentation in the project trailer and provide a copy to the District Traffic Unit.
- Upon removal of the detour, or elimination of non-detour route impacts, restore all traffic signals to their current, preconstruction Traffic Signal Permit Conditions, or as directed. Make all restorations in the presence of a representative of the District Traffic Unit.

(f) Temporary Modifications to Existing Permanent Traffic Signal.

Perform physical modifications to existing permanent traffic signals to accommodate geometric or operational changes during construction as required by the Traffic Control Plan. Provide a qualified signal technician to make the required changes to signalized intersections as indicated. This work will be as specified in Sections 950.3, 951.3, 952.3, 953.3, 954.3, 955.3, 956.3, 957.3, and as follows:

- Before making any initial changes, document the existing signal controller settings and verify that they are as indicated on the latest signal permit change. Notify the Inspector-in-Charge if unauthorized signal controller settings have been made.
- Add or modify signal equipment to provide configurations and operation as indicated. This work includes all necessary modifications to supports, signal controller/cabinet, signal heads, detection zones, signing, and timing/phasing, as indicated.
- Perform signal controller changes - phasing, interval, timing, and coordination settings – as indicated, or approved, by the District Traffic Unit. Perform changes within 24 hours of Department notification.
- Perform signal maintenance and repair responsibilities during construction as specified in 950.3(g).
- For each affected controller cabinet, keep a record of the existing controller settings and a record of the temporary changes made to the controller cabinet. Keep a copy of the documentation in the project trailer and provide a copy to the District Traffic Unit.

- Upon completion of all construction-related traffic signal impacts, restore all traffic signals to their current, preconstruction Traffic Signal Permit Conditions, or as directed. Make all restorations in the presence of a representative of the District Traffic Unit.

958.4 MEASUREMENT AND PAYMENT—

- (a) Temporary Traffic Control Signals on Fixed Supports.** Each.
- (b) Temporary Traffic Control Signals on Fixed Supports, Reset.** Each.
- (c) Temporary Traffic Control Signals, Pedestal-Mounted Portable Device.** Each.
- (d) Temporary Traffic Control Signal, Pedestal-Mounted Portable Device, Reset.** Each.
- (e) Temporary Traffic Control Signal, Trailer-Mounted Portable Device.** Each.
- (f) Temporary Traffic Control Signal, Trailer-Mounted Portable Device, Reset.** Each.
- (g) Temporary Timing Adjustments to Existing Permanent Traffic Signal Controller.** Each
- (h) Temporary Modifications to Existing Permanent Traffic Signal.** Each.
- (i) Temporary Modifications to Existing Permanent Traffic Signal, Reset.** Each.

SECTION 960—HOT THERMOPLASTIC PAVEMENT MARKINGS

960.1 DESCRIPTION—This work is the furnishing and installation of hot thermoplastic pavement markings, of the indicated type and color with a surface application of glass beads.

960.2 MATERIAL—

(a) **General.** Provide materials from a source listed in Bulletin 15. Certify materials as specified in Section 106.03(b)3.

(b) **Thermoplastic.** AASHTO M 249. Provide a material listed in Bulletin 15.

(c) **Glass Beads.** Section 1103.14, Type A

1. **Intermix.** Provide sufficient uncoated glass beads to comprise 40% of the marking material by weight.

2. **Surface-applied.** Moisture resistant coated with a maximum of 5% passing the No. 80 sieve and a minimum of 70% rounds per sieve and a minimum of 80% rounds overall.

960.3 CONSTRUCTION—

(a) **General.** For proper adhesion, perform surface preparation of the road surface and provide the pretreatment according to Bulletin 15 or recommended by the manufacturer. Clean the roadway surface where the hot thermoplastic pavement markings will be applied. Remove all surface treatment, laitance, curing compound, or any contaminants that would hinder adhesion. Clear any loose dirt and other debris from the application area. Surface preparation is incidental to the application of hot thermoplastic pavement markings, except for the removal of pavement markings which is performed and paid for under Section 963. Identify the location of the final pavement markings by applying spots on the pavement at 40-foot intervals. The Inspector-in-Charge will approve the locations. Apply on dry pavement when the air and roadway temperatures are between 50F and 90F and when the wind speed is less than 20 miles per hour.

(b) **Application.** Uniformly apply the markings at a minimum thickness of 90 mils \pm 3 mils. A tolerance of \pm 1/4 inch from the specified width will be allowed provided the variation is gradual and does not detract from the general appearance. For skip line patterns maintain a tolerance of \pm 6 inches for each 40-foot cycle and \pm 3 inches for each 10-foot skip line.

(c) **Glass Beads.** Apply glass beads immediately after application of the markings at a minimum rate of 10 pounds per 100 square feet of markings. Uniformly distribute glass beads on the surface. Provide markings with an average minimum initial retroreflectivity of 300 mcd/m²/lux for white and 250 mcd/m²/lux for yellow. Under the direction and supervision of the Representative, measure retroreflectivity with a 30-meter geometry retroreflectometer, conforming to ASTM E 1710 within 21 days after installation in accordance with PTM No. 431.

(d) **Defective Markings.** Remove any markings placed incorrectly and replace them. Repair those markings, which after application and drying, are determined to be defective by the Inspector-in-Charge. Complete this work at no additional cost to the Department. Major problem areas and method of repair include the following:

- Insufficient thickness or line width, uneven cross-section—Prepare defective material by grinding or blast cleaning to remove a substantial amount of beads and the marking surface is roughened. Remove loose particles and debris with compressed air. Restripe the cleaned surface as specified in Sections 960.3(b) and (c).
- Inadequate retroreflectivity, glass bead coverage or retention—Remove defective markings and clean pavement surface, including 1 foot beyond each end of the affected area. Remove loose particles and

debris with compressed air. Restripe the marking on the cleaned surface as specified in Sections 960.3(b) and (c).

(e) **Guarantee.** Where directed, remove and replace material that has not remained within close conformity to location or has not remained effective in performing useful service in accordance with Section 107.16(b) for a period of 180 days from the date of acceptance. The minimum acceptable service is as follows:

- **Longitudinal Markings.** 90% of material remains in each 1,000-foot section of marking where the intersection unit is defined as material on an approach leg within 160 feet of the intersection.
- **Transverse Markings, Legends, and Symbols.** 90% of material remains for each individual legend, symbol, crosswalk, or stop line.

960.4 MEASUREMENT AND PAYMENT—

(a) **Line.** Linear Foot

(b) **Legend.** Each

SECTION 961—COLD PLASTIC PAVEMENT MARKINGS OR LEGENDS

961.1 DESCRIPTION—This work is the furnishing and installation of plastic pavement markings or legends, of the type indicated.

961.2 MATERIAL—ASTM D 4505. When required, provide compatible “adhesive activator” or “primer sealer,” as listed in Bulletin 15 or as recommended by the manufacturer.

961.3 CONSTRUCTION—

(a) **General.** For proper adhesion, perform surface preparation of the road surface and provide the pretreatment according to Bulletin 15 or recommended by the manufacturer. Clean the roadway surface where the cold plastic pavement markings or legends will be applied. Remove all surface treatment, laitance, curing compound, or any contaminants that would hinder adhesion. Clear any loose dirt and other debris from the application area. Use a cleaning method that, as a last operation, provides a dust-free surface over the application area. Surface preparation is incidental to the application of cold plastic pavement markings or legends, except for the removal of pavement markings which is performed and paid for under Section 963. Identify the location of the final pavement markings. The Inspector-in-Charge will approve the locations. Apply on dry pavement when the roadway temperature is greater than or equal to 60F, unless, unless otherwise directed.

Apply according to the manufacturer's instructions.

Provide applicator units, manual or automatic, that are capable of applying two parallel lines simultaneously with a 6-inch space between the lines.

(b) **Retroreflectivity.** Provide markings with an average minimum initial retroreflectivity of 250 mcd/m²/lux for white and 200 mcd/m²/lux for yellow. Under the direction and supervision of the Representative, measure with a 30-meter geometry retroreflectometer conforming to ASTM E 1710 within 21 days after installation in accordance with PTM No. 431.

(c) **Inlaid.** Applied as part of an asphalt resurfacing project. Place the material, with a thickness of 60 mils ± 2 mils to 90 mils ± 3 mils, on the pavement before final compaction and within the temperature range specified by the manufacturer. Roll the material into the new surface to achieve a flush finished surface.

(d) **Surface Applied.** Apply the material with a thickness of 60 mils ± 2 mils, onto the existing, cleaned surface of concrete or asphalt roadways.

(e) **Guarantee.** Where directed, remove or replace material as specified in Section 107.16(b) has not remained within close conformity to location or has not remained effective in performing useful service for a period of 180 days from the date of acceptance. The minimum acceptable service is as follows:

- **Longitudinal Markings.** 90% of material remains in each 1,000-foot section of marking where the intersection unit is defined as material on an approach leg within 160 feet of the intersection.
- **Transverse Markings, Legends, and Symbols.** 90% of material remaining for each individual legend, symbol, crosswalk, or stop line.

961.4 MEASUREMENT AND PAYMENT—

(a) **Line.** Linear Foot

(b) **Plastic Legend.** Each

SECTION 962—WATERBORNE PAVEMENT MARKINGS

962.1 DESCRIPTION—This work is the furnishing and application of waterborne pavement markings, of the type and color indicated.

962.2 MATERIAL—

(a) **General.** Provide materials from a source listed in Bulletin 15. Certify materials as specified in Section 106.03(b)3.

(b) **Paint.** Provide waterborne traffic paints listed in Bulletin 15.

(c) **Glass Beads.** Section 1103.14, furnish Type A glass beads unless otherwise specified.

962.3 CONSTRUCTION—

(a) **General.** At least 5 days before beginning work, provide the Inspector-in-Charge with a schedule of operations. In addition, provide the Inspector-in-Charge with the manufacturer's instruction for the installation of the materials, application temperatures, proper mixing techniques, and any other data to ensure the material is being properly installed.

(b) Equipment.

1. **Line Application.** Use a machine that is:

- Capable of simultaneously applying two parallel lines of the width indicated in solid or broken patterns or various combinations thereof;
- Capable of automatically dispensing glass beads onto the painted surface, at the required application rate, by the pressurized gun method; and
- Equipped with a measuring device, which automatically and continuously measures the length of each line placed, to the nearest foot.

2. **Legend Application.** Include crosswalks, symbols, legends, stop lines, and other miscellaneous items. Do not apply with hand brushes or rollers. Glass beads may be hand-applied.

(c) Application Rates.

1. **Paint.** Dispense at a wet-film thickness of 15 mils \pm 1 mil for all markings, except edge line markings are 12 mils \pm 1 mil.

2. **Glass Beads.** Apply at a rate of 7 pounds per gallon of paint.

3. **Calibration.** Use a machine calibrated as follows:

- **Line Measuring Device .** Calibrate automatic line length gauges to maintain a tolerance of \pm 25 feet per mile.
- **Cycle Length/Line Timer .** Calibrate cycle length in a tolerance of 6 inches per 40 feet; calibrate line length to maintain a tolerance of 3 inches per 10 feet.
- **Bead Guns .** Calibrate to dispense glass beads at the specified rate. Check by dispensing glass

beads into a gallon container for a predetermined fixed period of time. Verify the weight of glass beads.

- **Paint Guns .** Calibrate to simultaneously apply the paint at the uniform rates specified with an allowable tolerance of 1 mil and with an allowable width tolerance of 1/4 inch.

(d) Surface Preparation. Clean the roadway surface where the waterborne pavement markings will be applied. Remove all surface treatment, laitance, curing compound, or any contaminants that would hinder adhesion. Clear any loose dirt and other debris from the area to be painted with compressed air. Surface preparation is incidental to the application of waterborne pavement markings, except for the removal of pavement markings which is performed and paid for under Section 963. Identify the location of the final pavement markings by applying spots on the pavement at 40-foot intervals. The Inspector-in-Charge will approve the locations.

(e) Temperature Restriction. Apply on a dry pavement with minimum ambient and pavement temperatures of 50F and a maximum relative humidity of 80%. Confirm the proper atmospheric and pavement surface conditions with the Inspector-in-Charge.

(f) Protection of Painted Surfaces. Provide protection to allow adequate time for the markings to dry and be track-free from vehicular traffic. Follow the manufacturer's recommendations or use a minimum of 30 minutes. Use barrier cones to protect markings that do not dry in less than 2 minutes on a roadway where traffic is maintained. Repaint marked or damaged areas, as directed.

(g) Centerline Application. Locate and place as indicated and as follows:

Avoid placing markings on longitudinal pavement joints and seams. Where existing centerlines are visible and properly located, apply directly over the existing pattern.

Where centerlines do not exist or existing centerlines are improperly located, apply at the correct location, as determined by the Inspector-in-Charge. Remove the improperly located existing markings, as specified in Section 963.3.

Divide the roadway on two-lane roadways. However, if a portion of the roadway on either or both sides is to be used for parking, then divide the traveled way.

(h) Edgeline Application. Do not place markings on joints or seams between the traveled way and shoulder.

(i) Retroreflectivity. Provide markings with an average minimum initial retroreflectivity of 250 mcd/m²/lux for white and 165 mcd/m²/lux for yellow. Under the direction and supervision of the Representative, measure with a 30-meter geometry retroreflectometer conforming to ASTM E 1710 within 21 days after installation in accordance with PTM No. 431.

(j) Defective Work. Remove and replace any markings placed incorrectly. Repair those markings, which after application and drying, the Inspector-in-Charge determines to be defective. Complete this work at no additional cost to the Department. Major types of defective work and method of repair include the following:

- **Inadequate retroreflectivity, glass bead coverage or retention .** Restripe over defective marking.
- **Insufficient thickness or line width, uneven cross-section, poor adhesion, or delaminating.** Remove defective markings as specified in Section 963.3 and clean pavement surface, including 1 foot beyond each end of the affected area. Remove loose particles and debris with compressed air. Restripe the marking on the cleaned surface as specified in this specification.

(k) Guarantee. Guarantee pavement marking material against failure due to premature wear or poor adhesion resulting from defective materials or method of application in accordance with Section 107.16(b) for a period of 90 days from the date of acceptance.

962.4 MEASUREMENT AND PAYMENT—

(a) Line. Linear Foot

(b) Legend. Each

(c) Pavement Marking Removal. Section 963.4

SECTION 963—PAVEMENT MARKING REMOVAL

963.1 DESCRIPTION—This work is the removal of pavement markings and legends.

963.3 CONSTRUCTION—Remove existing pavement markings, as indicated, immediately before any change in traffic patterns or before the application of final markings. Remove markings that conflict with revised traffic patterns and may confuse motorists. Do not paint over existing lines with black paint.

Remove markings for restriping to the extent that 90% of the material is removed without materially damaging or grooving the pavement surface more than 1/32 inch. For all other marking removal, eliminate the markings to the extent that the marking is not visible to motorists when viewed from a distance of 50 feet. Grinding is acceptable only for the removal of thermoplastic, cold plastic, or epoxy marking materials. Obtain approval from the Representative for the proposed removal method before beginning work.

Vacuum or collect residue, including sand, dust, and marking material, concurrently with the removal operation unless alternate procedure is submitted and accepted. Clean the area to completely remove loose debris. Perform this work only in the area where the markings are to be applied. Do not allow sand, dust, or other residual material, which may interfere with drainage or constitute a traffic hazard, to accumulate. Dispose of all residue in an acceptable manner.

Repair any pavement or surface damage caused during the removal process.

Prevent damage to transverse and longitudinal joint sealers, and repair any damage as specified in Section 513.

963.4 MEASUREMENT AND PAYMENT—

(a) Lines.

1. Linear Foot
2. Square Foot

(b) Legends.

1. Each
2. Square Foot

SECTION 964—EPOXY PAVEMENT MARKINGS

964.1 DESCRIPTION—This work is the furnishing and installation of reflectorized, two-component epoxy resin pavement markings of the color indicated, with glass beads, at the locations indicated.

964.2 MATERIAL—

(a) **General.** Provide materials approved by the Department, from a source listed in Bulletin 15. Certify materials as specified in Section 106.03(b)3.

(b) **Epoxy Resin.** Provide only those epoxy materials listed in Bulletin 15. Do not use polluting solvents or fillers.

1. Color. Furnish white and yellow pavement markings that satisfy the following chromaticity coordinates:

	1		2		3		4	
	x	y	x	y	x	y	x	y
White	0.330	0.370	0.355	0.345	0.310	0.300	0.285	0.325
Yellow	0.515	0.465	0.505	0.430	0.440	0.415	0.420	0.443

Furnish black epoxy that satisfies color chip 37038 of Federal Standard 595B and is equal to the quality of the white epoxy being used.

2. No Track Time. Dry to a no-track condition in 10 minutes or less when tested according to ASTM D 711 at a temperature of 75F ± 2F at a thickness of 20 mils ± 1 mil with glass beads applied at a rate of 20 pounds per gallon of epoxy.

(c) **Glass Beads.** Section 1103.14.

(d) **Black Aggregate.** Furnish with the following gradations:

<u>Sieve Size</u>	<u>Retained (%)</u>
No. 20	17-37
No. 30	45-65
No. 40	14-25

964.3 CONSTRUCTION—

(a) **Equipment.** Provide application equipment with a system capable of:

- Spraying epoxy material mixed in the proper formulation conforming to manufacturer's requirements.
- Applying symbol markings and longitudinal lines with the specified glass bead application.
- Heating Epoxy Part A to satisfy manufacturer's recommendations.
- Heating Epoxy Part B to satisfy manufacturer's recommendations.
- Mixing Part A with Part B according to manufacturer's recommendations.
- Applying glass beads using the double drop method.

Provide an operator for the equipment who is fully knowledgeable of all equipment operations and application techniques. Provide a pressure gauge on each proportioning pump to verify pressures. Position these gauges to be easily visible to the operator of the equipment and the Inspector-in-Charge.

Obtain from the manufacturer of the epoxy material being used, specifications for the proper mix ratios of the epoxy component, proper temperatures, proper mixing techniques, and any other data to ensure that the epoxy material is being properly installed. Furnish this information to the Inspector-in-Charge at least 5 days before beginning work.

(b) Procedures.

1. For proper adhesion, perform surface preparation of the road surface and provide the pretreatment according to Bulletin 15 or recommended by the manufacturer. Clean the roadway surface where the epoxy pavement markings will be applied. Remove all surface treatment, laitance, curing compound, or any contaminants that would hinder adhesion. Clear any loose dirt and other debris from the application area. Surface preparation is incidental to the application of epoxy pavement markings, except for the removal of pavement markings which is performed and paid for under Section 963. Identify the location of the final pavement markings by applying spots on the pavement at 40-foot intervals. The Inspector-in-Charge will approve the locations.

2. Before starting work, furnish four sample plates of each color of materials used. Prepare two plates with and two plates without glass beads or aggregate.

3. Uniformly apply the epoxy markings at a wet thickness of 20 mils \pm 1 mil. A tolerance of 1/4 inch from the indicated width will be allowed provided the variation is gradual and does not detract from the general appearance. For skip line patterns maintain a tolerance of \pm 6 inches for each 40-foot cycle and \pm 3 inches for each 10 foot skip line.

4. Apply glass beads immediately after application of the epoxy markings. Use the double drop method with a minimum rate of 10 pounds per gallon for Type A beads and 10 pounds per gallon for Type B beads for a total minimum of 20 pounds per gallon of epoxy. Uniformly distribute glass beads on the surface. Provide markings with an average minimum initial retroreflectivity of 250 mcd/m²/lux for white and 200 mcd/m²/lux for yellow. Under the direction and supervision of the Representative measure retroreflectivity with a 30-meter geometry retroreflectometer conforming to ASTM E 1710 within 21 days after installation in accordance with PTM No. 431.

5. After the application of epoxy material and glass beads, protect the markings from traffic for a minimum period of 30 minutes or until the epoxy has dried sufficiently to prevent dirt pickup or tracking.

6. Apply black epoxy markings on cement concrete roadways. Place the black markings, flooded with black aggregate, immediately after all white skip line patterns. Use the same line dimensions for both colors.

7. Install epoxy on dry pavement only if the road surface and ambient temperatures are 40F or higher unless otherwise approved by the Inspector-in-Charge and acceptable to the manufacturer.

(c) Defective Markings. Remove and replace any markings placed incorrectly. Repair those markings, which after application and drying, the Inspector-in-Charge determines to be defective. Complete this work at no additional cost to the Department. Major types of defective work and method of repair include the following:

- **Insufficient thickness or line width, uneven cross-section .** Grind or blast clean defective material to remove a substantial amount of beads and to roughen the marking surface. Remove loose particles and debris with compressed air. Restripe the cleaned surface as specified in this specification.
- **Inadequate retroreflectivity, glass bead coverage or retention .** Restripe over defective Marking.
- **Poor Adhesion, Delaminating.** Remove defective markings as specified in Section 963.3 and clean pavement surface, including 1 foot beyond each end of the affected area. Remove loose particles and debris with compressed air. Restripe the marking on the cleaned surface as specified in this specification.

(d) Guarantee. Guarantee 90% of the pavement marking material against failure due premature wear or poor adhesion resulting from defective materials or method of application as specified in Section 107.16(b) for a period of

180 days from the date of acceptance.

The Representative will identify material to be repaired or replaced.

Begin all repair or replacement work within 30 days of notification by the Representative and perform as specified in these specifications.

964.4 MEASUREMENT AND PAYMENT—

(a) **Line.** Linear Foot

(b) **Legend.** Each

SECTION 965—PREFORMED THERMOPLASTIC PAVEMENT MARKINGS

965.1 DESCRIPTION—This work is the furnishing and installation of preformed thermoplastic pavement markings, of the type and color indicated.

965.2 MATERIAL—

(a) **General.** Provide materials from a source listed in Bulletin 15. Certify materials as specified in Section 106.03(b)3.

(b) **Thermoplastic.** AASHTO M 249, Type 1, except that the material is in a preformed state. Provide a material listed in Bulletin 15. Furnish a material with a minimum initial skid resistance of 50 British Pendulum Number (BPN) for all crosswalks, stop lines, legends, or where indicated.

(c) **Glass Beads.** Section 1103.14, Type A.

1. **Intermix.** Provide sufficient uncoated glass beads to comprise 30% of the marking material by weight and have a minimum of 80% rounds overall.

2. **Surface-Applied.** Moisture resistant coated with a maximum of 5% passing the No. 80 sieve and a minimum of 70% rounds per sieve and a minimum of 80% rounds overall.

965.3 CONSTRUCTION—

(a) **General.** At least 5 days before beginning work, provide the Inspector-in-Charge with a schedule of operations. In addition, provide the Inspector-in-Charge with the manufacturer's instructions for the installation of the materials, application temperatures, proper mixing techniques, and any other data to ensure the material is being properly installed.

(b) **Pretreatment.** For proper adhesion, perform surface preparation of the road surface and provide the pretreatment according to Bulletin 15 or recommended by the manufacturer. Clean the roadway surface where the preformed thermoplastic pavement markings will be applied. Remove all surface treatment, laitance, curing compound, or any contaminants that would hinder adhesion. Clear any loose dirt and other debris from the application area. Surface preparation is incidental to the application of preformed thermoplastic pavement markings, except for the removal of pavement markings which is performed and paid for under Section 963. Identify the location of the final pavement markings by applying spots on the pavement at 40-foot intervals. The Inspector-in-Charge will approve the locations. Apply on dry pavement when the air and roadway temperatures are within the manufacturer's recommendations and when the wind speed is less than 20 miles per hours. If recommended by the manufacturer, preheat the surface to remove any moisture.

(c) **Application.** Apply markings, which have a minimum thickness of 125 mils \pm 4 mils. A tolerance of \pm 1/4 inch from the indicated width will be allowed provided the variation is gradual and does not detract from the general appearance. Use a heat gun to fuse the material to the pavement. Heat the material as recommended by the manufacturer.

(d) **Glass Beads.** Surface apply glass beads as recommended by the manufacturer immediately after application of the markings. Uniformly distribute glass beads on the surface. Provide markings with an average minimum initial retroreflectivity of 300 mcd/m²/lux for white and 250 mcd/m²/lux for yellow. Under the direction and supervision of the Representative measure retroreflectivity with a 30-meter geometry retroreflectometer conforming to ASTM E1710 within 21 days after installation in accordance with PTM No. 431.

(e) **Defective Markings.** Remove any markings placed incorrectly and replace them. Repair those markings, which after application and drying, are determined to be defective by the Inspector-in-Charge. Complete this work at no additional cost to the Department. Major problem areas and method of repair include the following:

- Insufficient thickness or line width, uneven cross-section—Prepare defective material by grinding or blast cleaning to remove a substantial amount of beads and the marking surface is roughened. Remove loose particles and debris with compressed air. Restripe the cleaned surface as specified in this specification.
- Inadequate retroreflectivity, glass bead coverage or retention—Remove defective markings and clean pavement surface, including 1 foot beyond each end of the affected area. Remove loose particles and debris with compressed air. Restripe the marking on the cleaned surface as specified in this specification.

(f) **Guarantee.** Where directed, remove and replace material that has not remained within close conformity to location or has not remained effective in performing useful service as specified in Section 107.16(b) for a period of 180 days from the date of acceptance. The minimum acceptable service is as follows:

- **Longitudinal Markings.** 90% of material remains in each 1,000-foot section of marking where the intersection unit is defined as material on an approach leg within 160 feet of the intersection.
- **Transverse Markings, Legends, and Symbols.** 90% of material remains for each individual legend, symbol, crosswalk, or stop line.

965.4 MEASUREMENT AND PAYMENT—

- (a) **Line.** Linear Foot
- (b) **Legend.** Each
- (c) **Decorative Crosswalk.** Square Foot

SECTION 966—SNOWPLOWABLE RAISED PAVEMENT MARKERS

966.1 DESCRIPTION—This work is the furnishing, installation, replacement, and removal of snowplowable, retroreflective, raised pavement markers of the type indicated.

966.2 MATERIAL—

- (a) **General.** Provide materials listed in Bulletin 15. Certify materials as specified in Section 106.03(b)3.
- (b) **Snowplowable Raised Pavement Markers.** ASTM D 4383
- (c) **Adhesive.** Two-component epoxy adhesive that conforms to AASHTO M 237 and is classified as Type IV according to manufacturer's recommendations for bonding the reflectors or holders to the pavement or the reflectors to the holders.
- (d) **Concrete Material.** Section 525.2
- (e) **Asphalt Material.** Section 413.2

966.3 CONSTRUCTION—As shown on the Standard Drawings, recommended by the manufacturer, and as follows:

- (a) **Layout.** Before installing, lay out the pavement marker locations.

Do not place devices on pavement surfaces that show visible evidence of pavement cracking, checking, spalling, or failure of underlying base material. Do not place devices within 4 inches of a pavement joint. During the pre-installation layout, if it is determined that a device would be placed at a point where any of the above conditions exists, relocate it longitudinally to the directed location.

- (b) **Sawing.** Cut the depression in the pavement.

(c) **Installation.** Install within 7 days of making the saw cuts. Before applying the adhesive, vacuum or blow the depression to remove loose material, then clean and dry the depression with compressed air. Apply the adhesive and place the unit into the depression. Be certain that markers are properly seated with the leading edges below the roadway surface or reflectors are placed as shown on the Standard Drawings. Secure in place until adhesive is set.

At the time of installation, be sure that devices are free of dirt, dust, oil, grease, rust, moisture, or any foreign matter that impairs adhesion to the pavement.

Do not apply devices if the pavement surface temperature and the air temperature at the time of application are less than 50F or as recommended by the manufacturer. Do not install markers if the pavement surface is moist or wet.

- (d) **Replacement.** Use the following procedures for the replacement of the holders or reflectors:

- Cut a new depression when required.
- Ensure the attachment area is smooth and clean.
- Apply adhesive and install the new holder or reflector as indicated above.

- (e) **Removal.** Remove and dispose of existing pavement markers before paving or milling operations.

Remove by method that will cause the least damage to pavement structure and is approved by the Department. Satisfactorily repair any pavement damage caused by the removal methods.

When pavement markers are removed from an asphalt pavement, prepare the existing surface voids as specified in Section 413.3(g). Fill voids in pavement with asphalt wearing course or approved equal.

When pavement markers are removed from a cement concrete pavement, clean void areas from all loose and foreign material. Fill voids as specified in Section 525.3 or approved epoxy that is used in the installation of the holders.

(f) Guarantee. Within 30 calendar days of notification, replace defective holders and/or reflectors if any of the following unsatisfactory conditions exist:

- The holder does not remain in place or does not resist deformation for 180 days after acceptance; has not remained in the exact location and alignment as originally placed; is deformed, cracked or otherwise not able to provide useful service; or shows visible signs of bond failure between the holder and the adhesive.
- Reflectors are missing or do not provide full service for a period of 180 days after acceptance.
- Reflectors fail between the date of notification and the replacement date.

966.4 MEASUREMENT AND PAYMENT—

(a) Raised Pavement Marker. Each

Includes removal and disposal of existing pavement markers and filling of pavement voids.

(b) Reflector Replacement. Each

Includes removal and disposal of existing reflectors.

(c) Raised Pavement Marker Removal Without Replacement. Each

As indicated for the existing pavement type. Includes filling of pavement voids.

SECTION 970—REMOVE POST MOUNTED SIGNS, TYPE A

970.1 DESCRIPTION—This work is the removal and disposal of existing signs of the type specified as indicated and directed.

970.3 CONSTRUCTION—Remove and dispose of existing signs and posts, and backfill any holes as specified in Section 206.3(b)4 as indicated and directed.

Remove existing foundations to a minimum depth of 12 inches below the final ground surface, and backfill any holes as specified in Section 206.3(b)4.

970.4 MEASUREMENT AND PAYMENT—Each

SECTION 971—REMOVE POST MOUNTED SIGNS, TYPE B

971.1 DESCRIPTION—This work is the removal of existing signs of the type specified as indicated and directed.

971.3 CONSTRUCTION—Remove existing signs and posts and backfill any holes as specified in Section 206.3(b)4 as indicated and directed.

Do not damage signs during removal. Salvage all aluminum signs, and dispose of other materials. Deliver aluminum signs to the Project Field Office and place in neat piles for pickup by the Department's maintenance forces.

971.4 MEASUREMENT AND PAYMENT—Each

SECTION 972—REMOVE POST MOUNTED SIGNS, TYPE C

972.1 DESCRIPTION—This work is the removal of existing signs of the type specified as indicated and directed.

972.3 CONSTRUCTION—Remove existing signs, posts, and foundations and backfill any holes as specified in Section 206.3(b)4 as indicated and directed.

Do not damage signs during removal. Salvage all aluminum signs, and dispose of other materials. Deliver aluminum signs to the Project Field Office and place in neat piles for pickup by the Department's maintenance forces.

972.4 MEASUREMENT AND PAYMENT—Each

SECTION 973—REMOVE POST MOUNTED SIGNS, TYPE D

973.1 DESCRIPTION—This work is the removal of existing signs of the type specified as indicated and directed.

973.3 CONSTRUCTION—Remove existing signs, supports, mounting brackets, and associated hardware as indicated.

Burn off bolts to 1 inch below concrete surfaces. Patch hole with non-shrink grout.

Salvage all aluminum signs and dispose of other materials. Do not damage signs during removal. Deliver aluminum signs to the Project Field Office and place in neat piles for pickup by the Department's maintenance forces.

973.4 MEASUREMENT AND PAYMENT—Each

SECTION 974—REMOVE POST MOUNTED SIGNS, TYPE E

974.1 DESCRIPTION—This work is the removal and disposal of existing signs of the type specified as indicated and directed.

974.3 CONSTRUCTION—Remove and dispose of existing signs, posts, and associated hardware as indicated and directed.

Remove existing foundations to a minimum depth of 12 inches below the final ground surface, and backfill any holes as specified in Section 206.3(b)4.

974.4 MEASUREMENT AND PAYMENT—Each

SECTION 975—REMOVE POST MOUNTED SIGNS, TYPE F

975.1 DESCRIPTION—This work is the removal of existing signs on existing posts and poles, vertical portion of traffic signal support, luminaire support, or sign structure support, as indicated.

975.3 CONSTRUCTION—Remove existing signs, sign anchor post, associated hardware from existing posts, and vertical portion of the support as indicated.

Salvage and stockpile all signs, support post(s), and cabling; dispose of all other materials. Do not damage signs during removal. If sign finish is damaged during sign removal, repair sign finish according to the manufacturer's recommendation. Deliver signs to the Project Field Office or store outside of right-of-way as indicated. Place in neat piles for Department pickup. When the sign pertains to the operation of the traffic signal, arrange for delivery to the municipality.

When a removed sign is wired into a traffic signal controller assembly, perform work as indicated.

975.4 MEASUREMENT AND PAYMENT—Each.

SECTION 976—REMOVE STRUCTURE MOUNTED SIGNS

976.1 DESCRIPTION—This work is the removal of existing signs mounted on the horizontal portion of existing overhead structures, span wires, and mast arms, as indicated.

976.3 CONSTRUCTION—Remove existing signs and associated hardware from the horizontal portion of overhead structures as indicated.

Salvage and stockpile all signs and cabling; dispose of all other materials. Do not damage signs during removal. If sign finish is damaged during sign removal, repair sign finish according to the manufacturer's recommendation. Deliver signs to the Project Field Office or store outside of right-of-way as indicated. Place in neat piles for Department pickup. When the sign pertains to the operation of the traffic signal, arrange for delivery to the municipality.

When a removed sign is wired into a traffic signal controller assembly, perform work as indicated.

976.4 MEASUREMENT AND PAYMENT— Each

SECTION 1000 STRUCTURES

SECTION 1001—CEMENT CONCRETE STRUCTURES

1001.1 DESCRIPTION—This work is construction of bridges, arches, culverts, and other cement concrete work.

1001.2 MATERIAL—

(a) Cement Concrete. Section 704. Do not use High Early Strength (HES), as specified in Section 704, Table A in bridge decks.

1. Barrier.

1.a Fixed Form Bridge Barrier. Class AA Cement Concrete – Section 704, except use No. 8 coarse aggregate.

1.b. Slip-Formed Bridge Barrier. Class AA Cement Concrete – Section 704, except, use No. 8, No. 67, or No. 57 coarse aggregate. Mixes using No. 8 coarse aggregate must contain No. 57 or No. 67 or both coarse aggregate.

(b) Concrete Curing Material and Admixtures.

- Curing and Protecting Covers—Section 711.1
- Curing Compounds—Section 711.2(a) (white only) and 711.2(c)
- Concrete Admixtures—Section 711.3. Do not use admixtures containing chloride salts in bridge-deck concrete.

(c) Structure Foundation Drains. Section 610.2 and Section 615.2

(d) Nonstaining, Nonshrinking Grout. Use for minor patching of concrete surfaces. Mix one part cement, two parts fine aggregate, and enough water to provide a consistency stiff enough to place by either manual or mechanical tamping. Do not use more than 4 1/2 gallons of water per bag of cement. Mix for 60 seconds, cover to prevent loss of moisture, and allow to stand for 45 minutes. Remix for 60 seconds without further addition of water, then place within 30 minutes after completion of mixing. Use material as follows:

- Cement, Type IP, IS, IL or II—Section 701
- Fine Aggregate, Type A or C—Section 703.1
- Water—Section 720.1

The Contractor may use premixed grout. Obtain from a manufacturer listed in Bulletin 15. Mix according to the manufacturer's instructions. Certify as specified in Section 106.03(b)3.

(e) Nonshrink Grout for Studs, Dowels, and Anchor Bolts. Section 1080.2(c), except use Type C fine aggregate.

The Contractor may use premixed nonshrink grout. Obtain a grout, which passes a No. 8 sieve, from a manufacturer listed in Bulletin 15. Mix according to the manufacturer's instructions. Certify as specified in Section 106.03(b)3.

(f) Asphalt Tack Coat (for Bridge Decks). Section 460.2

(g) Lighting Pole Anchorage. Provide as shown on the Standard Drawings and as follows:

- Anchor Bolts, Nuts, and Washers—Section 1105.02(c)2 (metallic coated)
- Steel Angle—Section 1105.02(a)2
- Conduit—Section 1101.09(b)
- Junction Box—Section 1101.10

(h) Forms.

1. Temporary. Use plywood at least 5/8 inch thick or other accepted material made for form work. For final exposed concrete surfaces, use smooth material, free of knots, holes, bulges, and depressions.

2. Metal Bridge Deck Forms. Use permanent forms, fabricated from steel conforming to ASTM A924/A924M and ASTM A653/A653M (Structural Quality (SQ) excluding Grade 50 Class 3), with a coating designation of G165, and a minimum thickness of 22 gage. Coat fasteners, if used, either by galvanizing according to ASTM A153 or ASTM B633, Thickness Class Fe/Zn 12; or cadmium plating, according to ASTM B766, Class 12.

An alternate form system may be used, if indicated or if accepted in writing by the Chief Bridge Engineer. Submit material details and erection methods of the alternate form system for review and acceptance.

Certify as specified in Section 106.03(b)3.

(i) Other Material.

- Premolded Expansion Joint Filler—Section 705.1
- Closed Cell Neoprene Sponge—Section 1107.02(p)1
- Joint Sealing Material—Section 705.4(b), (c), or (d)
- Waterstops—Section 705.5
- Caulking Compound—Section 705.7
- Reinforcement—Section 1002.2
- Steel Welded Wire Fabric (WWF)—Section 709.3
- Deformed WWF—Section 704.4
- Deformed and Plain Bar Dowels—Section 709.1
- Structural Steel—Section 1105
- Waterproofing—Section 680.2
- Coarse Aggregate, No. 57—Section 703.2
- Conduits and Conduit Protective Coating—Sections 1101.09(b) and (d)
- Selected Borrow Excavation—Structure Backfill, Section 205 and as shown on the Standard Drawings.
- Anchor Bolts—Section 1105.02(c)2

- Asphalt Material, Class RC-250—Section 702
- Geotextiles, Class 1—Section 735
- Polyethylene Sheeting—Section 505.2
- Asphalt Impregnated Paper—Section 727
- Asphalt Cement, PG 64S-22—Section 702
- Epoxy Binder Resin—Bulletin 15 approved epoxy based surface treatment for bridge decks, epoxy binder resin component only.
- Epoxy Bonding Compound—Section 706.1.

(j) Tremie Cement Concrete. Use Class A cement concrete as specified in Section 704, modified as follows:

- Cement Factor (Min.) — 7.0 bags per cubic yard
- Slump—7 inches \pm 1 inch
- Compressive Strength at 7 Days—2,000 pounds per square inch

Provide admixtures that retard concrete set 5 feet above and below the tremie pipe outlet, are compatible with the air entrainment agents, and do not allow excessive segregation of the aggregate.

(k) Concrete Bonding Compound. Section 706

(l) Anti-washout Admixture. Section 711.3(f) from a manufacturer listed in Bulletin 15. Certify as specified in Section 106.03(b)3.

1001.3 CONSTRUCTION—Construct as shown on the Standard Drawings and as follows:

(a) Forms and Centering.

1. General. Support forms so that deflection does not exceed 1/2 inch under plastic concrete. Before using forms, clean them and obtain approval for use. Use forms that are strong and firm; securely braced; tied together, if required, by means of form ties, tight enough to prevent the leakage of mortar; and strong enough to withstand the action of mechanical vibrators, if used.

Remove dirt, chips, sawdust, and other foreign materials before placing concrete. Except for stay-in-place forms, before placing reinforcing steel, thoroughly coat forms with a release agent. Coat forms for exposed surfaces with a nonstaining release agent.

Adequately brace forms. If forms are insufficiently braced or unsatisfactorily built, the work will be halted, either before or during concrete placement, until such defects have been satisfactorily corrected. Chamfer the edges as indicated. Do not leave wood separators in the completed work.

Do not use form support systems that will cause unacceptable overstress or deformation to permanent bridge members.

Use ties that are adjustable in length, to allow tightening of forms. Use ties that leave no metal in the concrete within 1 1/2 inches of the exposed surface. Do not fit ties with lugs, cones, washers, or other devices to act as spreaders within the form, or devices that leave depressions in back of the exposed surface of the concrete. Flat bands may be used, if the bands conform to the following:

- Not less than 3/4 inch wide.
- Not less than 14 gage thick.

- Placed on edge.
- Protected by adequate spreaders to prevent twisting during construction.

Do not use wire ties or thin, narrow, flat bands, except in the construction of endwalls, inlets, and manholes. Where necessary, coat the form ties with a release agent to facilitate removal. Do not damage the concrete on the exposed surface when removing forms and ties. Do not cut ties back from the concrete face.

Before starting construction, obtain acceptance of working drawings required for centering and falsework, as specified in Section 105.02(c). Before placing concrete, obtain acceptance of in-place forms. Camber the centering to compensate for dead-load deflection and settlement of centering. Provide for gradual and uniform lowering.

Where required, drench the inside of forms with water immediately before placing concrete.

2. Metal Bridge Deck Forms (Permanent). When portions of a bridge deck are constructed adjacent to each other and divided by an open or a preformed joint, do not use metal forms in the cantilever area on either side of the joint, except with prior written permission of the Chief Bridge Engineer.

Submit shop drawings of the forms as specified in Section 105.02(d) for review and acceptance. Include the following on the shop drawings:

- Grade of steel.
- Physical and section properties for permanent metal bridge deck form sheets.
- Methods of attachment.
- Locations where the forms are supported by steel beam flanges, subject to tensile stresses.

Prepare the drawings, conforming to the details and design shown on the Standard Drawings.

Before installing forms, submit for acceptance top of beam elevations in tenth points with tables showing beam haunches and deck elevations. For bridge deck replacements, before removing the existing deck, survey existing deck above beams at tenth points to determine deflection. If an asphalt overlay is present, remove before surveying. Tenth point surveys are incidental to the deck placement.

Before welding in a tension zone, make a test installation on a sample of a simulated flange, using the same welding procedure, materials, and fit-up that are to be used in the tension zone. Allow no burn-through of the parts being welded or fusion to the flange. Do not weld to flanges in tension zones. When this welding procedure has been satisfactorily demonstrated, do not deviate from that used in the test during welding in the tension zone.

Perform field cutting of forms, supports, and closures using saws, shears, or other acceptable methods. Do not cut by burning or melting. Make the attachments concrete tight. A fastening system, using a low-velocity, powder-actuated piston tool to attach forms to support angles, may be used. Thoroughly clean and wire brush form metal where galvanized coating has been damaged. Paint with two coats, no color added, according to ASTM A780. Areas of welds and of weld burns need not be touched up. Uncoated edges, resulting from shearing or punching, are acceptable.

(b) Reinforcement.

1. Reinforcement Bars. Section 1002.3. For bridge decks, also comply with the following:

Place bars as indicated. Use reinforcement chairs, spaced not greater than 3 feet apart, to maintain the position of bottom and top bars. Tie down the top bar mat as specified in Section 1002.3(d). Tie the top bar mat to the lower bar mat, forms or form straps, or studs or chairs tied to the lower mat, at sufficient locations to hold the reinforcement in the proper position. Provide beam haunch reinforcement as indicated and as shown on the Standard Drawings.

Use galvanized chairs with ASTM A641, Class 3 coating, or use stainless steel, plastic-coated or epoxy-coated steel chairs. Use chairs with exposed cut-ends coated or turned up.

Place reinforcement so the indicated cover clearance does not deviate from position by more than $\pm 1/4$ inch.

Do not place concrete until the reinforcing placement is accepted.

2. Steel WWF and Deformed WWF. Place as indicated. Lap ends and sides 12 inches. Fasten with annealed iron wire or metal clips.

(c) Weep Holes. Construct holes as indicated or directed. Place geotextiles, Class 1, as specified in Section 212.3. Then place approximately 1/2 cubic yard of No. 57 coarse aggregate within the geotextiles at the inlet end.

(d) Structure Foundation Drains. Construct as indicated. Place within geotextiles, Class 1, as specified in Section 212.3.

(e) Pipes and Conduits. Place pipes and conduits in the structure concrete as indicated, including pipes and conduits supplied by others. Maintain existing pipes and conduits, where indicated. If indicated, wrap pipes with asphalt impregnated paper.

(f) Placing Anchor Bolts and Expansion Plates. Place expansion plates, anchor bolts, pier nosing angles, and other material as indicated. Place anchor bolts as indicated or directed. Inspect and repair galvanizing on the projecting portions of anchor bolts as specified in Section 1105.02(s)2 as soon as practical after the anchor bolts have been set, but not until the surrounding concrete or grout has cured. Coat threads with grease.

If the bridge substructure and superstructure are built under separate contracts, proceed as specified in Section 1050.3(c)4.g.

(g) Placing Lighting Pole Anchorage. Construct the lighting pole anchorages as an integral part of the structure. Where indicated, install anchor bolts, nuts, and washers, as specified in Section 1105.02(c)2, 1 1/4-inch conduit, junction box, drain pipe, steel angles, and the required fittings. Cap the conduit with a cap or plug to prevent entry of foreign material and moisture.

For future lighting, protect the anchor bolts using a painted hardwood block.

(h) Consistency of Concrete at the Time of Placement. Do not add water to concrete in the field, unless authorized in writing by the District Executive. If written authorization is obtained, the quantity of water may be increased by a maximum of 1 gallon per cubic yard not to exceed maximum water cement ratio. Immediately remove free water, soft concrete, or mortar that appears on the surface of the concrete, and correct the cause of this condition.

For bridge decks, do not add water to concrete in the field. Adjustment of slump may be allowed by adding water reducer at the job site if a comprehensive procedure detailed in the QC plan has been submitted and accepted by the DME/DMM for this purpose.

(i) Mixing Conditions. Section 704.1(f)

(j) Proportioning and Mixing Concrete. Section 704

(k) Placing and Finishing Concrete.

1. General Requirements. At least 15 days before the element of work is started, submit, for review and acceptance, a QC Plan showing the methods, sequence, and schedule for placing concrete. Maintain material on hand and in place, if necessary, for curing and protecting the concrete. Before placing foundation concrete, ensure that the bearing area is firm, reasonably dry, and free of water. The Representative will inspect the foundation area for bearing capacity before placement. If directed, drill or drive a bar into the material below the foundation or footing bottom to a depth sufficient to determine the suitability of the material. Place concrete without segregation. Remove and discard any concrete that is segregated, too wet for use, or not of uniform consistency. Do not drop the concrete mixture a distance greater than 5 feet. Do not allow concrete to come in contact with aluminum, unless the aluminum is coated with an accepted coating.

Do not place consecutive batches adjacent to each other at concrete temperatures differing by more than 20F. Do not place concrete upon frozen foundation material, in forms containing frost, around frosted reinforcement, or in pile shells surrounded by ice or frozen earth.

For succeeding batches, place concrete in the forms within 30 minutes. Place concrete in horizontal layers no more than 15 inches in depth. Fill each part of the form by depositing the concrete as close to its final position as possible. Do not work or flow concrete along the forms from the point of deposit. Work the concrete without displacing the reinforcement. Place concrete so that the upper surface of the concrete is at the indicated elevation after it has been struck off and after initial shrinkage has taken place.

Finish exposed concrete surfaces accurately and evenly, free from open and rough areas, and free from depressions and projections. In bridge seats and walls, place concrete to the required elevation. Strike off with a

straightedge and float to the correct elevation. Do not add water or curing agent to the concrete surface to assist in finishing.

Finish bearing areas of substructures, as specified in Section 1001.3(k)9.

In areas where reinforcement extends through a construction joint, do not place concrete adjacent to previously placed concrete until at least 24 hours has elapsed.

2. Use of Vibrating Equipment. Keep sufficient vibration equipment in reserve to guard against a work shutdown, caused by the failure of the equipment in operation.

Use an acceptable mechanical vibrator. Do not attach it to the forms or reinforcement. Use a vibrator capable of transmitting vibration to the concrete with a frequency of not less than 100 impulses per second. Determine the vibrator size by the reinforcement spacing.

When sufficient concrete has been deposited, spade and manipulate it to fill the form. Apply the vibrator to the concrete, at intervals not exceeding 3 feet, immediately after the concrete has been deposited. Move the vibrator throughout the mass, completely working the concrete around the reinforcement and other embedded fixtures, and into the corners and angles of the forms. Correct any reinforcement displacement caused by the vibrator before continuing vibration. Move the vibrator slowly to prevent segregation. Do not use vibrators to spread concrete.

Remove and discard concrete segregated by the vibrating operation. Ensure that the vibrator does not penetrate or disturb partially hardened layers. Reinforcement in freshly placed concrete may be vibrated for short durations to ensure proper reinforcement embedment.

3. Placing Concrete in Water.

3.a General. When the depth of water in the foundation area is less than 1 inch, no adjustments to the specified class of concrete are required. When there is greater than 1 inch of water in the foundation, utilize an anti-washout admixture (AWA) as specified below unless otherwise approved by the DME/DMM based on a case specific justification. If use of the AWA is waived by the Representative, provide concrete with a 2.5 inch maximum slump and add 25% more cement than the quantity specified for the concrete class being used, as specified in Section 704.1(h).

Drilled shafts and caissons are exempt from this requirement. Do not deposit concrete in water having a temperature below 40F.

Utilize a mix design using an AWA to achieve a loss no more than 8.0% as determined by PTM No. 641.

If concrete with an AWA is placed below the frost line no air entrainment is required in the concrete mix design.

When concrete is placed above the frost line, design concrete to have an air content of 6.0%. Accept concrete at point of placement with an air content between 4.5% and 7.5%.

Limit the slump at point of placement to no more than 8.0 inches.

Hold a concrete placement meeting and present details of the placement to the Representative. Do not begin concrete placement until the placement procedures, concrete mix design, inspection procedures, and concrete sampling procedures have been accepted by the Representative.

If the tremie method is selected for placing concrete, submit a concrete placement procedure plan for approval at least 21 calendar days before performing the work, and include the following:

- Concrete mix design.
- Available concrete production capability.
- Availability and capacity of equipment to be used to transfer concrete to the tremie.
- The total volume of concrete to be placed.
- The various placement schemes available.
- Tremie locations.
- Maximum flow distance of concrete.

- Any restrictions to flow, such as reinforcing steel, piles, and internal form bracing.
- The method of sealing the tremies and the emergency restart procedure if the seal is broken.
- An inspection plan detailing sounding locations and the frequency of soundings. Take soundings over the entire placement area on, at least, an hourly basis.
- A concrete sampling and testing plan.

3.b Water Under 2 feet Deep. If placing concrete in water 2 feet deep or less, build the concrete above the water level in one end of the form, then place the concrete on top of the concrete above water, and gradually work ahead so that the smallest possible area of fresh concrete is exposed to the water.

3.c Water Over 2 feet Deep. If concrete is placed in water deeper than 2 feet, place in approximately horizontal layers, in a consolidated mass in its final position, using the tremie method or other acceptable method, and do not disturb after placing. Do not place concrete with bottom-dump buckets.

Use tight forms, constructed to retain concrete under water, and maintain still water within the forms. Regulate the consistency of the concrete to prevent segregation of the material.

Before placing tremie concrete, ensure the foundation area is level, and forms and surfaces are free of mud and silt.

Use a tremie with a smooth interior face; and watertight discharge tube at least 10 inches in diameter, long enough to reach the bottom of the placement, and marked in 1-foot increments. Provide a valve or similar device, including various types of plugs, at the lower end of the discharge tube that closes tightly while the tremie is being charged and lowered into position, and that can be fully opened in the lowered position. Attach tremie tube to a funnel or hopper of at least 1/2-cubic yard capacity to facilitate transfer of concrete to the tremie. Do not use tremie tubes fabricated from aluminum. Furnish at least two tremie tubes to ensure continuous concrete placement. Do not place tremie concrete by pumping directly to the bottom of placement. Place tremie concrete only in the presence of the Representative.

Maneuver the tremie tube by using an accurately controlled crane or hoist that allows free vertical movement of the discharge end of the tube. Keep the concrete level in the tremie tube stable. Maintain the equilibrium level. Keep the discharge end of the tremie tube fully submerged in the freshly deposited concrete. Keep the tremie tube relatively motionless. Do not move the tremie laterally during concrete placement.

Place tremie concrete in one continuous operation. Place concrete at a rate that prevents aggregate segregation and allows flow over the entire placement area. Keep the top surface of concrete as level as possible. Maintain balanced hydrostatic pressures to prevent form failure and movement of water through the plastic concrete.

When the tremie concrete has reached a minimum compressive strength of 2,000 pounds per square inch, proceed with dewatering of forms. Upon completion of dewatering, and in the presence of the Representative, thoroughly inspect the hardened tremie concrete. Remove laitance and other undesirable material by chipping, scraping, or other means that are not detrimental to the sound concrete. Visually inspect tremie slabs 3 feet or less in thickness, and if any areas of the concrete are suspect, drill cores as directed. For slabs greater than 3 feet in thickness, verify concrete integrity by drilling four 2-inch diameter cores, or one 2-inch core for every 100 square feet of slab area, whichever is greater. Drill additional cores as directed. Use a double tube core barrel with a diamond bit to obtain the cores. Do not exceed 5 feet for individual core runs. Drill cores from the top of the tremie slab to within 12 inches of the bottom. Operate drilling equipment at speeds and pressures that ensure satisfactory core recovery. Pull the core at the end of each run. Identify and store to preserve the integrity of the cores. Record the existence of any void areas or other concrete deficiencies. If defective concrete areas or voids are found, fill with pressure grout or Class A cement concrete as directed. Completely fill core holes as specified in Section 1001.3(k)11. Upon completion of the project, dispose of cores in a satisfactory manner.

4. Pumping Concrete.

4.a Concrete Pump and Reduction Device. Provide a concrete pump with a flexible end section at least 10 feet long equipped with a reduction device or combination of devices to provide a steady and continuous discharge. Devices that may be used include, but are not limited to, a combination of 90 degree angles, a tapered reduction hose, a slide gate, a 6-foot diameter loop in rubber hose, or a finger reducer. Pump and waste enough material through the pump to insure that the grout used to prime the pump has been discharged from the system.

4.b Determining QC and Acceptance Testing Location. The location of the QC sampling and acceptance sampling will be determined daily on the first load of concrete and for every 200 cubic yard thereafter, by the following procedure:

- Provide a concrete mixture in conformance with specification requirements in Section 704 for slump, air content, and temperature before placement into the pump.
- Obtain a sample of concrete before placement in the pump and perform slump and air content tests.
- Position the pump into the most severe vertical drop boom configuration, or, when pumping from the same elevation as the placement, at the longest horizontal section configuration that will occur during placement.
- Obtain a sample of concrete at the discharge end of the pump and perform slump and air content tests.
- The air content must conform to the requirements as specified in Section 704.1(c)3.

If the test results for slump and air content taken at the discharge end of the pump are within ± 1.0 inch of the slump and $\pm 1.0\%$ of the air content taken before placement into the pump, QC and acceptance testing may be performed before placement into the pump. If the test results are not within these tolerances, acceptance testing will be performed at the discharge end of the pump.

The Representative may require acceptance testing and QC testing to be performed at the point of placement at any time the quality of the material comes into question.

If more than one pump is utilized during a placement, each pump must comply with the above procedure.

5. Superstructures. When constructing superstructures, place the concrete in one continuous operation, unless otherwise indicated, specified, or directed.

Before constructing spandrel walls, barriers, or other concrete construction placed on concrete slab, T-beam, rigid frame superstructures, or open or closed spandrel arches, relieve the supporting centering of falsework to allow the superstructures to take part of the permanent deflection.

Do not place barriers for concrete rigid frame structures until after completing the backfilling and the embankment adjacent to the structures.

6. Bridge Decks. Follow the procedure as specified below:

6.a Pre-Placement Meeting. At least 2 weeks before concrete deck placement, schedule a deck pre-placement meeting to review the specification, method and sequence of placing deck concrete, quality control testing, and method of protective measures, to control the concrete evaporation rate.

6.b Ambient Conditions During Placement. Place concrete at a concrete temperature between 50F and 80F. Do not proceed with mixing and placement operations if the forecasted ambient temperature is expected to reach 80F within the scheduled placement time or if the evaporation rate will exceed 0.06 pounds per square foot per hour. Unless otherwise authorized in writing by the District Executive, do not start the placement operation unless the ambient air temperature is a minimum of 40F and rising and is predicted to stay above 40F throughout the placement operation. Do not proceed with placement operations if the temperature of the concrete and surfaces to be in contact with concrete differ by more than 22F.

Provide the necessary equipment and determine the evaporation rate before starting deck placement and every hour during the placement. Do not exceed an evaporation rate of 0.06 pounds per square foot per hour.

6.c Finishing Equipment. Have readily available at the bridge deck placement site, remediation equipment and procedures as submitted, accepted, and demonstrated during the dry run before starting the placement. If the evaporation rate in Section 1001.3(k)6.b is exceeded, stop concrete placement until protective measures are taken to reduce the values to an acceptable level.

Fog cure misting is an acceptable method to mitigate an excessive evaporation rate. Use high or low pressure equipment equipped with nozzles that atomize droplets and can keep a large surface damp without causing water deposits.

Apply the fog over the entire placement area behind the finishing operation, not covered by wet burlap when the evaporation rate in Section 1001.3(k)6.b is exceeded. Do not leave concrete exposed for an extended duration.

Place concrete no greater than 5 feet ahead of finishing machine to prevent any premature drying, unless concrete will be finished within 15 minutes.

Use self-propelled, motorized, mechanical finishing equipment capable of applying vibration to the plastic deck surface through the use of a separate attachment from the machine manufacturer or by other approved means. Use a finishing machine capable of forward and reverse movement under positive control. Make provision for raising screeds to clear the surface when traveling in reverse. Submit a sketch to the Inspector-in-Charge, describing the equipment and showing complete details of supports for the equipment. Vibrating screeds may be used, with the written permission of the District Executive. Vibrating screeds are to be power-vibrated and moved by means of a positive, power-operated apparatus, but are not to be a substitute for high-frequency vibrators. Hand-finishing methods will be allowed outside mechanically screeded areas and to a placed bulkhead in cases of power equipment failures. Use strike-off finishing machines or screeds large enough to finish the full width of deck between curbs or between longitudinal construction joints, or between both.

When strike-off finishing machines are used, support the wheels above the pavement surface on temporary rails, supported on non-deflecting forms or other horizontal structural devices. When vibrating air screeds are allowed, provide a temporary rail system that is supported above the concrete deck surface. Support vibrating screeds on temporary pipe guides or on-grade angles. Use adjustable finishing machine supports or vertical supports for screed guides. Fix supports during finishing, at intervals to limit deflection to not more than 1/8 inch in 10 feet. Do not place supports where concrete is to be placed unless allowed in writing by the District Executive. If allowed, use supports that are removable to at least 2 inches below the surface with a minimum disturbance of concrete. Fill voids left upon removal of screed guides and supports with nonstaining, nonshrinking mortar, after the deck concrete has reached its initial set.

6.d Concrete Placement and Finishing. For rigid frame decks, place the concrete from the center of the span toward each leg or abutment simultaneously. Continuously check falsework or supporting beams so the concrete, as placed, meets the lines and grades indicated. Keep wedges and blocking tight during placement of the concrete.

Use a placing sequence as indicated in the contract drawings or as accepted by the Structure Control Engineer.

Unless allowed in writing by the District Executive, do not allow truck mixers, truck agitators, or other heavy motorized equipment on the deck spans in which concrete is being placed.

Provide sufficient materials at the work site, during concrete deck placement, to protect the bridge deck concrete against rain before initial set. If rain begins, stop placement operations and immediately cover the concrete with protective materials.

If it is necessary to stop operations, due to weather or operational conditions, provide full depth bulkheads at the work site, and place them as directed. Remove bulkheads before resuming concrete placement operations.

Obtain acceptance of changes or additions to indicated construction joints, before incorporating into the work.

Adjust the deck openings at expansion joints and at expansion dams at the time concrete is placed to provide the openings indicated at 68F under full dead load.

Do not allow screed or runway supports to bear on the forms, unless direct undersupport is provided to prevent form damage or deflection. Do not discharge concrete near side laps or at midspan of the corrugated sheets, to a depth greater than 10 inches above the top of the forms. Do not discharge concrete in a manner that causes excessive concentrated construction loads.

Place concrete, at a minimum rate of 20 linear feet of deck per hour, in a longitudinal direction, except for reinforced concrete slabs and rigid frames.

Vibrate the concrete to prevent honeycombing and voids, especially at construction joints, expansion joints, valleys, and ends of form sheets. Obtain acceptance of placing sequences, procedures, and mixes before placing concrete.

Repair or replace damaged material.

Conduct final finishing operations immediately behind the finishing machines or screeds from work bridges of rigid construction, not in contact with the surface of the concrete, set on rails, and easily moved. Finish with a 10-foot, long-handled straightedge to achieve a smooth surface. Make one pass of the float if the concrete surface remains open after the finishing machine operations. Do not overfinish concrete. Use of steel trowels and fresno floats are prohibited.

Perform straightedge testing and surface correction as specified in Section 501.3(k)3 while the concrete is workable. After completing the straightedge testing and surface corrections, before the concrete becomes nonplastic, manually texture/tine the surface transversely as specified in Section 501.3(k)4.b. Immediately after texturing/tining operations are completed, perform intermediate curing as specified in Section 1001.3(p)3.c.

When mechanical texturing is indicated, immediately after straightedge testing and surface correction, provide initial texturing with a burlap drag or broom device to produce striations parallel with centerline. Provide a drag that

produces a uniform surface of gritty texture without blemishes, marks, tears and scratches deeper than 1/16 inch. Replace the drag as necessary to produce the desired finish. Water cure as specified in Section 1001.3(p)3.b.2 after the initial texturing operation.

6.e Concrete Curing and Testing. Cure the deck as specified in Section 1001.3(p)3.b.2. Maintain wet burlap application within 15 feet behind the finishing equipment. Minimal marking of the concrete is allowed. Following cure, test the surface again, as specified in Section 501.3(o). If directed to facilitate inspection, remove at least one section of permanent forms, at a location directed, for each span of every bridge in the project. After the deck concrete has been in place for a minimum period of 2 days, test the concrete by sounding with a hammer, where directed. If unsound or unconsolidated areas are found, or full depth cracking is visible, remove the forms as directed for inspection after the concrete has attained adequate strength. The forms need not be replaced. Repair the adjacent metal forms and supports in order to present a neat appearance. Remove or repair unsatisfactory concrete. Provide facilities for the safe and convenient conduct of the inspection.

6.f Mechanical Texturing. Provide mechanical texturing for bridge decks and approach slabs when indicated.

Do not begin grooving operations until directed and live loads can be applied as specified in Section 1001.3(q)2.2c.

Do not begin grooving operations until the surface tolerance has been checked and any high points are removed as specified in Section 501.3(o).

Terminate grooves 12 inches from gutter lines and scuppers.

Terminate grooves within 5 inches, but no closer than 3 inches of bridge joints. Use smaller grooving machine or hand held circular saw with diamond blade and guide to control depth of grooves at skewed joints or low spots missed with larger equipment to provide a uniformly grooved bridge deck where grooves terminate within 5 inches, but no closer than 3 inches of skewed joints.

Do not overlap sawed grooves or leave more than 1 inch of the surface without sawed grooves between passes or where a single pass of the grooving machine cannot be made.

Remove and collect debris and slurry resulting from the grooving operations concurrently with the grooving operations. Surfaces are to be immediately left in a washed and clean condition, free from slurry and debris.

Do not open to traffic until mechanical texturing is complete.

6.f.1 Test Area. Do not begin production grooving operations until the test area is accepted.

- **Transverse Sawed Grooves.** Perform a test pass of the grooving equipment. The test area is the width of a single pass of production grooving equipment by a length of one lane width. Check groove widths, depths and spacing to ensure conformance to requirements specified in Section 1001.3(k)6.f.2.
- **Longitudinal Sawed Grooves.** Perform a test pass of the grooving equipment. The test area is the width of a single pass of production grooving equipment by a length of ten feet longitudinally in one lane. Check groove widths, depths and spacing to ensure conformance to requirements specified in Section 1001.3(k)6.f.3.

6.f.2 Mechanical Texturing with Transverse Sawed Grooves. Texture the deck surface with transverse sawed grooves with the following characteristics:

- Perpendicular with centerline
- Rectangular in shape
- 1/8 inch (\pm 1/32 inch) in width
- 1/8 inch to 3/16 inch in depth
- Random groove pattern of 1.5 inches, 1.75 inches and 2 inches nominal center-to-center sawed groove spacing

6.f.3 Mechanical Texturing with Longitudinal Sawed Grooves. Texture the deck surface with longitudinal sawed grooves with the following characteristics:

- Parallel with centerline

- Rectangular in shape for straight bridge decks, sawed along the curve for curved bridge decks
- 1/8 inch ($\pm 1/32$ inch) in width
- 1/8 inch to 3/16 inch in depth
- 3/4 inch nominal center-to-center sawed groove spacing

7. Reinforced Concrete Arches. Place the concrete symmetrically on each side of the span and progress uniformly from the spring line to the crown.

8. Reinforced Concrete Box Culverts. Place concrete in the base slab with horizontal construction joints formed in the sidewalls as indicated. Form horizontal construction joints to provide keys, as shown on the Standard Drawings.

When the concrete has reached the top of the sidewall, stop the concrete operation for 2 hours to allow for settlement of the wall concrete before placing the top slab.

9. Bearing Areas of Substructures. As indicated, construct concrete bearing areas of substructures upon which neoprene pads, masonry plates, shoes, pedestals, column bases, or other metallic bearing devices are to be placed. Slope areas between and surrounding bearings to drain so no water accumulates or stands at any point. After curing, grind the defined bearing area to the indicated elevations, as necessary, according to the following tolerances:

- Deviation from specified elevations:
 - For steel beam superstructures, ± 0.01 feet, except do not exceed a 0.01 feet difference between specified elevations of bearing areas of adjacent beams measured at the centerline of beams and centerline of bearings.
 - For prestressed concrete beam superstructures, ± 0.02 feet
- Having no projecting irregularities exceeding 1/16 inch
- Variations in flatness:
 - For neoprene pads, $\pm 1/16$ inch
 - For metal bearings and high load multi-rotational bearings:
 - Bearing seats up to 30 inches long, $\pm 1/16$ inch
 - Bearing seats over 30 inches but less than 45 inches long, $\pm 3/32$ inch
 - Bearing seats over 45 inches long, $\pm 1/8$ inch
- Variation in slope between specified elevations for each beam seat:
 - For neoprene pads, 300:1
 - For metal bearing and high load multi-rotational bearings, 200:1

Submit as-built beam seat elevations for review and acceptance. Provide drawings and/or spreadsheets stamped by a professional land surveyor or professional engineer registered in the State. Do not set beams until accepted. For beam seat elevations that do not meet the tolerances above, submit a corrective action plan for review and acceptance. Do not set beams until the corrective action plan is accepted.

When using neoprene pads, provide a bearing surface with a rough texture.

For metal and high-load multi-rotational bearings, fill minor depressions caused by finishing, bush hammering, or grinding with a low-viscosity epoxy applied with a squeegee.

10. Final Finishes.

10.a Conventional Finish. Do not brush or bag finish, or paint with grout or neat cement. After the forms are removed, correct irregularities in the exposed concrete surfaces. Exposed surfaces are surfaces above normal ground level or water level, when applicable, and surfaces that will not be concealed by other construction. Irregularities include fins, protrusions, individual holes larger than 1 inch in any dimension, and clusters of smaller holes.

10.b Tooled Finish. Tool finish surfaces as indicated by cutting into the body of the concrete with a pointed tool or bush hammer until the concrete surface shows a grouping of broken aggregate particles in a matrix of mortar.

10.c Other Finishes. Finish surfaces by other methods as indicated.

11. Patching. Saturate holes with water and, immediately, completely fill the holes with nonstaining, nonshrinking mortar. For holes passing entirely through walls, use a plunger-type caulking gun or other device to force the mortar through the wall starting at the back face. Hold a piece of burlap or canvas over the hole on the front face. Then, when the hole is completely filled, strike off the excess mortar until the mortar is flush with the surface. Completely fill holes not passing entirely through the wall by ramming the mortar in place with a suitable tool. Strike off the excess material until the material is flush with the wall surface.

For minor patching, treat concrete surfaces to be patched with a paint coat mixture of neat cement and water. Tamp mortar into place manually, preferably to at least 1/2 inch depth. When possible, overfill spaces being repaired. Allow the excess to stand for 5 minutes, then strike off and finish without excess troweling. Where the space cannot be overfilled, finish immediately. Cure for at least 3 days using an acceptable method that ensures against loss of moisture by evaporation. When required for all or part of the curing period, hold the mortar in place or support by using an acceptable method that ensures retention of the mortar without its drying out.

12. Concrete Bridge Barriers. Construct barrier as indicated and as shown on the Standard Drawings using either a slip form or conventional fixed forms. Conform to the following finished tolerances for both slip-form and conventional fixed-form methods of bridge barrier construction:

- | | |
|--|---------------------|
| • Bar Reinforcement Cover | ±1/4 inch |
| • Width (Top) | ±1/4 inch |
| • Width (Bottom) | ±1/4 inch |
| • Surface Straightness (Deviation from centerline of individual section of unit) | 1/4 inch in 10 feet |
| • Vertical Profile Alignment (Deviation from a line parallel to the grade line) | 1/4 inch in 10 feet |
| • Alignment with Edge of Bridge Deck | 1/4 inch in 10 feet |

Test surface straightness and vertical alignment along the front face, top, and rear face of the barrier using a 10-foot straightedge. Hold the straightedge in successive positions for the entire length of the barrier and advance in stages of not more than 5 feet.

Cure barrier as specified in Section 1001.3(p).

12.a Fixed Formed Bridge Barriers. For the fixed form method, provide and install formwork as specified in Section 1001.3(a). Drilling or nailing into the bridge deck for the attachment of formwork is not allowed. Place barrier concrete in three lifts with the first lift being 8 inches in height. Ensure vibration and consolidation at gutterlines. Place remaining two lifts equal in height. Extend vibration equipment from second lift into the first and third lift into the second to ensure consolidation within the entire barrier placement.

12.b Slip-Formed Bridge Barriers. If the slip-form method is used, submit a QC Plan at least 15 calendar days before beginning slip-forming. Obtain acceptance of the QC Plan before placing barrier concrete. As a minimum, include in the QC Plan the type of equipment, materials, slump target and range, coarse aggregate source and procedures required for the test section and to construct the barrier. Furnish concrete conforming to the QC Plan.

If the finished tolerances, specified in Section 1001.3(k)12., cannot be maintained during production, stop slip-forming operations, remove the unacceptable work, and modify the operation. If the modifications do not produce acceptable results, as specified in Section 1001.3(k)12., use the fixed-form method of construction, as specified in Section 1001.3(a). The Department will not grant additional compensation or additional time as a result of required removals, modifications, or changes resulting from the method of forming concrete bridge barriers.

12.b.1 Test Section. Construct one 50-foot test section per project to demonstrate that an acceptable product can be produced. Construct this test section at a location near the project site using the same equipment, material, personnel, and procedures as described in the QC Plan. Construct an additional test section if any changes in equipment, material, procedures, or personnel are made. Place the test section on a concrete slab with reinforcing steel to simulate actual conditions. With the District Executive's written approval, the test section may be constructed

in-place, on the bridge structure. The test section will consist of the first 50 feet of the bridge barrier placed. Include in the submission to the District Executive, documentation of past experience constructing slip-form bridge barriers, with contract references

Test concrete as specified in Section 704. In addition, obtain three test cores from the test section, according to PTM No. 1. Submit cores to LTS to be tested for information. Repair tears as directed. Honeycombing, sags, tears, or other evidence of poor quality concrete that cannot be satisfactorily repaired without the use of water or extra concrete or grout, will be cause for rejection of the test section. Test reinforcement cover, in the presence of the Representative, using a Pachometer, or other non-destructive test method.

The Representative will evaluate the procedure, material, equipment, and appearance of the test section. If the test section is rejected by the Representative, place an additional test section, with the approval of the Representative, or use the fixed-form method of construction. Remove and dispose of rejected test sections. Leave the accepted test section in place until the slip-formed bridge barriers are complete. The slip-formed bridge barriers will be compared to the accepted test section to ensure that similar, acceptable quality is being achieved. If the test section was not constructed in place on the bridge structure, remove and dispose of the test section following completion and final acceptance of slip-formed bridge barriers.

12.b.2 Construction of Slip Formed Bridge Barriers. After set up, make a dry run of the equipment to ensure it will clear obstacles to be embedded or flush with surfaces, such as pull boxes, expansion joint plates, and light standard foundations. Ensure that clearances for concrete cover are maintained on reinforcement bars. If modifications are necessary, correct any deficiencies and perform another dry run, in the presence of the Representative, before starting the slip-form operation. At no additional cost to the Department, place additional epoxy-coated reinforcing steel to provide bracing for the barrier against displacement due to the pressure developed by the slip-form extruding process. If applicable, apply a uniform coat of concrete bonding compound as specified in Section 706 and according to the manufacturer's recommendations, to the interface between the hardened concrete bridge deck surface and the slip-formed bridge barrier, before the slip-forming operation. Coordinate operations for mixing, delivering and placing of concrete with minimal stopping and restarting of the slip-form machine and according to the QC Plan. Do not allow vehicular traffic on the bridge while slip-forming operations are in progress, except for slip-form machine and supply trucks. Meet temperature and humidity requirements as specified in Section 1001.3(k)3.

Ensure that the barrier maintains its shape, without support, after extrusion. If honeycombing, sagging, or tearing of the bridge barrier occurs during the slip forming operation, repair according to the approved QC Plan. Ensure that the completed surface is free of honeycombing, sags and tears, and finish with a light vertical brushing.

Mark the bridge deck in advance of the concreting operation to ensure that saw cuts are made at the indicated locations and do not conflict with the reinforcing steel pattern. Space joints as indicated. Accurately locate saw cut joints to ensure the reinforcement steel will have the specified cover. Saw cut as soon as possible after concrete has set sufficiently to preclude raveling during the sawing, and before any shrinkage cracking occurs in the concrete. Saw cut joints, 1/8 inch wide and 3/4 inch deep, in the top, outside, and inside faces. Complete saw cuts 3 inches above the top of the deck slab or pavement surface.

(l) Not used.

(m) Connections of Existing and New Concrete.

1. Terms. The terms “new concrete construction,” “fresh concrete,” and “hardened concrete” refer to work performed under the current contract. “Hardened concrete” has cured for a minimum of 28 days.

The terms “existing concrete structures” and “existing concrete” refer to work performed under a previous contract.

2. General. To connect fresh concrete with hardened or existing concrete, thoroughly clean the connecting surface of laitance and loose and foreign material before applying the Type II (in a non-load bearing joint) or Type V (in a load bearing joint) epoxy bonding compound as specified in Section 706.

Coat contact surfaces with concrete bonding compound at construction joints between fresh concrete and existing concrete. Coat contact surfaces with concrete bonding compounds to connect fresh concrete with hardened concrete at deck construction joints, deck expansion joints, expansion dam block out areas, and where indicated, as specified in Section 1040.3(e). Coat contact surfaces with concrete bonding compound to connect fresh concrete with hardened or existing deck concrete for Slip-Formed Bridge Barriers as specified in Section 1040.3(e) and Section 1001.3(k)12.b.2. Coat surfaces according to the manufacturer’s recommendations. Use of other bonding compound

coatings extends the period after coating between placement pours, but in no case longer than 24 hours (typical), or according to the manufacturer's recommended viability of the coating, whichever is less.

3. Tied Connections. Where indicated, to connect new concrete construction to existing concrete structures, use drill holes of the required depth and diameter in the existing structure to allow placing dowel bars, expansion bolts, or extensions of reinforcement. Furnish and place in the holes, dowel bars, expansion bolts, and reinforcement of the size and type indicated. Grout studs, dowels, and anchor bolts with nonshrink grout or anchor as indicated.

(n) Joints. Rivet or fold-seam the splices of metal waterstops before soldering. Make splices for rubber, plastic and similar waterstops according to the manufacturer's recommendations.

If the construction plane is to be horizontal and concrete placement is stopped for more than 30 minutes, provide acceptable keyways and sufficient dowel bars.

When directed, place vertical construction joints, then place acceptable dowel bars as required.

(o) Not used.

(p) Curing and Protection of Concrete. Begin curing as soon as the concrete has been placed and is sufficiently hardened. Cure concrete as specified in Section 1001.3(p)3.

1. Definitions of Temperatures.

1.a Air Temperature. Section 101.03

1.b Curing Temperature. Curing temperature is the temperature of the air immediately adjacent to concrete. Where concrete is not covered by forms or other protective coverings, or where protective coverings are considered inadequate, the curing temperature will be the air temperature. During cool and cold weather, the curing temperature is the temperature inside the forms, protective coverings, or housings specified in Section 1001.3(p)4 and Section 1001.3(p)5. The curing temperature for the first 24-hour period after placing concrete will be considered as not more than the temperature of the concrete at the time of its placement in the forms.

2. Curing Days, Curing Temperatures, and Records of Temperature. Do not count as a curing day, a day on which the curing temperature drops below 50F at any time during that day, except for flood curing of footings. For bridge decks, during day 1 through day 7, do not count as a curing day, a day on which the curing temperature drops below 50F. During day 8 through day 14, do not count as a curing day, a day on which the curing temperature drops below 40F. If at any time during the curing period, the curing temperature falls below 35F, the Department will consider the work unsatisfactory and will reject it.

Provide high-low thermometers to maintain an accurate daily record of air and curing temperatures during cool and cold weather. In the presence of an Inspector, take curing temperatures on the surface of the concrete, at representative locations on a structure. Submit these temperature records daily to the Inspector-in-Charge.

3. Normal Curing and Protection.

3.a Liquid Membrane-Forming Curing Compound. Utilize a white liquid membrane-forming curing compound. Apply curing compound according to the manufacturer's recommendations and as follows:

For surfaces cured by the liquid membrane-forming curing compound method, finish before application of the curing compound. Apply curing compound in two coats, by spraying, to provide a continuous, uniform membrane. For each coat, apply at least 1 gallon of curing compound per 300 square feet of concrete. After the first application has set, apply the second coat at a direction perpendicular to the first application. Do not apply curing compound to construction joint surfaces. Protect exposed steel during application of curing compound. Water cure these areas, as specified in Section 1001.3(p)3.b. If curing compound is damaged or peels from concrete surfaces, repair immediately.

Protect the curing compound against damage for a minimum of 7 days. Re-apply an additional coat of curing compound to any damaged areas at no additional cost to the Department. Should the curing compound be subjected to continuous damage, the Representative may limit work until the 7-day period is complete. Reduction of the 7-day period will not be allowed under any circumstance.

3.a.1 Formed Surfaces. For formed surfaces, perform water curing during the finishing period and until forms are removed. Apply the first coat of curing compound immediately after stripping forms, and after acceptance

of the concrete finish. If the surface is dry, soak the concrete with water, and apply the curing compound just as the surface film of water disappears. During spray-curing operations, keep unsprayed surfaces wet with water.

3.a.2 Unformed Surfaces. Apply curing compound to unformed surfaces immediately after finishing operations have been completed and after the surface film of water has disappeared. When applying curing compound after water curing to unformed surfaces, apply curing compound onto the surface within 30 minutes of removing the curing covers. Apply curing compound when no free water remains on the surface, but while the surface is still saturated. If the surface is dry or becomes dry, thoroughly wet the surface using a fogger or mister.

3.b Water Curing.

3.b.1 General. Use curing covers of either a double thickness of burlap, white polyethylene sheeting placed on top of a single layer of burlap, or burlap-backed white polyethylene sheeting. Use one type of cover for the duration of curing, unless a change in type is accepted or a combination of covers are accepted. Place curing covers in a manner that minimizes marring of the finished surface. Secure curing covers to prevent lifting or displacement due to adjacent construction operations or wind. Provide a minimum of 2 feet overlap at white polyethylene sheeting edges. Replace any torn or damaged curing covers as directed. If curing covers are temporarily removed for any reason during the curing period, use watering devices to keep the entire exposed area continuously wet. Replace saturated curing covers as soon as possible.

Saturate curing covers before use and keep in a saturated condition for the curing period. Soak burlap for a minimum of 48 hours before placement. Re-wet burlap as needed before placement. During times of delay expected to exceed 10 minutes, cover concrete that has been placed, but not finished, with wet burlap.

As soon as the concrete can support curing covers, place curing covers on the exposed concrete. Minimal marking of the concrete from curing covers is allowed. If the double thickness of burlap method is used, place second layer of burlap so each strip overlaps one-half the width of the preceding layer. Maintain curing covers in a fully wet condition using misting hoses, fogging machines, or other accepted devices until the concrete has sufficiently hardened to support watering devices.

As soon as forms or sections of forms are loosened or removed, cover the exposed concrete surfaces with pre-saturated curing covers, then keep saturated for the remainder of the curing period.

Use a fog-spray, perforated pipe, sprinkler, soaker hose, or other accepted watering devices to keep forms and curing covers saturated during the curing period. For curing and protecting covers on endwalls, inlets, manholes, copings, bridge seats, and similar miscellaneous concrete, keep saturated using an acceptable method. Flood curing of concrete footings will be allowed if the water temperature is 40F or above.

Cure for a minimum of 7 days and until minimum compressive strengths are attained, as specified in Section 704.1(d)4.b, as determined from molded cylinder specimens tested according to PTM No. 604.

3.b.2 Bridge Decks, Bridge Deck Patches, Expansion Dam Blockouts, Cast in Place (CIP) Box Culverts at Grade, and Box Culvert Distribution Slabs at Grade. Provide water curing as specified in Section 1001.3(p)3.b.1 and as follows:

Provide curing water that is a minimum of 50F for the entire water curing period. Use only a double thickness of burlap for curing covers. Apply two layers of wet burlap within 15 feet of strike-off from the finishing machine. Do not allow burlap stacked on a work bridge to drip onto the finished surface. Keep work bridge with stacked burlap over covered surfaces or reverse work bridge over covered surfaces when not placing burlap. Do not allow the surface to dry after strike-off, or at any time during the curing period. Maintain burlap in a fully wet condition using misting hoses, fogging machines, or other accepted devices that span the entire burlap covered surface until the concrete has sufficiently hardened to support foot traffic. At that time, place soaker hoses, sprinklers, or other accepted watering devices to maintain continuous saturation of burlap over the entire surface. At a minimum, place watering devices at grade breaks and high sides of superelevations to ensure continuous saturation.

Water cure for a minimum of 14 days. After 14 curing days, if the 14-day QC compressive strength result is greater than or equal to 3,500 pounds per square inch, water cure may discontinue for the lot of concrete represented by the QC cylinders. If the 14-day QC cylinders are less than 3,500 pounds per square inch, continue water curing until the 28 day minimum mix design strength is obtained, or for a maximum of 28 curing days. At the end of the water curing period, remove the wet burlap. While the surface is still saturated, place white polyethylene sheeting. If dry spots are present, ensure entire surface is saturated before placing white polyethylene sheeting. Keep white polyethylene sheeting in place for 7 days. When cool or cold weather curing and protection is required, leaving the insulation in place for 7 days after water curing instead of placing white polyethylene sheeting is allowed. For bridge deck patches and expansion dam blockouts, 7 day polyethylene sheeting is not required.

3.b.3 Approach Slabs. Section 1001.3(p)3.b.1 except use only a double thickness of burlap for curing covers.

3.c Bridge Deck Intermediate Curing. For manually textured decks in the plastic state or as directed by the Representative, apply an intermediate monomolecular film curing agent after the finishing operation. If directed, apply additional applications to prevent surface drying before placement of curing covers.

Apply the monomolecular film in a light-fog application, using a pressure spray tank with an adjustable nozzle. Use a water-to-curing agent ratio and rate of application, both according to the manufacturer's recommendations. Agitate the solution before each application.

Apply the monomolecular film in a continuous film, immediately after the final finishing operation is completed on any area. Do not perform finishing after application of the curing agent.

After application of the monomolecular film, complete curing using water.

3.d Accelerated Structural Concrete (ASC) Curing. When ASC is indicated, cure using white liquid membrane-forming curing compound as specified in Section 1001.3(p)3.a except apply as many uniform continuous coats of curing compound until the surface is equal in appearance to that of a sheet of white copy paper. The 7 day protection is not required. After application of curing compound, place insulation mats or heated curing blankets until a compressive strength of 3,000 pounds per square inch is attained.

3.e High Early Strength Concrete (HES) Curing. When HES is indicated, water cure as specified in Section 1001.3(p)3.b.1 except use only a double thickness of burlap for curing covers and cure for a minimum of 3 days. If the 3-day QC compressive strength result is greater than or equal to 3,000 pounds per square inch, water cure may discontinue for the lot of concrete represented by the QC cylinders. If the 3-day QC cylinders are less than 3,000 pounds per square inch, continue water curing until the 28 day minimum mix design strength is obtained, or for a maximum of 28 curing days. At the end of the water curing period, remove the wet burlap and apply liquid membrane-forming curing compound as specified in Section 1001.3(p)3.a except the 7 day protection is not required.

4. Cool Weather Curing and Protection. If the forecasted air temperature during concrete curing is expected to drop to 50F but not below 35F, or if concrete is placed at an air temperature below 50F but above 35F, follow the requirements specified for normal curing and protection. In addition, cover burlap with polyethylene sheeting and insulation mats as specified in Section 1001.3(p)7. Keep insulation mats in place during curing as required to maintain curing temperatures. Use heating as required during curing to maintain curing temperatures.

5. Cold Weather Curing and Protection. If the forecasted air temperature is expected to drop to 35F or lower, during concrete curing, or if concrete is to be placed at air temperatures below 35F, follow the requirements specified for normal curing and protection. In addition, cover burlap with polyethylene sheeting and insulation mats as specified in Section 1001.3(p)7. Keep insulation mats in place during curing as required to maintain curing temperatures. Use heating as required during curing to maintain curing temperatures.

If forms are removed before the end of the curing period, provide additional heating or insulation, as required, to maintain the curing temperatures for the remainder of the curing period.

After the concrete has cured for the required length of time, gradually lower its temperature to that of the surrounding air. Do not allow the temperature of the concrete to drop more than 20F in any 24-hour period for the first 3 days after the curing period. Continue to record the air temperature and curing temperature during this 3-day period.

6. Heating During Cool and Cold Weather Placement and Curing. Furnish and place sufficient canvas and frames, or another type of housing to enclose and protect fresh concrete, forms, and to protect concrete during curing. Before placing concrete, furnish necessary fuel and sufficient acceptable heating apparatus; preferably steam-heating equipment.

Keep air surrounding fresh concrete during placement at a temperature above 50F but not more than 80F. Maintain temperature of air surrounding concrete during curing as specified in Section 1001.3(p)2. Keep the concrete covers wet during the curing period. Do not allow the temperature difference between the concrete and surfaces in contact with concrete to exceed 22F during concrete placement and curing.

7. Insulating Mats or Foam Insulation. Insulating mats or foam insulation, as specified in Section 711.1(e) and Section 711.1(f), respectively, may be used to maintain curing temperature.

Apply the mat insulation tightly against the forms. Seal the ends of the mat to exclude air and moisture. Overlap the insulation on previously placed concrete by 1 foot.

When using steel forms, place the insulation tightly against the forms. In addition, insulate the framework of the steel forms, either by the use of the insulating mat material or foam insulation, or by draping polyethylene sheets or tarpaulins over the exposed members, to effectively reduce the heat loss.

Immediately repair tears in the mat liner. Where tie rods extend through the insulated form, place close-fitting washers on the rod against the mat and secure, to provide adequate protection.

Cover the tops of piers, abutments, and similar concrete surfaces with the insulation mat, tightly secured to prevent loss of heat.

For the areas around protruding reinforcement that cannot be protected with the insulation mat, cover with a double thickness of burlap. Cover with enough straw or hay to prevent loss of heat from the concrete during the curing period. In addition, cover insulated areas with tarpaulins.

Do not insulate bridge decks unless the underside is enclosed and preheated before the concrete is placed and the heat is maintained at the specified temperature during the entire curing period.

When foam insulation is used, use a minimum thickness of 1 1/2 inches. The Contractor may use cracked molded foam boards only after repairs are made with an adhesive.

Keep the insulation protection in place for the full curing period, but do not allow the concrete temperature to rise above 160F.

Do not expose fresh concrete to subfreezing temperatures. Provide standby heat, if directed. Failure to properly place the insulation material or failure to maintain the necessary concrete temperature will be cause for the Representative to deny continued use of the material on the project, for curing in cool or cold weather, and require the use of heating, as specified in Section 1001.3(p)6.

(q) Removal of Falsework and Forms and Application of External Loads to Concrete. Except for flood curing of concrete footings, do not count a day during which the curing temperature falls below 50F in the total elapsed days required for removal of falsework or forms or for the application of external loads on concrete.

1. Removal of Falsework and Forms. Keep falsework and forms under arches, box culverts, pier caps, slabs, beams, girders, and brackets in place for 5 days after placing the final portion of the section involved, after which they may be removed provided the concrete has attained a minimum compressive strength as specified in Table A. Determine the minimum compressive strength according to PTM No. 604 or determine the minimum compressive strength by the maturity method according to PTM No. 640. Cure test cylinders according to PTM No. 611.

During normal and cool-weather curing, keep forms for walls, columns, outside faces of pier caps, arches, sides of beams, and other vertical faces not sustaining loads, in place for a minimum of 12 hours after completing placement of concrete. Then, remove forms, provided the concrete has hardened enough to preclude damage resulting from form removal. Barrier forms may be removed in less than 12 hours, provided the concrete has hardened enough to preclude damage from form removal. During cold-weather curing, keep forms in place for a minimum of 5 days. Do not remove deck forms before the end of the water curing period (removal of burlap), unless approved by the Representative.

At construction joints, keep bulkheads in place for a minimum of 12 hours after placing concrete. Then, remove bulkheads provided the concrete has hardened enough to preclude damage resulting from removal of the bulkheads. During cold weather curing, keep bulkheads in place for 48 hours, and keep the concrete moist at all times.

Table A
Minimum Compressive Strength

	Minimum psi
Class AAAP	3,000
Class AAA	3,300
Class AA	2,750
Class A	2,500

2. Application of External Loads to Concrete. Strength determination for all values as specified in Section 1001.3(q)2 will be determined by compressive strength according to PTM No. 604 or maturity method according to PTM No. 640.

2.a Dead Loads. Do not begin work on wall, column, or pier shaft construction until 12 hours after placing footings. For footings on piles, do not begin work until 48 hours after placing footings.

Where falsework for the cap on pier bents is supported on the footings or from the ground, do not begin work on the cap construction until 24 hours after placing the columns.

Where forms are supported on collars attached to the columns, do not begin work on cap construction until 5 days after placing the columns, and the concrete has attained a minimum compressive strength, as specified in Table A.

Construct column- and pier-shaft lifts according to one of the following methods:

Method 1. Where the forms for previous lifts, not including the footing, are left in place and adequately braced, do not place the next higher lift until 24 hours after placing the lift immediately below.

Method 2. Where forms are supported by the concrete in the previous lift, not including the footing, and where other forms and bracing have been removed from the lower lifts, do not place the next higher lift until 5 days after placing the previous lift, and the concrete has attained a minimum compressive strength, as specified in Table A.

Do not place superstructure beams on abutment walls, or solid shaft piers without cantilevers until 3 days after placing the wall or shaft, and the concrete has attained a minimum compressive strength, as specified in Table A.

For all other substructure units, do not place superstructure beams until 5 days after placing the substructure units, and the concrete has attained a minimum compressive strength, as specified in Table A.

2.b Backfilling. Backfill as specified in Section 205 and as shown on the Standard Drawings. Do not backfill or place material adjoining CIP abutment walls, backwalls, retaining walls, box culverts, arches and precast box culvert end sections with closure placements until 7 days after placing last concrete, and then only if concrete has attained the 7-day Minimum Mix Design Compressive Strength as specified in Section 704, Table A.

Maintain symmetrical loading on each side of the span, and progress uniformly in placing embankment and structure backfill adjacent to, and over, arch rings, box culverts, or rigid frame structures, unless otherwise indicated.

2.c Live Loads. Do not allow live loads onto bridge decks or approach slabs until directed and the following minimum criteria are met:

TABLE B
Live Loads - Class AAAP Cement Concrete

Live Load	Min. Duration After Deck Placement	Min. Duration After Barrier Placement	Min. Concrete Compressive Strength (psi)	Additional Requirements
Conveyor Belt Systems	72 Hours	-	-	weight of system is uniformly distributed; operation of system does not damage deck
Truck Mixers, Slip Form Pavers, Truck Agitators, Heavy Equipment, Construction Traffic	7 Days	-	3,250 in Deck	do not exceed 5 mph; no more than one truck on deck at a time in a span or continuous unit for each truck placement occurrence
	-	7 Days	3,000 in Barrier	do not travel within 12 feet of barrier
Barrier or Sidewalk Placement	7 Days	-	3,250 in Deck	-
Power Operated Concrete Buggies	7 Days	-	3,250 in Deck	-
Diamond Grinding and Mechanical Texturing	21 Days	-	3,600 in Deck	-
Opened to Traffic	21 Days	-	3,600 in Deck	min. duration after last deck placement
	-	7 Days	3,000 in Barrier	min. duration after last barrier placement

TABLE C
Live Loads - Bridge Preservation

Live Load	Construction Operation	Min. Duration After Placement			Min. Concrete Compressive Strength (psi)
		AAAP or AA Concrete as noted	ASC	HES Concrete	
Opened to Traffic	Bridge Deck Patching	AAAP, 14 Days	Equal to time to attain min. concrete compressive strength plus time for liquid membrane-forming curing compound to set according to manufacturer's recommendations	*	3,000
	Expansion Dam Blockouts			*	
	Barrier Patching	AA, 7 Days		Equal to 3 days plus time for liquid membrane-forming curing compound to set according to manufacturer's recommendations*	
	Approach Slabs	AAAP, 7 Days			
		AA, 7 Days			

*Do not use HES in bridge decks

(r) Waterproofing. Apply waterproofing as indicated or where directed, as specified in Section 680.3 and as follows:

1. Cracks in Culverts. Where directed, cover minor cracks in culverts by waterproofing them with an accepted sealer. Apply the sealer as recommended by the sealant manufacturer. Seal cracks on backfill sides only.

2. Form Tie Holes. If directed, satisfactorily waterproof form tie holes on the backfill side of the box or arch culverts.

(s) Tack Coat for Bridge Decks. If an asphalt concrete surface is to be placed on the bridge deck, apply an asphalt tack coat on the deck, before placing the asphalt material as specified in Section 460.3.

(t) Bridge Deck, Barrier, and Approach Slab Sealing. For new bridge decks, at a minimum of 28 days after last barrier placement, apply 2 inch by 2 inch strip of epoxy binder resin along base of barrier reveal and deck to seal the gutterlines. Apply 2 inch by 2 inch strip of epoxy resin binder to seal curb gutterlines and barrier sidewalk gutterlines. After gutterlines have been sealed, apply boiled linseed oil as specified in Section 1019.3(a) or penetrating sealer as specified in Section 1019.3(c).2 as indicated to bridge deck and barrier. For new approach slabs, apply boiled linseed oil as specified in Section 1019.3(a) or penetrating sealer as specified in Section 1019.3(c).2 as indicated. If liquid membrane-forming curing compound was used to cure concrete to receive gutterline sealing, boiled linseed oil or penetrating sealer, remove curing compound from the surface by water blasting before sealing. Water blasting equipment must have a minimum rated capacity of 5,000 pounds per square inch.

(u) Defective Work. At no additional cost to the Department, remove and replace concrete that is bulged, uneven, or showing surface defects resulting from the effects of rain, improper finish, improper cure, scaling or honeycombing, which, in the Structure Control Engineer's opinion, cannot be repaired. If directed, remove and replace concrete that has not attained the minimum compressive strength. Repair or replace concrete that exhibits cracks or surface tears, as directed by the Structure Control Engineer. Use a high molecular weight methacrylate penetrating crack sealer, a low viscosity epoxy resin, or other suitable material to repair the surface cracks and tears.

Submit for review, a detailed Quality Control and Action Plan that includes, at a minimum, the proposed crack sealing material data sheet from the manufacture and conditions for use, including ambient and substrate temperature and moisture conditions. Do not perform any crack sealing before the Quality Control and Action Plan has been reviewed by the Representative.

(v) Bridge Approach Slabs. Construct as shown on the Contract Drawings and as specified in Section 505.3.

1001.4 MEASUREMENT AND PAYMENT—

(a) Cement Concrete. Cubic Yard or Lump Sum

As indicated, for the class specified, for the item indicated.

The Department will not make a deduction in measurement for anchor bolts, expansion plates, drainage openings, weep holes, pipes, or conduits if the volume displaced by an installation of opening does not exceed 1/2 cubic yard.

The Department will not deduct the volume of reinforcement bars from the measured volume of concrete.

Where it is impractical to measure concrete in cavities or sink holes, the Department will measure by the volume shown on the certified slips of the delivered batch weights, as recorded by Department representatives assigned to the work.

The cost of concrete cores, taken to examine tremie-placed concrete, is incidental to the other concrete work.

(b) Reinforcement.

1. Reinforcement Bars. Section 1002.4

Dowel bars required for unplanned joints are incidental to other reinforcement.

2. Steel-WWF. Pound

Annealed iron wire, chairs, and ties are incidental to the weight of the steel wire fabric.

3. Deformed WWF. Pound

Annealed iron wire, chairs, and ties are incidental to the weight of the deformed wire fabric.

(c) Structure Foundation Drain. Linear Foot

For the size indicated. Includes outlet protection.
Measurement includes all pipe connections.

(d) Selected Borrow Excavation, Coarse Aggregate, No. 57. Section 205.4

(e) Excavation. Section 204.4
For the class indicated.

(f) Backfill for Excavation Below Indicated Elevation. Cubic Yard
Paid as specified in Section 110.03.

(g) Selected Borrow Excavation, Structure Backfill. Section 205.4

(h) Lighting Pole Anchorage. Each
The price includes anchor bolts, nuts, washers, 1 1/4-inch conduit, junction box, drain pipe, steel angle, and required fittings.

(i) Anti-washout Admixture. Cubic Yard
The price includes only the additional cost associated with the incorporation of AWA into a cubic yard of cement concrete. This associated cost may include material, mix designs, and handling. The actual cement concrete is paid under the lump sum item for the structure or the item for the class of concrete specified.
Section 110.02(d) will not apply to this item.

(j) Mechanical Texturing with Transverse or Longitudinal Sawed Grooves. Square Yard
Measured as the finished grooved area.

(k) Epoxy Binder Resin for Gutterline Sealing. Sealing gutterlines with epoxy binder resin is incidental to the bridge deck and barrier placement.

(l) Boiled Linseed Oil or Penetrating Sealer. Section 1019.4

SECTION 1002—REINFORCEMENT BARS

1002.1 DESCRIPTION—This work is the furnishing and placement of reinforcement bars for cement concrete construction.

1002.2 MATERIAL—

- (a) **Reinforcement Steel.** Reinforcement bars, Section 709.1. As indicated, provide epoxy coating for reinforcement bars as specified in Section 709.1(c). Galvanized reinforcement bars as specified in Section 709.1(e) may be substituted for epoxy-coated reinforcement bars. As indicated, provide stainless steel reinforcement bars as specified in Section 709.1(f).

Uncoated, corrosion-resistant steel reinforcement bars may be substituted for epoxy-coated reinforcement bars as specified in Section 709.1(g). When uncoated, corrosion-resistant steel reinforcement bars are utilized, the Representative will select, for each size of reinforcement bar used, one sample (comprised of three increments, where each increment is collected from separate reinforcement steel bars of the same size and lot). Provide samples 48 inches in length. Immediately package and deliver the samples to the Representative. The Representative will submit the field verification samples (Sample Class FV) to LTS for testing to determine conformance to the specified requirements.

(b) **Other Material.**

- Annealed Iron Wire—ASTM A 684 as described in Section 1002.3(d)1.
- Cement—Section 701
- Water—Section 720.1
- Welding Material—Section 1105.02(t)

(c) **Mechanical Splice System.** From a manufacturer listed in Bulletin 15 and conforming to the following physical requirements:

- | | |
|---|---|
| • Ultimate tensile strength of mechanical splice system | 90% of specified ultimate tensile strength of reinforcement bars, minimum |
| • Allowable slip | See Table A |
| • Yield strength of mechanical splice system | 100% of specified yield strength of reinforcement bars, minimum |
| • Fatigue resistance, allowable slip
(California Test No. 670,
+25 kips per square inch to
-25 kips per square inch for 10,000 cycles) | 0.05 inch, maximum |

Table A	
Reinforcing Bar Number	Total Slip (inch), Maximum
3	0.010

4	0.010
5	0.010
6	0.010
7	0.014
8	0.014
9	0.014
10	0.018
11	0.018
14	0.024
18	0.030

Provide an epoxy-coated mechanical splice system to splice epoxy coated reinforcement bars. Apply a minimum coating thickness of 7 mils to repaired areas but not exceeding the manufacturer's recommendations, and repair according to the following sections of ASTM A 775:

- Scope - Section 1
- Referenced Documents - Section 2
- Terminology - Section 3
- Powder Coating - Section 5.2
- Patching Material - Section 5.4
- Surface Preparation - Section 6
- Coating Application - Section 7
- Coating Thickness Testing - Sections 8.1.3 and 8.1.4
- Coating Adhesion - Section 8.4
- Retests - Section 10
- Repair of Damaged Coating - Sections 11.2, 11.3 and 11.5

Provide a galvanized mechanical splice system to splice galvanized reinforcement bars. Thread reinforcement bar ends before galvanization. Remove all grease, oils, or other contaminants that would adversely affect the bond before galvanization. Galvanize the mechanical splice system according to ASTM A 153 with a minimum thickness of 2 mils or 1.2 ounce per square foot. Tap the splice system oversize according to ASTM A 563, Section 7.4. Chromate according to ASTM A 767, Section 4.3.

Provide a stainless steel mechanical splice system to splice stainless steel reinforcement bars compatible with one of the UNS designations listed in Section 709.1(f) for stainless steel reinforcement bars.

The Representative will select, for each size of reinforcement bar used, four splices, either sample or actual. Three are to be assembled for testing to verify the physical properties and one is to remain unassembled for testing of coating thickness or verification of reinforcement bar strength in case of a failing test result. Assemble samples or actual splices in the presence of the Representative according to the manufacturer's recommendations and Section 1002.3(e). All samples must have a minimum of 30 inches of reinforcement bar extending from each end of the coupler body. Immediately package and deliver the samples to the Representative. The Representative will submit the field verification samples (Sample Class FV) to the LTS for testing and conformance to the specified requirements.

Certify as specified in Section 106.03(b)3.

1002.3 CONSTRUCTION—

(a) General. Provide reinforcement bars free from injurious defects such as cracks and laminations. Provide reinforcement bars free from frost, dirt, oil, grease, paint, mortar, loose rust, mill scale, and other materials that would reduce bond. The Department will not reject reinforcement bars for bonded rust, surface seams, surface irregularities, or mill scale provided the minimum dimensions, cross-sectional area, and tensile properties of a hand wire brushed specimen meet the physical requirements for the size and grade of steel indicated.

Remove loose, scaly, or thick rust. A light powdery coating of rust, formed during project storage, does not require cleaning. The Representative will reject reinforcement bars with rusting that has caused detectable reduction

in cross-sectional area. Obtain the Representative's acceptance of in-place reinforcement bars before concrete is placed. Maintain the reinforcement bars in the correct position.

Verify the compatibility of the bar schedule with the structure plans and details. Make adjustments to the bar schedule, including reinforcement bar details and quantities, and obtain the Representative's acceptance before fabrication. The Department will not grant additional Contract time as a result of adjustments to the bar schedule or to reinforcement bars. With each shipment of reinforcement bars delivered to the project, have the material supplier furnish a bill of lading that provides an itemized listing, as shown on the bar schedule for individual structural units, of all bars in the shipment by quantity, size, length, mark, type, weight, and bending dimensions, as indicated. Include general project identification information as well as any appropriate remarks and plan references (drawing number, description, etc.) on the bill of lading. Submit bills of lading to the Representative to verify and document field quantities and for the Department's project records.

(b) Storage. Section 106.05(d) and as follows:

Store reinforcement bars off the ground on platforms, skids, or other supports, and protect the reinforcement bars from mechanical injury and surface deterioration caused by exposure to conditions producing rust. Keep reinforcement bars free from frost, dirt, oil, grease, paint, mortar, loose rust, mill scale, and other materials that would reduce bond.

Handle and store epoxy-coated reinforcement bars by methods that will not damage the epoxy coating. Furnish all systems for handling epoxy-coated reinforcement bars with adequately padded contact areas if possible. Pad all bundling bands and lift all bundles with a strong back, multiple supports, or platform bridge to prevent bar-to-bar abrasion from sags in the bar bundle. Do not drop or drag bars or bundles. Transport and store epoxy-coated reinforcement bars on wooden or padded supports. For additional storage and handling requirements for epoxy-coated reinforcement bars see Section 1002.3(g)1.

Follow additional storage requirements for stainless steel reinforcement as specified in Section 1002.3(i)3.

Follow additional storage and handling requirement for galvanized reinforcement bars, as specified in Section 1002.3(h)2.

Follow additional storage requirements for uncoated, corrosion-resistant steel reinforcement as specified in Section 1002.3(j)3.

(c) Field Adjustment. Furnish bars with shapes and dimensions, as indicated. Do not field bend except to make minor adjustments when approved by the Representative. If field bending or straightening is required, see Table B. Do not field bend rail or axle steel. Field bend uncoated, corrosion-resistant steel reinforcement bars at ambient temperature and do not bend or straighten bars in a manner that will damage the material. Heating of the uncoated, corrosion-resistant steel reinforcement bars to facilitate bending is not allowed. Cut uncoated, corrosion-resistant steel reinforcement bars by shearing or with a fluid-cooled saw. Torch cutting of uncoated, corrosion-resistant steel reinforcement bars is not allowed.

TABLE B
Bend and Straightening Requirements ^{(1) (2)}

Bar Size	Carbon Equivalent	Bend Temp. F	Straighten Temp. F	Bar Size	Dia. of Former Inches Min.
4 through 7	Unknown	1400-1500	1400-1500	4	3
	0.55 or less and A 706	70-100 or 1400-1500	70-100 or 1400-1500	5	4
				6	5
8	Any	1400-1500	1400-1500	7	6
>8	Bending and straightening not recommended				

⁽¹⁾ Use temperature sticks.

⁽²⁾ Avoid:

- 450F to 600F

- 1800F and greater

Note:

- A. Apply heat to sufficient area to encompass bend area.
- B. Apply heat for sufficient time to bring bar center to required temperature.
- C. Maintain temperature while bending and/or straightening.
- D. Allow free rotation.
- E. Bend with smooth continuous application of force.
- F. Straighten by moving hickey bar (if used) progressively around bend.

(d) Placing and Fastening.

1. General. Accurately place reinforcement bars as indicated and hold it firmly in position during the placing and settling of concrete using metal chairs or acceptable supports. Do not allow bar spacing to vary from the design spacing by more than 1/2 inch. Do not allow the distance from the surface of the formwork to the bars to vary more than 1/4 inch from the design distance. Do not place reinforcement bars closer than 1.5 times the maximum nominal size of the aggregate used in the concrete mix design. Firmly tie bars with annealed iron wire or secure the bars with acceptable metal clips. Tie bars at all perimeter intersections and at all intersections on the top mat of bridge decks and in bridge barriers. For other intersections, when bar spacing is greater than or equal to 12 inches, tie all intersections; when bar spacing is less than 12 inches, either tie all intersections or tie alternate intersections in each direction to provide a staggered tie layout. Tie bundled bars together at not more than 6-foot centers. When reinforcement bars are tied together and lifted into place as a unit, ensure stability of the unit and maintain proper bar alignment during lifting and placement operations.

For epoxy-coated reinforcement bars and galvanized reinforcement bars, provide plastic-coated tie wire, epoxy-coated tie wire, metal clips, or plastic clips.

When tying stainless steel reinforcement bars together, provide tie wire meeting one of the UNS designations as specified in Section 709.1(f) for stainless steel reinforcement bars. When attaching stainless steel reinforcement bars to any other dissimilar metals, provide 1/8 inch thick (minimum) nylon, polyvinylchloride, or polyethylene spacers or sheathing to ensure no contact between the reinforcement bars a minimum of 1 inch extending beyond the point of intersection in all directions. Use nylon or plastic coated wire ties to bind the spacers and/or reinforcement.

When attaching uncoated, corrosion-resistant steel reinforcement bars to other uncoated, corrosion-resistant steel reinforcement bars use nylon or plastic coated wire ties. When uncoated corrosion-resistant steel reinforcement bars are attached to or may come in contact with any dissimilar metals, provide 1/8-inch thick (minimum) nylon, polyvinylchloride, or polyethylene spacers or sheathing to ensure no contact between the reinforcement bars for a minimum of 1 inch extending beyond the point of intersection in all directions. Use nylon or plastic coated wire ties to bind the spacers and/or reinforcement.

If fabric reinforcement is shipped in rolls, straighten it into flat sheets before placing it. Do not weld cross bars (tack weld) for assembly of reinforcement bars unless authorized in writing by the Representative.

2. Support Systems. Support reinforcement bars in its proper position by use of mortar blocks, wire bar supports, supplementary bars, or other devices. Supply such devices of proper height and at sufficiently frequent intervals to maintain the distance between the reinforcement bars and the formed surface or the top surface of deck slabs within 1/4 inch of that indicated.

Support platforms, supporting personnel and equipment during concrete placement, directly on the forms and not on the reinforcement bars.

For uncoated, corrosion-resistant steel reinforcement bars, provide plastic supports as specified in Section 1002.3(d)2.c or steel bar supports as specified in Section 709.1(g). Use corrosion-resistant supports with plastic coated feet above steel beams or metal stay in place forms.

2.a Mortar Block Supports. Furnish mortar blocks of the same class as the concrete in which they are to be embedded. Use either a tie wire or, if the gravitational force of the reinforcement bars is sufficient to firmly hold the blocks in place, a groove in the top of the block. For epoxy-coated reinforcement bars or galvanized reinforcement bars, use plastic-coated or epoxy-coated tie wires. Do not use mortar blocks on vertical surfaces.

2.b Wire Supports. Furnish wire bar supports, such as ferrous metal chairs and bolsters conforming to industry practice as described in the Manual of Standard Practice of the CRSI. Ensure that chairs or bolsters that bear against the forms for exposed surfaces are either Class 1 - Maximum Protection (Plastic Protected) or Class 2, Type B - Moderate Protection (Stainless Steel Tipped) for which the stainless steel conforms to ASTM A 493, Type 430. For epoxy-coated reinforcement bars or galvanized reinforcement bars, provide plastic-coated, epoxy-coated, or galvanized wire bar supports and bar clips. For stainless steel reinforcement bars, provide plastic supports as specified in Section 1002.3(d)2.c or stainless steel bar supports meeting one of the UNS designations as specified in Section 709.1(f) for stainless steel reinforcement bars. Use stainless steel supports with plastic coated feet above steel beams or metal stay in place forms.

2.c Plastic Supports. Use chairs and bolsters that do not deflect more than 1/4 inch under the minimum point load requirement of 350 pounds-force as described in PTM No. 430. Use supports molded in a configuration that does not restrict concrete flow.

3. Adjustments. Adjust reinforcement used in post-tensioned concrete, or relocate it during the installation of prestressing ducts or tendons, as required to provide planned clearances to the prestressing tendons, anchorages, and stressing equipment, as approved by the Representative.

(e) Splicing and Lapping. Furnish all reinforcement in the full lengths, as indicated, unless otherwise allowed by the Representative.

Do not splice bars, except as indicated or directed. If splicing is allowed, lap the reinforcement bars as shown on the Standard Drawings and as indicated, and wire together securely. Do not substitute alternate bars unless allowed by the Representative. Stagger splices as far as possible.

In lapped splices, place and wire the bars maintaining the minimum distance to the surface of the concrete as indicated. Do not use lapped splices for Nos. 14 and 18 bars, except as provided in Articles 5.11.5.2.1 and 5.11.5.5.1 of the AASHTO LRFD Specification.

As indicated, use welded splices or mechanical splice systems. For welded splices, use butt splices only. Stagger welded splices or mechanical splice system connections if possible. Do not weld uncoated, corrosion-resistant steel reinforcement bars.

Only use welded splices if indicated or if the Chief Bridge Engineer gives written authorization to do so. Ensure that welding conforms to the Structural Welding Code, Reinforcing Steel, AWS D1.4.

Do not use welded splices on epoxy-coated reinforcement bars or galvanized reinforcement bars. Do not weld so close to epoxy-coated reinforcement bars to cause any heating of the coating.

Do not use welded splices on uncoated, corrosion-resistant steel reinforcement bars. Do not weld close to uncoated, corrosion-resistant steel reinforcement bars to prevent any heating of those reinforcement bars.

Assemble all mechanical splice systems according to the manufacturer's recommendations. Furnish a copy of the manufacturer's recommendations to the Representative. Mark reinforcing bars with scribe marks or indelible ink before splice attachment to ensure equal embedment.

When epoxy coated or galvanized mechanical splice systems are used, clean, assemble and repair any visible damage to the coating with an acceptable repair material according to the manufacturer's recommendations. For epoxy coated mechanical splice systems, seal off the epoxy coated rebar at the point of entry into the mechanical coupler using an acceptable epoxy repair material.

Use a mechanical splice system manufactured from uncoated, corrosion-resistant steel as specified in Section 709.1(g) to splice uncoated, corrosion-resistant steel reinforcement bars as specified in Section 709.1(g).

Do not encase mechanical splices in concrete until visual examination and required testing have been completed and approved.

(f) Epoxy-Coating Exposed Stirrups. If stirrups in precast bridge elements are not epoxy-coated during fabrication, epoxy-coat the exposed portion of the bars. Wire brush the bars before applying the epoxy coating. If epoxy-coated stirrups are expected to be exposed for more than 6 months, cover with opaque polyethylene, or other suitable material, to prevent ultra-violet damage to the epoxy coating.

(g) Epoxy-Coated Reinforcement Bars. In addition to the above, the following requirements apply if using epoxy-coated reinforcement bars:

1. Storage, Handling, and Placement. Where possible, do not store epoxy-coated reinforcement bars at the jobsite for more than 2 months. If field storage on site is expected to exceed 2 months, cover the epoxy-coated reinforcement bars or bundles with opaque polyethylene or other protective material. Provide ventilation to prevent condensation from forming under the covering.

Store, handle, and place epoxy-coated reinforcement bars at the jobsite according to ASTM D 3963. Inspect the bars before placement. If the epoxy coating is damaged and the damages do not exceed 2% of the surface area in any 1-foot section of the epoxy-coated reinforcement bars, repair all visible damage according to ASTM D 3963 before bar placement. Replace epoxy-coated reinforcement bars if damage to the surface area exceeds 2% in any 1-foot section. Do not apply heat to bend or straighten bars.

After placement, inspect the epoxy-coated reinforcement bars again and repair areas damaged during placement.

2. Welding. Do not weld.

3. Appurtenances. Use plastic-coated or epoxy-coated tie wire. Provide epoxy coated appurtenances with a minimum coating thickness of 5 mils according to CRSI Manual of Standard Practice section 3.2.6. Provide galvanized appurtenances according to ASTM A 123 Table 1 with a coating grade consistent with the measured wire diameter or thickness.

(h) Galvanized Reinforcement Bars. In addition to the above, the following requirements apply if using galvanized reinforcement bars:

1. Fabricate. Fabricate reinforcement bars after galvanization.

2. Storage, Handling, and Placement. Where possible, do not store galvanized reinforcement bars at the jobsite for more than 30 days. Store as specified in Section 1002.3(b) to allow air circulation to prevent the formation of wet storage stain. If field storage is expected to exceed 30 days, cover bars with opaque polyethylene or other protective material.

Provide galvanized reinforcement bars having uniform appearance. Do not use reinforcement bars with visible corrosion deposits, uncoated spots, spikes, or acid, flux or black spots.

During galvanization, use methods that prevent bars from becoming stuck together.

Do not field bend galvanized reinforcement bars except to make minor adjustments when approved by the Representative. Do not apply heat to bend or straighten galvanized reinforcement bars.

Do not place or store galvanized reinforcement bars in contact with uncoated reinforcement bars or other uncoated steel or stainless steel.

Before and after placement, inspect the galvanized reinforcement bars and repair areas damaged during placement according to ASTM A 780 using paints containing at least 92% zinc dust in the dry film to a minimum final coating thickness of 3.1 mils (cured). Prepare damaged areas according to SSPC-SP 11 and feather at least 1 inch of the surrounding undamaged galvanized coating before painting.

3. Welding. Do not weld.

4. Appurtenances. Use plastic-coated or epoxy-coated tie wire. Provide epoxy coated appurtenances with a minimum coating thickness of 5 mils according to CRSI Manual of Standard Practice section 3.2.6. Provide galvanized appurtenances according to ASTM A 123 Table 1 with a coating grade consistent with the measured wire diameter or thickness.

(i) Stainless Steel Reinforcement Bars. In addition to the above, the following requirements apply if using stainless steel reinforcement bars:

1. Fabricate. Where bent bars are indicated, provide plastic, polyvinylchloride, polyethylene or rubber sleeves around bending pins and contact points during the bending operation to prevent contamination.

2. Welding. Do not weld.

3. Storage, Handling, and Placement. Do not band strap or allow direct contact of stainless steel reinforcing bars to non-stainless steel reinforcement bars or other dissimilar metals.

Do not store non-stainless steel reinforcement bars or other dissimilar metals above stainless steel reinforcement bars unless adequate protection has been provided to prevent contamination.

Provide stainless steel reinforcement bars having a uniform appearance. Do not use stainless steel reinforcement bars with visible surface oxidation or corrosion deposits.

Do not field bend except to make minor adjustments when approved by the Representative. When field bending is required, do not permit non-stainless steel bending equipment to come in direct contact with the stainless steel reinforcement.

After placement, inspect the stainless steel reinforcement to ensure the no contact and tying requirements as specified in Section 1002.3(d) have been met.

(j) Uncoated, Corrosion-Resistant Steel Reinforcement Bars. In addition to the above, the following requirements apply if using uncoated, corrosion-resistant steel reinforcement bars:

1. Fabricate. Where bent bars are indicated, provide plastic, polyvinylchloride, polyethylene or rubber sleeves around bending pins and contact points during the bending operation to prevent contamination.

2. Welding. Do not weld.

3. Storage, Handling, and Placement. Do not band strap, or allow direct contact of uncoated, corrosion-resistant steel reinforcing bars to reinforcement bars or other metallic items manufactured from any dissimilar metals.

Do not store uncoated, corrosion-resistant steel reinforcement bars uncovered at the jobsite for more than 2 months. If field storage on site is expected to exceed 2 months, cover the bars or bundles with protective material. Provide ventilation to prevent condensation from forming under the covering.

Do not store uncoated, corrosion-resistant steel reinforcement bars below or in contact with reinforcement bars manufactured from any dissimilar metals unless adequate protection has been provided to prevent contamination.

Provide uncoated, corrosion-resistant steel reinforcement bars having a uniform appearance. Do not use uncoated, corrosion-resistant steel reinforcement bars with visible surface oxidation or corrosion deposits.

Do not field bend except to make minor adjustments when approved by the Representative. When field bending is required, do not permit uncoated, corrosion-resistant steel reinforcement to come in direct contact with bending equipment manufactured from any other dissimilar metals.

After placement, inspect the uncoated, corrosion-resistant steel reinforcement to ensure the no contact and tying requirements as specified in Section 1002.3(d) have been met.

1002.4 MEASUREMENT AND PAYMENT—

(a) Reinforcement Bars. Pound or Lump Sum

As indicated for the type specified.

Galvanized coating weight is incidental to the weight of the reinforcement bar.

Annealed iron wire, chairs, ties, spacers, and sheathing are incidental to the weight of the reinforcement bar.

(b) Mechanical Splice System. Each or Lump Sum

As indicated for the type specified.

Painting the uncoated threads and/or repairing the epoxy coating of the splice area after assembly is incidental, if epoxy-coated reinforcement bars and mechanical splice systems are used.

SECTION 1003—DOWEL HOLES

1003.1 DESCRIPTION—This work is the drilling of holes for dowels and the grouting of the dowels in place.

1003.2 MATERIAL—

- Nonshrink Grout—Section 1001.2(e)

1003.3 CONSTRUCTION—Drill holes for dowels at the locations and to the diameter and depth as indicated. Grout the dowels in place, using nonshrink grout to form a complete bond between the dowels and the concrete. Repair structure damage caused by dowel operations.

1003.4 MEASUREMENT AND PAYMENT—Each

SECTION 1005—PILES

1005.1 DESCRIPTION—This work is the furnishing and driving of new, unused test piles and production piles.

The following definitions apply:

(a) **Test Pile.** A pile driven to verify the capability of the pile hammer, determine driving characteristics, and establish the predetermined pile tip elevation, before driving production piles. Test piles may also be used to perform pile load tests.

(b) **Static Pile Load Test.** A test to determine pile bearing capacity and integrity by the application of a static load.

(c) **Dynamic Pile Load Test.** A test to determine pile bearing capacity and integrity by the application of a dynamic load and measuring the force and velocity response with a high strain dynamic load testing system. A dynamic pile load test may include post-driving analysis.

(d) **High Strain Dynamic Load Testing System.** A portable computer used to determine pile bearing capacity and integrity through instrumentation of the pile with accelerometers and strain gauges during dynamic pile load testing.

(e) **Production Pile.** A pile installed to provide structural support as part of the permanent foundation.

(f) **Point Bearing Pile.** A pile that develops bearing capacity primarily by point-bearing on sound, well-defined bedrock.

(g) **End Bearing Pile.** A pile that develops bearing capacity primarily by embedment of the lower portion in a dense or hard bearing stratum such as soft or decomposed bedrock, or hard or dense soil.

(h) **Friction Pile.** A pile that develops bearing capacity primarily from soil resistance acting along the pile shaft.

(i) **Penetration.** The length of pile driven into a soil or rock stratum.

(j) **Driving Resistance.** The resistance of soil or rock strata to pile driving, measured in blows per length of penetration.

(k) **Estimated Pile Tip Elevation.** The estimated elevation of the pile tip as indicated.

(l) **Predetermined Pile Tip Elevation.** The pile tip elevation determined by the Structure Control Engineer or District Geotechnical Engineer from the test pile(s). The predetermined pile tip elevation locates the intended bearing strata for point bearing or end bearing piles, or establishes the length of friction piles. Predetermined pile tip elevations are used to verify or adjust the estimated pile tip elevations indicated.

(m) **Maximum Allowable Driving Stress.** A driving stress equal to 90% of the yield strength of a steel pile.

(n) **Wave Equation.** An equation developed from wave propagation theory, used to evaluate the integrity and the bearing capacity of piles by simulating motions and forces in a pile if driven with the approved hammer and pile driving equipment.

(o) **Restrike.** A series of hammer blows applied to a driven test or production pile after a specified waiting period to evaluate the pile for setup or relaxation after initial driving.

1005.2 MATERIAL—

(a) Cast-in-Place Concrete Piles with Steel Shells. These piles consist of steel shells equipped with steel end closures or other acceptable designs, reinforced as indicated, then filled with Class A cement concrete after driving.

Provide steel shells and end closures of the type and size indicated, and as follows:

- Having a plain, fluted, or other acceptable wall design.
- Cylindrical, uniformly tapered, step-tapered, or a combination of the shapes.
- Having a nominal diameter not less than 12 inches for cylindrical shells and not less than 12 inches for the butt end of uniformly tapered shells.
- Having a tip diameter of not less than 8 inches for uniformly tapered shells.
- Having a diameter at any section of step-tapered piles not less than 8 inches.
- Of watertight construction.

The wall thickness indicated is the minimum required to satisfy structural design requirements. Increase the thickness, as necessary, to withstand driving without damage or exceeding the maximum allowable driving stress. Provide shells having a wall thickness of 9 gauge (5/32 inch) or thicker; consisting of steel pipe, ASTM A 53, Grade B; ASTM A 500, Grade B or C; ASTM A 501, Grade A or B; ASTM API 5L, Grade B, PSL 1 or PSL 2, X42 or X52; ASTM A 252, Grade 2, or 3; or cold-rolled steel tubing, basic open-hearth steel (AISE C1010 or SAE 1010)) with a minimum yield strength of 50,000 pounds per square inch. The use of ASTM A 252 or AISE C1010 or SAE 1010 is not recommended if splicing will be utilized; a Procedure Qualification Record must be submitted along with a Welding Procedure Specification according to AASHTO/AWS D1.1-2008 to the Structural Control Engineer for acceptance.

Provide each pile preferably in one piece without splices. Obtain the Structure Control Engineer's acceptance of splice location and splicing details if splicing is necessary, and splice piles as specified in Section 1005.3(g).

Provide end closures of forged steel, cast steel, steel plate, or other material as follows: forged steel, AISI 1020; cast steel, ASTM A 148, Grade 80-50 or 90-60. For flat steel plate end closures, provide plates not less than 3/4 inch thick, conforming to AASHTO M 270 (ASTM A 709), Grade 50. Provide end enclosures not extending more than 1/4 inch beyond the surface of the shell, welded to the shell. Attach end closures of the indicated type and size to the piles as indicated. Use the same end closures for test piles that will be used for production piles. Submit details, including method of attaching, to the Structure Control Engineer for acceptance. Weld end closures as specified in Section 1105.03(m) for the type and position of welding required.

Galvanize piles, or portions of piles, as specified in Section 1105.02(s) if indicated. End closures are not required to be galvanized unless indicated.

Submit a certification from the manufacturer of the steel shells, end closures, and splice material as specified in Section 106.03(b)3. Forward these certifications within 3 working days after shipment, together with a copy of the certified report showing the chemical and physical properties of the base metal to the Representative for the project file.

(b) Steel H-Piles. Provide new or stocked (unused) piles, pile sections, and splice material conforming to AASHTO M 270 (ASTM A 709), Grade 50; or ASTM A 572, Grade 50. Provide cast tip reinforcement conforming to ASTM A 148, Grade 80-50 or 90-60, and fabricated tip reinforcement conforming to AASHTO M 270 (ASTM A 709), Grade 50.

Provide each pile preferably in one piece without splices. Obtain the Structure Control Engineer's acceptance of splice location and splicing details if splicing is necessary, and splice piles as specified in Section 1005.3(g).

Attach pile tip reinforcement of the indicated type and size to the piles as indicated. Use the same pile tip reinforcement for test piles that will be used for production piles. Use prefabricated or cast steel tips as an alternate to the indicated tip reinforcement. Submit details, including method of attaching, to the Structure Control Engineer for acceptance. Weld pile tip reinforcement as specified in Section 1105.03(m) for the type and position of welding.

required. Heavy duty pile tips have an area of at least 2.0 times the pile area and steel prongs to penetrate rock.

Galvanize piles, or portions of piles, as specified in Section 1105.02(s) if indicated. Pile tip reinforcement is not required to be galvanized unless indicated.

Submit a certification from the manufacturer of the steel H-piles, pile tip reinforcement and splice material as specified in Section 106.03(b)3. Forward these certifications within 3 working days after shipment, together with a copy of the certified report showing the chemical and physical properties of the base metal to the Representative for the project file.

(c) Other Material.

- Class A Cement Concrete—Section 704, with high-range water-reducing (HRWR) admixture and a slump of 5 inches to 8 inches.
- Reinforcement—Section 709.1.
- Welding—Section 1105.02(t).
- Casing Pipe—Section 1006.2(a).
- Aggregate—Section 703.1 or AASHTO No. 10 as specified in Section 703.2 Table C.

1005.3 CONSTRUCTION—

(a) Equipment. Use pile-driving equipment of an acceptable type, weight, and rated energy. Use an approved pile hammer and pile driving equipment capable of installing the specified pile type in the indicated subsurface conditions to achieve the estimated pile tip elevation and required pile capacity without damage.

1. Hammers. Use diesel, steam, air, or hydraulic actuated pile hammers capable of developing at least 12,000 foot-pounds per blow, unless otherwise allowed. Equip hammers with a suitable drive head or anvil that securely holds the top of the pile in correct position relative to the hammer and that distributes the blows from the ram over the entire top area of the pile. Do not use capblocks or cushions containing asbestos. Inspect the hammer cushion in the presence of the Representative before the start of pile driving, and as requested if damage to the cushion is suspected.

Submit the pile hammer operating specifications and pile information for review and acceptance on Pile Hammer Data Form CS-5 at least 21 calendar days before driving test piles. Do not drive test or production piles before receipt of the Pile Hammer Approval Letter. Acceptance of the pile hammer and driving equipment will not relieve the Contractor of responsibility for properly driving piles, in satisfactory condition, to the driving resistance and tip elevations indicated or directed. The Structure Control Engineer will reject hammers that cause damage or driving stresses greater than the maximum allowable driving stress at any driving resistance.

Equip closed-end diesel hammers with a dial gauge for measuring pressure in the bounce chamber. Provide a hose for the gauge long enough to enable reading at ground level. Calibrate the dial gauge to allow for losses in the gauge hose. Verify the accuracy of the calibrated dial gauge to allow for losses in the gauge hose. Verify the accuracy of the calibrated dial gauge both during driving of the test piles and, as directed, during driving of the production piles. Ensure cylinder lift occurs if the bounce chamber pressure is consistent with the maximum energy given in the hammer specifications. Do not use closed-end diesel hammers that do not attain cylinder lift at the maximum energy bounce chamber relationship given in the hammer specifications.

Measure inlet pressures for double-acting and differential-acting air or steam hammers, using a needle gauge at the head of the hammer if driving test piles and, as directed, if driving bearing piles. As an alternative to periodic measurements with a needle gauge, develop a pressure versus speed calibration for the driving conditions at the site.

Use air compressors that can provide 25% more air than the manufacturer's specified air consumption for air-driven hammers.

Vibratory hammers may be permitted to advance test or production piles but are not acceptable for driving piles to absolute refusal or end of driving criteria. Submit manufacturer data sheets to the Structure Control Engineer for review and acceptance before advancing piles with a vibratory hammer.

2. Leads. Construct pile driver leads to allow free movement of the hammer. Hold the leads in true vertical or inclined positions, as required, by guys or stiff braces to ensure support of the pile during driving. Provide leads of sufficient length so a follower or excessive splices will not be necessary under normal conditions.

3. Predrilling Equipment. Provide predrilling equipment capable of drilling, augering, or boring holes and setting casing for piles to the depths as indicated or directed. Provide necessary equipment to advance through cobbles, boulders, rock, or other natural or manmade obstructions.

(b) Driving Piles.

1. General. Do not drive piles until the excavation is complete in the areas the piles are to occupy, unless otherwise allowed by the Structure Control Engineer. Do not drive piles within 25 feet of uncured concrete.

Use test piles and production piles of the types or sizes indicated. The Department may omit test or production piles. Furnish each steel H-pile or steel shell of the full length indicated and in one continuous unit, unless allowed by the Structure Control Engineer. If a pile is too short for the intended purposes, extend it to the length directed, as specified in Section 1005.3(g).

Lift piles into leads using an acceptable method. Submit a repair procedure for review and acceptance if any section of a pile that has been cut, drilled, or modified to attach a lifting device will be incorporated into the final driven length of pile.

2. Pile Driving Log. A detailed and accurate record will be kept while driving each test and production pile, showing the driving date, model of hammer, capblock material, capblock inspection date, pile numbers, types, sizes, heat numbers, actual lengths before driving, sound lengths after driving, lengths in footings, rebuild lengths, extended lengths, final pay lengths, pile tip elevations and driving resistances for the entire length of the piles driven. The Representative will record the pile driving log on Form CS-1005.

3. Driving Test Piles. Drive test piles in one continuous operation, except for splicing, so they can be incorporated into the permanent work, unless indicated. Drive piles to absolute refusal for point and end bearing piles terminating in bedrock. End of driving criteria will be established for friction piles and end bearing piles terminating in soil, unless indicated or directed. The Structure Control Engineer will verify the capability of the hammer to properly drive the production piles based on driving records of test piles at each substructure unit, at locations indicated or directed.

4. Driving Production Piles. Do not drive production piles until the Structure Control Engineer has established the predetermined pile tip elevation and driving resistance from representative test piles for each substructure unit. Drive production piles for each substructure unit with the same hammer, under the same operating conditions, and with the same type and size of capblock and cushion material used to drive the representative test piles.

Drive piles plumb or to the batter indicated. Drive piles to absolute refusal for piles terminating in bedrock, and end of driving criteria for piles terminating in soil.

Unless indicated, the predetermined pile tip elevation is considered approximate in order to allow for variations in the locations or strength of the stratum from which the pile obtains its primary capacity. The limit of the approximation is established from the test piles.

Redrive piles raised by the driving of adjacent piles to the required driving resistance and tip elevation.

5. Absolute Refusal and End of Driving Criteria.

5.a Absolute Refusal. For steel point bearing and end bearing piles terminating in bedrock, absolute refusal is reached if the driving resistance attains an average of 20 blows per 1 inch, or more in the intended bearing stratum. Minimum blow requirements are as follows:

Case 1. Piles Required to Be Driven to Absolute Refusal into Sound, Well Defined Bedrock (Point Bearing Piles). After the pile tip reaches the predetermined elevation in the intended bearing stratum, and after penetration becomes 1/4 inch or less for five consecutive blows, absolute refusal is reached if the penetration for five additional blows is less than 1/4 inch.

Case 2. Piles Required to Be Driven to Absolute Refusal into Soft or Decomposed Bedrock (End Bearing Piles). After the pile tip reaches the predetermined elevation in the intended bearing stratum, and after the penetration becomes 1/2 inch or less for ten consecutive blows, absolute refusal is reached if the penetration for ten additional blows is 1/2 inch or less. After the pile tip enters the intended bearing stratum, if an unreasonably large number of blows is required to increase the driving resistance from 10 blows per 1 inch to 20 blows per 1 inch, the Structure Control Engineer may waive the requirement for driving to absolute refusal.

The Structure Control Engineer will determine the acceptability of piles that do not achieve absolute refusal and capacity at the predetermined pile tip elevation for piles intended to bear in soft or decomposed bedrock. If piles are determined unacceptable, continue driving piles to Case 2 Absolute Refusal to ensure absolute refusal is obtained. The Structure Control Engineer will contact the BDTD to revise the Pile Hammer Approval Letter for differing site conditions if the continued driving exceeds the criteria provided.

Case 3. Piles Which Attain Absolute Refusal Above Predetermined Pile Tip Elevations. If hard driving is encountered because of dense strata or because of obstructions located above the bearing stratum identified by a predetermined pile tip elevation, absolute refusal is not reached until the Structure Control Engineer determines the total number of blows, as the average driving resistance specified for absolute refusal, indicates further driving will not advance the pile through the dense strata or obstructions. The Structure Control Engineer will verify the driven pile tip elevation is at or below the minimum embedment length indicated.

The Structure Control Engineer will contact the District Bridge Unit to determine the acceptability of piles that attain absolute refusal above the predetermined pile tip elevation. If piles are determined to be unacceptable, drive one or more production piles at locations directed. If the additional piles also fail to reach the predetermined pile tip elevation, and if directed, drive additional test piles to determine whether the predetermined pile tip elevation may have to be adjusted. Perform test borings and pile load tests, if directed. Perform augering, predrilling, spudding, preexcavation, or jetting, if directed. The Structure Control Engineer will contact the BDTD to revise the Pile Hammer Approval Letter for differing site conditions if necessary.

If production piles attain absolute refusal above the predetermined pile tip elevation due to freezing resulting from discontinuous driving, the Structure Control Engineer will reject the piles.

5.b End of Driving Criteria. For end bearing and friction piles terminating in soil, end of driving criteria is reached if the required capacity is attained, and the pile tip reaches the predetermined elevation in the intended bearing stratum. Dynamic pile load testing will be performed on the test piles to establish the end of driving criteria (i.e. hammer stroke, required driving resistance, pile tip elevation, and blow count) The Structure Control Engineer will set the required driving resistance in units of blows per inch or blows per foot based on the test piles, and establish end of driving criteria as follows:

Case 4. Piles Required to Be Driven to Hard or Dense Soil Strata (End Bearing Piles). After the pile tip reaches the predetermined elevation in the intended bearing stratum, end of driving criteria is reached if the driving resistance meets the minimum number of blows per inch established from the test piles.

Case 5. Piles Required to Be Driven to Loose or Soft Soil Strata (Friction Piles). After the pile tip reaches the predetermined elevation in the intended bearing stratum, end of driving criteria is reached if the driving resistance meets the minimum number of blows per inch or blows per foot established from the test piles. If the piles do not reach the required resistance at the predetermined pile tip elevation (or after restrike, if restrike is specified), contact the Structure Control Engineer for guidance. If the required resistance is not attained within an additional 10 feet of driving depth, the Structure Control Engineer is to contact BDTD to review

geotechnical information and recommend further actions.

Case 6. Piles Which Attain End of Driving Criteria Above Predetermined Pile Tip Elevations. If hard driving is encountered because of dense strata or because of obstructions located above the bearing stratum identified by a predetermined pile tip elevation, end of driving criteria is not reached until the Structure Control Engineer determines the total number of blows, as the average driving resistance specified, indicates further driving will not advance the pile through the dense strata or obstructions. The Structure Control Engineer will verify the driven pile tip elevation is at or below the minimum embedment length indicated. If piles reach the required driving resistance above the predetermined pile tip elevation due to freezing resulting from discontinuous driving, the Structure Control Engineer will reject the piles.

5.c Bearing Value of Piles. If piles are not required to be driven to absolute refusal or end of driving criteria, the Structure Control Engineer will determine driving resistances, tip elevations, and safe bearing values from pile load tests or wave equation analysis of the test pile-driving results. A maximum permissible driving stress of 90% of the steel yield should be used for predicting pile capacity using wave equation and dynamic pile load tests.

1. Static Pile Load Test: The product of a resistance factor of 0.8 times the static pile load test result is greater than or equal to the plan factored axial resistance as indicated.

2. Dynamic Pile Load Test: The product of a resistance factor of 0.65 times the ultimate pile capacity as established by dynamic pile load test is greater than or equal to the plan factored axial resistance as indicated.

3. Wave Equation: The product of a resistance factor of 0.5 times the wave equation predicted ultimate pile capacity result is greater than or equal of the plan factored axial resistance as indicated.

6. Jetting Piles. Jet piles, if directed. Do not jet through embankment areas. Use enough jets and enough volume and pressure of water at the jet nozzles to erode the material adjacent to and below the pile joint. Withdraw jets before the predetermined pile tip elevation is reached.

7. Driving Piles through Embankments. Driving piles through embankments or constructing embankments around driven piles can induce additional loading on the piles due to settlement of the fill. Do not drive piles through quarantined embankments until after the quarantine has been lifted, unless indicated or directed. Do not modify the proposed construction sequence or construction details such as casing, pile sleeves or coatings, pile windows, etc. for piles in embankments without prior approval from the District Geotechnical Engineer. As indicated or directed, spud, auger, or predrill through the embankment material to the original ground.

8. Damaged Piles. Acceptance of a hammer relative to driving stress damage will not relieve the Contractor of responsibility for piles damaged because of misalignment of the leads, failure of capblock or cushion material, failure of splices, malfunctioning of the hammer, or other improper construction methods. The Structure Control Engineer will reject piles damaged for these reasons, if it is determined the damage impairs the strength of the completed piles. Remove piles showing damage due to improper driving if the pile cannot be rebuilt or extended. Backfill the resulting hole if it interferes with other construction. Drive another pile as close as possible to the required location within the indicated distance from the edges of the footing. Fill damaged steel shells left in place with concrete.

(c) Restriking. Restriking of test or production piles may be indicated based on the anticipated subsurface conditions or directed based on the initial driving of the piles.

- 1. Restriking Test Piles.** If indicated, restrike the test piles a minimum of 3 days after initial driving at each substructure unit to evaluate pile relaxation or set-up, unless a longer waiting period is indicated. Do not restrike before pile load test reports for the original test pile driving, including supplemental analyses, are submitted to the Structure Control Engineer.

Before restriking test piles, warm up the hammer by striking a minimum of 20 blows of the hammer on a production pile located as far as practical from test pile(s) to be restruck.

Restrike each test pile until the ultimate pile resistance obtained from dynamic testing data is greater than design load requirements.

Maintain driving records and perform dynamic pile load testing during the restriking of the test piles if indicated or directed for the initial drive. Record dynamic data on the first restrike and other blows as approved. Submit data and reports as specified in Section 1005.3(h)2 using the restrike data.

2. **Restriking Production Piles.** Based on the results of the test pile restrike, the Structure Control Engineer will determine the need for restriking production piles. Perform restriking of production piles to termination criteria provided, if directed.

(d) Tolerances. The Structure Control Engineer will reject piles driven outside of the following tolerances:

1. **Deviation from Vertical or Batter Indicated.** No greater than 2 inches in 10 feet or 1 degree from vertical or batter indicated for all structure types.

2. **Rotation of the Horizontal Axis of the Pile.** No greater than 15 degrees from the orientation indicated for Integral Abutments, Abutments on Mechanically Stabilized Earth (MSE) Walls, or piles extending above ground for open bent construction. No greater than 30 degrees from the orientation indicated for all other structure types.

3. **Location of the Butt End (Top) of the Pile.** No greater than 2 inches in any direction from the indicated position for Integral Abutments, Abutments on MSE Walls, or piles extending above ground for open bent construction. No greater than 6 inches in any direction from the position indicated for all other structure types. Extend the footing or pile cap as directed to enclose piles that are driven closer to the edges of footings than indicated. Extend far enough to obtain the indicated encasement. Add additional reinforcement, as directed.

(e) Cutting Off Piles. After piles have been driven and accepted, cut them off at the indicated top elevations, perpendicular to their axis, unless otherwise directed. Provide watertight covers for steel shells which have not been filled with concrete.

(f) Filling Shells with Concrete. Thoroughly clean driven shells of water and debris and inspect driven steel shells using a safe light attached to a cord long enough to reach the entire pile length and obtain the Structure Control Engineer's acceptance before placing concrete in them. Place reinforcement as specified in Section 1001.3(b) and as indicated. Place and cure Class A cement concrete as specified in the applicable parts of Section 1001.3. Drop the concrete into the shells slowly without forming air pockets. Discharge concrete through hoppers with a short pipe centered on the shell for piles without rebar cages. Do not allow concrete to freefall within the length of the rebar cage. Vibrate concrete within the rebar cage.

(g) Splicing, Rebuilding and Extending Piles. Splice, rebuild or extend test and production piles as necessary during the driving operation with approval of the Structure Control Engineer. Use extensions between the tip and butt end not less than 10 feet long. At the butt ends, use extensions at least 5 feet in length for approximately 75% of the piles in a substructure unit. At the tip ends, use extensions at least 5 feet in length. If piles extend above ground for open bent construction, do not rebuild or splice between the cutoff elevation and a point 10 feet below finished grade, unless indicated or directed.

If splicing is anticipated, submit weld procedure specifications for steel H-piles on PennDOT Form TR-52 and for steel shells on PennDOT Form TR-50 to the Structure Control Engineer at least 14 calendar days before the start of driving. Provide copies of current welder certification cards to the Representative before splicing.

Weld splices, pile tip reinforcement, or metal end-closures as shown on the Standard Drawings and as specified in Section 1105.03(m) for the type and position of the welding required.

Provide splices for steel H-piles that fully develop the yield strength of the pile.

Provide splices developing the yield strength of steel shells based on the indicated shell thickness. If the shell thickness exceeds the indicated thickness, base the splice strength on the indicated shell thickness, unless a stronger

splice is needed to resist driving forces.

Do not splice pile reinforcement, unless allowed in writing by the District Executive.

(h) Pile Load Tests.

1. **Static Pile Load Tests.** If static pile load tests are required, the contract documents will specify the detailed requirements.
2. **Dynamic Pile Load Tests.** Conduct dynamic testing on the specified pile(s) at each substructure as indicated or as directed. Conduct dynamic testing during the entire length of piles driven and during the time piles are restruck, if restrike is indicated. The purpose of dynamic testing is to provide the Department with supplemental information for evaluating pile hammer performance, driving stresses, potential pile damage and bearing capacities.

Provide dynamic pile load testing with equipment and accessories conforming to ASTM D4945. The same hammer and equipment must be used for the dynamic pile load testing on the test piles or production piles or both.

2.a Qualifications. Submit qualifications for acceptance. Do not begin dynamic testing until qualifications are accepted. Perform the dynamic testing with a Professional Engineer and workforce experienced in dynamic testing meeting the following qualifications and submitting proper documentation:

- The dynamic testing operator must have a minimum of 3 years of experience that demonstrates successful performance on at least three projects in similar geotechnical conditions and pile type with the use of high-strain dynamic pile testing. Include a brief description of each project and the name and phone number of the owner's representative knowledgeable in each project listed.
- Furnish the full name and license number of a Professional Engineer registered in the State, having at least 5 years of experience in the performance of dynamic testing of driven piles, who is responsible for the work performed and preparing test reports. Do not use only the company names of consultants or manufacturers to meet the requirements of this section; use the names of the personnel.

2.b Submittals. Submit proposed methods of documentation and reports for acceptance. Include the format of the electronic template for the submission of pile driving records. As the tests are completed, provide electronic output records from the dynamic pile load testing with data to correlate the records with the respective pile and driving records. Submit records within 24 hours of testing. Record signals on approved electronic media. Perform supplementary office analyses on piles dynamically tested, as directed. Include an interpretive report that summarizes pertinent field data, to determine pile tip elevations, pile capacity, soil resistance distribution, dynamic soil properties of shaft and toe quake and damping resistances and driving stresses throughout the pile for each substructure unit. Evaluate and report the pile capacity versus plan factored axial resistances, maximum measured driving stress, hammer system efficiency, and pile structural damage/integrity. Submit a preliminary report within 48 hours of dynamic pile load testing. Submit a complete report with the information according to ASTM D4945, signed and sealed by a Professional Engineer licensed in the State, to the Representative within 5 days of testing.

2.c Dynamic Pile Load Testing. Perform dynamic pile load testing only if the Representative is present for witnessing during the entire time piles are driven, redriven or restruck. Notify the Representative of a tentative schedule for testing at least 21 calendar days before starting the tests. Notify the Representative of a firm date at least 48 hours before starting the tests but give the notice between start of work on Monday and noon of the following Friday. Do not schedule dynamic testing on Saturdays, Sundays, or Holidays without prior approval from the Representative. Perform dynamic testing according to ASTM D4945. Drill the necessary holes in the pile to fasten a pair of transducers

and a pair of accelerometers. Drive the pile while testing until ordered to stop by the Representative. Remove the transducers and accelerometers after the dynamic testing is completed. Submit a repair procedure to the Representative to seal holes drilled in the pile if that section is to be incorporated into the structure.

(i) **Predrilling.** Predrill holes at pile locations and to depths and intended bearing strata if indicated. Deviations of drill hole from plan location and verticality are allowed, provided the driven pile is within the tolerances as specified in Section 1005.3(d). Piles installed in predrilled holes must be driven to absolute refusal or end of driving criteria to ensure the pile is not bearing on sloughed material.

For non-integral abutments, drill a hole with a minimum diameter 3 inches larger than the largest cross-sectional dimension of the pile. For integral abutments, drill a hole with a minimum diameter that is the larger of 2 feet or 10 inches larger than the largest cross section dimension of the pile.

Provide permanent casing if indicated for integral abutments or piles in embankments.

Provide temporary casing if indicated. Temporary casing is required to maintain an open hole for the following conditions:

- If there is evidence of exchange of soils or materials between adjacent predrilled holes.
- If drilling methods compromise the lateral support provided by the soil surrounding the pile due to excessive loss or migration of material.
- If excessive sloughing of material occurs into the predrilled hole so infilling of the predrilled hole is visible and evident at the surface.

The use of casing is recommended for predrilled holes influenced by groundwater. Unless otherwise specified, casing is not required for a predrilled hole to be maintained as an open hole for pile insertion.

1. **Piles Driven without the Use of Casing.** The length of the predrilled hole is to remain open and unobstructed to allow insertion of the pile and aggregate, and to maintain adequate lateral support for the installed pile. An incidental amount of material, which can be penetrated by the pile during driving, may slough into the bottom of the hole. Minimize the potential for sloughing and collapse of the hole by installing the pile and aggregate (or aggregate only, if the predrilled length is less than 20 feet and approved) in predrilled holes promptly after predrilling. Drive piles in as specified in Section 1005.3(b).
2. **Piles Driven with the Use of Casing.** Install casing as indicated or required to maintain an open hole and install the pile and aggregate (or aggregate only, if the predrilled length is less than 20 feet and approved) in cased holes. Temporary casing may be removed after backfilling if site conditions and project specifications permit. Drive piles as specified in Section 1005.3(b). Piles that reach absolute refusal or end of driving criteria above the bottom of the predrilled hole will be rejected. Remove temporary casing after driving operations, unless directed otherwise.

(j) **Predrilling for Unforeseen Obstructions.** For piles that cannot be advanced to the predetermined tip elevation due to unforeseen obstructions, extract the pile(s) using a vibratory hammer, crane or other acceptable method. Inspect extracted piles for damage and obtain approval from the Structure Control Engineer to reuse extracted piles or portions thereof. Discard damaged piles or portions of piles not able to be reused. Predrill holes at the extracted pile location(s) as specified in Section 1005.3(i) and drive new or extracted piles, if approved.

1005.4 MEASUREMENT AND PAYMENT—The Department will not pay for unauthorized piles, defective piles, unsatisfactorily driven piles, piles that reach absolute refusal or end of driving criteria above a predrilled elevation, portions of piles cut off, piles not driven, or for costs for such piles or portions of piles.

The following work will be considered Extra Work as specified in Section 110.03 (if items are indicated for this work, the work will be paid for as indicated and will not be considered Extra Work):

- Spudding, preexcavation, jetting, and test borings related to such work, if such work is directed to advance the piles to predetermined pile tip elevations due to unforeseen conditions.
- If piles installed for integral abutments or abutments on mechanically stabilized walls are damaged by twisting as a result of conditions identified as differing site conditions as specified in Section 110.02(b), the extraction of such damaged piles, predrilling for the driving of piles replacing such damaged piles,

- and the driving of piles replacing such damaged piles.
- Splicing required due to one or more individual piles penetrating more than 10 feet below the estimated pile tip elevation indicated if the total quantity of piling does not significantly change the character of the work to be performed under the contract, as specified in Section 110.02(d). Payment for splicing if a pile penetrates more than 10 feet below the estimated pile tip elevation is limited to one splice per individual pile.

The cost of spudding, augering, or drilling to original ground through embankments placed is incidental for test and production piles, unless payment for such work is indicated.

The Department will not pay for the extraction and replacement of piles damaged due to misalignment of the leads, failure of capblock or cushion material, failure of splices, malfunctioning of the hammer, or other improper construction methods, if it is determined the damage impairs the strength of the completed pile.

(a) Test Piles. Each

The Department will pay for each test pile, including necessary cutting off, splicing, and rebuilding to the indicated test pile length. The price includes necessary excavation for pile splicing, rebuilding, and extending; pile driving equipment furnished on the project; costs of transporting the equipment to the project; erecting, maintaining, and moving the equipment within the project; and dismantling and removing the equipment from the project, and pile tip reinforcement.

If any portion of a test pile is indicated to be galvanized, the entire length of the pile will be paid under the galvanized test pile item unless indicated.

Additional test piles and extensions in excess of the indicated number and length will be measured and paid for by the linear foot price of corresponding production piles. The excess length will be measured from the estimated pile tip elevation to the elevation of the final driven tip end for test piles driven below the estimated pile tip elevation, or from the cutoff elevation to the final driven tip end for additional test piles not indicated.

For test piles specified in the proposal but not required to be placed, adjustment of payment will be made as specified in Section 110.02. Cutoff portions of test piles will remain the property of the Contractor.

Costs associated with the use of proximity switches for the monitoring of piles, as specified, will be incidental to the price bid for test piles.

(b) Production Piles. Linear Foot

Measured from the indicated or directed cutoff elevation to the final driven tip end of the pile, including length of pile driven if restrike is indicated or directed. This length does not include any portion of the tip reinforcement or end closure that extends below the driven end of the pile.

The unit price includes costs of furnishing and driving, cutting off, splicing, rebuilding or extending and excavating necessary for splicing and rebuilding or extending.

If any portion of a production pile is indicated to be galvanized, the entire length of the pile will be paid under the galvanized production pile item unless indicated.

If acceptable piles must be replaced with another type of construction and are removed or cut off, payment will be made for the length below the cut off elevation, or the bottom of the other construction.

Piles that reach absolute refusal or end of driving criteria above a predetermined pile tip elevation due to freezing resulting from discontinuous driving are unsatisfactorily driven piles, and the Department will not pay for these piles. If augering, predrilling, spudding, preexcavation, or jetting is directed because of these unsatisfactory piles, the additional work is to be done at no additional cost to the Department.

The Department will not deduct the volume of concrete displaced by piles from the foundation concrete quantities.

Costs associated with the use of proximity switches for the monitoring of piles, as specified, will be incidental to the price bid for production piles.

(c) End Closures for Steel Shells. Metal end closures will be included in the Contract unit price per linear foot for the pile of which it is a part. The Department will not pay separate or additional compensation.

End closures for test piles will be included in the Contract lump sum prices for those items.

(d) Production Pile Tip Reinforcement. Each

(e) Dynamic Pile Load Test. Each

Applies if dynamic testing is performed while driving the entire length of pile, including restrike if indicated. No additional time or payment will be made for the following:

- Testing that is unable to be completed or is terminated by the Contractor before driving the entire length of the pile, as determined.
- Work determined to be unsatisfactory due to improper driving methods, inadequate equipment and materials, or unacceptable splice or tip welding.
- Cost for interruptions, delays, time lost due to malfunction, breakdown of equipment, or inclement weather.
- Additional testing done without the prior approval of the Representative.
- Costs associated with replacing a hammer rejected due to unacceptable performance, inadequate capacity based on the dynamic pile load testing results, or if the Contractor should choose to replace an already accepted hammer. These costs include, but are not limited to, transporting the replacement hammer to the job site, unloading and setup, additional analyses and submissions, additional dynamic pile load tests required for the replacement hammer acceptance, lost production time, etc. Before driving piles with the new hammer, the Contractor must submit the operating specifications and Pile Hammer Data sheet (Form CS-5) for acceptance of the proposed hammer as specified in Section 1005.3(a)1.

(f) Restriking Test Piles. Each.

Includes costs to mobilize and restrike test piles. Additional driven length of pile will be paid as specified in Section 1005.4(a). Paid only if restrike of test piles is indicated or directed. Does not include costs for restriking due to poor hammer performance or rejection, or restriking piles raised by driving of adjacent piles.

(g) Restriking Production Piles. Each.

Includes costs to remobilize and restrike piles, except for additional driven length of pile which is paid as specified in Section 1005.4(b). Paid only if restrike of production piles is indicated or directed. Does not include costs for restriking due to poor hammer performance or rejection, or restriking piles raised by driving of adjacent piles.

(h) Predrilling.

1. Mandatory Predrilling for Driven Piles. Linear Foot.

Measured from the bottom of the footing elevation or ground surface elevation at the time of drilling, whichever is lower, to the bottom of the predrilled hole. Includes mobilization, access to the foundations, drilling, maintaining an open hole, permanent or temporary casing and backfilling with aggregate.

2. Predrilling for Unforeseen Obstructions, Earth Drilling. Dollar.

The proposal will include an item and a predetermined amount of money for Predrilling for Unforeseen Obstructions, Earth Drilling. The contract item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the contingent or unpredictable nature of the work being performed, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for by determining the actual amount of equipment, tools, labor, and work involved to acceptably perform the work as follows:

1.a Negotiated Price. At a price agreed upon by the Department before performing the work.

1.b Force Account Basis. Section 110.03(d).

Includes access to the foundations, drilling, maintaining an open hole, temporary casing and backfilling with aggregate.

3. Predrilling for Unforeseen Obstructions, Obstruction Drilling. Dollar.

The proposal will include an item and a predetermined amount of money for Predrilling for Unforeseen Obstructions, Obstruction Drilling. The contract item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the contingent or unpredictable nature of the work being performed, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for by determining the actual amount of equipment, tools, labor, and work involved to acceptably perform the work as follows:

1.a Negotiated Price. At a price agreed upon by the Department before performing the work.

1.b Force Account Basis. Section 110.03(d).

Includes access to the foundations, drilling, maintaining an open hole, temporary casing and backfilling with aggregate.

4. Pile Extraction and Redriving. Dollar.

The proposal will include an item and a predetermined amount of money for Pile Extraction and Redriving. The contract item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the contingent or unpredictable nature of the work being performed, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for by determining the actual amount of equipment, tools, labor, and work involved to acceptably perform the work as follows:

1.a Negotiated Price. At a price agreed upon by the Department before performing the work.

1.b Force Account Basis. Section 110.03(d).

Pile extraction and redriving for driven piles that reach absolute refusal or end of driving criteria above the predrilled elevation will be considered unsatisfactory and payment will not be made. Payment will not be made for piles or portions of piles which are not able to be reused after extraction.

5. Mobilization for Predrilling of Unforeseen Obstructions. Dollar.

The proposal will include an item and a predetermined amount of money for Mobilization for Predrilling of Unforeseen Obstructions. This work includes transportation, assembly, setup and removal of the equipment needed to perform predrilling operations, permitting, access to the foundation, initial items required to start the work, restoration of disturbed areas and site cleanup associated with predrilling. The contract item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the contingent or unpredictable nature of the work being performed, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for by determining the actual amount of equipment, tools, labor, and work involved to acceptably perform the work as follows:

1.a Negotiated Price. At a price agreed upon by the Department before performing the work.

1.b Force Account Basis. Section 110.03(d).

SECTION 1006—DRILLED CAISSONS

1006.1 DESCRIPTION—This work is construction of reinforced cement concrete drilled caisson foundations consisting of shaft sections with or without casings left in place, and with or without rock sockets or belled footings, formed within drilled excavations.

The following definitions apply:

(a) **Drilled Caisson.** Cast-in-place foundation element consisting of shaft section with or without enlarged bearing area at its base, a minimum of 30 inches in diameter, and deriving load capacity through load transfer to the bearing strata in side resistance, tip resistance, or a combination of both.

(b) **Bell Footing.** Enlargement at base of shaft constructed with an underreaming tool in materials that will stand open.

(c) **Bearing Strata.** Layer(s) of soil or rock providing principal support of applied loads.

(d) **Rock Stratum.** A stratum of geomaterial having an unconfined compressive strength equal to or greater than 250 pounds per square inch that cannot be drilled with conventional earth augers or underreaming tools, thus requiring the use of special rock augers, core barrels, air tools, blasting, or hand excavation.

(e) **Shaft Section in Soil.** Length of caisson shaft from top of shaft to top of rock stratum.

(f) **Shaft Section in Rock.** Length of caisson shaft from top of rock stratum to top of rock socket.

(g) **Rock Socket.** Length of caisson in rock stratum below the shaft, providing a fixed connection between the caisson and the rock stratum.

(h) **Permanent Casing.** Steel pipe, typically of cylindrical shape, installed by drilling, driving, or vibrating that when filled with concrete, becomes a permanent part of the drilled caisson.

(i) **Temporary Casing.** Protective steel pipe, typically of cylindrical shape, installed by drilling, driving, or vibrating, that provides lateral earth support during shaft excavation, cleaning, and inspection; controls groundwater infiltration; and is removed as part of the concrete placement operation.

(j) **Obstruction.** A natural or manufactured object above designated rock socket tip elevation that cannot be drilled with conventional earth augers or underreaming tools, and that requires the use of special rock augers, core barrels, air tools, blasting, or hand excavation.

(k) **Class A Self Consolidating Concrete (SCC) for Drilled Caissons and Sockets.** Class A SCC typically consists of a mixture of Portland cement, supplementary cementitious material, fine aggregate, coarse aggregate, water, viscosity-modifying admixtures, air-entraining admixture with high range water reducing admixture, and other ASTM C494, Type S admixtures.

(l) **Thermal Image Profiling (TIP).** Used to measure the temperature profile within a deep foundation element constructed using cast-in-place concrete. The thermal profile induced by the curing concrete is used to evaluate the homogeneity and integrity of the concrete mass for the entire height and diameter of the caisson within the deep foundation element. TIP will also show misalignment of the reinforcement cage within the caisson.

(m) **Crosshole Sonic Logging (CSL).** Used to measure the propagation time and relative energy of an ultrasonic pulse between parallel access ducts installed in the drilled shaft. The velocity reduction is correlated to a concrete quality and is used as an indicator of the homogeneity and integrity of the concrete mass between the access ducts.

(n) **Submersible Inspection Device (SID).** An inspection device consisting of a digital video camera and video control housing unit used for inspection of the bottom of the drilled caisson excavation capable of being submersed in water.

(o) Downhole Camera. An inspection device consisting of a digital video camera and video control housing unit used for inspection of the sides of the drilled shaft excavation, or rock socket capable of being submersed in water.

1006.2 MATERIAL—

(a) Casing. Section 1105.02(a)2. Provide smooth, clean, rust-free metal casing of sufficient strength to withstand handling and installation stresses and the pressure of concrete, water, and the surrounding earth; and to prevent water seepage. Casing diameters refer to inside diameters subject to applicable API tolerances for steel pipe. Weld any required casing splices according to ANSI/AWS D1.1 with no interior splice plates, producing true and straight casing.

(b) Reinforcement Bars. Section 1002.2. Provide reinforcing steel for main vertical bars and ties and for spirals as specified in Section 709.1(a)1. Use mechanical splice systems as specified in Section 1002.2(c).

(c) Welding Material. Section 1105.02(t)

(d) Class A Cement Concrete. Section 704, with high-range water-reducing (HRWR) admixture and a slump of 5 inches to 8 inches.

(e) Class A SCC. Section 704, conforming to ACI 211 and ACI 237R, and as specified in Table A. Submit mix designs to the DME/DMM for review and approval. Use of an approved workability retention admixture is required to ensure slump flow is maintained throughout the duration of the concrete placement. Use of an anti-washout admixture, according to PTM 641, is required for concrete placed in a caisson containing 3 inches or more of standing water. Take immediate corrective action whenever the slump flow range limit or action points are exceeded. Perform plastic SCC slump, air, and temperature tests on the first three consecutive trucks at the beginning of placement operations or after significant stoppage such as plant or equipment breakdown to determine if material control has been established. Material control is established when all test results of SCC slump, air, and temperature for three consecutive trucks are determined to be within the established action points.

TABLE A

SCC Requirements		
Cement	Section 701, Type(s) I, II, IP, or IS	-
Water	Section 720.1	-
Admixtures	Section 711.3	-
Supplementary Cementitious Material	Section 724	-
Cement Factor, Diameters \leq 6'-0"	564 lb/cy - 752 lb/cy	Note 1
Cement Factor, Diameters $>$ 6'-0"	400 lb/cy min. (including supplementary cementitious material)	Note 1
	250 lb/cy min. of Portland Cement	-
Maximum Water Cement Ratio	0.45 lb/lb	-
Minimum Mix Design Compressive Strength	7 day 2,750 psi	-
	28 day 3,000 psi	-
28 Day Structural Design Compressive Strength	3,000 psi	-
Minimum Allowable Compressive Strength	2,500 psi	-
Fine Aggregate	Section 703.1	-
Coarse Aggregate	Section 703.2	Note 2
Coarse Aggregate Volume	9.10 cf/cy - 13.43 cf/cy	-
Column Segregation (Mix Design Phase)	ASTM C1610, 12% max. (9% where gravels are used having a crushed fragment percentage less than 55%)	-

Slump Flow Target	ASTM C1611, 20 inches - 30 inches	Note 3
Visual Stability Index (VSI)	≤ 1	Note 4
J Ring	ASTM C1621	Note 5
Plastic Air Content Target	6.5% within a tolerance of $\pm 1.5\%$ during the work	Note 6
Hardened Entrained Air	2% min.	Note 6

Note 1 - Include one or more of the following as a replacement for a portion of the cement as specified in Section 704.1(g). The minimum percentages listed are required to be met when one or more of the aggregates have a linear expansion listed in Bulletin 14 greater than 0.10%:

- Slag Cement, Grade 100 or 120, 25% min.
- Flyash (Type F or Type C**) 15% min. (for flyash minimum cement content equal to 580 pounds per cubic yard. **Type C may be used provided alkali-silica reaction (ASR) is mitigated through the use of additional Supplementary Cementitious Materials.
- Silica Fume 5% - 10%
- The total substitution of Portland cement must not exceed 50%, including the amount in the blended cement.

Note 2 - Section 703.2 except: The requirement for crushed fragments is not required provided the column segregation testing performed during mixture qualifications does not exceed 9%. The requirement for meeting established Section 703 gradations do not apply if an optimized aggregate gradation is submitted and approved during the mix design qualification phase and controlled/verified during production according to an approved QC plan.

Note 3 - Maintain slump flow within ± 3 inches of target. Reject SCC if upper slump flow limit is exceeded. If the slump flow test is less than the lower limit, reject SCC unless approved for vibration and is vibrated.

Note 4 - Reject SCC with a VSI > 1

Note 5 - If the difference between the slump flow test and J Ring test is greater than 2 inches, reject SCC unless approved for vibration and is vibrated.

Note 6 - Air entrainment is not required where the top of caisson is 36 inches or more below grade.

(f) Nonshrink Grout. Section 1080.2(c). Use nonmetallic nonshrink grout.

(g) TIP Materials. Provide materials necessary to perform TIP testing according to ASTM D7949 Method B and as indicated. Provide a sufficient quantity of thermal wires as indicated. If not indicated, provide quantity of thermal wires to achieve a distribution of one embedded thermal sensor for every foot of caisson diameter, with a minimum of four embedded thermal sensors, extending the full length of each drilled caisson. Provide wire length sufficient to be attached to readout boxes upon completion of concrete placement. Provide connection supplies and necessary splices. Provide sufficient data loggers to maintain readings on each thermal wire for 96 hours from the completion concrete placement.

Provide and maintain functional TIP equipment. At a minimum, maintenance includes protection during use and repair/replacement of any damaged equipment. Maintain redundant equipment based on manufacturer's recommendations. Provide equipment according to the approved TIP supplier and the following:

- Thermal Wires (as indicated)
- Wire splices
- Data Logger (one per active wire)
- Connection and charging wires
- Software (most recent version available at time of shaft installation)

(h) CSL Materials. Provide crosshole sonic access tubes at each caisson for all projects. Provide CSL testing equipment only when indicated, as needed, or as directed to verify the integrity and homogeneity of drilled caissons.

1. CSL Access Tubes. Section 1105.02(j)1. Provide 2 inch inside diameter (ID), Schedule 40 steel pipe access tubes. Provide one tube for every foot of caisson diameter, with a minimum of three tubes per caisson. Prepare access tubes according to ASTM D6760. Fit each tube with a watertight shoe on the bottom and a removable cap on the top. Use threaded couplings according to ASTM A865. Provide a threaded joint at the top for use during testing. Hydrostatic test requirements are waived. CSL access tubes are required in all caissons. CSL access tubes may also be used for performing TIP according to ASTM D7949, Method A, as required or directed.

2. CSL Equipment. Provide equipment to conduct CSL testing according to ASTM D6760. At a minimum, include the following CSL equipment:

- Microprocessor-based CSL system for display of individual CSL records, analog-digital conversion and recording of CSL data, analysis of receiver responses and printing of CSL logs
- Ultrasonic source and receiver probes for use in 2 inch ID pipe
- Ultrasonic voltage pulsar to excite the source with a synchronized triggering system to start the recording system
- Depth measurement device to determine and record depths
- Appropriate filter/amplification and cable systems for CSL testing.

(i) SID. Provide a SID that consists of a rugged steel device incorporating a high-resolution digital color video camera and probing tool in a submersible housing and employs pressurized nitrogen gas and water to enable viewing of the bottom of the hole in murky conditions. Provide electrical power, lighting, cable connections, color monitor, audio and video recording system and any other necessary electronic devices required to document the inspection operation. Provide a probe inside the SID with a visible gauge, graduated in 0.25 inch increments or smaller, to measure the amount of sediment on the bottom of the rock socket shaft.

(j) Downhole Camera. Provide a downhole camera when indicated or as directed. Provide a downhole camera conforming to the following requirements:

- Color camera with supplemental dive lighting
- Capability of recording at low light and/or in turbid water.
- Capability of tilting vertically and horizontally using motorized panning and tilting.
- Fits into a 2 3/4 inch diameter hole.
- Waterproof to a depth of 120% of the indicated drilled shaft length.
- A high-resolution color video and audio recording system, with microphone, mounting bracket, and sunshade.
- 7 inch LCD color monitor or better.
- Operating cable capable of holding 200 pounds.
- Compass Attachment.
- Winch Manual Emergency Hand Crank.
- Carrying case to hold the monitor, compass attachment, LCD screen, and camera.
- Capability to operate on rechargeable battery power for eight hours - Batteries and charger to operate the camera for eight hours.
- Depth readout.
- Cable protection from top of hole or casing friction.
- Centralizer assembly.
- Corrosion resistance.

1006.3 CONSTRUCTION—

(a) Qualifications and Submittals. Provide submittals a minimum of 30 days before construction of drilled caissons. Do not construct drilled caissons before review and acceptance of submittals.

1. Contractor Qualifications. Construct caissons with a supervisor and workforce experienced in the construction of drilled caissons, and meeting the following qualifications:

- Submit a list containing at least five projects that, together, demonstrate a minimum of 3 years of experience in the construction of drilled caissons, including the proposed method of concrete placement. Required experience is drilling, reinforcement installation, concrete placement and all aspects of caisson construction. Include a brief description of each project, and the name and telephone number of owner's representative knowledgeable in each project listed.
- Provide the name of the Professional Engineer registered in the State, directing the work, with at least 3 years of experience in the design and construction of drilled caissons.

- Provide names of drill operators and on-site supervisors under the direction of the Professional Engineer. Each drill operator and on-site supervisor must have at least 1 year of experience in the construction of drilled caissons.
- Furnish names and experience of those performing bottom inspections using the SID, with at least five projects that demonstrate proficiency in the performance of bottom inspections.
- Provide the names of personnel, consultant companies, and manufacturers to meet the requirements of this Section. Do not provide only company names of consultants or manufacturers.

2. Site Inspection. Inspect the project site and the available subsurface information including any available soil or rock samples. Prospective bidders are to contact the District Geotechnical Engineer to schedule a viewing of the subsurface information.

3. Independent Testing Agency. Furnish the name of an independent testing agency(ies) providing TIP testing, and CSL testing (as necessary). Include a list containing at least five projects that, together demonstrate a minimum of 3 years of experience with TIP and CSL testing for drilled caissons. Include names and experience of specific representatives and their roles. Include a brief description of each project, and the name and telephone number of owner's representative knowledgeable in each project listed. Include the name and experience of the independent testing agency Professional Engineer registered in the State who will oversee the testing and sign and seal reports.

4. Drilled Caisson Installation Plan. Submit a Drilled Caisson Installation Plan with the following information:

- List of proposed equipment to be used on the project, including cranes, templates, drill rigs, drills, augers, concrete and rock socket core barrels/downhole hammers, bailing buckets, final cleaning equipment (including airlift/suction equipment), core sampling equipment, welding equipment, tremie, concrete pumps, casing, lifting ring and cradle, etc.
- Details of the overall construction operation sequence and the sequence of drilled caisson construction, including a specific planned schedule for caisson installation.
- Details and methods for locating and maintaining non-drilled and drilled caisson and casing position and alignment during excavation, inspection, and concreting operations, including curing and the use of temporary tool casing. Floating templates attached to a barge will not be allowed. Provide stable templates fixed directly to the ground (or streambed).
- Details and methods for caisson excavation.
- Details and procedures for the installation and removal of casing including details for cutting off permanent casing. Include details of methods proposed to backfill any remaining annular space between the caisson and adjacent ground surface.
- Details of methods to mechanically clean the drilled caisson excavation, including airlift or suction methods.
- Details, methods, equipment for bottom inspections using the SID and downhole camera. Include SID and downhole camera for sign structure, sound barrier, and highway lighting caisson foundations only when indicated.
- Details of reinforcing cage fabrication and handling, lifting and installation along with methods and devices that will be used to center the reinforcing cage and maintain concrete cover.
- Details of methods for concrete mixing, transport and placement including operational

procedures. Placement procedures should demonstrate that a continuous supply of concrete is provided to the finished elevation. Include procedure used to ensure that unsuitable concrete is removed by overfilling or other methods. Describe concrete placement and curing procedures to be used during hot/cold weather to protect and provide acceptable concrete. Provide a procedure and detail for an emergency cold joint.

- Details of methods to monitor and maintain concrete temperatures below 75F during concrete placement. Also, for drilled caissons larger than 5 feet in diameter, include methods to monitor and maintain the concrete at a minimum temperature of 50F and a maximum temperature of 150F during curing. Develop the placement method, taking into account water condition, set time and hydraulic pressures.
- Sample of proposed drilled caisson report, including log of materials encountered; sample of proposed test boring log, and sample integrity testing TIP and CSL logs. Provide caisson integrity testing for sign structure, sound barrier, and highway lighting caisson foundations operated by qualified individuals only when indicated.
- Welding procedures and qualifications of welders and tackers according to ANSI/AWS D1.1 for casing steel.
- Mix designs for concrete and non-shrink grout.
- For SCC, submit slump flow, VSI and J-ring tests with a trial mix as follows:
 1. Make the trial mix for the slump test from a trial mix proportioned from the approved concrete mix design. Ensure that it is at least 3.5 cubic yards in volume and prepared in a mixing truck.
 2. Prepare the mix for the slump loss test at a temperature consistent with the highest ambient temperature and concrete temperatures anticipated during concrete placement. Obtain the Representative's approval of the test temperature.
 3. After initial mixing, determine slump, concrete temperature, ambient temperature, and air content. Concrete properties must be within specification limits.
 4. Mix the concrete intermittently for 30 seconds every 5 minutes at 6 to 18 truck-drum rpm.

Accepted procedures are subject to trial in the field. If the procedures fail to perform, this failure will not result in additional cost to the Department or relieve the Contractor of the responsibility to satisfactorily complete the work. Do not begin construction on work affected by the Drilled Caisson Installation Plan until approved. Delays due to resubmission of the Drilled Caisson Installation Plan will be at no additional cost to the Department and with no extension of contract time. After approval of the installation plan, make no changes in the procedures without review and approval.

5. QC Procedures.

- Method for determining initial drilled caisson position and verticality, including the formed section, as well as method for monitoring and procedures for correction during excavation.
- Procedure for coring drilled caisson concrete.
- Methods and procedures for downhole inspection, including the use of downhole inspection camera, maintaining access for SID testing, TIP testing and for the use of CSL tests to verify the integrity of the caisson concrete.

- Include a plan and protocols to maintain continuous access for the Representative to observe TIP testing for the entire duration of the testing at each drilled caisson.
- Plan for compliance with applicable environmental regulations.

6. Drilled Caisson Pre-Construction Meeting. Attend a pre-construction meeting to discuss drilled caisson construction after submittals are accepted and a minimum of 7 calendar days before beginning drilled caisson construction. Discuss construction procedures, personnel, and equipment to be used. The following are required to attend: Project Superintendent, Drilled Caisson Superintendent, Testing Firm Representative, and other individuals designated by the Department. If key personnel change or if significant revisions to Drilled Caisson Installation Plan are proposed, an additional drilled caisson pre-construction meeting may be required at the discretion of the Representative.

(b) Excavation. The Representative will confirm the top elevation of the rock socket before the start of drilling for rock sockets. The effective "top elevation" is based on observation of the boundary zone where broken or weathered rock becomes competent rock and is also influenced by the presence of any coal seams, which are not considered competent rock. The top of the rock socket cannot be located within casing or within a coal seam. Competent rock is rock that cannot be drilled with conventional earth augers and/or under reaming tools and requires the use of special rock augers, core barrels, air tools, and/or other methods of hand excavation. Excavate to the dimensions and elevations indicated, or as directed. The estimated lengths indicated are considered to be approximate. Actual lengths and embedment will be verified by inspection. Additional shaft lengths may be required depending on actual subsurface conditions. Variations of indicated shaft lengths may only be constructed with the written approval of the Representative.

Unless otherwise indicated, bore excavations for vertical caissons plumb to within a tolerance equal to 2% of the shaft length; and for battered caissons, as indicated, to within a tolerance equal to 5% of the shaft length but not more than 1 foot. If holes are more than 6 inches out of plumb, redesign the footing that is to be supported by the caissons. If caissons are out of tolerance, make needed corrections to the structure at no additional cost to the Department. Do not place the top of a caisson out of the indicated position by more than 1/24 of the shaft diameter or 3 inches, whichever is less. If belled footings are required, excavate to form a bearing area of the size and shape indicated. Do not disturb formations below or outside the limits of the caisson under construction or any previously constructed caissons adjacent to the excavation. Blasting is not allowed.

Provide excavation and drilling equipment with a capacity to excavate to a depth of 120% of the proposed drilled shaft length, but not less than 15 feet beyond the rock socket tip depths indicated. Submit the minimum output of the drill rig torque and crowd to the Representative.

Do not excavate within three diameters of caissons with new concrete until 24 hours after concrete placement.

If satisfactory foundation materials are encountered at other than the indicated elevations, adjust drilling depths as directed.

Use permanent metal casing when indicated to prevent caving of the soil material, to exclude groundwater or surface water, and to form the non-drilled and drilled caisson, including the shaft section. Seal the casing a minimum of 2 feet into impervious materials and bedrock to create a tight seal. Use casing to control dimensions and alignment of excavations within tolerances and to execute other construction operations. If artesian water flow is encountered, extend the top of the casing to above the level required to achieve static water head conditions for proper placement of concrete.

If a caving condition or excess groundwater is encountered, discontinue the drilling operation and employ a construction method that prevents caving and groundwater infiltration, such as the installation of casings.

Remove, as directed, caked material from the sidewalls and loose cuttings from the bottom of the excavation so that such material will not cause unanticipated settlement, reduce caisson capacity, or affect concrete strength.

Do not expose the rock socket to water for more than 48 hours without approval. Ream rock socket exceeding 48 hours of water exposure, or that, as determined by the Representative, has deteriorated due to exposure to air or water, with an approved grooving tool to a depth of not less than 1/2 inch, or as directed. Reaming of the rock socket, if necessary, is incidental to drilling the rock socket.

Unauthorized over-drilling, including the additional reinforcement and concrete resulting from over-drilling, will be at no additional cost to the Department.

Promptly remove tools lost in the shaft during drilling and repair hole degradation due to removal operations at no additional cost to the Department with no extension of contract time.

Provide casing through soil and broken or unstable rock during hand cleaning and inspection of the excavation. If joining two or more sections of casing to obtain the required length, weld sections together as specified in Section 1105.03(m) to develop the full tensile strength of each section. Provide no interior splice plates.

Maintain a log of excavation to complete the As-Built Record.

(c) Test Holes. For caissons founded on or socketed into rock, drill standard NW (NX) size core borings at each caisson location, to a minimum depth of 10 feet below the bottom of the excavation (caisson or rock socket), unless otherwise directed. Provide a PennDOT certified drilling inspector for this work. Advance a minimum of one test hole per substructure through overburden soil using continuous Standard Penetration Testing techniques. Begin test hole from the existing ground surface, before site excavation. Advance additional test holes for other caissons at the same substructure locations using unsampled methods through overburden soils, unless otherwise directed. Begin coring at the top of bedrock (auger refusal) or the depth indicated or directed. Drill, log, store, and ship the samples according to the Department's Standard Specification for Subsurface Boring, Sampling, and Testing, Publication 222. The Representative will use the samples to verify whether there is material of sufficient strength and thickness at the bearing elevations indicated to support the required load and for proper founding of caissons. Test holes will also be used to establish the presence of obstructions within the soil shaft of the caisson. Adjust depth or length of caisson shafts and/or rock sockets, as directed.

(d) Probe Holes. Drill 2 inch diameter unsampled holes at the specified locations, to the specified depth below the bottom of the excavation (caisson or rock socket), or as directed. The Representative will use the rate of drilling of the holes to determine whether there is satisfactory material or rock of sufficient thickness and type to support the required load, and to locate the presence of open joints, voids, soft rock, or other deleterious material that may be inadequate for support of the required load.

(e) Inspection. Do not place concrete until the foundation excavation has been inspected and accepted. After completion of excavation and cleaning of the rock socket, perform required inspections and provide details of drilled caisson construction to the Representative for review. Inspect each drilled caisson excavation in the presence of the Representative. Check the dimensions and alignment of each drilled caisson for its full length, including the cased/formed section and rock socket excavation using methods indicated in this section or others approved by the Representative. Determine dimensions and alignment under the observation and/ or direction of the Representative. Measure the final drilled caisson depth (after final cleaning) using a weighted tape or other approved method.

Record Caisson Bottom and Side Inspections. Provide a copy of recordings and field boring logs to the Representative within 7 calendar days of drilled shaft completion on flash drives or digital video disc (DVD) format compatible with Department approved software. Store and catalog flash drives or DVDs on-site in dust-free containers and label the project title, drilled shaft number, date, and other appropriate information.

The Representative reserves the right to order an inspection dewatering and manual cleaning/inspection or by diving or other acceptable methods if the above-describe procedure does not obtain the appropriate information.

Upon completion of each rock socket excavation and inspection, the Representative may accept the socket, or order deeper excavation. The adequacy of each rock socket will depend on the condition of its sides, bottom surface, and underlying layers. Concrete must be placed in the accepted drilled caisson within 18 hours of completion of excavation (including cleaning) and within 3 hours of final inspection.

1. Drilled Caisson Bottom Inspection. Perform the drilled caisson bottom inspection (cleanliness inspection) using a SID according to the accepted Drilled Caisson Installation Plan and as directed. Use the SID water flushing jets to clean sediment from the rock as directed. Include SID for sign structure, noisewall and highway lighting caisson foundations only when indicated.

Provide an approved, qualified individual to operate the SID and allow the Representative to visually evaluate the caisson bottom condition. Provide slack in line and ensure SID is fully seated on the bottom of the caisson before taking measurements of sediment. Using the SID, observe the bottom of the caisson at a minimum of five locations, including the center of the base and the 3, 6, 9, and 12 o'clock positions around the perimeter to verify cleanliness requirements are met. Locate perimeter positions approximately 1 foot from the wall of the socket. Based on the results of readings at these five locations, make additional observations at other locations as directed.

Perform cleaning operations for the base of the rock socket so that, at the time of concrete placement, a minimum of 50% of the base of each socket will have less than 1/2 inch of sediment and the maximum depth of sediment or other debris at any place on the base of the socket cannot exceed 1-1/2 inch.

2. Drilled Shaft Side Integrity Inspection. Inspect the quality of rock along each drilled caisson using a downhole camera and/or other means considered appropriate by the Representative. Include downhole camera for sign structure, sound barrier, and highway lighting caisson foundations only when indicated.

Using the downhole camera, observe the shaft and rock socket sides of the drilled caisson at a minimum of four locations, including the 3, 6, 9, and 12 o'clock positions around the perimeter to visually inspect the quality of the rock. Dewater or flush the drilled caisson with clean water to increase visibility as directed. Make additional observations as directed.

Follow safety practices as specified in Section 107.08 and include, as a minimum, the following items specifically required for inspection of drilled caisson excavations:

- Cover open excavations immediately upon completion or, if work is discontinued for any period of time, with a cover capable of preventing persons from falling into or entering the excavation without proper authorization. Secure the cover by approved methods.
- Provide casing through soil cavities and broken or unstable rock for inspection of the excavation.

(f) Reinforcement. Section 1002.3 and as follows:

Provide a reinforcing cage that consists of longitudinal bars, spiral, hoop, or tie bars, cage stiffener bars, spacing devices, and any other appurtenances required to maintain alignment, shape, and clearances. Maintain an absolute minimum clearance of 5 times the maximum aggregate diameter between reinforcing steel, including spirals and hoops. Use concrete spacers or other approved non-corrosive spacing devices at sufficient intervals (within 5 feet of the top and bottom and at intervals not exceeding 10 feet along the length of the drilled caisson) to ensure concentric spacing for the entire cage length. Provide one centering device for each 36 inch of caisson perimeter but a minimum of four at each level. Install the indicated or required number of equally spaced steel tubes in the reinforcement cage for use in CSL testing. Install the indicated or required number of thermal wires to each drilled caisson reinforcement cage for use in TIP testing. Attach CSL access tubes and thermal wires according to the testing agency's recommendations. Provide testing agency(ies) representative(s) onsite during CSL access tube and thermal wire installation, reinforced steel installation, and concrete placement for the initial caisson construction.

Use splicing methods for the reinforcement as indicated or approved. Tie intersections of drilled caisson reinforcing steel with cross or figure 8 ties. Tie and support reinforcing steel in the drilled caisson so that the reinforcing steel remains within allowable tolerances for position.

Before placing the reinforcing cage, demonstrate to the satisfaction of the Representative that the fabrication and handling methods to be used will result in a reinforcing cage placed in the proper position, with the proper clearances, and without bending or racking of the reinforcing cage.

Before installation of reinforcing steel cage, check and clean the cage of any materials that would prevent bonding. Immediately upon approval of the condition of the cage, acceptance of the rock socket, and just before placement of concrete, install the fully assembled cage into the hole. Use of a lifting ring and a rigid cradle is required to achieve full support of the cage. Place each cage as one unit by lowering into the hole in a manner that will prevent distortion. Remove cages distorted by placement and replace with a new approved cage. Remove internal stiffeners as the cage is placed in the caisson so there is no interference with the placement of concrete.

Epoxy-coat reinforcing bars and steel centering devices.

Support the cage from the top by use of a frame or other positive means.

Place the bottom of reinforcing steel cage a minimum of 3 inches and a maximum of 6 inches from the bottom of the drilled caisson excavation. The Representative may approve additional clearance. Do not set the cage on the rock socket bottom without support.

If the caisson has been excavated below the anticipated tip elevation, extend the reinforcing cage at the tip (low) end using splicing methods as indicated or approved and extend thermal wires and CSL access tubes.

Unless otherwise indicated or specified, place No. 6 deformed bars vertically around the circumference at a 6 inch spacing, and No. 4 bars as tie bars on 12 inch centers. Furnish bars with hooks meeting seismic requirements.

(g) Dewatering. Unless otherwise specified, dewater excavations before placing concrete. A drilled caisson excavation is considered dry if less than 3 inches of groundwater is present in the bottom of the excavation at the start of concrete placement and the groundwater infiltration rate is less than 1/4 inch rise per minute. Remove water that has accumulated in the excavation after final inspection and before concrete placement using approved methods.

(h) Concrete Placement. Class A cement concrete mixes are only allowed for sign structure, sound barrier, and highway lighting caisson foundations. Use SCC for all other drilled caisson foundations.

Before production placement of SCC, produce and transport a mock batch of not less than 3 cubic yards of SCC to the project for testing to verify plastic concrete test requirements will be met. The mock batch for previously approved SCC mixes may be eliminated by the Representative. If the time between batches of concrete could exceed 30 minutes, submit a procedure to the DME/DMM before placement describing how the placed concrete will be evaluated to ensure the minimum slump value is maintained and the concrete does not reach initial set. Ensure uninterrupted delivery of concrete to avoid cold joints.

Do not start production concrete placement without written acceptance.

Place concrete within 18 hours of the completion of excavation, within 3 hours of final inspection approval and after the reinforcing steel cage has been installed in the shaft section and rock socket and is approved. Keep the excavation free from accumulated seepage water and loose material until concrete is placed. If the Representative determines that water seepage will be detrimental to the quality of the caisson or hinder proper placement of concrete by the free fall method, fill the excavation to the surrounding groundwater level with clean, fresh water and place concrete to the cutoff elevation by the tremie method, as specified in Section 1006.3(h)2, in one continuous operation.

Mix, place, vibrate, and cure concrete as specified in Section 1001.3. Place concrete for each caisson in one continuous operation. Thoroughly work and vibrate the upper 5 feet of concrete. Vibration of the concrete is required, unless the clear distance between bars is more than three times the bar diameter or three times the maximum aggregate size.

Do not allow concrete to come in contact with aluminum during placement.

Do not exceed 75F concrete placement temperature unless otherwise noted. For drilled caissons larger than 5 feet in diameter, maintain the concrete at a minimum temperature of 50F and a maximum temperature of 150F during curing.

1. Placement by Free Fall Method. Place Class A cement concrete by free fall only in dry, clean, unobstructed excavations that are at least 30 inches in diameter. Provide a hopper and a section of rigid pipe not less than 5 feet long and 10 inches in diameter to direct concrete fall and avoid impact with reinforcement on the sides of the excavation. Unless otherwise directed, limit depth of free fall to 25 feet. Do not place SCC by free fall method.

2. Placement by Tremie Method. Place concrete using a rigid, watertight, ferrous metal tremie pipe, as specified in Section 1001.3(k)3.c. Place concrete using a tremie tube of sufficient length, height, and diameter to discharge concrete at the drilled shaft base elevation. Provide a tremie pipe with a minimum inside diameter of 10 inches to a maximum inside diameter of 18 inches and marked clearly on the outside at 1 foot intervals. Use a tremie pipe which is clean and watertight with smooth inside and outside surfaces to permit both flow of concrete and unimpeded withdrawal during concreting. Provide a tremie pipe that does not crimp or restrict the flow of concrete. Test the tremie tube joints for water tightness in the presence of the Representative before using it for concrete placement using a method acceptable to the Representative.

Do not begin concrete placement until the tremie tube is placed at the bottom of the caisson. Valves, bottom plates, or plugs may be used only if concrete discharge starts within approximately 2 inches above the excavation bottom. Provide plugs that either can be removed from the excavation or of an approved material that will not cause defects in the drilled shaft if not removed. Once the tremie flow begins, set the tremie tube on the bottom of the caisson and allow the tremie tube to completely fill with concrete. Once full then raise the tube and begin placing the concrete.

Place concrete for each caisson in one continuous operation. Pumping of concrete into the drilled caisson will not be allowed, but concrete may be pumped to the tremie. Thoroughly work the concrete. Provide documentation to satisfactorily demonstrate experience in the use of the tremie method.

Construct the discharge end of the tremie pipe to permit the free radial flow of concrete during placement operations. Maintain the tremie pipe discharge end at or near the bottom of excavation as long as practicable during concrete placement. Maintain the tremie discharge end immersed as deep as practicable in the concrete, consistent with the approved construction methods, and at least 5 feet but not more than 20 feet in concrete after starting the flow of concrete. Maintain a continuous flow of concrete. Maintain the concrete in the tremie at a positive pressure differential to prevent water intrusion into the concrete.

The entire drilled caisson will be considered defective if at any time during concrete placement, the tremie pipe orifice is removed from the fluid concrete column and discharges concrete above the rising concrete level or it is found that the tremie pipe is not watertight. In such case, remove the reinforcing cage and concrete, complete necessary rock socket sidewall removal as directed, and reconstruct the drilled caisson at no additional cost to the Department.

Overflow the concrete until only fresh, uncontaminated concrete is visible at or above the indicated top of caisson elevation, as determined by the Representative. Completely remove overflow concrete.

Use tremie method to place SCC under all conditions.

3. Placement by Pumping Method. Pump only if concrete placement cannot be done by other means. Place concrete by pumping, as specified in Section 1001.3(k)4, through a flexible; ferrous metal, rubber, or plastic pipe with a minimum diameter of 6 inches. Do not allow the concrete to segregate during pumping. If directed, pump 1 cubic foot of concrete into a container so that the Inspector may verify that the concrete is not segregating during the pumping operation.

Begin pumping with the pipe discharge positioned not more than 6 inches off of the bottom of the excavation. Maintain a concrete head of not less than 5 feet above the discharge. Keep the pump hopper continuously filled with concrete to prevent entrapment of air in the discharge.

4. Placement within Casing. Use the free fall or tremie method to place Class A cement concrete in dewatered excavations supported by casing. Pump Class A cement concrete within casing only if placement cannot be done by other means. Use the tremie method to place Class A cement concrete under water in casing supported excavations. Use tremie method to place SCC under all conditions.

If the top of shaft elevation is below ground level at the time of concrete placement, provide an oversized casing from ground elevation to a point below the top of shaft to prevent extraneous material from falling into fresh concrete during and after placement. Keep the oversized casing in place until concrete has cured at least 24 hours.

For permanently cased drilled caissons that carry lateral loads, grout the area between casing and excavation to provide adequate bearing.

5. SCC Test Requirements. Perform acceptance tests on plastic SCC mix as follows:

5.a Before placement of SCC, obtain acceptance of a Field Operation QC Plan as specified in Section 704.1(d)1.a.

5.b Provide a Concrete Field Testing Technician as specified in Section 704.1(d)2 during placement of concrete to perform the required acceptance testing.

5.c Conduct concrete tests as specified in Table A.

6. Field added admixtures. For SCC mixes, high range water reducers and/or viscosity modifying admixtures may be added in the field following the manufacturer's recommendations. Submit a QC plan for acceptance. Clearly identify the process for incorporating the admixtures in the field in the QC Plan and include a personnel matrix listing names and titles of individuals involved in the field addition process. A representative of the admixture supplier is required to be onsite during the mock batch and initial production placement.

7. Lot Size for Concrete Acceptance. For SCC mixes, the lot size is 100 cubic yards or less. Mold a minimum of four concrete test cylinders for each lot placed. Mold additional test cylinders for Department acceptance testing if directed. Test cylinders according to PTM No. 604. Match-mark test cylinders with the lot represented. Record test results and give records to the Representative.

8. Finishing. Finish exposed concrete free from open and rough areas, and free from depressions and projections. Do not add water or curing agents to the concrete surface to assist in finishing. Ensure the top elevation of the caisson is within plus 1 inch or minus 3 inches of the indicated top elevation.

(i) Casing Removal. If temporary casing is used, withdraw each section, except the final section, in partial stages, as concrete is deposited, at a rate that keeps the bottom of the casing below the top of the fresh concrete. During removal, ensure that there is no reduction in shaft cross-section and that displacement of steel reinforcement is less than 2 inches upward and less than 2 inches downward per 20 feet of shaft length. Maintain the specified 3 inch reinforcement bar clearance at bearing level and on the sides during casing removal. If observations indicate otherwise, reduce the rate of casing removal and establish a head of concrete within the casing sufficient to offset the forces tending to cause concrete arching or displacement of the reinforcing cage. As concrete is deposited, withdraw the final section of casing to a point 2 feet below existing ground elevation and allow it to remain for approximately 2 hours, depending on the temperature. Then, completely withdraw the section or cut it off flush with existing ground. If cavities or unstable materials are encountered and the danger exists of losing concrete or of the concrete becoming mixed with extraneous material, cut off the casing at the top of shaft elevation and leave in place.

When temporary casing is used to form caisson above the ground surface or in open water, remove the casing at the prescribed elevation after the drilled caisson has been completed and the concrete has attained sufficient strength so as not to be damaged as specified in Section 1001. If split casings, forms or other special casing systems are proposed for use in open water, design the casing or forms to be watertight and to prevent damage to the finished concrete during their removal.

(j) Caisson Integrity Testing. Use the TIP method as the primary test method to verify the integrity and homogeneity of each drilled caisson. In the event of an equipment malfunction, loss of data, or other conditions that results in a failure to produce acceptable TIP data, perform CSL Testing at no additional cost to the Department.

Retain a qualified independent testing agency(ies) to perform TIP testing according to ASTM D7949, and CSL testing according to ASTM D6760. Prepare and label thermal wires and CSL tubes according to the respective ASTM standards as if both tests were required.

Provide caisson integrity testing for sign structure, sound barrier, and highway lighting caisson foundations operated by qualified individuals only when indicated.

Log TIP data for a minimum of 96 hours immediately following concrete placement at each drilled caisson. Provide safe and secure access for the Representative and TIP testing agency representative during TIP data logging at each drilled caisson.

Submit TIP reports and evaluations to the Representative within 5 calendar days of completion of TIP testing at each caisson. The TIP results will determine conformance with diameter and quality requirements or if additional testing is necessary.

If the Representative does not accept the drilled caisson based on the TIP test results, or if the TIP method fails to produce acceptable data, perform CSL testing to evaluate the quality of the drilled caissons. Do not perform CSL testing until a minimum of 96 hours after concrete placement, but before 10 calendar days after placement. Do not perform CSL testing until the concrete has gained sufficient strength for a satisfactory test.

Perform CSL testing in the presence of the Representative. Submit CSL reports and evaluations to the Representative within 5 calendar days of completion of CSL testing at each caisson tested. The CSL results will then be used to determine the integrity and acceptability of each drilled caisson tested. CSL is backup testing and is incidental to TIP testing.

(k) Integrity Testing Results. Prepare a drilled caisson integrity testing report for each caisson. At a minimum, include the following in the report:

- Date of test.
- Description of the testing apparatus unit and probes.
- Identification of testing agency and person responsible for the validity of the test report.
- Identification and location of shaft.
- As-built geometry of shaft including nominal and/or actual diameter and length.
- Arrangement and identification of access tubes and wires, relative separation of tubes and wires, and identifying designation documentation.
- Documentation of water removal and replacement in access tubes, if applicable.
- Thermal profiles including the access location for each profile with temperature and depth axes and scales allowing clear data interpretation (TIP).
- Report any failure of the probes to penetrate the full depth of the access tubes (CSL, if applicable).
- Initial pulse arrival time or compression wave velocity versus depth (CSL, if applicable).
- Pulse energy/amplitude versus depth (CSL, if applicable).
- A log that presents results for each tube/wire pair tested with any anomaly/defect zones indicated on the log and discussed in the report as appropriate.
- Analysis, evaluation, and summary of any defect zones indicated on the logs with recommendations regarding acceptability and soundness.

(l) Evaluation of Integrity Test Results. Based on the results of the drilled caisson integrity testing reports and other information on the drilled caisson construction, the Representative will decide if each drilled caisson is accepted.

The Representative may allow the construction of additional drilled caissons to continue before acceptance of the completed drilled caisson, if observations of the drilled caisson construction, integrity testing, and other information are satisfactory.

Acceptance criteria of the drilled caisson based on the test results will be determined by the Representative according to guidance set forth in FHWA Publication No. FHWA-NHI-18-024 dated September, 2018.

1. **TIP Results.** Measurements showing a non-uniform temperature distribution will be considered anomalous. Anomalies identified by the TIP results will require further investigation. Perform CSL testing or core drilling as further investigation methods.
2. **CSL Results.** CSL results will be evaluated based upon the following criteria.
 - A Good test cannot exhibit reductions in relative velocities of greater than 10%, and cannot exhibit any reductions in relative signal strength energies of greater than 6 dB. These caissons are accepted provided that no other indicators of potential defects have been identified by other means or test methods.
 - A Questionable test exhibits a reduction in relative velocities of greater than 10% but less than 20%, or a reduction in relative signal strengths of greater than 6 dB but less than 9 dB. In no case can the reduction in relative velocity exceed 20%, nor can the reduction in relative signal strength exceed 9 dB. Submit for acceptance, sufficient justification with supporting evaluation, analysis, or testing. The Representative reserves the right to reject the caisson based on CSL or other non-destructive testing and subsequent justification, and to require additional analysis and/or testing, or verification by core drilling.
 - A Poor test exhibits a reduction in relative velocities greater than 20%, or a reduction in relative signal strengths of greater than 9 dB. These caissons will be rejected and require verification by core drilling.

If the review of the caisson integrity test results determine that a drilled caisson is acceptable, dewater the tubes at the accepted caisson location and fill with nonshrink grout having a strength equal to or greater than the 28 day compressive strength of the concrete used in the caisson.

(m) Evaluation by Core Drilling. If the Representative does not accept a drilled caisson based on the integrity test results and/or other non-destructive testing, verify the drilled caisson conditions using concrete coring.

Core drilled caissons using HQ double-tube core barrels, with a split inner barrel, to core drilled caissons that have been rejected. Provide a PennDOT certified drilling inspector for this work. Drill one or more core holes at the location(s) determined by the Representative. Adjust coring procedures and the length of coring to maximize recovery and quality of cored material. Provide continuous core sampling. Keep an accurate log of the core and box and properly mark the core according to Publication 222, showing the drilled caisson depth at each interval of core recovery. Submit the core and Field Inspector's Boring Log within 24 hours of the completion of the coring.

If the quality of the caisson, as represented by the core samples, is determined to be acceptable by the Representative, grout the hole using tremie procedures with nonshrink grout having equal to or greater strength than the concrete used in the caisson, before proceeding with further construction. If testing and inspection of cores indicates that concrete meets specifications, coring and grouting will be paid for as specified in Section 1006.4(i).

If a defect is confirmed, investigative coring will be at no additional cost to the Department. Submit a corrective action plan for repair for approval. Engineering evaluations and any modifications to the drilled caisson and load transfer mechanisms caused by the repair will require calculations and working drawings stamped by a Professional Engineer registered in the State for foundation elements affected. Do not begin repairs until notified that the proposed corrective action plan is approved by the Representative. Provide test data on the repaired drilled caisson that confirm the integrity of the repair. Perform corrective action engineering, evaluation, design, repairs, and provide test data on the repaired caisson at no additional cost to the Department with no extension of contract time.

If this information is not sufficient for a proper judgment, the Representative will reserve the right to order an inspection by other methods either through a separate specialty subcontractor or through the Contractor at no additional cost to the Department with no extension of contract time.

(n) Records. Prepare and submit detailed inspection reports for each drilled caisson, and include the following information:

1. Drilling Records. Submit within 24 hours of completion of drilling.

- Accurate location and dimensions of the excavation.
- Accurate top and bottom elevations.
- Measurement data for plumbness.
- Methods of excavation used.
- Description of materials encountered during excavation.
- Description of groundwater conditions encountered.
- Description of obstructions encountered and whether or not obstruction removal was achieved.
- Description of temporary or permanent casing placed including purpose, length, and wall thickness, and anchorage or sealing methods used, if any.
- .
- Elevation at which the top of rock was encountered and description of rock.
- Elevation at which bearing material was encountered. Description of bearing material. Probe holes made, along with method of probing, rate of drilling in rock, samples taken, tests made, and conclusions reached regarding adequacy of bearing material.
- Shaft, bell footing, and rock socket measurements.
- Downhole camera inspection data.

2. Concrete Placement Records. Submit within 24 hours of concrete placement.

- Description of clean-out methods, adequacy of initial clean-out, and final clean-out just before concrete placement.
- Record of depth of water in excavation and rate of water infiltration before concrete placement.
- SID inspection data.
- Record of reinforcing steel inspection for position and adequacy.
- Method of concrete placement and casing removal, if any. Record of concrete head and elevation during removal of casing. Record of concrete elevation when vibration started. Also, include when temporary casing was removed from hardened concrete.
- Difficulties encountered including soil inclusion, voids, shaft squeeze-in, and casing collapse.
- Concreting curves showing actual versus theoretical volume of concrete required to fill caisson excavation. Concrete curing details. Concrete strength test results. Include volume of concrete placed to the bottom of permanent casing, top of permanent casing, and top of the drilled caisson.
- Condition of concrete delivered to site including record of slump, density, air content, and other tests. Record of cylinders made for compression testing.

3. Integrity Testing Reports and Evaluation. Submit within 5 calendar days of completion of testing.

- TIP results.
- CSL results, if applicable.
- Core drilling logs and photographs of core samples
- Any deviations from the specifications.

1006.4 MEASUREMENT AND PAYMENT—

(a) Drilled Caissons, Shaft Section.

1. Shaft Section in Soil. Linear Foot

Measured from the shaft top to the top of rock.

2. Shaft Section in Rock. Linear Foot

Measured from the top of rock to the shaft bottom.

(b) Drilled Caissons, Bell Footing. Each

(c) Drilled Caissons, Rock Socket. Linear Foot

Measured from the shaft bottom to the socket bottom. For uneven rock surfaces, measure length of rock excavation from the rock surface at shallowest depth to the socket bottom.

(d) Permanent Casing for Drilled Caissons. Linear Foot

The Department will measure and pay for temporary casing left in place, as specified in Section 1006.3(i), as permanent casing.

(e) Test Holes. Linear Foot

Augering through overburden, from existing ground surface to the elevation at which NW (NX) core boring is to begin (bottom of caisson or rock socket excavation as specified in Section 1006.3(c)), is incidental to this work.

(f) Probe Holes. Linear Foot

(g) Obstructions. Linear Foot

The unit price includes mobilization of drilling equipment.

(h) TIP. Each

The unit price for each drilled caisson includes work associated with the TIP test and reporting. Grouting of access tubes is incidental to this item.

(i) HQ Coring. Linear Foot. The unit price includes drilling, inspection and reports. HQ coring will only be paid if quality of the caisson, as represented by the core samples, is determined to be acceptable. Grouting of cored concrete is incidental to this item.

SECTION 1007—MICROPILES

1007.1 DESCRIPTION—This work is the furnishing of materials, tools, equipment, and labor for the installation of micropiles. This includes test micropiles, production micropiles, and load testing. A micropile is a small-diameter, bored, cast-in-place composite pile, in which the applied load is resisted by steel reinforcement, cement grout and frictional grout-ground bond.

The following definitions apply:

(a) **Alignment Load (AL).** A minimum initial load, no greater than 5% of the design load, applied to the micropile during testing to keep the testing equipment correctly positioned.

(b) **Centralizer.** A device to support and position the reinforcing steel in the drill hole and casing so that a minimum grout cover is provided.

(c) **Mechanical Splice System.** Component that transmits load capacity from one partial length of reinforcement to another.

(d) **Creep Movement.** The movement that occurs during the portion of the micropile load test that applies a sustained loading over a relatively long period of time.

(e) **Design Load (DL).** Anticipated maximum service load in the micropile.

(f) **Load Test.** Incremental test-loading of a pile that includes the measurement and recording of the total movement at each load increment.

(g) **Maximum Test Load.** The maximum load to which the micropile is subjected during testing.

(h) **Post-Grouting.** The high-pressure injection of additional grout into the load transfer length of a micropile after the primary grout has set.

(i) **Primary Grouting.** Portland-cement-based grout placed into the micropile hole before or after the installation of the reinforcement to transfer the load to the surrounding ground along the pile.

(j) **Proof Load Test.** Testing of a production pile performed to prove load resistance.

(k) **Spacer.** A device to separate elements of a multiple-element reinforcement.

(l) **Test Pile.** A pile constructed to confirm installation methods and validate contractor technique, evaluate micropile capacity with depth, and establish contractor micropile order lengths.

(m) **Verification Load Test.** Testing of a test pile performed to verify design and load resistance.

1007.2 MATERIAL—

(a) **Grout.** Provide a neat-cement grout or sand-cement grout with a minimum 3-day compressive strength of 2,000 pounds per square inch and a minimum 28-day compressive strength of 5,000 pounds per square inch according to AASHTO T106. Determine material proportions with adequate flowability without causing segregation at the end of the grout tube.

(b) **Water.** Section 720.1.

(c) **Fine Aggregate.** Type A, Section 703.1.

(d) Cement. Use Type I, II, or III cement, manufactured according to ASTM C150 and as specified in Section 701.

(e) Admixtures. Section 711.3. When approved by the Representative, admixtures may be used according to the manufacturer's recommendations to control bleed, reduce shrinkage, improve flowability, reduce water content, or retard setting time. Accelerators and admixtures containing chlorides are not permitted.

(f) Reinforcement Bar. Section 709. Provide solid, continuous deformed reinforcing steel bars according to AASHTO M31, Grade 75. Bars with full-length thread meeting the same material requirements are allowed. Provide bars clean of deleterious substances. When mechanical splice systems are required, they must develop the ultimate tensile strength of the bars and maintain the required grout cover over the splices.

(g) Casing. Steel pipe casing according to API 5CT or 5L Grade N80, or meet the Tensile Requirements of ASTM A-252 Grade 3 with an elongation of 15 percent and have a minimum yield strength of 50 ksi to 80 ksi as used in the design submittal. Pipe casing diameter and minimum wall thickness as indicated. Pipe casings from 5 inches to 12 inches in diameter will be considered micropiles. Material with visual defects such as dents, cracks or tears will be rejected.

Use of material classified as mill secondary is acceptable when tests are performed verifying tensile strength and steel chemical composition.

Provide flush-joint type pipe casing splices, threads and joints. Threaded casing joints and welded joints must develop at least the required compressive, tensile, and bending strength used in the design of the micropile.

For permanent pipe casing seams and splices that will be shop or field welded the following fabrication and material conditions apply:

- Maximum carbon equivalency (CE) of 0.45, according to AWS D1.1 as specified in Section 1005, and according to mill certification.
- Maximum sulfur content 0.05%, according to mill certification.
- Use only complete penetration welds.
- Do not use welded lap splicing.

(h) Welding Material. Section 1105.2(t). Visual Inspection only.

(i) Centralizers and Spacers. Fabricate centralizers and spacers from PVC, steel, or other acceptable material that is non-detrimental to the reinforcing steel or grout. Do not use wood or aluminum.

1007.3 CONSTRUCTION—

(a) Qualifications. Construct the micropiles with a supervisor and workforce experienced in the construction of micropiles, and meeting the following qualifications:

- Micropile contractor has completed at least five projects that demonstrate experience in the construction of micropiles.
- Employ a Professional Engineer registered in the State, with at least 3 years of experience in the design and construction of micropiles and pile load test systems, who is to design the system, verify the proper construction of the testing system and the piles, and certify the test results.
- Employ drill operators and on-site supervisors each having at least 3 projects within the last 5 years of experience in micropile construction in similar site and soil conditions.

(b) Pre-Construction Submittals. Provide the required submittals as specified in Section 105.02 at least 21 calendar days before planned micropile construction. Begin micropile work only after all construction submittals have been received, reviewed, and accepted in writing by the Representative.

1. Qualifications Report. Submit the required company qualifications according to Section (a). List the company names of consultants or manufacturers, and provide the names of the applicable personnel as follows:

- List at least five completed projects that, together, demonstrate the required experience in the construction of

micropiles. Experience must include all phases of micropile construction, from start to finish. Include a brief description of each project, and the name and telephone number of owner's representative knowledgeable in each project listed.

- The Professional Engineer who is to design the system, verify the proper construction of the testing system and the piles, and certify the test results.
- List of drill operators and on-site supervisors that will be under the direction of the Professional Engineer.

2. Mill Test Reports. Certified reports for the reinforcing steel and for steel pipe casing. Include the ultimate strength, yield strength, elongation, and material properties composition. For mill secondary pipe casing, coupon test results may be submitted instead of mill certification. Provide testing results for two coupons per 500 linear feet of casing for each lot of mill secondary casing delivered to project site.

3. Welding Procedure. If welding of casing is proposed, submit the Welding Procedure Qualification Record along with Welding Procedure Specifications according to AWS D1.1, Structural Welding Code, to the Structure Control Engineer for acceptance.

4. Calibration Reports. Verify calibration for each test jack and pressure gauge to be used. Perform calibration tests by an independent testing laboratory within 6 months before use.

5. Grouting Plan. Include complete descriptions and details in the grouting plan for the following:

- Grout mix design. Include type of materials used, certified test data, trial batch reports, and density of the wet mix. In addition to a planned standard mix design, include data for modified mix design(s) containing fine aggregate or admixtures that may be needed to control excessive grout loss.
- Methods and equipment for accurately monitoring and recording the grout depth and volume as the grout is being placed.
- Procedure and equipment for monitoring grout quality. At a minimum, immediately before grout placement, measure the density of mixed grout from each batch or truckload using a mud balance, according to API RP-13B-1.
- Estimate curing time for installed grout to achieve the specified minimum 3-day strength. Previous test results for the proposed grout mix completed within one year of the start of grouting may be submitted for initial verification and acceptance and start of production work. Any previous test results must have used the same materials and proportions as the proposed mix design.
- Method to control and dispose of surface water, groundwater, and excess waste grout generated by the work.

6. Load Testing Plan. Provide a plan sealed by the Professional Engineer that details the proposed micropile load testing method. Include drawings, details, and structural design calculations necessary to clearly describe the proposed test method, reaction load system capacity and equipment setup, types and accuracy of apparatus to be used for applying and measuring the test loads and pile top movements according to this specification. The Professional Engineer must verify that the load test system is constructed correctly and the testing is done according to the approved plan.

7. Work Plan for Installation of Micropiles. Submit Working Drawings, in accordance with Section 105.02(c), showing proposed sequence of pile installation, including pile number and location. Define the personnel, equipment, and materials to ensure quality control. Provide step by step description of the proposed procedures to be used to install the micropiles. Provide sufficient detail to allow the Representative to monitor the construction and quality of the micropiles. Include information on headroom and space requirements for installation equipment, which verify that the proposed equipment can perform at the site.

(c) Excavation. Coordinate work so the micropile structures are properly constructed. Perform the micropile construction and related excavation as indicated, and according to the approved submittals.

(d) Drilling. Use drilling equipment and methods suitable for the conditions encountered. Do not damage adjacent or overlying facilities, structures, or newly installed piles. Provide an open borehole free of loose material and of minimum diameter and length as indicated, before placing reinforcement and grout. Do not use bentonite-based muds or other drilling slurries that adversely affect the grout to rock bond.

(e) Casing and Reinforcement. Extend top of steel pipe casing a minimum of one foot above the adjacent ground to avoid water and other drill material from entering and contaminating the drillhole. Lengths of casing and reinforcing bars to be spliced shall be secured in proper alignment and in a manner to avoid eccentricity or angle between the axis of the two lengths to be spliced. Splices and threaded joints shall meet the requirements of the reinforcement. Threaded pipe casing joints shall be located at least two casing diameters (OD) from a splice in any reinforcing bar. When multiple bars are used, bar splices shall be staggered at least 12 inches.

Bar reinforcement groups, if used, shall be sufficiently strong to withstand the installation and grouting process without damage or displacement. Use only threaded couplers for bar reinforcement splices. Bars must be threaded sufficiently into the couplers to develop the full tensile strength of the bar. Do not weld bar reinforcement.

Bar reinforcement may be placed before or after the drillhole grout is placed. If placing bar reinforcement before grouting, first perform sufficient visual inspection or water retention testing of the borehole, or both to ensure the pile can be fully grouted. Lower the bar reinforcement steel with centralizers into the stabilized drillholes to the desired depth. Do not drive or force partially-inserted reinforcing bars into the drillhole. Provide centralizers at 10-foot maximum spacing on bar reinforcement. Locate the upper-most and lower-most centralizers 3 feet maximum from the top and bottom of the central reinforcement. Use no less than 3 centralizers per micropile. If steel is placed first, centralizers must allow insertion of grout tremie pipe to the bottom of the drillhole. Securely attach and position centralizers and spacers to the reinforcement; sized and positioned to allow grout to flow freely and entirely within the length of the drillhole and casing, and between adjacent reinforcing bars without causing misalignment of the reinforcement.

(f) Grouting. Use verifiable means and methods of measuring the grout quality, quantity and pumping pressure during the grouting operations. Determine and schedule adequate installation methods such that there will be no grout communication between boreholes or damages to micropiles in which grout has not achieved final set. Keep and provide records for inspection by the Representative that show the quantities, test data, and grout pressures as indicated.

After drilling is complete and immediately before grouting, assure the drillhole is free of drill cuttings and loose debris. Clean the final drillhole by flushing with air or water if necessary. When in a karst geology, protect groundwater and surface water quality during drilling and grouting. When significant voids are encountered within the bonded zone, stop installation activity and notify the Representative. When voids greater than 12 inches are encountered, or grout takes begin to exceed 200% of the neat theoretical borehole volume, be prepared to take immediate measures to control grout take by modifying the grout mix or placement, or both, as detailed in the approved Grouting Plan.

Provide neat-cement or sand-cement grout meeting the specified minimum unconfined compressive strengths that is colloiddally-mixed, completely and thoroughly disbursed, free of clumped cement or sand. Use a mixer capable of continuous agitation of the grout. Use a progressing cavity pump capable of developing sufficient pressures and flow rates.

Monitor grout consistency and delivery pressures with a pressure gauge equipped pump. The pressure gauge must be capable of measuring pressure twice the actual grout pressures used. Size the grouting equipment to enable the grout to be pumped in one continuous operation. Estimate the required grout take volume needed based on borehole dimensions and geologic conditions.

In the presence of the Representative, test grout cube samples for compressive strength according to AASHTO T106 at a frequency of no less than one set of three 2-inch grout cubes from each grout plant each day of operation or every 10 micropiles, whichever occurs more frequently. The compressive strength for acceptance is considered the average of the cubes tested. Provide compressive strength and density test results to the Representative within 24 hours of testing.

Place primary grout in one continuous operation within 24 hours after the load-transfer (rock bond zone) length is drilled. Place the grout by tremie tube method only, to deliver grout from the lowest point of the drill hole. Use pumping pressure only as required to aid grout delivery through the tremie tube, countering the flow resistance within the tube. Grout take should mimic gravity-head placement. Control grout delivery pressures to prevent fracturing of the adjacent rock and soil formations and ground heave. If the tremie is withdrawn as the grouting progresses, extract it incrementally that the tube remains extended a minimum of 3 feet below the wet grout level in the micropile. If the tremie tube remains permanently within the pile, it must be filled with grout. Fill the entire rock socket and the annulus between the rock and casing with grout without voids from the pile bottom to the top of the rock plunge depth. Continue grout placement until uncontaminated grout flows from the top of the micropile.

If excessive grout loss into subsurface voids prevents a fully-grouted pile, allow the first stage of primary grout to set a minimum of 18 hours before redrilling the grouted zone to the bottom of the pile. Take measures to minimize quantities of both grout loss and redrilling. Redrill to a diameter equal to the nominal inside diameter of the micropile casing. Grout the entire micropile with a second stage of primary grout until grout flows from the top of the micropile. If the grout level drops below the designed cut-off level due to seepage or shrinkage, top off with additional grout.

High-pressure post-grouting methods employed after the primary grouting/regrouting are not allowed unless approved by the Chief Bridge Engineer.

Check the micropile top elevations and cut off installed piles to plan elevations.

(g) Site Drainage Control. Control surface water, drill flush water, and excess grout such that entry into the micropile drill holes is prohibited. Dispose of these fluids as indicated and according to local, state, and federal regulations and standards.

(h) Tolerances. Install micropiles within the following tolerances:

- Center of top of pile within 2 inches of the indicated planned pile center location.
- The pile alignment within 2% of the specified alignment (vertical or specified batter) for the entire length of the pile.
- Pile top vertical elevation within plus 1 inch to minus 1 inch of the design top of pile elevation including required pile embedment in footing.
- Center of the entire length of reinforcement bar or bar group within 0.5 inches from the center of the micropile.

(i) Micropile Damage. Replace, in a manner acceptable to the Representative, piles deemed unacceptable due to improper or inadequate construction or due to damage caused by the Contractor. Before making a modification which requires changes to the design or construction of the structure, the Representative must review the modification and accept in writing.

(j) Load Testing. Notify the Structure Control Engineer at least 7 calendar days before beginning the installation and testing of any micropile scheduled for load testing. The grout within a micropile must attain the minimum required 3-day compressive strength of 2,000 pounds per square inch before performing the load testing.

Design and construct the test reaction frame to be sufficiently rigid and of adequate dimensions such that excessive deformation of the testing equipment does not occur, and settlement of the apparatus does not occur for the duration of the test. Reaction testing that utilizes weighted-frames or crib-type frames must not cause instabilities in supporting ground or adjacent embankment slopes, and must not cause settlement during the load test. An analysis may be required to verify ground and slope stability during loading imposed by the weighted or cribbed test platforms.

During test set-up, align the testing jack, bearing plates, and stressing anchorage such that unloading and repositioning will not be required during the test. An AL may be applied to the micropile before setting the movement recording devices. Zero the dial gauges at the first setting of AL.

Perform the required Verification Load Testing by loading piles in compression at the loads and increments in Table A.

TABLE A
Verification Test Loading Schedule

Cycle	Step	Applied Load	Hold Time (minutes)
Apply AL	1	AL	2.5
Load Cycle 1	2	0.15 DL	2.5
	3	0.30 DL	2.5
	4	0.45 DL	2.5
	5	AL	1
	6	0.15 DL	1
Load Cycle 2	7	0.30 DL	1
	8	0.45 DL	2.5
	9	0.60 DL	2.5
	10	0.75 DL	2.5

	11	0.90 DL	2.5
	12	1.00 DL	2.5
	13	AL	1
Load Cycle 3	14	0.15 DL	1
	15	1.00 DL	1
	16	1.15 DL	2.5
	17	1.30 DL	10 to 60*
	18	1.45 DL	2.5
	19	AL	1
Load Cycle 4	20	0.15 DL	1
	21	1.45 DL	1
	22	1.60 DL	1
	23	1.75 DL	2.5
	24	1.90 DL	2.5
	25	2.00 DL	10
	26	1.50 DL	5
	27	1.00 DL	5
	29	0.50 DL	5
	30	AL	5

*The verification test pile shall be monitored for creep at the 1.30 DL. Pile movement during the creep test shall be measured and recorded at 1, 2, 3, 4, 5, 6, 10, 20, 30, 50, and 60 minutes.

Tension load testing for verification according to the loading shown in Table A is allowed in place of compression load testing if indicated on the contract drawings. The tension load test method, if used, requires the reinforcing bar to be sized to handle the test loads, and the bar length must extend adequately above the micropile to allow proper coupling with the load cell. If upsizing the reinforcement bar is needed to complete the tension testing, the larger bar size is not required to be used in the production piles.

Within 24 hours of completing a load test, submit a summary report to the Structure Control Engineer that includes time-load settlement data. Indicate in the report if micropile has passed or failed the load test.

1. Case 1: Verification Load Testing

Perform Verification Load Test on a test micropile as indicated, or as directed by the Structure Control Engineer. Verification Load test the first production pile installed at each designated substructure unit before the installation of the remaining piles in that unit. Two additional production piles may be installed to serve as reaction piles for the test.

The acceptance criteria for the Verification Load Test are:

1.a The pile must sustain the DL with no more than 0.75 inches of total vertical movement at the top of the pile as measured relative to the top of the pile before the start of testing. If an alignment load is used, then the allowable movement will be reduced by multiplying by a factor of (DL-AL)/DL.

1.b Test piles must have a creep rate at the end of the 1.3 DL increment which is not greater than:

- 1/32 inch/log cycle time (1 to 10 minutes), or
- 1/16 inch/log cycle time (6 to 60 minutes) and has a linear or decreasing creep rate.

1.c Failure does not occur by 2.0 DL. Failure is defined as a slope of the load versus deflection curve (at end of increment) exceeding 0.025 inch/kip.

Submit the Verification Load Test time-load settlement data and graphical representations of the data which show the acceptance criteria and the actual test data of the pile being load tested to the Structure Control Engineer and District Geotechnical Engineer. For test piles, the test results must be reviewed and accepted by the Structure Control Engineer

before beginning the construction of any production piles represented by the test pile. The drilling and grouting methods, pipe casing, grout, and minimum depth of embedment of the production micropiles must be identical to those of the accepted verification test micropile.

If a verification-tested micropile fails to meet the acceptance criteria, modify the construction procedure. Modifications may include, but are not limited to, modifying the installation method, installation equipment, or installed material as required to achieve acceptable verification tests. Submit proposed modifications of the accepted Work Plan to the Structure Control Engineer and the Designer for review and acceptance.

Costs resulting from any micropile construction procedures that deviate from the accepted Work Plan, and the associated costs of additional verification testing, will be at the Contractor's expense. Any modifications of the micropile design that are due to changes or limitations in equipment or material will be at the Contractor's expense. These modifications include, but are not limited to, changes to maximum load, bond length, or micropile type, size or spacing. The Structure Control Engineer's and the Designer's prior review and acceptance is required for any modification that necessitates changes to the structure.

If a verification load tested pile fails to meet the acceptance criteria, immediately verification-test another micropile within the footprint of that substructure unit using the accepted modified criteria. At the completion of verification testing, remove the failed micropile down to a minimum of 2 feet below the bottom of the pile cap elevation.

2. Case 2: Verification Load Testing and Proof Load Testing.

Case 2 Verification and Proof Load Testing is intended for micropiles in highly variable geology, or for verifying consistency of sizeable micropile capacity. If load testing is conducted according to Case 2, micropile details such as bond lengths may be adjusted according to the grout-to-ground bond values from the results of the verification testing and supporting approved design calculations.

2.a Verification Load Testing

Perform test in accordance with 1007.3(j)1 Case 1.

Submit design calculations, prepared by a Professional Engineer licensed in the State for any proposed modifications to the micropile details, including modifications to the bond length or diameter which may result from the results of the micropile Verification Load Test for approval. If a verification tested micropile fails to meet the acceptance criteria, propose modifications to the design, the construction procedure, or both. Include a copy of the Verification Load Test results with the submittal containing proposed modifications. The submittal containing modifications to the micropile details is incidental to the micropile item. A subsequent pile redesign requires an additional Verification Load Test to be completed and passed to determine the grout-to-ground bond strength of the redesigned pile.

The as-designed pile cannot be modified based on the results of the Verification Load testing without the approval of the District Bridge Engineer.

2.b Proof Load Testing

After Verification Load Tests are performed and proposed modifications to the micropile details are approved by the District Bridge Engineer, perform Proof Load tests at the micropile locations indicated on the plans, or as directed by the Structure Control Engineer. Proof Load test the first post-verification load tested production pile installed at each designated substructure unit before the installation of the remaining piles in that unit. Two additional production piles may be installed to serve as reaction piles for the test. Submit the Proof Load Test time-load settlement data and graphical representations of the data which show the acceptance criteria and the actual test data of the pile being load tested to the Structure Control Engineer and District Geotechnical Engineer. The Proof Load Test results must be reviewed and accepted by the Structure Control Engineer before beginning the installation of the remaining piles for a given pile group or substructure represented by the proof-tested pile. The drilling and grouting methods, pipe casing, grout, and minimum depth of embedment of the production micropiles must be identical to those of the accepted proof-tested micropile.

Perform the required Proof Load Testing by loading piles in compression at the loads and increments in Table B.

TABLE B
Proof Test Loading Schedule

Cycle	Step	Applied Load	Hold Time (minutes)
--------------	-------------	---------------------	--------------------------------

Apply AL	1	AL	2.5
Load Cycle	2	0.15 DL	2.5
	3	0.30 DL	2.5
	4	0.45 DL	2.5
	5	0.60 DL	2.5
	6	0.75 DL	2.5
	7	0.90 DL	2.5
	8	1.00 DL	2.5
	9	1.15 DL	2.5
	10	1.30 DL	10 to 60*
	11	1.45 DL	2.5
	12	1.60 DL	2.5
Unload Cycle	13	1.30 DL	4
	14	1.00 DL	4
	15	0.75 DL	4
	16	0.50 DL	4
	17	0.25 DL	4
	18	AL	4

*Depending on performance, either a 10-minute or 60-minute creep test shall be performed at the 1.30DL Test Load. Where the pile top movement between 1 and 10 minutes exceeds 0.04 inches, the 1.30DL Test Load shall be maintained an additional 50 minutes. Movements shall be recorded at 1, 2, 3, 5, 6, 10, 20, 30, 50 and 60 minutes.

The acceptance criteria for the Proof Load test are:

2.b.1 The pile must sustain the DL with no more than 0.75 inches of total vertical movement at the top of the pile as measured relative to the top of the pile before the start of testing. If an alignment load is used, then the allowable movement will be reduced by multiplying by a factor of (DL-AL)/DL.

2.b.2 Test piles must have a creep rate at the end of the 1.3 DL increment which is not greater than:

- 1/32 inch/log cycle time (1 to 10 minutes), or
- 1/16 inch/log cycle time (6 to 60 minutes) and has a linear or decreasing creep rate.

2.b.3 Failure does not occur by 1.6 DL. Failure is defined as a slope of the load versus deflection curve (at end of increment) exceeding 0.025 inch/kip.

For failed micropiles and further installation of other micropiles, modify the construction procedure. Modifications may include, but are not limited to, revising the installation method, the installation equipment, the installed material, installing replacement micropiles, or incorporating micropiles at not more than 50% of the maximum load attained. Costs for modifications due to non-performance of the accepted Work Plan will be at the Contractor's expense, including modifications to installation procedures, additional production micropiles, additional verification tests and verification and/or proof load testing. Submit variations from the approved Work Plan to the Structure Control Engineer and the Designer for review and acceptance.

Any modifications of the micropile design that are due to changes or limitations in equipment or material will be at the Contractor's expense. These modifications include, but are not limited to, changes to maximum load, bond length, or micropile type, size or spacing. The Structure Control Engineer's and the Designer's prior review and acceptance is required for any modification that necessitates changes to the structure design.

If a proof-tested micropile fails to meet the acceptance criteria, immediately proof test another micropile within the footprint of that substructure unit using the modified criteria. Re-submit the Proof Load Test time-load settlement data and graphical representations of the data which show the acceptance criteria and the actual test data of the pile being load tested to the Structure Control Engineer. At the completion of proof testing, remove any failed micropiles down to a minimum of 2 feet below the bottom of the pile cap elevation, at no additional cost to the Department.

(k) Installation Report. Within 28 calendar days after completion of the micropile construction, submit a pile

installation report to the Structure Control Engineer for acceptance. The report must be sealed by a Professional Engineer licensed in the State. Include written confirmation that the test load system was properly constructed, the tests were completed correctly, and the test piles have met the required acceptance criteria. Provide a separate log for each micropile that includes the following:

- Pile identification.
- Pile materials and dimensions.
- Pile drilling start and finish times along with drilling observations.
- Description of soil, rock and water encountered.
- Actual pile location.
- Actual top of rock elevation.
- Final tip elevation.
- Cut-off elevation for top and bottom of casing.
- Grout pressure measurements.
- Grout quantities pumped, including start and finish times.
- Grout cube compression test results.
- Description of unusual installation behavior or conditions.
- Deviation from plans or planned parameters.
- Load testing time-load settlement data and graphs, including items required by ASTM D1143.
- Comparison of load testing results and acceptance criteria.

1007.4 MEASUREMENT AND PAYMENT-

(a) Micropiles. Linear Foot.

Measured from the micropile tip elevation (bottom of the bonded zone) to the final cutoff elevation (top of the casing) for accepted test micropiles and production micropiles. Includes compensation for labor, materials, equipment and incidentals necessary to perform the intended work to complete micropile installation. Includes temporary casing if required and drilling through, soil, rock, concrete and obstructions. No payment will be made for reaction piles installed solely to provide reaction loads for the verification testing of a test pile.

The Representative will reject micropile(s) because of mis-location, misalignment, damage, or failure to meet other installation criteria. No payment will be made for rejected piles. Replace rejected piles as directed.

(b) Verification Load Test. Each.

Payment will be lump sum per each including all testing apparatus design and analysis, furnishing and placing materials, furnishing, erecting, maintaining, and replacing equipment, and for labor and incidentals necessary to complete the verification testing and installation report as specified. No payment will be made for a Verification Load Test when the contractor has not performed the Verification Load Test in accordance with this specification, or when a load test fails due to improper pile construction.

(c) Proof Load Test. Each.

Payment will be lump sum per each including all testing apparatus design and analysis (if it differs from Verification Load Test apparatus design and analysis), furnishing and placing materials, furnishing, erecting, maintaining, and replacing equipment, and for labor and incidentals necessary to complete the proof testing and installation report as specified. No payment will be made for Proof Load Test when the contractor has not performed the Proof Load Test in accordance with this specification, or when a load test fails due to improper pile construction.

(d) Grout. Cubic Foot.

Grout in excess of two (2) times the neat theoretical volume of the drill hole. Grout volume includes primary first-stage, primary second-stage, and top-off grout, if required. Any grout required to fill the pile that is less than two times the neat volume is considered incidental to the micropile.

(e) Redrilling. Linear Foot.

Measured from the top of the first stage of primary grouting to the bottom of the redrilling.

SECTION 1008—PREFORMED NEOPRENE COMPRESSION JOINT SEAL FOR BRIDGES

1008.1 DESCRIPTION—This work is the furnishing and installation of preformed neoprene compression seals for bridge joints.

1008.2 MATERIAL—

(a) **Seal and Lubricant Adhesive.** Section 705.4(d) and from a manufacturer listed in Bulletin 15. Notify the District Executive as to the brand of seal to be furnished. Provide a data sheet from the manufacturer showing the nominal dimensions and allowable joint openings for the seal to be furnished. Do not change the brand, except with written permission from the District Executive.

(b) **Premolded Expansion Joint Filler.** Section 705.1

(c) **Foam Joint Fillers.** Section 705.4(e) or (f), except that the dimensions specified in Section 705.4(f) do not apply.

1008.3 CONSTRUCTION—

(a) **General.** Construct the basic joint as indicated.

(b) **Basic Joint.** The basic joint is the as-designed joint required for the anticipated movement. Form the basic joint, top to bottom, to the width as indicated. Place two strips of foam joint filler in the joint, with one strip placed tightly on top of the other. Provide a depth of the upper strip equal to the depth of the seal groove plus 3/4 inch. After the joint is sawed, remove this upper strip of foam with the broken concrete.

(c) **Seal Groove.** The seal groove is the sawed joint opening into which the seal is to be installed. The seal groove width is the width of the formed basic joint plus the seal seating ledge on each side of the joint, provided by the sawcut. Provide a seal groove width and depth according to the manufacturer's recommendations. Make joints true to alignment, $\pm 1/4$ inch, having vertical faces and uniform width throughout the length of the joint.

1. Deck Slab. Saw the seal groove, in the deck slab using a double-bladed, self-propelled concrete saw to the width and depth according to the manufacturer's recommendations. Begin the saw-cut at the centerline of the bridge and proceed beyond the gutter line in one operation. Use a saw speed that minimizes spalling. Provide smooth, even seal seating ledges. Grind 1/8 inch to 1/4 inch x 45 degree chamfer at the top corners along the entire length of the sawcut.

2. Curb on Sidewalk Section. Saw the seal groove in the curb, sidewalk, and barrier section, as shown on the Standard Drawings. Grind 1/8 inch to 1/4 inch x 45 degree chamfer at the top corners along the entire length of the sawcut.

(d) **Seal Installation.** Submit for approval the manufacturer's data sheet for the seal that includes seal preparation and installation recommendations. Before installing the seal, remove foreign material, including broken concrete, and thoroughly clean the joint according to the manufacturer's recommendations. Keep the joint in a dry or damp-dry condition. Swab the lubricant adhesive on the faces of the groove, and while the adhesive is wet, install the seal according to the manufacturer's recommendations.

Install the seal with the top surface continuous. Upturn seal continuous into barriers, curbs, and sidewalks as shown on the Standard Drawings. Do not install cocked or twisted seals. At walls, place the top of the seal in contact with the deck joint at a uniform depth of 1/4 inch minimum to 1/2 inch maximum below the deck surface. Ensure seals are waterproof at the gutter line.

Do not splice the seal unless indicated. If splices are indicated, use only if splices are vulcanized and spliced by the manufacturer in the shop/factory and are watertight. If necessary to stretch the seal during installation, do not exceed 5% elongation.

If the seal is damaged during installation, remove and install a new seal. Seal or cap the ends of the seal.

After installation, flood seal with water and inspect for leaks and/or damage. Repair any leaks or damage as directed and according to the manufacturer's recommendations.

1008.4 MEASUREMENT AND PAYMENT—Linear Foot

Measured out-to-out along centerline of seal, including horizontal, vertical, inclined, or curved portions.

SECTION 1012—PEDESTRIAN RAILING

1012.1 DESCRIPTION—This work is the construction of a pedestrian railing.

1012.2 MATERIAL—Before fabrication, submit shop drawings of the railing for review and acceptance.

(a) Railing.

- Aluminum-Alloy Casting—ASTM B 26/B 26M, Alloy SG70A-T6 or ASTM B 108, Alloy SG70A-T6.
- Aluminum-Alloy Bolts—ASTM B 211/B 211M, Alloy 2024-T4.
- Aluminum-Alloy Nuts—ASTM B 211/B 211M, Alloy 6061-T6.
- Nylon Washers—Section 1103.11(j)2
- Bolt Heads—Regular hexagon, ANSI B18.2.3.5M (ANSI B18.2).
- Nuts. Finished hexagon, ANSI B18.2.4.6M (ANSI B18.2)—Threads, Class 6, 6g, or 6H (Threads, Class 2, 2A, or 2B).
- Aluminum Alloy Balusters – ASTM B 221/B 221M, Alloy 6061-T4.
- Post assembly and panel to post aluminum washers – ASTM B 209, Alloy 2024-T3.
- Cast Aluminum Post Base – ASTM B 26/B 26M, Alloy SG70A-T6 or ASTM B 108/ B 108M, Alloy SG70A-T6.
- Other Aluminum Alloys—Section 1013.2(a)

Certify as specified in Section 106.03(b)3.

(b) Anchor Bolts, Nuts, and Washers. Section 1105.02(c)2, galvanized as specified in Section 1105.02(s).

(c) Caulking Compound. Section 705.7

1012.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) General. Before erection, thoroughly coat the surface of aluminum alloys in contact with other metals, stone masonry, or concrete with caulking compound. After erection and alignment, seal openings between metal surfaces and concrete with caulking compound.

After the concreting and other operations have been completed, thoroughly clean the railing. Remove accumulations of oil, grease, dirt, or foreign materials, using a solvent cleaner.

(b) Assembly. Assemble, as shown on the accepted shop drawings and the Standard Drawings.

Make cuts true, smooth, and free from burrs or ragged edges. Fillet-drill all re-entrant cuts, before cutting. Do not flame cut.

To facilitate bending, the Contractor may heat material to a temperature of 400F for a period not exceeding 15 minutes.

Drill rivet and bolt holes, or subpunch 3/16 inch smaller than the nominal diameter of the fastener; then ream to size.

1012.4 MEASUREMENT AND PAYMENT—Linear Foot

Measured from center to center of end posts. The Department will not deduct gaps at lighting pole foundations.

SECTION 1013—ALUMINUM BRIDGE RAILING

1013.1 DESCRIPTION—This work is the construction of an aluminum bridge railing.

1013.2 MATERIAL—Before fabrication, submit shop drawings for review and acceptance.

(a) Railing.

- Cast Aluminum Railing Posts—ASTM B 108, Alloy A444-T4 or ASTM B 26/B 26M, Alloy SG70A-T6.
- Aluminum-Alloy Extruded Bars, Rods, Shapes, and Tubes—ASTM B 221/B 221M, Alloy 6061-T6 or 6351-T5.
- Aluminum-Alloy Drawn Seamless Tubes—ASTM B 210/B 210M-Alloy 6061-T6.
- Aluminum-Alloy Seamless Pipe and Seamless Extruded Tube—ASTM B 241, Alloy 6061-T6, 6061-T4 or Aluminum-Alloy Extruded Structural Pipe and Tube ASTM B 429, Alloy 6061-T6.
- Aluminum-Alloy Sheet and Plate—ASTM B 209/B 209M-Alloy 6061-T6, 1100-0 or Alclad 2024-T4.
- Aluminum-Alloy Bars, Rods, and Wire—ASTM B 211/B 211M, Alloy 6061-T6, 6262-T9, or 2024-T4. (Alloy 2024-T4 with an anodic coating of 0.0002 inch minimum thickness and dechromate or boiling water seal.)
- Aluminum-Alloy Standard Structural Shapes, Rolled or Extruded—ASTM B 308/B 308M-Alloy 6061-T6
- Toggle Bolts—Section 1014.2(a)
- Miscellaneous—Aluminum wedges, shims, end caps, washers, and nuts of acceptable material.

Certify as specified in Section 106.03(b)3.

(b) Anchor Bolts, Nuts, and Washers. Section 1105.02(c)2, galvanized as specified in Section 1105.02(s).

(c) Caulking Compound. Section 705.7

1013.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) General. Section 1012.3(a)

(b) Assembly. Section 1012.3(b) except:

At bend areas, do not vary the diameter of rail tubes by more than 5% of the outside diameter, when rail tubes are bent to the radii indicated.

1013.4 MEASUREMENT AND PAYMENT—Linear Foot

Measured from center-to-center of end posts. The Department will not deduct gaps at lighting pole foundations.

SECTION 1014—STEEL BRIDGE RAILING

1014.1 DESCRIPTION—This work is the construction of a steel bridge railing.

1014.2 MATERIAL—Galvanize materials as specified in Section 1105.02(s). Before fabrication, submit shop drawings for review and acceptance.

(a) Railing.

- **Steel Rails**—Rails may be either pipe conforming to ASTM A53, Type E or S, Grade B; or tubing conforming to ASTM A500 or A501.
- **Railing Posts**—ASTM A47/A47M, Grade 24018 (Grade 35018), or ASTM A536, Grade 60-40-18.
- **Toggle Bolts**—An acceptable, galvanized type, capable of supporting a 9,000-pound load in tension, when tested through a 1-inch round hole. Toggle bolts may be cadmium-plated to conform to the requirements of ASTM B766, Class 5, in place of galvanizing.
- **Miscellaneous**—Malleable iron wedges, shims, end caps, washers, and nuts of acceptable material.

Certify as specified in Section 106.03(b)3.

(b) Anchor Bolts, Nuts, and Washers. Section 1105.02(c)2, galvanized as specified in Section 1105.02(s).

(c) Caulking Compound. Section 705.7

1014.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) General. Before erection, use caulking compound to thoroughly coat surfaces of posts in contact with concrete. After erection and alignment, use caulking compound to seal openings between metal surfaces and concrete.

(b) Assembly. Remove blemishes and scratches from exposed surfaces. For areas that have been damaged, exposing base metal, paint with two coats, according to ASTM A780. Assemble the rail members to grade and the posts normal to grade.

Make cuts true, smooth, and free from burrs or ragged edges. Fillet-drill all re-entrant cuts, before cutting. As indicated, provide slotted holes for expansion.

The diameter of holes in the posts, for anchor bolts, may exceed the nominal bolt diameter up to 50%, with a maximum measurement of 1/2 inch greater than the nominal bolt diameter.

Place joints, as indicated.

At bend areas, do not vary the diameter of rail tubes by more than 5% of the outside diameter when rail tubes are bent to the radii indicated.

1014.4 MEASUREMENT AND PAYMENT—Linear Foot

Measured from center-to-center of end posts. The Department will not deduct gaps at lighting pole foundations.

SECTION 1015—PROTECTIVE BARRIER

1015.1 DESCRIPTION—This work is the construction of a protective barrier on bridges over electrified railroads.

1015.2 MATERIAL—Before fabrication, submit shop drawings for review and acceptance.

(a) Barrier.

- Aluminum-Alloy Extruded Section—ASTM B 221/B 221M, Alloy 6061-T6 or 6351-T5.
- Aluminum-Alloy Sheet and Plate—Alloy 6061-T6
- Aluminum-Alloy Bolts—ASTM B 211, Alloy 2024-T6 or 6061-T6
- Aluminum-Alloy Nuts—ASTM B 211/B 211M, Alloy 6061-T6.
- Nylon Washers—Section 1103.11(j)2
- Bolt Heads—Regular hexagon. ANSI B18.2.3.5M (B18.2)
- Nuts—Finished hexagon, ANSI B18.2.4.6M (B18.2) Thread, Class 6, 6g, or 6H (2, 2A, or 2B)
- Other Aluminum Alloys—Section 1013.02(a)

Certify as specified in Section 106.03(b)3.

(b) Anchor Bolts, Nuts, and Washers. Section 1105.02(c)2, galvanized as specified in Section 1105.02(s).

(c) Caulking Compound. Section 705.7

(d) Miscellaneous Connection Elements.

1. Used for barrier attachment at PA Type 10M Bridge Barrier and PA Bridge Barrier.

- High strength bolts. ASTM F3125, Grade A325 as specified in Section 1105.02(d), galvanized as specified in Section 1105.02(s).
- Elastomeric pads and washers. Section 1113.03(h), Type I
- Fabric bushing material, Section 1113.03(h), Type II
- Anchor bolts. Section 1105.02(c)3, galvanized as specified in Section 1105.02(s).

2. Used for barrier attachment at PA Type 10M Bridge Barrier.

- 3/4 inch fill plate as specified in Section 1105.02(a)2, galvanized as specified in Section 1105.02(s).

3. Used for barrier attachment at PA Bridge Barrier.

- 1/2 inch fill plate as specified in Section 1105.02(a)2, galvanized as specified in Section 1105.02(s).

1015.3 CONSTRUCTION—As shown on the Standard Drawings and as specified in Section 1013.3.

1015.4 MEASUREMENT AND PAYMENT—Linear Foot
Measured from end-to-end of barrier.

SECTION 1016—PROTECTIVE FENCE

1016.1 DESCRIPTION—This work is the construction of barrier protective fences, sidewalk protective fences, and railroad protective fences.

1016.2 MATERIAL—Before fabrication, submit shop drawings for review and acceptance.

(a) Protective Fence (Steel).

1. Fabric. Section 1110.01(a), size of mesh, 1 inch.

2. Fabric Tie Wire. No. 9 gage aluminum wire; or No. 9 gage steel wire, galvanized, conforming to ASTM F 626, or aluminized, conforming to ASTM A 491.
Certify as specified in Section 106.03(b)3.

3. Posts, Rails, and Fittings. End, corner, and line posts; top and bottom rails; and brace rails to be Heavy Industrial Steel Fence Pipe ASTM F 1043 Grade IC 50,000 pounds per square inch minimum yield strength) with plain ends. Substitution of High Strength ASTM F 1083 Grade 83000 (83,000 pounds per square inch yield strength) Schedule 40 pipe is allowed at no additional cost to the Department. Fittings and hardware as specified in Section 1110.02(a).

Certify as specified in Section 106.03(b)3.

4. Plates. ASTM A709, Grade 36. Certify as specified in Section 106.03(b)3.

5. Welding Material. Section 1105.02(t).

(b) Anchor Bolts, Nuts, and Washers. Section 1105.02(c)2, galvanized as specified in Section 1105.02(s).

(c) Caulking Compound. Section 705.7

1016.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) General. Coat the surfaces of the base plates in contact with concrete or masonry, using caulking compound, before erection. Use caulking compound to seal openings between metal surfaces and concrete after erection and alignment. Fasten fabric to the line posts, top and bottom rails, and brace rails, using tie wires spaced not more than 24 inches apart; fasten to end and corner posts using 3/16-inch by 3/8-inch stretcher bar bands. Use stretcher bars with square edges attached by threading through the fabric, attached with clamps, or attached by other positive mechanical means.

Use brace bands and stretcher bar bands 1/8 inch by 1 inch, with 3/8-inch diameter by 1 1/2 inches long, non-removable bolts.

Do not use bent or damaged posts or rails. Place moisture-proof post tops. Position line-post tops to pass the top rail through the post tops.

Place top rails in 20-foot lengths, with couplings or expansion devices joining the lengths to form a continuous brace for each stretch of fence. Fasten top rails to end and corner posts by means of rail ends and brace bands.

Use brace rails at end and corner posts, midway between the top and bottom rail, extending from the end or corner post to the adjacent line posts.

Fasten bottom rails and brace rails to end, to corner, and to line posts, using rail ends, brace ends, and brace bands.

Place truss rods, 3/8 inch in diameter, with turnbuckles, between the brace ends of the brace rail and the bottom rail.

(b) Welding. Section 1105.03(m).

1016.4 MEASUREMENT AND PAYMENT—Linear Foot

Measured from center-to-center of end posts. The Department will not deduct gaps at lighting pole foundations.

SECTION 1017—PRESSURE MORTAR POINTING AND SURFACING

1017.1 DESCRIPTION—This work is the pointing and the surfacing of areas of structures.

1017.2 MATERIAL—

(a) **Cement.** Section 701

(b) **Fine Aggregate.** Type A, Section 703.1

(c) **Water.** Section 720.1

(d) **Reinforcement Bars.** Section 709.1

(e) **Fabric Reinforcement.** AASHTO M 55 (ASTM A 185). Use fabric reinforcement, consisting of galvanized, welded straight-line fabric, conforming to one of the following:

- No. 12 gage wire, spread 2 inches in each direction;
- No. 10 gage wire, spaced 3 inches in each direction; or
- as indicated.

Certify as specified in Section 106.03(b)3.

(f) **Burlap.** Section 711.1(d)

(g) **Liquid Membrane-Forming Curing Compound, Clear.** Section 711.2(a)

(h) **Expansion Bolts.** From a manufacturer listed in Bulletin 15.
Certify as specified in Section 106.03(b)3.

1017.3 CONSTRUCTION—

(a) **Preparation of Structure.** Thoroughly clean the surfaces and voids of rust, scale, grease, loose and disintegrated particles, and material that might impair the bond between the surfaces to be covered and the mortar mixture. Remove unsound concrete and mortar as directed, and thoroughly clean surfaces.

(b) **Placing Reinforcement.** Lap adjacent sheets of fabric at least 4 inches for 2-inch mesh and at least 6 inches for 3-inch mesh. Fasten fabric together with wire ties at intervals of not more than 18 inches.

1. Steel Surfaces. Place fabric on the top, sides, and bottom of steel members. Bend the fabric to conform to the outlines of the members and hold approximately 3/4 inch away from the surface of the members, or as directed. Place 1/4-inch diameter bars vertically on each side of the webs, then tie in place, using holes in the webs or clip plates. Space on 3-foot centers, or as indicated. Tie the fabric outside of and to the bars, on approximately 12-inch centers. Place the fabric or bars clear of the surface of the members.

2. Masonry Surfaces. In areas of buildup for the replacement of disintegrated material, unless otherwise indicated or directed, place a layer of fabric for each 3-inch layer of mortar or fraction thereof. More than one layer of fabric may be attached to an anchor bolt, provided the bolt is long enough.

Hold the fabric in place by means of lead-collared expansion bolts, either 1/4 inch by 3 inches, or 3/8 inch by 4 inches. Use longer bolts, where necessary. Space 1/4-inch diameter bolts approximately 20 inches center-to-center in each direction, starting 3 inches from the outside edges of the areas to be pressure-mortared. Space 3/8-inch diameter bolts approximately 30 inches center-to-center in each direction, starting 6 inches from the outside edges of the areas to be pressure mortared. Fasten the fabric to the expansion bolts away from the prepared surface, with 1 inch clear below the finished surface of the repair.

Where existing reinforcement is exposed due to removal of deteriorated concrete, fabric may be tied to this reinforcement at 18-inch intervals, to form a cage to position and support the fabric within 1 inch of the finished surface of repair.

Avoid excessive fabric layers, which may create planes of weakness or internal stresses.

(c) Mixing Mortar. Mix the mortar of one part cement and 3 1/2 parts fine aggregate. Thoroughly dry-mix the mortar in a batch mixer. Screen the dry-mix and remove material retained on a No. 4 sieve, before placing the mixture in the hopper of the mortar pressure gun. Do not mix more than 1 hour's supply of mortar at a time. Keep the mixture in the gun bin thoroughly stirred.

(d) Pressures. At the gun, supply air pressure of at least 35 pounds per square inch when shooting the mixture. Increase the air pressure, as necessary, when the lift is greater than 25 feet, or when using more than 100 feet of hose. Maintain uniform air pressure. At the nozzle, maintain a uniform water pressure of at least 15 pounds per square inch greater than the air pressure at the gun. Supply pressure in the lower gun chamber to produce a nozzle velocity of 375 feet per second to 450 feet per second, with a 1 1/4-inch tip opening. Vary these pressures and velocities only when directed. Determine the nozzle pressure and velocity from the nozzle velocity meter attached to the gun.

(e) Moisture Content of Mortar. Use approximately 8% to 10% moisture, by weight, when shooting, of approximately 3 1/2 gallons of water per bag of cement. Do not use a greater quantity of water than necessary to produce a proper mixture. When using reinforcement fabric, supply a moisture content of approximately 8%, for mortar below the fabric, and approximately 9% to 10% above the fabric.

(f) Application. Perform pressure mortar work under the continuous supervision of an experienced pressure-gun foreperson, using only experienced personnel as gun and nozzle operators. When pointing masonry, saturate the surfaces with clean water before applying mortar. When surfacing structural steel, keep the outer edges of the mortar at the flanges and stiffeners square and true to line by using shooting strips, placed to maintain the specified dimensions without trapping the rebound.

Use guide strips at corners and other places, where necessary, to ensure true lines, corners, and the placement of specified thickness, dimensions, and designs. Bring mortared surfaces to a reasonably true plane, then finish the entire mortared area with a pressure-gun finish. Apply the main body of the mortar in at least two coats. Apply bottom surfaces in at least two coats to obtain proper adhesion and to avoid sagging. Bring the last main coat to within 1/8 inch of the proposed surface, then correct irregularities and remove high spots with trowels. Give the entire surface a thin coat of mortar, but do not trowel or float. If directed, give the final surfaces a finish using a long-bristled brush, saturated with clean water, then dragged over the surfaces. Do not work the surfaces with the brush.

For masonry pointing, or pointing and surfacing, fill voids with mortar, making the surface flush with the adjacent face of the structure. After completing the pointing, clean the face of the masonry.

Shoot mortar at right angles to the surface, holding the gun nozzle approximately 3 feet from the surface, when using a 3/4-inch or a 1-inch nozzle, or 4 feet from the surface, when using a 1 1/4-inch nozzle. Use a shorter distance only where working space requires closer shooting. Remove deposits of loose fine aggregate. If any deposit of loose, fine aggregate is covered by succeeding layers of mortar, remove the surfacing and replace with suitable mortar. At the end of a day's work or at other required stopping periods, slope off the mortar to a thin edge. Do not use square joints. Before shooting the adjacent section, joining new work to old work, or placing additional coats, clean this sloped portion, old work, or previous coat.

Saturate the previous coat by a combination of air and water blasting. Do not place mortar unless the air temperature or the surface on which it is placed is 50F or higher.

(g) Curing. Immediately after initial hardening, saturate mortar and keep wet for a period of at least 96 hours. Protect pressure mortar pointing and surfacing on masonry surfaces, and where practical on structural steel, with burlap. Keep burlap wet during this curing period.

If allowed as an alternative to burlap curing, apply Liquid Membrane Forming Curing Compound, Clear, as specified in Section 1001.3(p)3.a.

Cure in cool and cold weather, as specified in Section 1001.3(p).

(h) Backfilling. For spaces excavated around areas being pointed and surfaced, backfill with acceptable embankment material in layers no more than 4 inches in depth. Thoroughly compact mechanically, as specified in Section 202.3(f).

1017.4 MEASUREMENT AND PAYMENT—

(a) Pressure Mortar Surfacing. Square Yard

(b) Pressure Mortar Pointing. Linear Foot

SECTION 1018—REMOVAL OF EXISTING BRIDGES OR CULVERTS

1018.1 DESCRIPTION—This work is the removal and disposal of existing bridges, culverts, or superstructures.

1018.2 MATERIAL—

- Topsoil—Section 802.2
- Seeding and Soils Supplements—Section 804.2
- Mulching—Section 805.2

1018.3 CONSTRUCTION—

(a) Demolition Plan. Submit a demolition plan to the District Executive showing or describing the demolition and removal methods to be used for the removal of an existing bridge or culvert, as indicated. Demolition is the point in time when a portion of the structure is being cut, sawed, drilled, or impacted through excavation or other means that could affect the stability of the structure. Provide, at a minimum, the following information within the demolition plan:

- Methods of protection and safety for the general public, inspection personnel, and construction personnel.
- Location and method of protection of utilities.
- Method of protecting streams/waterways when present.
- Phasing and sequence of operations indicating construction equipment to be used for the intent of the operation being performed.
- Location and weights of equipment during demolition.
- Weights of equipment/materials to be staged/stockpiled on the structure. Consider the condition of the existing structure when proposing to place loads on the portion of the structure to be demolished.
- When and how critical sections of the structure are to be removed (i.e. fracture critical components, arches, rigid frames) and provide analysis as required by the Representative to determine the structural stability of partial or complete parts of the structure being demolished.
- Method of providing temporary support for elements which will become unstable.

Demolition plan submissions for bridge removal are to be signed and sealed by a Professional Engineer, registered in the State if one or more of the following criteria apply to the structure being removed:

- Over a roadway;
- Span length exceeds 80 feet;
- Existing structures without plans with span length over 50 feet;
- Arches or rigid frame structures with span length over 50 feet;
- Fracture critical structures;
- Structures on, under, or adjacent to a railroad; or
- Specifically called for in the contract.

Do not proceed with demolition work until the plan has been reviewed and accepted. Acceptance of the demolition plan by the Representative will not relieve the Contractor of liability for safe demolition and/or removal of the structure.

If the structure to be removed is over or under a railroad, submit the accepted demolition plan to the railroad company's Area Engineer. Do not proceed with the demolition work until written acceptance is received from the railroad company. Provide a copy of this written acceptance to the Department. Notify the railroad company a

minimum of 10 days before starting demolition work. Failure to obtain the railroad company's acceptance will require an alternate plan submittal to the Department and the railroad company for review and acceptance.

(b) Demolition. A pre-demolition meeting is to be held at the project site before the start of demolition with the Representative, Structure Control Engineer, Contractor's superintendent, and the person responsible for development of the demolition plan if requested by a party with involvement in the demolition.

Non-structural items attached to the structure must be removed before beginning demolition. Identify non-structural items and provide procedures for removal in the demolition plan.

Use extreme caution during removal operations to avoid damaging portions of the structure that are to remain. Repair or replace any portion of the existing structure damaged or removed beyond the indicated limits as directed by the Representative at no additional cost to the Department.

If indicated, leave in place portions of the existing substructure that do not interfere with new construction, landscaping, or other operations. Provide documentation (photographs, survey notes) for portions of the structure to remain in place if blasting is used as a method of removal.

For structures over or carrying streams/waterways, remove existing structure as indicated. If removal limits are not indicated, remove existing structure a minimum of one foot below streambed. In areas where the new substructure is within the limits of existing, remove the existing structure in its entirety. Unless indicated, do not intentionally demolish or drop the existing structure into the stream/waterway. Immediately remove material that falls into the stream/waterway during the removal operation.

After removing the existing structure, backfill the area where the existing bridge or culvert was removed, as specified in Section 202.3(f). Grade into the existing topography. If directed, place topsoil. Seed and provide soil supplements, as specified in Section 804.3. Use a type and rate of seeding and soil supplements typical for project. Mulch with the type and rate of mulch typical for project, as specified in Section 805.3.

Where the removal area coincides with new construction, backfill voids below the elevation of the bottom of the proposed footings, using acceptable material, then compact, as specified in Section 202.3(f).

(c) Structures Retained by the Department. If indicated, remove members or parts of the structure to be retained by the Department. Match-mark the members or parts, and place them within the right of way at an indicated or directed location, within 1,000 feet of the existing structure. If indicated, load the members or parts, haul them to, and unload them at, the indicated location. If indicated, load the members or parts on railroad cars, ready for shipment. Carefully remove bridge plaques and/or benchmarks from the existing bridge and deliver them to the Representative at the Project Field Office.

(d) Structures Retained by the Contractor. If not otherwise indicated, the Department will not retain structures, or parts of structures. Remove and dispose of the structure, or parts of the structure, in a satisfactory manner.

1018.4 MEASUREMENT AND PAYMENT—

(a) Removal of Existing Bridge. Lump Sum

When removal area coincides with excavation area of new construction, the pay limit for removal extends 1 foot horizontally beyond the outer limits of the structure being removed.

The Department will pay for backfilling of voids below the indicated elevation of the bottom of proposed footings for new construction as specified in Section 1001.4(f).

(b) Removal of Existing Culvert. Lump Sum

When removal area coincides with excavation area of new construction, the pay limit for removal extends 1 foot horizontally beyond the outer limits of the structure being removed.

The Department will pay for backfilling of voids below the indicated elevation of the bottom of proposed footings for new construction as specified in Section 1001.4(f).

(c) Removal of Existing Bridge Superstructure. Lump Sum

SECTION 1019—PROTECTIVE COATING FOR REINFORCED CONCRETE SURFACES

1019.1 DESCRIPTION—This work is applying a protective coating on concrete surfaces.

1019.2 MATERIAL—

(a) Boiled Linseed Oil. Section 503.2
Certify as specified in Section 106.03(b)3.

(b) Epoxy Resin (For Abutments, Pier Caps, and Endwalls). A two-component, epoxy resin system, as follows:

1. General. An epoxy-type base polymer, thermosetting resin as follows:

- Composed of 100% reactive constituents (condensation products of the reaction of epichlorohydrin with bisphenol A).
- Essentially pure, diglycidyl-ether of bisphenol A, containing no more than trace amounts of hydrolyzable chlorine.
- Epoxide equivalent between 465 and 530.
- Reacting system consisting of a blend of condensation polymers of dimerized and trimerized unsaturated, fatty-acids and an aliphatic polyamine.
- Pigmentation added so the cured coating conforms to the Federal Color Standard 595, and as indicated.
- Nonskid material added, if directed.

2. Physical Requirements of the Mixed Epoxy System.

- Viscosity—300 centipoises to 700 centipoises at 72F
- Pot Life—a minimum of 7 hours at 75F
- Minimum solids content—48%
- A cured system that does not exhibit amine blushing or sweating.

When the pigmented finished coats are tested for abrasion, according to ASTM D 968, a minimum of 25 L of sand is required to abrade a 1-mil thickness of coating.

A 2 1/2-mil dry film thickness of the coating, tested by ASTM D 522, is required to pass a 1/8-inch diameter mandrel test, without splitting the film or causing loss of bond.

3. Sampling. A representative sample of each component will be taken for the required tests, either from a well blended bulk lot, before packaging or by withdrawing thief samples from no less than 5% of the containers comprising the lot or shipment. Unless the samples show evidence of variability, they may be blended into a single composite sample to represent that component. Package materials may be sampled by random selection of containers or each component from each lot. The entire lot of both components may be rejected if samples fail to meet any specified requirements.

4. Packaging and Marking. Furnish the two components in separate containers that are nonreactive with the contained materials. If directed, provide a container size so the recommended final mixture proportions can be obtained by combining one container of a component with one or more containers of the other component. Have containers marked as base polymer and reacting system, showing the mixing directions and usable temperature range. Have each container marked with the name of the manufacturer, the lot or batch number, the date of packaging, pigmentation, if any, and the quantity in pounds and gallons.

Indicate the potential hazards on the package, according to the Federal Hazardous Products Labeling Act.

5. Certification. If directed, certify, as specified in Section 106.03(b)3. Provide either a copy of the manufacturer's dated test report or a statement, accompanied by a copy of the dated test results, showing the system has been sampled and tested.

(c) Penetrating Sealers (For Reinforced Concrete Substructure Surfaces). Furnish a penetrating sealer from a manufacturer listed in Bulletin 15 as follows:

- Silicates in Water.
- Epoxies Dispersed in Water. Only use on surfaces that the sealer does not totally encapsulate the structural unit being treated.
- Organo-Silicon Compounds in Solvent.
- Resins in Mineral Spirits.

Certify as specified in Section 106.03(b)3.

(d) Penetrating Sealers (For Bridge Superstructure). A one-component, penetrating sealer material, composed of a minimum of 40% silane or siloxane material, with no petroleum distillates meeting the following properties:

- **Water Absorption.** The final average percent water absorbed, for concrete coated with the protective sealer, not greater than 20.0% of the final average percent water absorbed by the uncoated reference concrete.
- **Moisture Vapor Transmission.** The final average percent moisture loss, for concrete coated with the protective sealer, not less than 75.0% of its final average percent water absorption.
- **Chloride Ion Penetration.** The final average absorbed chloride ion content, for concrete coated with the protective sealer, not greater than 15.0% of the final average absorbed chloride ion content of the uncoated reference concrete.
- **Durability.** The protective sealer does not show any signs of weathering, discoloration, or deterioration after 6 months of exposure to atmospheric conditions.

Certify as specified in Section 106.03(b)3.

1019.3 CONSTRUCTION—

(a) Boiled Linseed Oil.

1. Areas and Preparation.

1.a General. Thoroughly dry and clean the surfaces of dirt, debris, oil, grease, and foreign matter that would prevent protective coating penetration, adhesion, or drying. Do not use membrane-forming curing compound where linseed oil treatment is to be applied.

Apply the protective coating as soon as possible after completion of a structure or portion of a structure.

2. Application. Section 503.3(b)

3. Safety Precautions. Section 503.3(c)

(b) Epoxy Resin.

1. Substructures (Subject to Staining). If indicated, apply epoxy resin protective coating as follows:

1.a Surface Preparation. Clean sound, dry, new concrete surfaces, of laitance or other potential bond-inhibiting matter. Do not apply epoxy until 28 days after placing concrete, unless allowed to apply sooner. Do not use membrane-forming curing compounds where epoxy treatment is to be applied.

Clean old concrete surfaces of oil, grease, and potential bond-inhibiting matter by acid etching, using a 10% to 15% muriatic-acid solution. Spread the acid solution and allow it to react for 3 minutes to 5 minutes or until bubbling has subsided. Flush the surface with clear water and allow to dry. Where, in the Representative's opinion, acid etching is insufficient to clean the concrete, use an acceptable method of mechanical abrading. Clean steel surfaces until bright metal is exposed. Then immediately apply the protective coating to prevent the reoccurrence of oxidation.

1.b Mixing. Measure and mix, as recommended by the manufacturer of the epoxy, in a clean mixing container. Thoroughly mix the epoxy using a 400 rpm to 600 rpm (low speed, \pm 2-inch) electric drill, and paddle-type mixer. After mixing, let the material stand for an induction period of one hour before application.

1.c Application. Apply the mix by brush, roller, or spray. If applied by roller, use a first-quality, long-nap roller for rough surfaces and a short-nap roller for smooth surfaces. If applied by spray, use an externally atomized spray gun. For spray application, use a thinner of the type and quantity recommended by the manufacturer of the epoxy.

Apply two thin, uniform coats of the mixed material, each approximately 2 mils to 3 mils dry film thickness (4 mils to 5 mils wet thickness). Apply the second coat 24 hours after the application of the first coat. Use a rate of cover recommended by the manufacturer of the epoxy. Apply at temperatures between 60F and 90F.

(c) Penetrating Sealers.

1. Substructures.

1.a Surface Preparation. Thoroughly dry and clean the surfaces of dirt, debris, oil, grease, and foreign matter that would prevent protective coating penetration, adhesion, or drying.

1.b Application. Apply penetrating sealer, which does not discolor the concrete, to areas indicated according to the manufacturer's instructions.

2. Bridge Superstructure. Provide a penetrating sealer meeting the material requirements of Section 1019.2(d) and apply according to the manufacturer's recommended application procedures to exposed concrete surfaces of bridge decks; curbs, sidewalks, and divisors; and to inside and top surfaces of barrier. Apply the penetrating sealer after the completion of the specified concrete wet cure period, followed by an initial drying period of a minimum of 14 days after the wet curing period and the concrete surface is dry.

1019.4 MEASUREMENT AND PAYMENT—Square Yard

For the type indicated.

The Department will pay for additional maintenance and protection of traffic, if necessary for the application of additional protective coating to bridge decks experiencing excessive cracking, as specified in Section 110.03(d).

SECTION 1020—TOOTH EXPANSION DAM WITH DRAIN TROUGH

1020.1 DESCRIPTION—This work is construction of a tooth expansion dam with fabric reinforced drain troughs for bridge joints.

1020.2 MATERIAL—

(a) **Fabricated Structural Steel.** Section 1105.02(a)2, hot-dipped galvanized as specified in Section 1105.02(s).

(b) **High Strength Bolts.** Section 1105.02(d)

(c) **Stainless Steel Bolts and Studs.** ASTM F 593. Certify as specified in Section 106.03(b)3.

(d) **Stainless Steel Washers and Lock-Nuts.** ASTM F 594. Certify as specified in Section 106.03(b)3.

(e) **Galvanizing.** Section 1105.02(s)

(f) **Polyester or Nylon Fabric.** Certify as specified in Section 106.03(b)3. Conform to the following requirements:

- | | |
|--|-----|
| • Number of plies | 2 |
| • Minimum fabric weight, oz./sq. yd. | 7.5 |
| • Minimum tensile strength lb./in., ASTM D 378 | 425 |

(g) **Rubberized Trough Material.** Certify as specified in Section 106.03(b)3. Furnish Butadiene Acrylonitrile Elastomer conforming to the following requirements:

- | | |
|--|--|
| • Hardness shore 'A', ASTM D 2240, minimum – maximum | 60-70 durometer |
| • Minimum tensile strength, psi, ASTM D 412 | 1400 |
| • Minimum elongation at break, %, ASTM D 412 | 300 |
| • Oven aging, 70 hours at 212F, ASTM D 573 | |
| Maximum elongation loss, % | -25 |
| Maximum tensile strength loss, % | -35 |
| Maximum hardness points change | +10 |
| • Brittleness to heat aging, ASTM D 2137 | 0F |
| • Tear resistance, lb./in., Die C, ASTM D 624 | 120 |
| • Resistance to ozone aging, ASTM D 1149 (Method B, bent loop) | No cracks, 70 hours @ 104F and 50 ppm ozone, |
| • Oil swell, ASTM D 471, 70 hours @ 212F using | |

IRM 903 oil, mass change % maximum 45

(h) Fabric Composite Properties. Preformed fabric material consisting of the multi-ply polyester or nylon fabric and rubberized trough material, vulcanized to form a laminate, with the following properties:

- Minimum thickness, in. 1/8
- Minimum composite tensile strength of the fabric reinforced bridge trough, lb./in., ASTM D 378 800
- Maximum elongation @ ultimate tensile strength, % ASTM D 412 30
- Maximum resistance to water absorption, (less than 10% weight gain for 7 days of water immersion @ 150F, ASTM D 471 – Procedure for Change in Mass with Liquid on One Surface Only 10

1020.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

Prepare shop drawings as specified in Section 105.02(d). Obtain acceptance of the shop drawings before beginning fabrication.

Use a prequalified fabrication shop as specified in Section 1105.01(a).

Weld as specified in Section 1105.03(m).

Fabricate and erect the expansion dam according to the shop drawings and as appropriate for the bridge deck grade and crown. Preset the dam opening before shipment and assemble with temporary shipping angles.

Install the dam as indicated. After erection, remove the temporary shipping angles and grind plates smooth.

Place concrete under the expansion dams, vibrate until the concrete is forced through air holes, and strike off excess concrete. After the concrete has cured, clean air holes and fill with an approved sealer.

Do not splice the drain trough, unless indicated. If splices are indicated, use only if splices are vulcanized and spliced by the manufacturer in the shop/factory and are watertight. Do not use longitudinal splices.

Repair galvanizing damaged during construction operations as directed and according to the manufacturer's recommendations, at no additional cost to the Department.

Install the trough with stainless steel fasteners.

After installation, flood trough with water and inspect for leaks and/or damage. Repair any leaks or damage as directed and according to the manufacturer's recommendations.

1020.4 MEASUREMENT AND PAYMENT—Pound

SECTION 1021—ARMORED PREFORMED NEOPRENE COMPRESSION DAM

1021.1 DESCRIPTION—This work is the furnishing and installation of armored preformed neoprene compression dams for bridge joints, including the necessary fabricated structural steel.

1021.2 MATERIAL—

(a) **General.** Use a prequalified fabrication shop, as specified in Section 1105.01(a).

(b) **Preformed Neoprene Compression Seal and Lubricant Adhesive.** Section 705.4(d), from a manufacturer listed in Bulletin 15.

(c) **Structural Steel.** Section 1105.02(a)2, hot-dip galvanized as specified in Section 1105.02(s). The galvanization in the retainer extrusion must be of uniform thickness and free of excessive build-up, which would hinder the installation of the dam.

(d) **Studs.** Section 1105.02(e)

1021.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

Before fabrication, submit shop drawings, as specified in Section 105.02(d), showing complete details, dimensions, size, type, and compression-deflection characteristics of the seal, as well as other information and data necessary for the complete fabrication and erection of the dam. Obtain acceptance of shop drawings before beginning fabrication.

The seal may be installed in the shop, at the width determined for the erection temperature. For a shop-installed seal, make final width adjustment on the completed seal, if necessary, in the field for the temperature at the time when the dam is securely fastened to beams. No field adjustment will be needed for a $\pm 10^\circ\text{F}$ variation in temperature from the temperature for which the joint width was adjusted in the shop.

After width adjustment, the seal may be installed in the field.

Submit for approval the manufacturer's data sheet for the seal that includes seal preparation and installation recommendations. Before installing the seal, clean metal surfaces in direct contact with the seal, to remove foreign material and to provide for proper bond between the seal and the metal surfaces. Clean according to the manufacturer's recommendations.

Swab the lubricant-adhesive on the faces of the angles forming the groove, according to the manufacturer's recommendations. While the adhesive is wet, install the seal, according to the manufacturer's recommendations.

Do not splice the seal, unless indicated. If splices are indicated, use only if splices are vulcanized and spliced by the manufacturer in the shop/factory and are watertight.

If stretching of the seal during installation is unavoidable, do not exceed 5% elongation.

Place the top of the seal at the walls, in contact with the deck joint structural steel, at a uniform depth of 1/4 inch minimum to 1/2 inch maximum below the deck surface.

The Department will not accept cocked or twisted seal installations.

Remove and replace seals that are damaged during installation. Repair galvanizing damaged during construction operations as directed and according to the manufacturer's recommendations, at no additional cost to the Department.

After installation, flood seal with water and inspect for leaks and/or damage. Repair any leaks or damage as directed and according to the manufacturer's recommendations.

1021.4 MEASUREMENT AND PAYMENT—Linear Foot

For the movement specified.

Measured out-to-out along the centerline of the exposed surfaces of the seal and the steel plates, including sidewalks if applicable, following the vertical and sloped faces of curbs and barriers, resulting in a true length, not a horizontally projected length.

SECTION 1022—STEEL BRIDGE HAND RAILING

1022.1 DESCRIPTION—This work is construction of a steel bridge hand railing.

1022.2 MATERIAL—

(a) Railing.

- Pipe for the Rails—ASTM A53, Type F, Schedule 40, certified as specified in Section 106.03(b)3.
- Plates—AASHTO M 270 (ASTM A709), Grade 36. Certify as specified in Section 106.03(b)3.
- Welding Material—Section 1105.02(t)

(b) Toggle Bolts. Use an acceptable galvanized type capable of supporting a 1,000-pound load in tension, when tested through a 3/4-inch round hole. Toggle bolts may be cadmium-plated to meet the requirements of ASTM B766, Class 5, in place of being galvanized.

Certify as specified in Section 106.03(b)3.

(c) Malleable Iron Wedges, Shims, End Caps, Washers, and Nuts. Certify as specified in Section 106.03(b)3.

(d) Anchor Bolts, and Nuts and Washers for Anchor Bolts. Section 1105.02(c)2

(e) Caulking Compound. Section 705.7

(f) Galvanizing. Section 1105.02(s)

1022.3 CONSTRUCTION—Construct as shown on the Standard Drawings and as follows:

(a) General. Submit shop drawings for review and acceptance before starting fabrication.

Before erection, coat the surface of posts in contact with concrete or masonry, using caulking compound. After erection and alignment, use caulking compound to seal openings between metal surfaces and concrete.

After the concreting and other operations have been completed, clean the railing. Use an acceptable solvent cleaner to remove accumulations of oil, grease, dirt, and foreign materials.

(b) Assembly. Remove blemishes and scratches from exposed surfaces. Assemble the rail members with the rails parallel to grade and with the posts normal to grade. Place joints as indicated.

Make cuts true, smooth, and free from burrs or ragged edges.

Fillet drill all re-entrant cuts before cutting.

(c) Welding. Section 1105.03(m)

1022.4 MEASUREMENT AND PAYMENT—Linear Foot

Measured from center to center of end posts. The Department will not deduct gaps at lighting pole foundations.

SECTION 1023—ALUMINUM BRIDGE HAND RAILING

1023.1 DESCRIPTION—This work is construction of an aluminum bridge hand railing.

1023.2 MATERIAL—

(a) Railing.

- Pipe for the Rails—ASTM B241-Alloy 6061-T6, 6063-T6 or ASTM B429-Alloy 6061-T6, 6063T6.
- Plates—Alloy 6061-T6.

Certify as specified in Section 106.03(b)3.

(b) Toggle Bolts. Use an acceptable galvanized type capable of supporting a 1,000-pound load in tension, when tested through a 1/2-inch round hole. Toggle bolts may be cadmium-plated to conform to the requirements of ASTM B766, Class 5, in place of being galvanized.

Certify as specified in Section 106.03(b)3.

(c) Aluminum Wedges, Shims, End Caps, Washers, and Nuts. Certify as specified in Section 106.03(b)3.

(d) Anchor Bolts, and Nuts and Washers for Anchor Bolts. Section 1105.02(c)2, galvanized as specified in Section 1105.02(s).

(e) Caulking Compound. Section 705.7

1023.3 CONSTRUCTION—Construct as shown on the Standard Drawings and as follows:

(a) General. Before fabrication, submit shop drawings for review and acceptance.

Coat surfaces of aluminum alloys in contact with other metals, stone masonry, or concrete, using caulking compound, before erection. Use caulking compound to seal openings between metal surfaces and concrete after erection and alignment.

Protect the railing from damage or accumulations of oil, grease, dirt, concrete splatter, or foreign materials. After the other bridge construction operations have been completed, clean the aluminum bridge hand railing. Remove accumulations of oil, grease, dirt, or foreign materials, using an acceptable solvent cleaner.

(b) Assembly. Assemble the rail members. Place joints as indicated.

Make cuts true, smooth, and free from burrs or ragged edges. Fillet drill all re-entrant cuts before cutting. Do not flame cut. Weld as specified in Section 1105.03(m).

1023.4 MEASUREMENT AND PAYMENT—Linear Foot

Measured from center to center of end posts. The Department will not deduct gaps at lighting pole foundations.

SECTION 1025—MODIFICATION OF EXISTING BARRIERS

1025.1 DESCRIPTION—This work is the modification of existing bridge barriers for the type indicated.

1025.2 MATERIAL—

- Class AA Cement Concrete—Section 704
- Reinforcement Bars—Section 1002.2
- Concrete Bonding Compound—Section 706
- Threaded Rods and Couplings and Steel Plates—Section 1105.02(a)2.
- Galvanizing—Section 1105.02(s)
- Welding Material—Section 1105.02(t)
- Nuts and Washers—ASTM A 536 for nuts, certified as specified in Section 106.03(b)3, and Section 1105.02(c)2.b for washers.
- Dowel Holes—Section 1003
- Caulking Compound—Section 705.7
- Joint Backing Material—Section 705.8
- Overlay Material—Section 1042.2. Use material of the same type as the deck overlay material.

1025.3 CONSTRUCTION—In the field, verify sizes, dimensions, and types of materials, as necessary to satisfactorily complete work.

Before beginning barrier modification, submit plans for review and acceptance to the Chief Bridge Engineer. On the plans, show the method of modification proposed, including modification of open joints, expansion dam, and the deck at the existing scuppers.

Satisfactorily repair any damage done to the existing structure beyond the indicated removal limits.

Straighten existing reinforcement that is to remain in place, within the limits of removal. If necessary, cut and bend the existing reinforcement. Wire brush, clean, and paint the existing reinforcement with a coating of neat-cement (semi-liquid mixture of cement and water).

Satisfactorily dispose of debris resulting from the removal operation.

The Department will retain the bridge barrier railings, posts, and miscellaneous hardware. Remove and store within the right of way for removal from the project site by Department forces. When removing railings and posts from the structure, bundle and stack in piles. Store nuts, bolts, washers, and shims in boxes or barrels with the railing elements. Store the bundles and boxes or barrels in a manner to be picked up and moved with a fork lift.

If necessary, provide additional deck overlay. Modify the deck portions of the existing expansion dam, then warp the deck to existing scuppers, when indicated.

1025.4 MEASUREMENT AND PAYMENT—Linear Foot

For the type indicated, measured from end to end along the inside face of the completed barrier, with no deductions for expansion dams or joint areas.

SECTION 1026—NEOPRENE STRIP SEAL DAM

1026.1 DESCRIPTION—This work is the furnishing and installation of neoprene strip seal expansion dam for bridge joints, including the necessary fabricated structural steel extrusions and sliding plates.

1026.2 MATERIAL—

(a) **General.** Use a prequalified fabrication shop as specified in Section 1105.01(a).

(b) **Structural Steel.** Section 1105.02(a)2, hot-dipped galvanized as specified in Section 1105.02(s). The galvanization in the retainer extrusion must be of uniform thickness and free of excessive build-up, which would hinder the installation of the seal. Have the expansion dam fabricator demonstrate that the seal can be installed properly before shipment.

(c) **Anchor Bolts and Washers.** Section 1105.02(c)

(d) **Studs.** Section 1105.02(e)

(e) **Neoprene Strip Seal and Lubricant Adhesive.** Section 705.4(d), from a manufacturer listed in Bulletin 15.

1026.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

Before fabrication, submit shop drawings, as specified in Section 105.02(d), showing complete details, dimensions, size, and type of seal as well as other information and data necessary for the complete fabrication and erection of the dam.

Before installing the seal, clean metal surfaces in direct contact with the seal according to the manufacturer's recommendations. Install seal with hand or air driven tools recommended by the manufacturer.

Do not splice the seal, unless indicated. If splices are indicated, use only if splices are vulcanized and spliced by the manufacturer in the shop/factory and are watertight.

If stretching of the seal during installation is unavoidable, do not exceed 5% elongation.

The Department will not accept cocked or twisted seal installation.

Remove and replace seals that are damaged during installation. Repair galvanizing damaged during construction operations as directed and according to the manufacturer's recommendations, at no additional cost to the Department.

After installation, flood seal with water and inspect for leaks and/or damage. Repair any leaks or damage as directed and according to the manufacturer's recommendations.

1026.4 MEASUREMENT AND PAYMENT—Linear Foot

For the movement specified.

Measured out-to-out along the centerline of the final, in place, exposed surfaces of the seal, fabricated structural steel extrusion, and the steel sliding plates, including sidewalks if applicable, following the vertical and sloped faces of curbs and barriers, resulting in a true length, not a horizontally projected length. Non-exposed surfaces will not be included in the final, in-place measurement.

SECTION 1031—TIMBER STRUCTURES

1031.1 DESCRIPTION—This work is the construction of all timber structures except hardwood glue-laminated (glulam) structures.

1031.2 MATERIAL—

(a) Structural Timber. Douglas Fir-Larch, Hem-Fir, Southern Pine, Beech, Birch, Hickory, Mixed Maple, Red Maple, Northern Red Oak, Red Oak, Mixed Oak, White Oak, and Yellow Poplar. Provide Select Structural, No. 1 or No. 2 grade lumber and timber. Provide sawn lumber and timber conforming to the Specifications for Structural Timber, Lumber and Piling, AASHTO M 168. Certify as specified in Section 106.03(b)3.

Accept only pieces consisting of sound wood, free from decay. Avoid boxed heart timber.

Use structural timber complying with the American Softwood Lumber (ASL) Standard PS 20-70 for manufacture of dressed-sized lumber and timber products. Grade Douglas Fir-Larch and Hem-Fir using West Coast Lumber Inspection Bureau (WCLIB) or Western Wood Products Association (WWPA) inspection rules. Grade Douglas Fir-Larch (North) and Hem-Fir (North) using National Lumber Grades Authority (NLGA) inspection rules. Grade Southern Pine according to Southern Pine Inspection Bureau (SPIB) inspection rules. Grade Beech-Birch-Hickory, Mixed Maple, Red Maple, Northern Red Oak, Red Oak, Mixed Oak, and White Oak according to Northeast Lumber Manufacturer's Association (NELMA) grade rules. Grade Yellow Poplar according to Northern Softwood Lumber Bureau (NSLB) rules.

Adequately protect structural timber during transport.

Accept only kiln dried dimension lumber at 15% average moisture content, and 19% maximum moisture content.

Accept only solid sawn timbers that have been air seasoned or dried to an average moisture content not exceeding 19%.

Accept only softwood glue-laminated timbers with a maximum 16% moisture content.

Preservative treat lumber and timber by pressure treatment process according to the AWPA C1, "All Timber Products - Preservative Treatment by Pressure Processes."

Treat structural timbers for highway/bridge construction according to AWPA C14, "Wood for Highway Construction - Preservative Treatment by Pressure Processes."

Minimum retention of creosote preservative for wood species not covered under AWPA C14 is 11.6 pounds per cubic foot.

Treat piles as specified in Section 1005.2(a) and according to the AWPA C3, "Piles - Preservative Treatment by Pressure Processes."

Provide treated lumber and timber products with permanent symbol imprints or documentation to identify the treating company, treatment type, year of treatment, and certification of conformance with AWPA. Certify as specified in Section 106.03(b)3.

Accept treated structural timber that conforms to appropriate recommended AWPA treatment requirements.

(b) Adhesives (Glulam Fabrication). Provide adhesives conforming to ANSI/AITC A190.1, "Structural Glued Laminated Timber," Section 4.4. Provide wet-use adhesives. Certify as specified in Section 106.03(b)3.

(c) Hardware. Furnish bolts, nuts, washers, timber connectors, drift pins, dowels, nails, screws, spikes, other metal fasteners, and wire rope as necessary. Provide bolts and nuts as specified in Section 1105.02(c)1. Provide machine head bolts and nuts of regular hex series and coarse thread series, Class 6g and 6H (Class 2) tolerances, all conforming to applicable ANSI Standards. Provide cast iron Ogee, malleable iron, plate, or cut washers, as indicated. Galvanize all hardware except cast and malleable iron. Certify as specified in Section 106.03(b)3.

(d) Galvanizing. Section 1105.02(s). Galvanize hardware after fabrication.

(e) Structural Steel. Section 1105.02(a)

(f) Painting. Paint all structural steel, except hot-dip galvanized material, as specified in Section 1060.

(g) Laminated Girders and Deck Panels.

1. Fabrication.

1.a Mechanically Laminated Panels. Perform all possible fabrication of mechanically laminated members before preservative treatment.

Treat mechanically laminated girders and deck panels for highway construction according to AWPA C14.

1.b Glued laminated Members. Fabricate structural glued laminated softwood timber according to ANSI/AITC 190.1, "Structural Glued Laminated Timber," and AITC-117, "Manufacturing, Standard Specifications for Structural Glued Laminated Timber of Softwood Species."

Treat glued laminated timbers for highway construction according to AWPA C14.

2. Tolerances. Provide laminated structural members with net width, depth, and length as indicated on the structural drawings, and with tolerances according to the ANSI/AITC A190.1 (AITC 113, "Standard for Dimensions of Structural Glued Laminated Timber") or tolerances as follows:

- **Width.** $\pm 1/8$ inch of the indicated width.
- **Depth.** $\pm 1/8$ inch per foot of indicated depth.
- **Length.** $\pm 1/8$ inch up to 20-foot length with a $\pm 1/8$ -inch allowance for every 20 feet of additional length.
- **Squareness.** Provide a cross section for all glued laminated structural members which is square within $\pm 1/8$ inch per foot of depth of member unless a special shape is indicated.
- **Beam Camber.** $\pm 1/4$ inch for lengths up to 20 feet. Add $\pm 1/8$ -inch allowance for each additional 20-foot length.

Provide industrial appearance grade glued laminated timbers according to AITC 110, "Standard Appearance Grades for Structural Glued Laminated Timber."

Accept only glued laminated timbers in standard dressed widths according to AITC 113.

(h) **Membrane Waterproofing.** Section 680

(i) **Superpave Asphalt Mixture Design.**

- **Asphalt Wearing Course.** Section 413.2

(j) **Timber Piles.** Section 1005.2(a)

(k) **Cement Concrete.** Class A and Class AA. Section 704.

(l) **Wood Preservative.** AASHTO M 133. Certify as specified in Section 106.03(b)3. Use only oil-borne preservatives with hardwood lumber and timber.

1031.3 CONSTRUCTION—

(a) **Storing and Handling.** Store lumber and timber neatly in piles on skids above ground. Protect from exposure to the elements if stored for prolonged periods of time. Store material so that it can be readily inspected.

Handle in a manner to avoid injury or breakage. Handle treated lumber with nylon or other non-damaging rope slings. Do not use cant hooks, peaveys, or other sharp instruments in handling treated timber. Provide corner protection for banded material. The Department will reject treated lumber unduly injured in handling.

(b) Workmanship. Cut all lumber and timber accurately, and frame to a close fit, to provide for even bearing of joints over the entire contact surfaces. Make joints without shimming. Field drill only as indicated or as allowed.

1. Bored Holes. Treat all bored, drilled, or reamed holes with approved field treatment according to AWP A M4, "Standard for the Care of Preservative-Treated Wood Products." Plug unfilled holes, after field treatment, with treated timber plugs.

Bore holes in untreated lumber 1/16 inch in diameter less than the pin or dowel. Bore holes 1/16 inch in diameter larger than the bolt. Bore holes for lag screws not larger than the base of the thread. Bore holes in small timbers with the same diameter as the spike shank when necessary to prevent splitting. Do not field drill or nail, except for railing.

2. Installation of Connectors. Provide one of the following timber connector types, as indicated: split ring, shear plate, or spike grid. Install split ring and shear plate types in precut grooves of dimensions as indicated or as recommended by the manufacturer. Force spike grids into the wood so that timbers are in firm contact. Use pressure equipment that does not damage the wood. High-strength bolts or rods fitted with low friction ball-bearing washers made for this purpose may be used. Replace the high-strength bolts with specified bolts for the final installation. Embed all connectors of this type at a joint simultaneously and uniformly.

Cut connector grooves in timber concentric with the bolt hole, conforming to the cross-sectional shape of the rings, and providing a snug fit. Supply an inside groove diameter larger than nominal ring diameter so that the ring will expand slightly during installation. (See Table A)

3. Bolts and Washers. Use a washer of the size and type indicated under all bolt heads (except for timber bolts with economy type heads) and nuts that would otherwise come in contact with wood.

After final tightening, lock the nuts of all bolts.

(c) Substructure. Construct as indicated, and as follows:

1. Bent Piles. Drive piles as accurately as possible in the correct location, vertical or to the batter indicated, and as specified in Section 1005.3.

Make cut-offs accurately to ensure uniform bearing between the sills and piles of a bent. Treat cut pile ends according to AWP A M4.

2. Framed Bents. Bed mudsills firmly and evenly upon solid bearing material, and tamp into place. Construct concrete pedestals for the support of framed bents, as specified in the applicable portions of Section 1001.3. Finish pedestals carefully to provide full and even bearing for sills or posts.

Provide for true and even bearing of sills on mudsills, piles, or pedestals. If possible, remove all earth from contact with sills to provide for free air circulation around them.

3. Bearing Sill Caps. Place timber caps to secure an even and uniform bearing over the tops of the supporting posts or piles, and to secure an even alignment of their ends. Secure all sills as indicated. For sills secured using drift bolts, place drift bolts approximately in the center of the post or pile.

4. Bracing. Properly align bents before placing bracing. Bolt the ends of bracing through the pile, post, or cap. Furnish bracing of sufficient length to provide a minimum distance of 8 inches between the outside bolt and the end of the brace.

TABLE A
Typical Dimensions of Timber Connectors
 (dimensions in in.)

Split Rings				
Size	2 1/2 in.		4 in.	
Split ring				
Inside diameter at center when closed	2.500		4.000	
Thickness of metal at center	0.163		0.193	
Depth of metal (width of ring)	0.750		1.000	
Groove				
Inside diameter	2.56		4.08	
Width	0.18		0.21	
Depth	0.375		0.50	
Bolt diameter	1/2		3/4	
Bolt hole diameter	9/16		13/16	
Washers, standard				
Round, cast or malleable iron, diameter	2 5/8		3	
Round, mild steel				
Diameter	1 3/8		2	
Thickness	3/32		5/32	
Square plate, mild steel				
Length of side	2		3	
Thickness	1/8		3/16	
Shear Plates				
Size	2 1/2 in.	2 1/2 in.	4 in.	4 in.
Shear plate material	Pressed steel	Light gage	Malleable	Malleable
Diameter of plate	2.62	2.62	4.03	4.03
Diameter of bolt hole	0.81	0.81	0.81	0.94
Thickness of plate	0.172	0.12	0.20	0.20
Depth of flange	0.42	0.35	0.64	0.64
Use steel straps or shapes, for use with shear plates, designed according to accepted engineering practices.				
Hole diameter in straps or shapes for bolts	13/16	13/16	13/16	15/16
Circular dap dimensions				
A	2.63	2.63	4.03	4.03
B	—	1.07	1.55	1.55
C	0.81	0.81	0.81	0.94
D	—	0.65	0.97	0.97
E	0.19	0.13	0.27	0.27
F	0.45	0.38	0.64	0.64
G	0.25	0.14	0.22	0.22
H	—	0.34	0.50	0.50
I	2.25	2.37	3.49	3.49
Bolt hole—diameter in timber	13/16	13/16	13/16	15/16
Washers, standard				
Round, cast or malleable iron, diameter	3	3	3	3 1/2
Round, medium steel, minimum				
Diameter	2	2	2	2 1/4
Thickness	5/32	5/32	5/32	11/64
Square plate				
Length of side	3	3	3	3
Thickness	1/4	1/4	1/4	1/4

(d) Superstructure. Construct as indicated, and as follows:

1. Timber Stringers. Place stringers for bridge decks better edge down. Provide for even bearing of the floor on the stringers. Use butt joints for outside stringers, centered over caps of floor beams. Lap interior stringers to take bearing over the full width of cap or floor beams at each end.

Frame cross-bridging between stringers neatly and accurately, and fasten securely. Provide for full bearing of each end of cross-bridging members against the sides of stringers. Unless otherwise directed, place cross-bridging at the center of each span and at supports.

2. Glued laminated Timber Stringers. Place stringers according to beam fabricators' "TOP" mark. Provide for even bearing of the deck on all stringers at piers as indicated, but allow no less than 1/2 inch clearance between butt ends to allow for air circulation.

Treat all field drilled holes or reamed holes before installation of hardware according to AWP M4. Treat all field-drilled holes before installing diaphragms.

Provide for close fit (full bearing) of diaphragm between stringer beams. Place diaphragms or cross bracing as indicated.

3. Wheelguards, Rail, and Barrier. Frame and align wheel guards, rail posts, rails, and barriers accurately and as indicated.

4. Panel-to-Panel Connections. Provide a snug fit for all panel-to-panel connections on interconnected decks. Field drill or ream connections only if directed. Treat all field-drilled or reamed holes according to AWP M4.

(e) Surface Treatment of Timber. Do not paint wood treated with oil-borne preservatives.

Using pressure process, treat portions of rail posts that are to be embedded in earth or concrete and where faces of timber bulkheads will be in soil contact, with a 11.9 pounds per cubic foot retention of creosote preservative for softwoods and 11.6 pounds per cubic foot to 11.9 pounds per cubic foot retention of creosote for hardwoods.

Apply a two-coat finish sealer to treated structural timber railings where prolonged exposure to direct human contact is likely. Acceptable sealers include latex epoxy, urethane, shellac, or other finishes with effective coating agents that adhere to treated rails.

When framing, cutting, or boring of treated timber is performed after treatment, swab all cuts, daps, and holes thoroughly with two applications of accepted wood preservative treatments according to AWP M4.

(f) Post-Tensioning. Perform post-tensioning operations as directed.

Stress to 100% of the required tensioning force at the time of installation (Stage 1). Restress to 100% of the required tensioning force 1 week after completion of Stage 1 (Stage 2). Restress to 100% of the required tensioning force 4 to 8 weeks after completion of Stage 2.

Pressure inject protective sheathing with noncorrosive material or with material containing a corrosion inhibitor.

(g) Superpave Asphalt Mixture Design, Asphalt Wearing Surface. Clean the deck of the heavier excretions and surface residues of the treatment solution before constructing the asphalt leveling course.

Spread a blotter of fine material (silt and sandy silt) over the surface. Use a mixture consisting of 20% crushed material passing a 2.36 mm (No. 8) sieve and 80% material passing a 150 μ m (No. 100) sieve. Spread at a rate of 5 kg/m² to 8 kg/m² (10 pounds per square yard to 15 pounds per square yard). Broom off the blotter material. Repeat process until the surface is free of exudates.

Construct the Superpave Asphalt Mixture Design, leveling course as indicated and as specified in Section 413.3. Use only non-vibratory rollers for compaction of the Superpave Asphalt Mixture Design, leveling course.

For stressed-laminated timber decks, prepare the Superpave Asphalt Mixture Design, leveling course surface and construct waterproofing membrane as indicated.

Construct the Superpave Asphalt Mixture Design, surface course as specified in Section 413.3. Use only non-vibratory rollers for compaction of the Superpave Asphalt Mixture Design, surface course.

Provide geotextile Class 4 fabric as specified in Section 735, for glued laminated timber decks. No leveling course is necessary for glued laminated decks.

1031.4 MEASUREMENT AND PAYMENT—Lump Sum

- (a) **Fabricated Structural Steel.** Section 1050.4
- (b) **Structural Timber.** Cubic Foot
- (c) **Membrane Waterproofing.** Section 680.4
- (d) **Guide Rail.** Section 620.4
- (e) **Geotextiles, Class 4.** Section 212.4
- (f) **Piles.** Section 1005.4
- (g) **Superpave Asphalt Mixture Design.**

(g) **Cement Concrete.** Section 1001.4

SECTION 1039—CONCRETE BRIDGE DECK SURFACE PREPARATION, HYDRODEMOLITION

1039.1 DESCRIPTION— This work is bridge deck surface preparation after scarification using hydrodemolition to provide a rough and bondable surface and to remove unsound concrete. This work includes the removal and disposal of concrete and debris, vacuuming, shielding, water control, jack hammering and chipping, and work necessary for preparing the deck for completing concrete bridge deck repairs and the placement of a new latex modified concrete wearing surface as indicated and directed.

1039.2 MATERIAL— Not used.

1039.3 CONSTRUCTION—

(a) **General.** Submit a hydrodemolition water control plan to the Structure Control Engineer for review and approval for control and filtering of water discharged during the hydrodemolition operation. Include in the submission the maximum and minimum water pressure (pounds per square inch) and water usage (gallons per minute) the hydrodemolition machine will provide. Provide settlement basins or devices to allow only visibly clear water from leaving the project site. Protect scuppers, inlets, and downspouts from material that would cause plugging. Provide free flowing, unobstructed drainage structures at the completion of this operation.

Provide a technical field representative on the project site during the calibration and the hydrodemolition surface preparation operation.

(b) Equipment.

1. Hydrodemolition Equipment. The hydrodemolition equipment is required to be a computerized, self-propelled machine that utilizes a high-pressure water jet stream to provide a rough and bondable surface while removing unsound concrete, rust and concrete particles from exposed reinforcement during the hydrodemolition operation.

1.a Calibration. Completely remove construction debris, scarification debris and dust from the bridge deck surface before calibration.

Calibration is required each time hydrodemolition surface preparation is performed and as required to achieve the results specified.

Before commencement of the hydrodemolition surface preparation operation, calibrate the hydrodemolition equipment on an area of sound concrete (7 foot x 7 foot) as designated by the Structure Control Engineer to demonstrate that the hydrodemolition equipment can provide a rough and bondable surface. Calibrate hydrodemolition equipment to remove no more than 1/4 inch of concrete (original deck surface to peaks of roughened surface) in sound areas.

Move the hydrodemolition equipment to a second area (7 foot x 7 foot) that is unsound as designated by the Structure Control Engineer to demonstrate that the hydrodemolition equipment can provide a rough and bondable surface while removing unsound concrete in one pass. Adjust the settings as required within the limits established below to achieve total removal of unsound concrete.

Provide verification of the following settings to the Representative:

- Water pressure gauge (psi)
- Water usage (gpm)
- Machine staging control (step)
- Nozzle size
- Nozzle speed (travel)

The hydrodemolition surface preparation production may begin after the Structure Control Engineer accepts the calibration and production settings. Maintain and provide the calibration and production settings to the Representative before and during hydrodemolition surface preparation production.

If unsatisfactory results are obtained, stop hydrodemolition until the equipment deficiency or malfunction is

corrected. Provide another hydrodemolition unit for calibration if onsite equipment deficiencies cannot be corrected at no additional cost to the Department. No additional contract time will be provided for equipment deficiencies, malfunctions or recalibration of another hydrodemolition unit if required.

2. Pneumatic hammers. In areas inaccessible to hydrodemolition units or where the provided coverage is insufficient, use pneumatic hammers not exceeding 30 foot-pounds, operated at no more than a 45 degree angle from horizontal. Hand held water blasting equipment capable of delivering a minimum of 25 gpm at 10,000 psi are also allowed. Use chipping hammers not exceeding 15 foot-pounds or hand held water blasting equipment when removing concrete within one inch of the reinforcement steel.

(c) Surface Preparation Before Hydrodemolition. Provide shielding, as required, to ensure containment of dislodged concrete within the removal area to protect property and the traveling public from flying debris on, adjacent to, and below the work site.

Perform scarification as specified in Section 1041 on the bridge deck before hydrodemolition. Remove construction debris, scarification/milling debris, and dust completely from the bridge deck surface before commencement of the hydrodemolition surface preparation operation.

(d) Hydrodemolition. Perform hydrodemolition surface preparation over the entire top surface of the bridge deck or locations indicated to provide a rough and bondable surface and to remove unsound concrete in one pass. Verify and document removal every 30 feet along the cutting path. Do not allow vehicles other than approved construction equipment on those sections of deck where hydrodemolition has begun. Prevent contamination of the deck by providing protection for hydrodemolished portions of the deck.

Stop the surface preparation operation if it is determined that sound concrete is being removed in excess of 1/4 inch (scarified deck surface to peaks of roughened surface in sound areas) or unsatisfactory results are being obtained, as determined by the Representative. Perform recalibration or changes in equipment and methods before resuming the operation.

(e) Cleaning. Clean the hydrodemolition debris with a vacuum system equipped with fugitive dust control devices and capable of removing wet debris and water in the same pass. Cleaning includes but is not limited to fine material, powder, dust, water, and particles in pockets, voids, and crevices that would hinder an overlay from bonding with the substrate. Use oil-free compressed air to remove excess water and to dry the deck. Perform cleaning before debris and water dries on the deck surface. Remove material allowed to dry at no additional cost to the Department.

(f) Deck Sounding Verification. After the hydrodemolition surface preparation operation has been performed and the deck is dry and clean, resound the deck to ensure unsound material has been removed with the exception of Type 3 concrete bridge deck repair removal areas. Perform the remaining removal for Type 3 concrete bridge deck repair areas as specified in Section 1040 and as directed. Unsound concrete is defined as existing bridge deck concrete that is deteriorated, spalled, or determined by the Representative to be unsound. Remove remaining unsound concrete, patching material, or existing unsound overlay, as determined by the Representative, with pneumatic hammers or hydrodemolition at no additional cost to the Department. Use pneumatic hammers to provide a rough and bondable surface in areas that are inaccessible to hydrodemolition equipment. Remove unsound concrete or original deck surface found after the hydrodemolition surface preparation operation at no additional cost to the Department.

(g) Reinforcing Steel. Protect exposed reinforcement bars from bending by providing adequate supports. Splice or replace reinforcing steel damaged, bent, or dislodged by the hydrodemolition operations with the same size bar at no additional cost to the Department. Repair reinforcing steel distorted as a result of contractor operations at no additional cost to the Department. Remove portions of heavily corroded reinforcement steel where less than 1/2 of the effective cross-sectional area remains. Replace with the same type and size of bars as specified in Section 1002.3 and as directed.

The requirement to provide a minimum 3/4 inch clearance around reinforcement bars that are more than 1/2 diameter exposed is waived, provided the existing substrate concrete is sound. Where more than 1/2 diameter of the reinforcement bar is exposed, and the bar is corroded around the circumference, adjacent concrete is rust stained, or the bar is debonded from the substrate concrete, chip away concrete or water blast to provide a minimum 3/4 inch clearance.

1039.4 MEASUREMENT AND PAYMENT— Square Yard of deck area regardless of the number of passes.

SECTION 1040—CONCRETE BRIDGE DECK REPAIR

1040.1 DESCRIPTION—This work is removing and patching unsound bridge deck concrete as indicated and directed. Unsound concrete is defined as existing bridge deck concrete that is deteriorated, spalled, or determined by the Representative to be unsound. This work applies to approach slabs and barrier when indicated or directed. Concrete Bridge Deck Repair is classified into three types as follows:

(a) **Type 1.** Areas where unsound concrete removal extends no deeper than the top mat of reinforcement bars without exposing the top mat. Type 1 repairs are only performed when a latex overlay is indicated.

(b) **Type 2.** Areas where unsound concrete removal exposes the top mat of reinforcement bars and extends no deeper than the bottom mat without exposing the bottom mat.

(c) **Type 3.** Areas where unsound concrete removal exposes the bottom mat of reinforcement bars or the full depth of the deck is unsound. This includes deck overhang areas; and areas where curb, barrier, or deck ends need to be patched as part of the repair. Type 3 repairs over adjacent box beams extend to the top of the beam.

1040.2 MATERIAL—

(a) Patching Material.

- Class AAAP Cement Concrete—Section 704, except use No. 8 coarse aggregate.
- Class AA Cement Concrete—Section 704, except use No. 8 coarse aggregate. For use in barrier repairs only.
- Latex Modified Concrete (LMC)—Section 1042.2(f)
- Accelerated Structural Concrete (ASC)—Section 704, except use No. 8 Coarse Aggregate. Do not use ASC unless indicated or directed.
- Bag Mix—When the quantity of concrete is smaller than the minimum delivery requirement from a mix supplier, a Bulletin 15 approved bag mix with No. 8 coarse aggregate may be used. Submit the bag mix data sheets for review and do not use until accepted.
- Concrete Bonding Compound—Type II, Grade 2, ASTM C881 epoxy as specified in Section 706
- Wearing Surface Material for Patching—Section 1042.2

(b) Reinforcement Bars. Section 1002.2

(c) Concrete Curing Material and Admixtures. Section 1001.2(b)

1040.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) **Deck Sounding and Delineation of Repair Areas.** Provide a chain drag 3 feet in width with chain drops spaced every 6 inches for Department use. Sound the entire bridge deck with the chain drag in the presence of the Representative. When scarification and a latex overlay are indicated without hydrodemolition, sound the entire deck after scarification in the presence of the Representative. The Representative will delineate the repair areas.

(b) Equipment.

1. **Hand Tools.** Use hand tools for removal including hammers and chisels. Use hand tools to remove final

particles of unsound concrete or to provide necessary clearances around reinforcement bars.

2. Pneumatic Hammers.

- Do not exceed 30 foot-pound hammers.
- Do not exceed 15 foot-pound hammers to remove final particles of unsound concrete, to provide necessary clearances around reinforcement bars, or below the bottom mat of steel overtop of concrete beams.
- Do not operate pneumatic hammers or mechanical chipping tools at an angle in excess of 45 degrees relative to the surface of slab.
- Do not use pointed or narrow chisels overtop of beams, provide 2 inch minimum width chisels.
- Do not place pneumatic hammers in direct contact with reinforcing steel.

3. Water Blasting Equipment. Provide water blasting equipment with a minimum rated capacity of 5,000 pounds per square inch.

(c) Surface Preparation and Concrete Removal. Provide satisfactory protective shielding during removal operations. During removal for Type 3 repairs, provide shielding to prevent debris from falling below the deck. Prevent damage to underlying beams.

Outline the unsound delineated areas with a 3/4-inch deep saw-cut. Remove unsound concrete with hand tools and pneumatic hammers. Notify the Representative if unsound concrete extends beyond the delineated areas. Extend repair areas as directed.

Remove portions of damaged or heavily corroded reinforcement bars, and replace with the same type of bars, as specified in Section 1002.3 and as directed.

For Type 1 repairs, perform Type 1 removal only when scarification and a latex overlay are indicated without hydrodemolition. When a latex overlay is not indicated, perform Type 1 repairs as Type 2 repairs.

For Type 2 repairs, remove concrete to a depth that provides a minimum of 3/4-inch clearance around all reinforcement bars in the top mat, regardless of concrete deterioration. If portions of the bottom mat of reinforcement bars are exposed during removal, remove full-depth and perform a Type 3 repair as directed.

Satisfactorily repair damage to the structure beyond the limits of this work due to construction operations at no additional cost to the Department.

(d) Cleaning. Provide satisfactory protective shielding during cleaning operations for repair areas. After concrete removal operations are complete, remove remaining debris and loose materials. Abrasive blast exposed reinforcement bars to clean white metal. Air-blast repair areas with oil-free compressed air, ensure abrasive blast material is removed, and remove contaminants detrimental to the bond of the patching material. Epoxy coat exposed reinforcement bars. Protect cleaned areas from contamination.

(e) Concrete Bonding. Coat contact surfaces of repair areas with concrete bonding compound. Do not coat surfaces to receive a new overlay. Remove concrete bonding compound from surfaces to receive an overlay at no additional cost to the Department.

1. Epoxy Bonding Compound. Place concrete against contact surfaces while epoxy bonding compound is still tacky to ensure bond between contact surfaces and fresh concrete. Wire brush or sandblast hardened epoxy before recoating with fresh epoxy.

2. Other Bonding Compound. Place concrete against contact surfaces within the compound manufacturer's recommended time frame. When recommended time frame has expired, follow manufacturer's recommendations for recoating contact surfaces.

(f) Patching.

1. Type 1. Perform Type 1 repairs as Type 2 repairs.

2. Type 2. Patch Type 2 bridge deck repair areas with modified Class AAAP cement concrete, LMC or ASC if indicated or directed. Patch Type 2 barrier repairs with Class AA cement concrete or ASC if indicated or directed. Vibrate concrete with a pencil vibrator. Finish patches to match the existing deck surface elevation. Before the concrete

becomes nonplastic, trow the surface as specified in Section 501.3(k)4. Finish barrier patches to match adjacent barrier contours. Do not trow barrier patches.

3. Type 3. Patch and finish Type 3 repair areas the same as Type 2 repairs. In addition, use removable formwork of sufficient strength to prevent lateral or vertical deflection. Provide side forms including drip-strip and chamfering.

4. Patching in Preparation of Latex Overlay Placement.

4.a Type 1. Patch Type 1 repair areas concurrently with the overlay placement with the same material used for the overlay. Place overlay as specified in Section 1042.3.

4.b Type 2, Concurrent with Overlay. Patch Type 2 repair areas up to 4 inches in depth concurrently with the overlay placement with the same material used for the overlay. Place overlay as specified in Section 1042.3.

4.c Type 2, Patching before Overlay Placement. If Type 2 repair areas exceed 4 inches in depth, patch before overlay placement. Perform scarification before patching. If indicated, perform hydrodemolition before patching. Patch repair areas with modified Class AAAP cement concrete, LMC or ASC if indicated or directed. Vibrate concrete with a pencil vibrator. Finish patches to match the scarified or hydrodemolitioned deck surface elevation. Provide a rough texture on patch surfaces. After patches have attained a minimum compressive strength of 3,000 pounds per square inch, remove laitance from patch surfaces by water blasting.

4.d Type 3. Do not place Type 3 patches concurrently with overlay. Perform scarification before patching. If indicated, perform hydrodemolition before patching. Use removable formwork of sufficient strength to prevent lateral or vertical deflection. Provide side forms including drip-strip and chamfering. Patch repair areas with modified Class AAAP cement concrete, LMC or ASC if indicated or directed. Vibrate concrete with a pencil vibrator. Finish patches to match the scarified or hydrodemolitioned deck surface elevation. Provide a rough texture on patch surfaces. After patches have attained a minimum compressive strength of 3,000 pounds per square inch, remove laitance from patch surfaces by water blasting.

(g) Curing Patches.

1. Normal Curing. Water cure bridge deck patches as specified in Section 1001.3(p)3.b.2. Cure barrier patches with curing compound as specified in Section 1001.3(p)3.a or water cure as specified in Section 1001.3(p)3.b.1. After 28 days, remove laitance and contamination on the surface by water blasting. Apply a penetrating sealer after water blasting as specified in Section 1019 and according to the manufacturer's recommendations. When a latex overlay is indicated, do not apply penetrating sealer to bridge deck patching performed before overlay.

2. ASC. Cure as specified in Section 1001.3(p)3.d. When a latex overlay is indicated, do not apply curing compound to bridge deck patching performed before overlay.

3. Bag Mixes. When bag mixes are accepted for use as a substitute for modified Class AAAP cement concrete or LMC for bridge deck patches or modified Class AA cement concrete for barrier patches, cure as specified in Section 1040.3(g)1. When bag mixes are accepted for use as a substitute for ASC, cure as specified in Section 1040.3(g)2.

(h) Live Loads. As specified in Section 1001.3(q)2.c, Table C.

1040.4 MEASUREMENT AND PAYMENT—

(a) Patching. Square Foot
For the type indicated.

(b) Reinforcement Bars. Section 1002.4

(c) Penetrating Sealer. Penetrating sealer is incidental to the patching items.

SECTION 1041—SCARIFICATION

1041.1 DESCRIPTION—This work is scarifying existing concrete bridge decks in one or multiple passes as indicated to the overall uniform depth, in preparation for placing a concrete or mortar wearing surface or before performing hydrodemolition surface preparation.

1041.2 MATERIAL—Not used.

1041.3 CONSTRUCTION—

(a) **General.** Submit for acceptance the proposed method and equipment used for scarification of concrete surfaces. Before scarification, perform a precondition survey of the existing concrete bridge deck cracks to locate potential reflective cracks in the wearing surface. Perform a bridge deck survey as specified in Section 1042.3(b).

Do not perform scarification on new concrete until a compressive strength of 3,300 psi is attained. Verify the cover of the top mat of reinforcement bars before scarification. Scarify the existing concrete bridge deck the number of uniform depth passes indicated to the required overall removal depth. When hydrodemolition is not indicated, perform scarification in 1/4 inch maximum uniform depth passes. When hydrodemolition is indicated, perform scarification in 1/4 inch or 1/2 inch uniform depth passes as indicated.

If the overall removal depth indicated was not achieved, perform additional scarification to the overall removal depth at no additional cost to the Department. When existing overlays are present or are indicated for removal, do not demobilize the scarification equipment until the Representative verifies the removal depth and complete removal of existing overlays up to 1/2 inch to the top mat of reinforcement bars. Do not scarify within a 1/2 inch clearance of the top mat of reinforcement bars. Clean the deck surface as directed for verification of the removal depth and to ensure existing overlays were completely removed or the deck has been removed to 1/2 inch of the top mat of reinforcement bars.

In areas inaccessible to scarification equipment, use pneumatic hammers not exceeding 30 foot-pounds, operated at no more than a 45 degree angle from horizontal to remove the required depth indicated. Do not use triple-headed tampers fitted with star drills less than 2 inches in diameter.

Completely remove by hand, power broom, or vacuum all broken concrete and laitance resulting from the scarification operation. Do not flush debris. Remove debris at the end of each work day. Clean debris from scuppers and downspouts as needed. Do not allow construction vehicles or equipment, other than power brooms, on the scarified deck surface, unless the surface is adequately protected to prevent contamination.

(b) **Equipment.** Scarify using a self-propelled machine capable of preparing 1,000 square yards per day. The equipment used for scarification is required to remove the single pass depth indicated across the cutting path. A micromill milling machine is required when scarifying before placing a polyester polymer concrete overlay.

1041.4 MEASUREMENT AND PAYMENT—Square Yard for the single pass depth indicated.

Payment will only be made for the surface area of each uniform single pass depth indicated and required to achieve the overall removal depth regardless of the number of passes made with the scarifying equipment.

SECTION 1042—LATEX MODIFIED MORTAR OR CONCRETE WEARING SURFACE

1042.1 DESCRIPTION—This work is construction of a latex modified mortar or concrete wearing surface on bridge decks, approach slabs or indicated surfaces. The indicated or specified depth of the wearing surface is the minimum.

1042.2 MATERIAL—

(a) **Cement.** Type I, IP, IS, or II (MH), Section 701.1.

(b) **Fine Aggregate.** Type A, Section 703.1.

(c) **Coarse Aggregate.** Type A, No. 8, Section 703.2.

(d) **Water.** Section 720.1

(e) **Latex Emulsion Admixture.** Section 711.3(e)

(f) **Latex Modified Mortar (LMM) or Concrete (LMC) Mix Design.** Use latex modified mortar for depths less than 1 1/4 inches. Use latex modified concrete when the depth is 1 1/4 inches or more.

Provide a concrete technician as specified in Section 704.1(d)2. Provide testing facilities and equipment as specified in Section 704.1(d)3.

The term “latex,” as used in this Section, refers to latex modified mortar or concrete, unless otherwise specified. Provide latex conforming to the following requirements:

Latex Modified Mortar or Concrete Mix Design Requirements	Requirements	
	Mortar	Concrete
Cement Content, bags/cu. yd.	8.0	7.0
Latex Emulsion Admixture Modifier, gal/bag of Cement	3.5	3.5
Air Content, % of Plastic Mix (AASHTO T 152)	1 - 7	1 - 7
Water/Cement Ratio, by Weight	0.35 - 0.40	0.30 - 0.40
Slump ⁽¹⁾ , inches (AASHTO T 119)	4 - 6	3 - 7
Percent Fine Aggregate as Percent of Total Aggregate, by Weight	100	60 ± 5
Cement/Fine Aggregate/Coarse ⁽²⁾ Aggregate Ratio, by Weight	1:3.25	1:2.5:2.0 to 1:2.9:1.6
5-day Compressive Strength (psi) (PTM Nos. 604 & 611) ⁽³⁾	3,000	3,000
28-day Compressive Strength (psi) (PTM Nos. 604 & 611) ⁽³⁾	3,500	3,500

⁽¹⁾ Discharge the sample from the mixer and transport it to a point unaffected by vibration. Deposit the sample on the deck in a suitable container and do not disturb for five minutes. Then, remix the sample and perform the slump test according to AASHTO T 119.

⁽²⁾ Dry basis, Aggregate Specific Gravity = 2.65. The dry weight ratios are approximate and should produce good workability, but due to gradation changes, the ratios may be adjusted within limits by the Representative.

⁽³⁾ Cure specimens according to PTM No. 611, Section 11.1, except strip after the first 48 hours (± 2 hours), and air cure as specified in Section 1042.3(d) Table A.

Accelerated Latex Modified Concrete Mix Design Requirements	
Cement	Type I, IP, or II, Section 701.1 or other rapid setting cement accepted by the DMM/DME
3 Hour Minimum Compressive Strength	3,000 psi
12 Hour Minimum Compressive Strength	3,000 psi

1. Compatibility Testing During Mix Design. Verify the compatibility of the mix components during mix design and ensure that the mix provides sufficient time of workability to satisfactorily finish and texture the surface. Re-verify compatibility whenever there is a change in mix components. Provide a technical expert from the latex admixture manufacturer for the design process, if directed.

(g) Mix Designs Using Potentially Reactive Aggregates. Section 704.1(g)

1042.3 CONSTRUCTION—

(a) Equipment. Obtain acceptance of equipment for the deck preparation, mixing, placing, and finishing of the latex wearing surface, before start of wearing-surface work. Include equipment specifications in the QC Plan specified in Section 1042.3(c).

1. Surface Preparation Equipment. Of the following types:

1.a Abrasive Blasting or Water Blasting Equipment. Capable of removing partially loosened chips of concrete and removing rust and corrosion from reinforcement bars. Provide water blasting equipment with a minimum rated capacity of 5,000 pounds per square inch.

1.b Power-Driven Hand Tools. Section 1040.3(b)

1.c Scarification. Section 1041.

1.d Hydrodemolition. Section 1039.

2. Proportioning and Mixing Equipment. Provide self-contained, mobile equipment, capable of continuous mixing, with the capacity to deliver a minimum of 6 cubic yards of latex per hour, and subject to the following:

2.a Mixing Equipment. Provide equipment with a metal plate or plates permanently attached in a prominent place, plainly marked with the gross volume of the unit in terms of mixed mortar, operating speed, auger mixing angle, and the weight-calibrated cement constant of the machine, in terms of a revolution counter or other output indicator, all as rated by the manufacturer.

2.b Compartments. Provide separate compartments to carry the necessary ingredients needed for the production of latex modified mortar or concrete. Cover aggregate bins at all times. Provide cement bins free of moisture and contamination at all times. Provide suitable means to carry water and additives on the truck and to incorporate the additives with the mixing water in the mix.

2.c Feed Systems. Provide a unit with a feeder system mounted under the compartment bins to deliver the ingredients to the mixing unit. Provide each bin with an accurately controlled, individual gate to form an orifice for volumetrically measuring the material drawn from each respective bin compartment. Maintain belt feeders and scrapers to prevent leakage of materials onto the deck.

Set the cement bin feeding mechanism to discharge continuously, and at a uniform rate, a given volumetric weight equivalent to cement during the mixing operation. Coordinate the aggregate feeding mechanisms with the cement feeding mechanisms to deliver the required proportions.

2.d Mixing Unit. Provide an auger-type mixing unit, incorporated into the truck's discharge chute or other suitable mixing mechanism, capable of producing latex of uniform consistency and discharging the mix without segregation.

2.e Dials and Measuring Devices. Equip the unit with an accurate revolution counter indicator allowing the reading of the volumetric weight equivalent to cement discharged during the mixing operation. Equip the counter with a ticket printout to record this quantity. Use aggregate dials that allow the setting of required openings for volumetric proportioning.

Equip the unit with a cumulative water meter and a water flow gauge to accurately indicate the discharge rate of water by volume (gallons per minute) entering the mix. Provide an approved device on the mixing unit for the Representative to use to check the rate of flow of the latex modified admixture entering the mix along with the total amount of latex modified admixture contained in the mix. Coordinate the water and additive measuring devices with the cement and aggregate feeding mechanisms. Equip the flow meters with scales appropriate for the type and amount of material being added.

Mount a tachometer on the mixing unit to indicate the drive shaft speed.

Place required indicating devices in full view and near enough to be accurately read or readjusted by the operator while latex is being produced. Provide the operator with convenient access to controls.

2.f Calibration. Provide a unit constructed to allow convenient calibration of the gate openings and meters. Have the calibration conducted by the supplier of the latex in the presence of the Representative, and recalibrate after every 100 cubic yards of production for each unit. Document the calibration of Form CS-4342 and keep with the mobile mixer. Have the supplier of the latex make satisfactory arrangements with the Representative at least 7 calendar days in advance of calibration. Provide platform scales calibrated annually. Calibrate using the maximum water/cement ratio, cement, and aggregates listed on the approved mix design. Verify compatibility of components and mix workability time while performing a yield test at the conclusion of the calibration process, if directed.

Conduct a recalibration in the event of a change in source of aggregates. Conduct additional calibration as directed. Have each approved unit carry a copy of the calibration certificate. In addition to calibration, perform a yield test according to AASHTO T 121, if directed.

An additional check may be made using the following procedure:

With the cement meter set on zero and controls set for the desired mix, activate the mixer discharging mixed material into a 1/4 cubic yard container (36 inches by 36 inches by 9 inches). When the container is level-struck full, making provision for settling the material into corners, the cement meter is required to show a discharge of 2 bags of cement for modified mortar (8 bags per cubic yard mix) or 1.75 bags of cement for modified concrete (7 bags per cubic yard mix).

2.g Mixing and Delivery Control. Proportion, measure, and batch cement and aggregates by a volumetric weight equivalent method. In operation, the entire measuring and batching mechanism is required to produce the specified proportions of each ingredient. Establish volume/weight relationships during the calibration of the measuring devices. Provide tolerances in proportioning the various ingredients as follows:

- | | |
|------------------------------|-------------|
| • Cement, weight % | 0.0 to +4.0 |
| • Fine Aggregate, weight % | ±2.0 |
| • Coarse Aggregate, weight % | ±2.0 |
| • Water, weight or volume % | ±1.0 |
| • Latex, weight or volume % | ±2.0 |

During mixing, maintain the drive shaft speed as indicated by the tachometer at operating speed ± 50 rpm. Set the auger mixer angle in the range determined by the manufacturer. Do not exceed one-half hour for the interval between the continuous placement of successive batches. Equip the mixer to spray water.

2.h Loading. Charge aggregate bins no more than 6 hours before time of scheduled placement unless otherwise approved by the Representative. Ensure the aggregate is maintained in a uniform wet condition before loading. Determine the amount of free water on the aggregates at the time of loading by performing aggregate moisture tests according to AASHTO T 255 or ASTM C70. Adjust mix proportions to account for the amount of available free water. Empty bins and recharge if not utilized within 6 hours or if conditions contribute to variable moisture content of the aggregate. Stock aggregates in a manner that prevents contamination.

Upon arrival at the project site, empty bins of aggregate that were charged before coming to the current project. Empty the cement bin and latex tank unless use on a previous project can be verified by the Representative, or, in the presence of the Representative, obtain a sample of the liquid latex admixture and cement being used in the mixture and deliver the samples to the Representative for testing. The Representative will submit the samples to LTS for testing. Circulate and mix latex tank as recommended by the latex manufacturer.

3. Placing and Finishing Equipment. Provide finishing equipment as specified in Section 1001.3(k)6.c. Provide hand tools for placing and brushing-in freshly mixed latex and for distributing latex over the bridge deck surface before striking off with the mechanical finishing equipment. Use approved hand-operated vibrators and screeds to place and finish small areas of work. Do not use 2-cycle engine vibrators or equipment on the prepared deck. Conduct final finishing operations immediately behind the finishing machines or screeds from work bridges of rigid construction, not in contact with the surface of the concrete, set on rails, and easily moved.

(b) Surface Preparation. Before scarification, hydrodemolition, or removal of portions of the deck surface, survey existing gutter lines and breakpoints every 25 feet including each metal expansion dam along the length of the bridge deck.

Not more than 7 days before the placement of the overlay, scarify the deck surface, to the depth indicated, as specified in Section 1041.

When the indicated surface preparation includes scarification without hydrodemolition, perform scarification, then remove remaining unsound concrete and repair as specified in Section 1040.

When the indicated surface preparation includes scarification and hydrodemolition, perform hydrodemolition after scarification to provide a rough and bondable surface and to remove unsound concrete, as specified in Section 1039. Perform Type 3 concrete bridge deck repairs after hydrodemolition, as directed and as specified in Section 1040.

Before placement of the latex overlay, complete Type 3 deck repairs and Type 2 deck repairs exceeding 4 inches in depth as specified in Section 1040. Type 2 deck repairs that do not exceed 4 inches in depth can be placed concurrently with the latex overlay.

Abrasive blast exposed reinforcement bars to remove rust, contaminants, and pockets of corrosion. Do not apply epoxy coating to reinforcement bars.

Not more than 24 hours before placement begins, clean the entire surface including edges of previously placed lanes of latex, to remove trowel-cut surfaces and promote bond. Clean the surface thoroughly by water blasting, and air blasting using clean, oil-free compressed air to remove dust, slurry, blast media, weak or fractured concrete, petroleum stains, leaves, paint, debris, oil, or other foreign materials detrimental to achieving bond, if necessary. Protect the entire prepared deck surface against contamination by covering with clean full width polyethylene sheeting until the overlay operations are completed. Include cleaning methods in the QC Plan, as specified in Section 1042.3(c).

Allow 48 hours of curing to elapse before performing scarification, hydrodemolition, or chipping on adjacent concrete within 6 feet of previously placed latex.

Raise expansion dams and scuppers if indicated before placing the wearing surface.

(c) Placing and Finishing.

1. Quality Control (QC) Plan. Prepare and submit a field operation QC Plan for review and acceptance according to Form CS-1042. Do not proceed with latex placement until the QC Plan has been accepted. Include in the QC Plan, testing and sampling frequencies and target points to initiate corrective measures. Include key personnel and relevant experience, method of operations, a sketch describing the equipment, and showing complete details of supports for the equipment.

2. Pre-latex Placement Meeting. At least 2 weeks before overlay placement, schedule a pre-latex placement meeting to review the specification, method and sequence of placing latex, quality control testing, and method of protective measures, to control the concrete evaporation rate.

3. Finishing Equipment. Provide anchorage for supporting rails for horizontal and vertical stability. Do not treat screed rails with parting compound to facilitate their removal.

Adjust screeds to finished grade before placing the wearing surface. For superelevated bridges, adjust screed guides to compensate for the curvature.

Determine the finished grade by referencing the survey data obtained before surface preparation. Raise the existing grade or match existing grade, as indicated. Provide a final setting of the screeds such that a smooth riding surface is achieved. Do not lower the screed to compensate for wear on the existing deck or for over scarification or hydrodemolition. Before placing latex, perform a dry run by passing the finishing equipment over the deck area to check the clearance between the bottom of the screed and the prepared surface. Demonstrate that the fogging equipment is working properly during the dry run. Remove concrete that does not clear the screed by the minimum depth of wearing surface.

4. Latex Placement and Finishing. Immediately before placement of the latex, thoroughly wet the clean surface for a period of not less than one hour. Vacuum standing water in depressions, holes or areas of concrete removal. Maintain prepared deck in a damp, puddle-free condition. Use a fogger/mister to dampen visible dry spots before the latex placement.

Brush/broom damp vertical surfaces with latex grout. For horizontal surfaces not prepared with hydrodemolition that will be in contact with the latex overlay, brush/broom damp horizontal surfaces with latex grout. When using latex concrete, collect and discard excess aggregate. Do not over-extract grout from the mix to the point that the grout becomes diluted. If directed, apply a second brushed/broomed coat of grout to areas where grout is diluted by excessive surface moisture. Immediately remove material from the deck that is not properly mixed or proportioned, or lacks component material, and regROUT the area. Ensure brushed/broomed surfaces receive a thorough, even coating of latex grout and that the rate of progress is limited so that the brushed/broomed material does not become dry before it is covered with additional material, as required for the final grade.

Place and strike-off the mixture to approximately 1/4 inch above final grade. Vibrate latex in front of finishing machine. For hydrodemolitioned surfaces, snake vibrator through latex at no more than 12 inch passes. Vibrate edges, adjacent to joint bulkheads and expansion dams, in depressions, and in areas of bridge deck repair. Fill and consolidate each Type 2 deck repair placed concurrently with the overlay before the advancement of the overlay placement operation. Finish to final grade with the approved finishing equipment. Hand-finishing with a float may be required along the edge of the placement or on small areas of repair. Edge-tooling is required at joints, metal expansion dams, curbs, and previously placed lanes. Place latex continuously and complete the finishing of each area within 15 minutes after the initial brooming. Provide finish with a closed surface, free of pock marks, ridges, tears, and other defects. Place latex at a minimum rate of 20 linear feet of deck per hour, in a longitudinal direction.

When placing latex against latex that has not achieved initial set, but has formed a surface crust or film, remove the surface crust until plastic latex is exposed, place fresh latex against the exposed surface and consolidate both until homogeneous.

Separate screed rails and construction bulkheads from the newly placed material by passing a pointing trowel along their inside face. Do not separate metal expansion dams from the wearing surface. Ensure that this trowel cut is made for the entire depth and length of rails after the mixture has stiffened sufficiently.

Conduct operations behind the finishing machines or screeds from work bridges suspended above the wearing surface. Provide work bridges of rigid construction. Do not allow work bridges to come into contact with the surface of the latex.

Perform straightedge testing, surface correction and edging while the latex is still workable as specified in Section 501.3(k)3. After the straightedge testing and surface corrections have been completed and before the latex becomes nonplastic, manually texture/tine the surface transversely as specified in Section 501.3(k)4.b if mechanical texturing is not indicated. Cure the wearing surface as soon as possible without marking the fresh latex. After the latex has hardened, test the surface again as specified in Section 501.3(o). Resound the deck if directed.

When mechanical texturing is indicated, perform as specified in Section 1001.3(k)6.f. Do not begin grooving operations until directed, the latex has reached a compressive strength of 3,000 psi according to PTM No.604, the grooving equipment live loads can be applied as specified in Section 1042.3(g), and until the surface tolerance has been checked and high points are removed as specified in Section 501.3(o).

Provide adequate lighting, as indicated on the field operation QC Plan, for placement not completed in the daylight. Ensure lighting allows proper placement, testing, and inspection operations of the entire surface area and until curing covers are placed over the surface area.

(d) Curing and Protection. Begin curing as soon as the latex has been placed, finished, and textured, if

applicable. Do not use membrane-forming or monomolecular curing compounds:

1. Curing Temperatures, Curing Days and Records of Temperature. Sections 1001.3(p)1 and as follows: Maintain cure temperatures of 45F or greater throughout the wet and dry cure period. Do not count as a curing day, a day on which the curing temperature drops below 45F. If the curing temperature falls below 35F during the curing period, the Department will consider the work unsatisfactory and it will be rejected. Protect the overlay using methods as specified in Section 1001.3(p)4 during cool weather and Section 1001.3(p)5 during cold weather.

2. Water Cure. Saturate curing covers before use and keep in a saturated condition for the curing period. Soak burlap for a minimum of 48 hours before placement. Re-wet burlap as needed before placement. Promptly cover the surface with a double layer of clean, wet burlap within 15 feet of strike-off from the finishing machine. Place burlap so each strip overlaps one-half its width. Minimal marking of the surface from curing covers is allowed. Maintain burlap in a fully wet condition using misting hoses, fogging machines that span the entire burlap covered surface, or other approved devices until the concrete has set sufficiently to support foot traffic. At that time, place soaker hoses on the burlap to maintain continuous saturation of burlap over the entire deck surface. At a minimum, place soaker hoses at grade breaks and high sides of superelevations to ensure continuous saturation. Secure burlap to prevent lifting or displacement due to adjacent construction operations or wind. Cure the surface according to Table A.

3. Dry Cure. After water curing, remove the curing covers and dry cure for an additional period according to Table A. Maintain the surface of the overlay in a dry condition for the entire dry cure period. Cover the surface with waterproof coverings as required. If the overlay surface becomes wet during the dry period, extend the dry cure period to the equivalent time that the overlay surface was wet.

TABLE A
Curing Times and Application of Live Load

Overlay Type	Depth	Water Cure (hours)	Dry Cure (hours)	Live Load Application Total Cure Time MIN (hours)	Live Load Application Comp. Strength MIN (psi)
LMM or LMC	≤ 2 inches	48	72	120	3,000
	> 2 inches	48	96	144	3,000
Accelerated LMC, 3 Hour	All	3	None	3	3,000
Accelerated LMC, 12 Hour	All	12	None	12	3,000

(e) Limitations of Operations. Place the latex during periods where the ambient and substrate deck temperatures are between 45F and 85F. At ambient temperatures above 80F, conduct the overlay placement at night or early morning hours. If the ambient temperature is expected to reach 80F 24 hours before the overlay placement, take steps necessary, but not limited to the following to mitigate the mix component temperatures that are acceptable to the Representative:

- cover the latex admixture tanker and cement tanker with wet burlap or station the latex admixture tanker and cement tanker in shaded areas;
- condition aggregates with cool water, cover with light-colored tarps and/or stockpile in shaded areas;
- charge the water tank on the mobile mixer with cool water as close to the time of placement as possible, or condition with ice;
- park mobile mixes in shaded areas or cover with wet burlap before the placement.

Place latex at a plastic latex mixture temperature between 50F and 85F. Stop the placement if the Representative determines that a satisfactory surface finish is not being achieved.

Install a bulkhead in case of a major delay in the placement operation resulting in the formation of a surface film. During minor delays, protect the placement from drying with several layers of wet burlap.

Take adequate precautions to protect freshly placed latex from rain. Stop placement operations when it starts to

rain. The Representative may order removal of latex damaged by rainfall.

Do not place latex when the evaporation rate exceeds 0.06 pound per square foot per hour according to ACI 305R, Figure 2.1.5. Wind breaks, sunshades, or fogging may be used to reduce evaporation to below the maximum allowable rate.

Discontinue placement when the Representative determines that flash set of the latex does not provide a suitable placement or finish. Submit redesign and corrective action plan as directed.

(f) Testing and Acceptance.

1. Concrete Field Testing Technician. Section 704.1(d)2.a

2. Testing Facilities and Equipment. Section 704.1(d)3

3. QC and Acceptance Testing.

3.a QC Sampling and Testing of Plastic Latex. Perform testing according to the accepted QC Plan. Furnish a copy of the QC Plan to be maintained in the Department's field office.

Test each 5 cubic yards of latex for plastic air content, temperature, and slump. Continue testing the load until control is established. Do not wait for the completion of the initial test before collecting subsequent samples. Perform slump tests as specified in Section 1042.2(f) and air content tests according to AASHTO T 152. Notify the Inspector when sampling and QC testing are to be performed. The Inspector will witness the sampling and QC testing. Report test results to the Inspector promptly. Coordinate and facilitate changes as needed in a timely manner.

Do not incorporate latex into the work that does not conform to specification requirements. Immediately separate and remove nonconforming material from the deck surface.

3.b Acceptance Testing. Latex will be accepted on a lot-by-lot basis. Test for plastic air content according to AASHTO T 152; temperature; and compressive strength according to PTM No. 611 and PTM No. 604. Each lot will consist of 20 cubic yards or a day's placement, whichever is less.

The Inspector will select acceptance samples (n=1) according to PTM No. 1. Obtain samples of fresh latex at the point of placement under the direction and supervision of the Inspector and according to PTM No. 601. Acceptance testing of plastic concrete will be performed at a site near the point of placement, as selected by the Inspector. Latex will be tested for yield as directed. Latex not conforming to specification requirements at the point of placement will be rejected.

If the results of testing the plastic latex conform to specification requirements, mold a sufficient number of acceptance cylinders for 5-day compressive strength tests. Compressive strength cylinder molds of 4-inch diameter by 8-inch height may be substituted for cylinder molds of 6-inch diameter by 12-inch height. Perform compressive testing according to PTM No. 604. The Inspector will identify the cylinders as acceptance cylinders. Field cure cylinders as specified in Section 1042.2(f). The compressive strength of the sample will be determined as the average of the compressive strength of two 6-inch diameter by 12-inch height individual cylinders or the average of three 4-inch diameter by 8-inch height individual cylinders according to ACI 318. The lot will be accepted when the 5-day compressive strength meets or exceeds 3,000 pounds per square inch.

3.c Bond Tests.

3.c.1 Scarified Surfaces (no hydrodemolition). When the indicated surface preparation includes scarification without hydrodemolition, perform a vertical pull bond test according to ASTM C1583 between 24 hours and 72 hours after curing is complete and the latex has attained a minimum compressive strength of 3,000 psi. Perform a minimum of one vertical pull bond test on each span or day's placement, whichever is smaller, at a location or locations as designated. If multiple tests are taken in a span, the test result is the average of the tests for that span. The required minimum bond strength between the latex overlay and substrate is 250 psi. If the initial vertical pull bond test results do not meet the minimum requirement of 250 psi, perform up to three additional vertical pull bond tests per span where the minimum requirement of 250 psi was not met. After additional testing, if the average of the test results for a span do not meet the minimum requirement of 250 psi, the bond between the substrate and latex overlay in each span not meeting this requirement is considered defective work, and the latex overlay must be removed and replaced at no additional cost to the Department. Repair bond test locations with nonshrink grout, as specified in 1001.2(d).

3.c.2 Hydrodemolitioned Surfaces. When the indicated surface preparation includes hydrodemolition and the overlay exhibits cracking or surface tears and potential debonding, perform bond tests as specified in Section 1042.3(f)3.c.1 as directed.

(g) Application of Live Loads. After latex placement, do not allow heavy equipment or vehicular traffic on the latex surface until the end of the period according to Table A, and until the latex has achieved the minimum strength as specified in Section 1042.3(d), Table A.

(h) Defective Work. Sections 105.12 and 1001.3(u), and as follows:

When latex overlays exhibit cracking or surface tears, perform an investigation with the Representative to determine the type of cracking, source of cracking, and extent of cracking. Measure the width, depth, and length of each crack and establish the locations of the ends of each crack with respect to permanent reference points. Coring may be necessary if crack depths cannot be accurately determined using a mechanical probe. If coring is required, obtain two cores at each location, submit one core to an independent laboratory for analysis of the cracks and submit one core to the Representative for analysis of the cracks at the LTS.

If the investigation indicates the type of cracking to be nonstructural cracks (plastic shrinkage, drying shrinkage, temperature related, or surface tears caused by finishing and texturing) that are evidence of defects in materials or workmanship, repair surface cracks and tears greater than 1/4 inch depth and between 0.007 inch and 0.016 inch width at no additional cost to the Department. Use a high molecular weight methacrylate penetrating crack sealer, a low viscosity epoxy resin, or other suitable material to repair the surface cracks and tears.

Submit for review, a detailed Quality Control and Action Plan that includes, at a minimum, the proposed crack sealing material data sheet from the manufacture and conditions for use, including ambient and substrate temperature and moisture conditions. Do not perform crack sealing before the Quality Control and Action Plan has been reviewed by the Representative.

Keep cracks clean, covered, and dry until the crack sealing operation is performed to the satisfaction of the Representative.

Unless directed in writing by the District Executive, remove and replace wearing surface deficient in surface tolerance as specified in Section 501.3(o); defective in air content as specified in Section 1042.2(f); defective in compressive strength as specified in Section 1042.3(f)3.b; failing to bond to the substrate; bonded to unsound concrete; exhibiting nonstructural cracks or tears greater than 1/4 inch depth and greater than 0.016 inch width; or showing surface defects resulting from the effects of rain, improper finish, improper cure, or honeycombing, which, in the Representative's opinion, cannot be repaired.

1042.4 MEASUREMENT AND PAYMENT—

(a) Latex Modified Mortar or Concrete Wearing Surface. Square Yard

As indicated, for the type specified, for the item indicated.

Survey prior to surface preparation and bond tests are incidental to this item.

The Department will pay for grade adjustments of expansion dams and scuppers, scarification, and hydrodemolition separately.

When hydrodemolition is not indicated, the Department will pay for bridge deck repairs separately under the respective type of concrete bridge deck repair items.

When hydrodemolition is indicated, the Department will pay for Type 3 deck repairs and Type 2 deck repairs exceeding 4 inches placed and cured before the overlay placement.

(b) Latex Modified Mortar or Concrete, Variable Depth. Cubic Yard

The limits of payment are the peaks of the roughened deck surface elevation to the bottom of the Latex Modified Concrete Wearing Surface.

For material costs only for furnishing latex modified mortar or concrete to the work site. Labor and equipment costs to place the material are incidental to the Latex Modified Concrete Wearing Surface work.

SECTION 1043—SHOTCRETE

1043.1 DESCRIPTION—This work is the production, application, and construction of pneumatically applied shotcrete according to ACI 506. Shotcrete may be produced by either dry-mix or a wet-mix process.

1043.2 MATERIAL—

(a) Shotcrete.

1. Cement. Section 701

2. Supplementary Cementitious Materials. Section 724.4. Use a quantity of silica fume from 5% to 10%, by weight of the total cementitious material. For pre-packaged dry mix shotcrete, use silica fume that is pre-blended by the manufacturer.

3. Water. Section 720.1

4. Aggregates. Type A, Section 703. For shotcrete mix designs using potentially reactive aggregate, evaluate aggregate for reactivity and if using aggregates that are deemed potentially reactive use according to Section 704.1(g). Conform to the composite gradation envelope in Table A. Other gradations according to ACI 506, Table 2.1 may be approved by the Representative.

TABLE A
Aggregate Gradation

Sieve Size	Total Percent Passing
1/2-inch	100
3/8-inch	90 - 100
No. 4	70 - 85
No. 8	50 - 70
No. 16	35 - 55
No. 30	20 - 35
No. 50	8 - 20
No. 100	2 - 10

5. Admixtures. Section 711.3.

Use a migrating corrosion inhibitor according to AASHTO M 194, from a manufacturer listed in Bulletin 15. Provide a dosage according to the manufacturer's recommendations.

6. Fibers. ASTM C 1116, Type II or III. Provide a minimum dosage of 1.5 pounds per cubic yard. Use fibers that are a minimum of 1/2-inch length, monofilament or collated-fibrillated microfibers.

7. Mix Design Performance Requirements. Proportion shotcrete to meet the mix design requirements in Table B.

TABLE B
Shotcrete Mix Design Requirements

Test Description	Test Method	Age (Days)	Specified Requirements
Maximum Water/Cementitious Materials Ratio	-	-	0.40
Air Content - As Shot (%)*	AASHTO T 152	-	4 ± 1.5
Slump at Discharge into Pump (inches)	AASHTO T 119	-	3 1/2 ± 1 1/2

Minimum Compressive Strength (psi)	PTM No. 611	7	3,600
		28	4,500

*compensate for air entrainment loss during shooting according to ACI 506

8. Design Basis. Section 704.1(c) and ACI 506. Aggregate and cement may be batched by weight or volume according to AASHTO M 157 or AASHTO M 241. For pre-packaged dry-mixes, provide mixes according to ASTM C 1480, and from a manufacturer listed in Bulletin 15.

(b) Reinforcement. Section 709, as indicated. Use annealed iron wire ASTM A 684 for fastening.

(c) Burlap. Section 711.1(d).

(d) Liquid Membrane-Forming Curing Compound, Clear or White. Section 711.2(a).

(e) Wedge Expansion Anchors. As indicated, from a manufacturer listed in Bulletin 15.

1043.3 CONSTRUCTION—

(a) General. Apply shotcrete according to ACI 506 and ACI CP-60.

Assign a shotcrete crew supervisor that has at least 5 years experience in shotcrete repair work on projects of similar size and character. Provide nozzlemen who are certified by the ACI for application of the proposed shotcrete process for both vertical and overhead surface and who have successfully completed three projects, of similar size and character.

Submit written documentation to the Structure Control Engineer at least 10 working days before start of shotcrete work, which provides the following:

- Proof of experience for shotcrete crew supervisor and nozzlemen. Submit three references for crew supervisor and nozzlemen from persons who were responsible for supervision of these projects.
- Mix designs and test records, showing all material sources and indicating conformance to project specifications for all shotcrete materials.
- Details of proposed forming, bracing, falsework, or temporary support systems.
- A field QC plan

Provide in the field QC plan at a minimum, the following:

- A list of the proposed shotcreting equipment, including water supply pumps, valves and mixing equipment. Provide brand name, model and capacity of proposed pump or gun and air compressor.
- Details of proposed means of preparing existing concrete substrate in areas to receive shotcrete.
- Details of proposed means of controlling line, grade, and reinforcement cover.
- Details of proposed methods for control and disposal of waste materials, including demolition slurries, blasting grits, concrete debris, waste shotcrete, rebound, and overspray.
- Details of the proposed curing procedures

Do not start shotcreting work until the Structure Control Engineer has reviewed and approved all submittals.

(b) Preparation of Structure. Thoroughly clean the surfaces and voids of rust, scale, grease, loose and disintegrated particles, and material that might impair the bond between the surfaces to be covered and the shotcrete mixture. Remove unsound concrete and mortar, as directed. After removal of unsound material, clean sound surface.

Clean existing reinforcement to SSPC-SP6 cleaning standards. Saturate the prepared concrete substrate with clean water the day before shotcrete application. Bring wetted surfaces to a saturated surface dry (SSD) condition before application of shotcrete. Do not apply shotcrete to a dry surface, or to a surface with free surface water.

(c) Placing Reinforcement. Provide reinforcement, including wire fabric meeting the general and storage requirements of Sections 1002.3(a) and 1002.3(b). Lap adjacent sheets of wire fabric a minimum length of 4 inches for 2-inch mesh and a minimum length of 6 inches for 3-inch mesh. Fasten wire fabric together with wire ties at intervals of not more than 18 inches.

1. Steel Surfaces. Section 1017.3(b)1 or as indicated.

2. Concrete and Masonry Surfaces. In areas of buildup for the replacement of unsound material, unless otherwise indicated or directed, place a layer of wire fabric for each 3-inch layer of shotcrete or fraction thereof. More than one layer of fabric may be attached to an expansion anchor, provided the anchor is long enough.

Hold the wire fabric in place by means of wedge expansion anchors, either 1/4 inch diameter by 3 to 3 1/4 inches in length, or 3/8 inch diameter by 3 3/4 to 4 inches in length. Use longer 3/8-inch diameter anchors where necessary, unless otherwise indicated. Space 1/4 inch diameter anchors approximately 20 inches center-to-center in each direction, starting 3 inches from the outside edges of the areas to be shotcreted. Space 3/8-inch diameter anchors approximately 30 inches center-to-center in each direction, starting 6 inches from the outside edges of the areas to be shotcreted. Fasten the fabric to the wedge expansion anchors away from the prepared surface, with 1 inch clear below the finished surface of the repair.

Where existing reinforcement is exposed due to removal of deteriorated concrete, wire fabric may be tied to this reinforcement at 18-inch intervals, to form a cage to position and support the fabric within 1 inch of the finished surface of repair.

Avoid excessive wire fabric layers, which may create planes of weakness or internal stresses.

(d) Weather Restrictions.

1. Cold Weather. Unless otherwise allowed in writing, discontinue shotcreting operations when the descending air temperature, away from artificial heat, falls to 40F or less. Do not resume operations until the air temperature, away from artificial heat, rises above 40F.

For mix proportioning in cold weather, do not let water with a temperature above 90F come in direct contact with the cement, until the cement has been mixed with the aggregates. Place shotcrete when the mix temperature is between 50F and 100F. Do not use materials containing frost, lumps, or crusts of hardened materials. Do not place shotcrete on surfaces which are less than 40F.

2. Hot Weather. When the air temperature in the immediate vicinity of operation rises to 90F or above, take thermometer readings of the plastic concrete at 1/2-hour intervals and at the conclusion of the mixing cycles. Discontinue shotcrete operations if the plastic concrete temperature exceeds 90F for wet mix or 100F for dry mix. Lower the temperature of reinforcement and receiving surfaces below 100F before shooting.

3. Protection from Elements. Protect all shotcrete applications and completed surfaces from damage due to environmental conditions such as wind and rain.

(e) Batching and Supply.

1. Wet-Mix Shotcrete. Mix pre-packaged dry mix materials with water added at site according to Section 704.3. For plant or truck mixed material, produce according to Section 704.2.

Apply all shotcrete within 90 minutes after addition of mix water to the batch. Do not use shotcrete that has exceeded 45 minutes without agitation. Utilize shotcrete delivery equipment capable of delivering a steady stream of uniformly mixed material to the discharge nozzle at the proper velocity and rate of discharge.

2. Dry-Mix Shotcrete. Mix dry material with equipment as specified in ACI 506. Apply all dry-mix shotcrete within 45 minutes of the first contact of cement with water. Discard aged materials and do not apply them in the work.

Provide shotcrete delivery equipment capable of delivering an uninterrupted flow of pre-dampened material to the discharge nozzle at sufficient velocity. Use a rotary gun or pressure vessel with pre-dampening equipment.

(f) Pre-construction Trial. Perform a pre-construction trial to evaluate the ability of the proposed materials, shotcrete mixture, equipment, and crew to produce shotcrete conforming to the project specifications. Acceptance of the pre-construction trial results is required before application of any shotcrete on the project.

Perform the pre-construction trial with the certified nozzlemen proposed for use on the project. Nozzlemen who have not been pre-qualified may not apply shotcrete on the project. Use the same materials, shotcrete mixture and equipment proposed for use on the project and approximate working conditions, reinforcement and shooting positions (vertical and overhead).

Obtain 5 cores from each mock-up at locations selected by the Representative. At least two of the cores must contain reinforcement when the work represented by the panels contains reinforcement. The Representative will visually examine the cores for defects. If defects are evident, the Representative will grade the cores according to the requirements of ACI 506. A test mock-up with any single core grade exceeding Core Grade 3 or with more than two of the 5 cores having a Core Grade 3 will be considered a failure.

In addition to the mock-up, pre-qualify the shotcrete mixture by shooting a plain (non-reinforced) test panel, minimum 24 inches x 24 inches, according to ASTM C 1140. Perform compressive strength testing on 3 cores from the test panel, according to PTM No. 606. Mixture will be approved for application on the project if all 3 cores meet the 7 day minimum compressive strength of 3,600 pounds per square inch.

If the pre-construction test specimens fail to meet the project performance requirements, make the necessary adjustments in shotcrete materials, mixture design, or application, and re-shoot test panels. Do not start shotcrete work on the project until the pre-construction performance testing requirements have been met.

(g) Construction Testing. Shoot one construction test panel (Minimum 24 inches x 24 inches) per lot. Establish new lots daily. A lot is each 25 cubic yards of shotcrete production, or portion thereof. Shoot the test panel in the same position as the work being done.

Produce, store, handle, and field cure construction lot test panels in the same manner as the permanent work. Extract 3 cores from each test panel according to ASTM C 1140 for compressive strength testing. Perform 28 day acceptance testing on the extracted cores according to ASTM C 1140 and PTM No. 606. Acceptance of the lot represented will be based on the compressive strength testing of the 28 day acceptance cores. If the results of the average, (N=3) fails to meet a minimum 28 day compressive strength of 4,500 pounds per square inch, adjustments to payment will be made according to Section 110.10(d) using the minimum compressive strength requirements of Class AAA concrete.

(h) Shotcrete Application. All areas prepared for shotcrete application are to be reviewed and approved by the Representative before the application of any shotcrete.

For restoration and repair work, finish shotcrete to match existing surfaces. For finishing on bridge piers, caps, soffit, and abutments, trim shotcrete with a cutting rod or other suitable device to the specified line and grade.

Unless otherwise specified, finish shotcrete to a sandy texture as approved by the Representative using a rubber float or other suitable finishing tools. Tolerance of finished surface must not exceed 1/4-inch under a 10-foot straightedge in any direction. Abrupt surface irregularities must not exceed 1/8-inch.

Continuously remove accumulations of rebound and overspray using blowpipe, or other suitable devices in advance of deposition of new shotcrete. Protect all fixtures and adjacent concrete surfaces from build-up of rebound, overspray and shotcrete trimmings. Remove all such materials on a daily basis.

Construct construction joints to a 45 degree tapered edge. Cut plastic shotcrete with a trowel or other suitable tool to form a construction joint. Do not featheredge construction joints.

For large applications requiring multiple layers, remove curing compound on previously placed shotcrete surfaces by sandblasting. Install approved depth gauges to indicate the thickness of the shotcrete layers. Install depth gauges on 6-foot centers longitudinally and transversely with no less than two gauges per increment of surface area to receive shotcrete. Moisten all surfaces.

(i) Curing. Section 1001.3(p)3.b and as follows: On completion of finishing, water cure using double thickness burlap and/or fogging for 7 days. Keep shotcrete and burlap fully saturated during the entire curing period. Assure 100% contact between the burlap application and shotcrete material.

As an alternate, two applications of liquid membrane-forming curing compounds may be used only when water curing is not feasible, and approved by the Representative.

(j) Hot and Cold Weather Protection. Section 1001.3(p), and as follows: Maintain the air temperature of the shotcrete surfaces at 50F or greater for the first 4 days after application of shotcrete and above 40F for the last 3 days of the curing period. Do not count a day on which the minimum curing temperatures are not maintained as a curing day. Do not utilize cold weather curing until the Representative reviews the proposed means of maintaining the curing

temperature. Do not use unvented heaters that may cause carbonation. If at any time during the curing period, the curing temperature falls below 35F, the Department will consider the work unsatisfactory and will reject it.

(k) Shotcrete Acceptance and Repair. Shotcrete, not conforming to specifications, will be rejected.

Deficiencies during the shotcrete application process, such as, but not limited to the following, constitute a cause for shotcrete rejection:

- Failure to properly control and remove build-up of overspray and rebound
- Incomplete consolidation of shotcrete around reinforcing steel
- Incorporation of sand lenses, excessive voids, delaminations, sags or sloughing
- Failure to apply shotcrete to the required line, grade and tolerance

Perform remedial work to correct deficiencies while shotcrete is still plastic.

The hardened shotcrete will be examined by the Representative for any evidence of excessive plastic or drying shrinkage cracking, tears, featheredging, sloughs, or other deficiencies. The Representative will sound the material to check for delaminations. If delaminations are discovered during sounding, or if directed by the Representative, conduct bond pull-off tests according to ASTM C 900 at locations and a frequency selected by the Representative. The average of a set of three bond pull-off strengths must exceed 145 pounds per square inch, with no individual result less than 100 pounds per square inch. If the bond pull-off strength results fail to meet the specified requirement, the work will be rejected.

When test results or the assessment of plastic or hardened shotcrete indicate deficiencies or non-conformance to the specifications, the Representative will implement a program to evaluate the in-place shotcrete. Provide all labor, materials and equipment necessary to perform the evaluation at no cost to the Department. Correct deficiencies to the satisfaction of the Representative.

Remove and replace deficient or non-conforming shotcrete at no cost to the Department.

1043.4 MEASUREMENT AND PAYMENT—Square Foot

SECTION 1044—AESTHETIC COATINGS FOR CONCRETE SURFACES

1044.1 DESCRIPTION—This work is the preparation and coating of new concrete surfaces with a coating system for aesthetic purposes only. If protective performance is required against chlorides, water infiltration, concrete deterioration and/or rebar corrosion perform work as specified in Section 1045. A coating system may be paint, stain, or penetrating sealer.

1044.2 MATERIAL—

(a) **Coating System for Concrete.** Use an approved coating system from a manufacturer listed in Bulletin 15. Do not mix components or coats from different systems. Use the products of one manufacturer for the entire system.

1. Manufacturer's Recommendations. Submit comprehensive recommendations that include, but are not limited to surface preparation, surface preparation method(s), coating application method(s), and application conditions. Include the recommended method(s) for correction of damage to one or more coats, including correction of damage caused during handling, shipping, and erection; correction of deficient or excessive coating thickness; correction of runs, sags, peeling, and poorly adhered coating; and removal of contaminants that would be detrimental to succeeding coats.

(b) **Product Approval Submittal Requirements.** Submit the following information for Bulletin 15 evaluation and approval. Include the following:

1. Coating Characteristics Properties. (to establish Post-Approval material verification ranges)

- Attenuated Total Reflection – Fourier-Transform Infrared (ATR-FTIR) curves for each component of each coat and for mixed coat(s); according to ASTM E1252 as modified by AASHTO National Transportation Product Evaluation Program Concrete - Coatings Systems (NTPEP CCS) workplan Section 5.14
- Weight per gallon, at 75F, for each component of each coat; according to ASTM D1475
- Viscosity in Krebs Units, at 77F, for each component of each coat; according to ASTM D562
- Percent solids by weight of each component of each coat; according to ASTM D2369

2. Coating Performance Properties

- **Color Fastness by UV Resistance:** Conducted according to ASTM D4587, Cycle 2 for 2,500 hrs. Evaluate every 500 hrs. Change must be $\Delta E < 4.0$ after final weathering cycle

(c) **District Approval Submittal Requirements.** Submit the following information to the Representative a minimum of 21 calendar days before beginning the coating. Begin coating after the Representative accepts the submittals. Including the following:

1. Coating Sample. Provide a sample of each lot or batch of coating in quart containers.

2. Finished Coat Color Chip. Provide color chips of the indicated color.

3. Manufacturer's Technical Data Sheets. Provide technical data sheets, VOC values with product test data, Safety Data Sheet (SDS), and specific application instructions for all coats. In the event of a conflict between the data/instruction sheets and this Specification, the Chief Structural Materials Engineer will determine the governing specification. Do not proceed with work until this information is received.

4. QC Plan. Submit a QC Plan. Include written procedures for review and acceptance of surface preparation, cleaning, and the application methods; including the inspection hold points.

5. Damage Prevention, Repair, and Application Procedures. Furnish a damage prevention plan that describes the procedures and protective material to use to prevent damage to coated items, method to remove coating from surfaces not designated for coating, and method to clean-up a major spillage.

1044.3 CONSTRUCTION—

(a) General.

Protection of Structure, Persons, and Property. Conduct work in compliance with applicable occupational and environmental health and safety rules and regulations. When applying or repairing coating damage, protect pedestrians, vehicles, and other traffic, upon or under the structure; and surrounding property surfaces, buildings, and grounds. Protect against damage or disfigurement from surface preparation media and spatters, splashes, overspray, and smirches of coating or material. Furnish canvas or other containment materials, for protection.

Remove coating dropped on surfaces not designated for coating. Remove debris from cleaning operations, empty coating containers, and other refuse.

Use scaffolding and rigging conforming to OSHA regulations and providing safe and ready access to work areas for inspection purposes.

1. Form Oils, Release Agents, and Curing Compounds. Ensure compatibility with coating manufacturer.

2. Pollution Controls. Prevent environmental pollution including stream and air pollution caused by coating, dust, or other harmful materials.

Provide documentation to ensure all work is being performed according to Pennsylvania Code-Title 25 Environmental Protection Chapters 121-145 “Air Resources”. Comply with County and local ordinances before the start of work.

All DEP permits and notifications, for fieldwork, are required before any in-stream work that may be necessary. Adhere to all Special Provisions as required.

3. Coating Certifications. Provide a dated certification Form CS-4171 from the manufacturer stating that each batch of the coating system meets specifications. Include in the certification the product name for each coat of the supplied system and the production lot number of the certified batch.

4. Technical Representation. Furnish the services of a Technical Coatings Representative from the coating manufacturer at the beginning of operations and when required by the Department.

(b) Mock-Up. Before proceeding with production coating operations and the pre-application meeting, provide a full size mock-up, unless otherwise directed. Prepare a mock-up that is representative of the concrete surface with the specified coating material(s). Prepare the mock-up using the same cleaning, surface preparation, and application techniques that will be utilized during production. Provide a mock-up meeting the following size requirements:

- Precast items, 1 complete unit
- Prestressed Beams, 10 percent of the length of the beams with a minimum length of 5 feet and a maximum of 10 feet
- Cast-in-place concrete, 10 percent of the square footage with a minimum size of 25 square feet and a maximum of 50 square feet

A production piece can be used as the mock-up. Use the mock-up to verify moisture testing acceptance criteria. When only color acceptance is required, submit a 2 foot by 2 foot test panel for initial color approval.

(c) Pre-Application Meeting. Before proceeding with production coating operations conduct a pre-application meeting with the Structural Materials Engineer, the Representative, and/or any other applicable representatives.

Determine, during this meeting, the maximum repair limits for repairing unsatisfactory coating as specified in Section 1044.3(e)10.

During this meeting a review of the mock-up or test panel will be evaluated for acceptance.

(d) Surface Preparation

1. Concrete Surface Condition. Visually inspect concrete surfaces to be coated for signs of concrete defects, physical damage, chemical damage and contamination. Remove/repair all laitance, efflorescence, bug holes, voids, and other surface defects before and after surface preparation according to coating manufacturer's recommendations. Recondition repair areas before coating.

1.b. Potential Surface Contamination. When directed based on age and condition of surface, perform pH testing before surface preparation according to Section 5.2 of ASTM F710. Remove contamination to levels recommended by the coating manufacturer. If no manufacturer recommendations exist, provide pH levels greater than or equal to 7.0 and less than or equal to 10.0. Perform another pH test after removal to verify manufacturer's cleaning method achieved the recommended level.

2. Surface Pre-Cleaning. Where oil, grease, mildew, lubricants, petroleum products, efflorescence, drawing compounds, form oil, and other contaminants are present, remove according to manufacturer's recommendations or at a minimum according to ASTM D4258. Perform cleaning before surface preparation. If contamination remains after surface preparations, clean the surface again as recommended by the coating manufacturer. Perform water bead test according to ASTM F22, as directed by the Representative, to verify contaminant removal.

2.a Other Cleaning. Remove soil, concrete spatter, or other foreign matter by brushing with stiff fiber or wire brush, by scraping or by cleaning according to the coating manufacturer's recommendations.

3. Surface Preparation. Prepare surfaces according to ASTM D4258 or ASTM D4259, using the method of surface preparation according to manufacturer's recommendations. Prepare surface to provide an anchor profile to meet minimum adhesion requirements as specified in Section 1044.3(e)9.a. Determine the anchor profile by using International Concrete Repair Institute (ICRI) comparator plates according to Technical Guideline No. 310.2-1997.

(e) Coating

1. Surface Cleanliness and Age. Immediately before coating, ensure concrete surfaces are free of dust, dirt, grease, oil, moisture, overspray, and other contaminants. Concrete must cure a minimum of 28 days before coating.

2. Handling. Deliver coating and thinner in original unopened containers with the manufacturer's labels intact. The Representative may accept containers with minor damage, if containers are not punctured.

3. Storage. Store coating and thinner according to manufacturer's recommendations. Store coating and thinner in well-ventilated areas not subjected to temperatures in excess of the manufacturer's maximum storage temperature. If necessary, store in heated storage areas to maintain material temperature at or above the manufacturer's minimum storage temperature, listed on the product data sheet.

4. Mixing Coatings.

4.a. Primer. Mix the primer with a high shear mixer, according to manufacturer's recommendations to a smooth, lump free consistency. Mix in the original containers. Ensure that the coating solids that might have settled to the bottom of the container are thoroughly dispersed.

4.b. Subsequent Coats. Mix each subsequent coat, according to manufacturer's recommendations, to achieve and maintain a homogeneous mixture.

5. Thinning Coating. Thin coating only as recommended by the manufacturer. Do not thin once coating application has begun.

6. Conditions for Coating. Apply coating only on clean dry surfaces. Test for the presence of moisture using the plastic sheet method according to ASTM D4263 or by using an electrical impedance moisture meter according to ASTM F710 using the concrete scale. When using an electrical impedance moisture meter perform calibration

verification in the presence of the Representative before taking any measurements. Moisture acceptance criteria will be according to the paint manufacturer's and the moisture meter manufacturer's recommendations and as approved. If not specified in the technical data sheet, then moisture content shall not exceed 2.5 percent. If 2.5 percent is exceeded, then correlate the electrical impedance results with use of the plastic sheet method to obtain approval from the Representative to continue use of the electrical impedance meter. Evaluate the moisture acceptance criteria as part of the full size mock-up. Do not apply coating when the temperature of the air, coating, or concrete is above or below that described in the technical data sheet; if not specified in the technical data sheet do not exceed 100F or go below 35F. Do not apply coatings when the air is misty. Do not apply coating when relative humidity is above that described in the technical data sheet or above 85 percent if not specified. Do not apply coating on damp or frosted surfaces or surfaces hot enough to cause the coating to blister, to produce a porous coating film, or to cause the vehicle to separate from the pigment. Apply coating only when the surface temperature is at least 5F above the dew point. Determine the dew point with the use of a psychrometer and psychrometric tables or electronic psychrometer. Check environmental conditions before coating operations begin and at 4-hour intervals. If the dew point begins to rise and comes within 10F of the surface temperature, check environmental conditions every 15 minutes.

7. Application. Perform application after inspection acceptance of the surface. Apply coating within 12 hours of final moisture content and surface profile/cleaning acceptance. If the coating application does not occur within 12 hours of final moisture content acceptance or the surface temperature of the concrete falls below the dew point temperature, recheck the moisture content of the concrete surface.

When the approved system contains a primer, apply according to manufacturer's recommendations.

Apply the coating after fabrication, inspection, acceptance, and once the concrete has had a chance to cure according to the coating manufacturer's recommendations, but not less than 28 days.

Protect concrete surface from direct sunlight during coating application and curing, if required, to prevent exceeding manufacturer's temperature limits for air or concrete.

Verify that each coat has cured before applying the succeeding coat. Follow the manufacturer's recommendations for time to topcoat, unless a longer curing time is required.

In damp or cold weather, keep the shop work under cover until thoroughly dry or until weather conditions allow exposure.

For shop applied coatings, allow the coating to cure completely before loading and shipping.

Apply finish coats from the same lot number or batch number when possible.

7.a. Spray Application. If conventional (air) spray is used, provide suitable traps or separators to exclude oil and water from the air. Conduct blotter test(s) according to ASTM D4285 before coating application begins. Keep the coating thoroughly mixed by continuous mechanical agitations, when required by the manufacturer.

7.b. Roller Application. Use rollers that do not leave a stripped texture in the coating film. Use rollers only on flat, even surfaces to produce a coating film of uniform thickness with no skips, runs, sags, or thin areas.

7.c. Brush Application. Only use brushes if recommended by coating manufacturer. Manipulate the coating under the brush to produce a uniform thickness. Work the coating into corners and crevices. Move the brush in a series of small circles to thoroughly fill irregularities in the surface, then brush out and smooth by a series of parallel strokes until the coating film has an even thickness.

7.d. Coating Areas Not Readily Accessible. Thoroughly cover surfaces inaccessible to normal coating method by use of sheepskin daubers, spray, or other means to ensure thorough coverage.

8. Thickness of Coats. Apply coating to achieve the Dry Film Thickness (DFT), above the anchor pattern, according to manufacturer's recommendations. Perform nondestructive DFT measurements according to SSPC-PA 2; take and record a minimum of five spot measurements for each 100 square foot of coated surface area. Measure DFT using an ultrasonic thickness gage or other approved measuring device according to ASTM D6132. For multiple coat systems, perform DFT measurements after the application of each coat. Determine the DFT of subsequent coats by subtracting the average DFT of the underlying coat(s) from the cumulative readings.

Increase the thickness of coating, if directed, to ensure a finish that is uniform in color and appearance.

8.a. Primer (When Applicable). Apply primer to the DFT above the anchor pattern, according to the coating manufacturer's recommendations. A dense and uniform appearance is required after the applied coating has cured.

For areas deficient in coating thickness, repair as recommended by the coating manufacturer.

8.b. Subsequent Coats (When Applicable). Apply subsequent coat(s), above the underlying coat(s) to achieve the DFT, according to the coating manufacturer's recommendations.

9. Inspection. Submit samples from each lot or batch of coating along with Form CS-4171 and Certificate of Analysis to the LTS, when directed. Provide unopened sample kits for testing, when unopened sample kits are not practical sampling will be done according to ASTM D3925.

9.a. Adhesion Acceptance Testing. Perform adhesion testing, on 10 percent of the total number of coated items, according to Method A of ASTM D3359 when directed. Adhesion ratings meeting condition 2A or better are acceptable. Perform adhesion test on formed or finished (flat) surfaces. Adhesion testing on textured surfaces is not required. Increase testing frequency, as directed, if results are unacceptable.

9.b. Visual Acceptance Testing. Inspect 100 percent of coated surface for color consistency from a distance of 30 feet, unless otherwise specified. Determine color consistency by comparing an approved mock-up sample to each coated surface. Use the same color consistency for the mock-up as the approved test panel, as determined.

10. Unsatisfactory Coating. Coating is unsatisfactory if:

- the coating lifts, blisters, wrinkles, or has excessive runs or sags,
- the adhesion is rated 1A or worse,
- evidence shows application was under unfavorable conditions,
- the workmanship is poor or impure,
- an unauthorized coating has been used,
- the ΔE color variation is 2.0 or more,
- the visual acceptance testing is unacceptable, or
- for other reasons as determined.

11. Repair of Unsatisfactory Coating. Repair each damaged coat according to manufacturer's recommendations. Submit repair procedures for approval before starting repair application.

Remove unsatisfactory coating, clean surface, prepare surface, and recoat according to the manufacturer's specifications. The Representative will approve the completed repair. Evaluate repaired areas at 30 feet for color acceptance.

12. Stenciling for Coated Concrete. After the final coat of paint has dried to recoat, stencil the following information on the outside face of the fascia members at the near and far abutment ends (two in total) unless directed otherwise:

- Line 1: Month and year of completion and ECMS number
- Line 2: BR Key
- Line 3: BMS Number
- Line 4: Type of coating system, and cleaning method
- Line 5: NEPCOAT number listed in Bulletin 15, and the manufacturers name

Examples:

08-2018, ECMS 88335
BR KEY: 712
02-0051-0110-0000
IZEU, SSPC-SP10
SSC(12)-03, Carboline

Stencil using indelible black paint compatible with the coating system and approved by the coating manufacturer. Provide uniform block lettering 2 inches to 3 inches high.

13. Storage, Shipping, and Handling. Protect the coating from damage and staining. Use covering and proper storage, handling, shipping, and erection techniques. Install padding or other acceptable material on dunnage to protect coated surfaces from damage and staining.

Before shipping display in a manner, that will allow the Representative access to all sides of the coated items for inspection and acceptance.

1044.4 MEASUREMENT AND PAYMENT—Square Yard

Construction of the test panel and mock-up is incidental to this work.

SECTION 1045—PROTECTIVE COATINGS FOR CONCRETE SURFACES

1045.1 DESCRIPTION—This work is the preparation and coating of new concrete surfaces with a coating system for protective purposes. Use this specification if protective performance is required against chlorides, water infiltration, concrete deterioration and/or rebar corrosion. A coating system may consist of paint, stain, or penetrating sealer and be a single coat or a primer coat followed by a top coat. After application the system shall be opaque and uniform in color.

1045.2 MATERIAL—

(a) **Coating System for Concrete.** Use an approved coating system from a manufacturer listed in Bulletin 15. Do not mix components or coats from different systems. Use the products of one manufacturer for the entire system.

1. Manufacturer's Recommendations. Submit comprehensive recommendations that include, but are not limited to surface preparation, surface preparation method(s), coating application method(s), and application conditions. Include the recommended method(s) for correction of damage to one or more coats, including correction of damage caused during handling, shipping, and erection; correction of deficient or excessive coating thickness; correction of runs, sags, peeling, and poorly adhered coating; and removal of contaminants that would be detrimental to succeeding coats.

(b) **Product Approval and Verification Submittal Requirements.** Submit the following information for Bulletin 15 evaluation and approval. Include the following:

1. Coating Characteristics Properties. (to establish Post-Approval material verification ranges)

- Attenuated Total Reflection – Fourier-Transform Infrared (ATR-FTIR) curves for each component of each coat and for mixed coat(s); according to ASTM E1252 as modified by AASHTO National Transportation Product Evaluation Program Concrete - Coatings Systems (NTPEP CCS) workplan Section 5.14
- Weight per gallon, at 75F, for each component of each coat; according to ASTM D1475
- Viscosity in Krebs Units, at 77F, for each component of each coat; according to ASTM D562
- Percent solids by weight of each component of each coat; according to ASTM D2369

2. Coating Performance Properties

- **Water Absorption:** The final average percent water absorbed, for concrete coated with the protective coating, not greater than 25.0 percent of the final average percent water absorbed by the uncoated reference concrete; according to AASHTO T 384
- **Moisture Vapor Transmission:** The final average percent moisture loss, for concrete coated with the protective coating, not less than 50.0 percent of its final average percent water absorption; according to ASTM E96
- **Chloride Ion Penetration:** The final average absorbed chloride ion content, for concrete coated with the protective coating, not greater than 25.0 percent of the final average absorbed chloride ion content of the uncoated reference concrete, according to AASHTO T 384
- **Color Fastness by UV Resistance:** Conducted according to ASTM D4587, Cycle 2 for 2,500 hrs. Evaluate every 500 hrs. Change must be $\Delta E < 4.0$ after final weathering cycle

(c) **District Approval Submittal Requirements.** Submit the following information to the Representative a minimum of 21 calendar days before beginning the coating. Begin coating after the Representative accepts the submittals. Include the following:

1. **Coating Sample.** Provide a sample of each lot or batch of coating in quart container.
2. **Finished Coat Color Chip.** Provide color chips of the indicated color.
3. **Manufacturer's Technical Data Sheets.** Provide technical data sheets, VOC values with product test data, Safety Data Sheets (SDS), and specific application instructions for all coats. In the event of a conflict between the data/instruction sheets and this Specification, the Chief Structural Materials Engineer will determine the governing specification. Do not proceed with work until this information is received.
4. **QC Plan.** Submit a QC Plan. Include written procedures for review and acceptance of surface preparation, cleaning, and the application methods; including the inspection hold points.
5. **Damage Prevention, Repair, and Application Procedures.** Furnish a damage prevention plan that describes the procedures and protective material to use to prevent damage to coated items, method to remove coating from surfaces not designated for coating, and method to clean-up a major spillage.

1045.3 CONSTRUCTION—

(a) General.

Protection of Structure, Persons, and Property. Conduct work in compliance with applicable occupational and environmental health and safety rules and regulations. When applying or repairing coating damage, protect pedestrians, vehicles, and other traffic, upon or under the structure; and surrounding property surfaces, buildings, and grounds. Protect against damage or disfigurement from surface preparation media and spatters, splashes, overspray, and smirches of coating or material. Furnish canvas or other containment materials, for protection.

Remove coating dropped on surfaces not designated for coating. Remove debris from cleaning operations, empty coating containers, and other refuse.

Use scaffolding and rigging conforming to OSHA regulations and providing safe and ready access to work areas for inspection purposes.

1. **Form Oils, Release Agents, and Curing Compounds.** Ensure compatibility with coating manufacturer.
2. **Pollution Controls.** Prevent environmental pollution including stream and air pollution caused by coating, dust, or other harmful materials.
Provide documentation to ensure all work is being performed according to Pennsylvania Code-Title 25 Environmental Protection Chapters 121-145 "Air Resources". Comply with County and local ordinances before the start of work.
All DEP permits and notifications, for fieldwork, are required before any in-stream work that may be necessary. Adhere to all Special Provisions as required.
3. **Coating Certifications.** Provide a dated certification Form CS-4171 from the manufacturer stating that each batch of the coating system meets specifications. Include in the certification the product name for each coat of the supplied system and the production lot number of the certified batch.
4. **Technical Representation.** Furnish the services of a Technical Coatings Representative from the coating manufacturer at the beginning of operations and when required by the Department.

(b) **Mock-Up.** Before proceeding with production coating operations and the pre-application meeting, provide a full-size mock-up, unless otherwise directed. Prepare a mock-up that is representative of the concrete surface with the specified coating material(s). Prepare the full-size mock-up using the same cleaning, surface preparation, and application techniques that will be utilized during production. Provide a mock-up meeting the following requirements:

- Precast items, 1 complete unit
- Prestressed beams, 10 percent of the length of the beams with a minimum 5 feet and a maximum of 10 feet
- Cast-in-place concrete, 10 percent of the square footage with a minimum size of 25 square feet and a maximum 50 square feet

A production piece can be used as the mock-up. Use the mock-up to verify moisture testing acceptance criteria. When only color acceptance is required, submit a 2 foot by 2 foot panel for initial color acceptance.

(c) Pre-Application Meeting. Before proceeding with production coating operations conduct a pre-application meeting with the Structural Materials Engineer, the Representative, and/or any other applicable representatives.

Determine, during this meeting, the maximum repair limits for repairing unsatisfactory coating as specified in Section 1044.3(e)10.

During this meeting a review of the mock-up or test panel will be evaluated for acceptance.

(d) Surface Preparation

1. Concrete Surface Condition. Visually inspect concrete surfaces to be coated for signs of concrete defects, physical damage, chemical damage and contamination. Remove/repair all laitance, efflorescence, bug holes, voids, and other surface defects before and after surface preparation according to coating manufacturer's recommendations. Recondition repair areas before coating.

1.a. Potential Surface Contamination. When directed based on age and condition of the surface, perform pH testing before surface preparation according to Section 5.2 of ASTM F710. Remove contamination to levels recommended by the coating manufacturer. If no manufacturer recommendations exist, provide pH levels greater than or equal to 7.0 and less than or equal to 10.0. Perform another pH test after removal to verify manufacturer's cleaning method achieved the recommended level.

2. Surface Pre-Cleaning. Where oil, grease, mildew, lubricants, petroleum products, efflorescence, drawing compounds, form oil, and other contaminants are present, remove according to manufacturer's recommendations or at a minimum according to ASTM D4258. Perform cleaning before surface preparation. If contamination remains after surface preparations, clean the surface again as recommended by the coating manufacturer. Perform water bead test according to ASTM F22, as directed by the Representative, to verify contaminant removal.

2.a Other Cleaning. Remove soil, concrete spatter, or other foreign matter by brushing with stiff fiber or wire brush, by scraping or by cleaning according to the coating manufacturer's recommendations.

3. Surface Preparation. Prepare surfaces according to ASTM D4259 using the method of surface preparation required to achieve an anchor profile of CSP 2, CSP 3 or CSP 4; unless a greater CSP is required by the manufacturer. Determine the anchor profile by using International Concrete Repair Institute (ICRI) comparator plates according to Technical Guideline No. 310.2-1997.

(e) Coating

1. Surface Cleanliness and Age. Immediately before coating, ensure concrete surfaces are free of dust, dirt, grease, oil, moisture, overspray, and other contaminants. Concrete must cure a minimum of 28 days before coating.

2. Handling. Deliver coating and thinner in original unopened containers with the manufacturer's labels intact. The Representative may accept containers with minor damage, if containers are not punctured.

3. Storage. Store coating and thinner according to manufacturer's recommendations. Store coating and thinner in well-ventilated areas not subjected to temperatures in excess of the manufacturer's maximum storage temperature. If necessary, store in heated storage areas to maintain material temperature at or above the manufacturer's minimum storage temperature, listed on the product data sheet.

4. Mixing Coatings.

4.a. Primer. Mix the primer with a high shear mixer, according to manufacturer's recommendations to a smooth, lump free consistency. Mix in the original containers. Ensure that the coating solids that might have settled to the bottom of the container are thoroughly dispersed.

4.b. Subsequent Coats. Mix each subsequent coat, according to manufacturer's recommendations, to achieve and maintain a homogeneous mixture.

5. Thinning Coating. Thin coating only as recommended by the manufacturer. Do not thin once coating application has begun.

6. Conditions for Coating. Apply coating only on clean dry surfaces. Test for the presence of moisture using the plastic sheet method according to ASTM D4263 or by use of an electrical impedance moisture meter according to ASTM F710 using the concrete scale. When using an electrical impedance moisture meter perform calibration verification in the presence of the Representative before taking any measurements. Moisture acceptance criteria will be according to manufacturer's and the moisture meter manufacturer's recommendations and as approved. If not specified in the technical data sheet, then moisture content shall not exceed 2.5 percent. If 2.5 percent is exceeded, then correlate the electrical impedance results with use of the plastic sheet method to obtain approval from the representative to continue use of the electrical impedance meter. The moisture acceptance criteria to be evaluated as part of the full size mock-up. Do not apply coating when the temperature of the air, coating, or concrete is above or below that described in the technical data sheet; if not specified in the technical data sheet do not exceed 100F or go below 35F. Do not apply coatings when the air is misty. Do not apply coating when relative humidity is above that described in the technical data sheet or above 85 percent if not specified. Do not apply coating on damp or frosted surfaces or surfaces hot enough to cause the coating to blister, to produce a porous coating film, or to cause the vehicle to separate from the pigment. Apply coating only when the surface temperature is at least 5F above the dew point. Determine the dew point with the use of a psychrometer and psychrometric tables or electronic psychrometer. Check environmental conditions before coating operations begin and at 4-hour intervals. If the dew point begins to rise and comes within 10F of the surface temperature, check environmental conditions every 15 minutes.

7. Application. Perform application after inspection acceptance of the surface. Apply coating within 12 hours of final moisture content and surface profile/cleaning acceptance. If the coating application does not occur within 12 hours of final moisture content acceptance or the surface temperature of the concrete falls below the dew point temperature, recheck the moisture content of the concrete surface.

When the approved system contains a primer, apply according to manufacturer's recommendations.

Apply the coating after fabrication, inspection, acceptance, and once the concrete has had a chance to cure according to the coating manufacturer's recommendations, but not less than 28 days.

Protect concrete surface from direct sunlight during coating application and curing, if required, to prevent exceeding manufacturer's temperature limits for air or concrete.

Verify that each coat has cured before applying the succeeding coat. Follow the manufacturer's recommendations for time to topcoat, unless a longer curing time is required.

In damp or cold weather, keep the shop work under cover until thoroughly dry or until weather conditions allow exposure.

For shop applied coatings, allow the coating to cure completely before loading and shipping.

Apply finish coats from the same lot number or batch number when possible.

7.a. Spray Application. If conventional (air) spray is used, provide suitable traps or separators to exclude oil and water from the air. Conduct blotter test(s) according to ASTM D4285 before coating application begins. Keep the coating thoroughly mixed by continuous mechanical agitations, when required by the manufacturer.

7.b. Roller Application. Use rollers that do not leave a stripped texture in the coating film. Use rollers only on flat, even surfaces to produce a coating film of uniform thickness with no skips, runs, sags, or thin areas.

7.c. Brush Application. Only use brushes if recommended by coating manufacturer. Manipulate the coating under the brush to produce a uniform thickness. Work the coating into corners and crevices. Move the brush in a series of small circles to thoroughly fill irregularities in the surface, then brush out and smooth by a series of parallel strokes until the coating film has an even thickness.

7.d. Coating Areas Not Readily Accessible. Thoroughly cover surfaces inaccessible to normal coating method by use of sheepskin daubers, spray, or other means to ensure thorough coverage.

8. Thickness of Coats. Apply coating to achieve the Dry Film Thickness (DFT), above the anchor pattern,

according to manufacturer's recommendations. Perform nondestructive DFT measurements according to SSPC-PA 2; take and record a minimum of five spot measurements for each 100 square foot of coated surface area. Measure DFT using an ultrasonic thickness gage or other approved measuring device according to ASTM D6132. For multiple coat systems, perform DFT measurements after the application of each coat. Determine the DFT of subsequent coats by subtracting the average DFT of the underlying coat(s) from the cumulative readings.

Increase the thickness of coating, if directed, to ensure a finish that is uniform in color and appearance.

8.a. Primer (When Applicable). Apply primer to the DFT above the anchor pattern, according to the coating manufacturer's recommendations. A dense and uniform appearance is required after the applied coating has cured. For areas deficient in coating thickness, repair as recommended by the coating manufacturer.

8.b. Subsequent Coats (When Applicable). Apply subsequent coat(s), above the underlying coat(s) to achieve the DFT, according to the coating manufacturer's recommendations.

9. Inspection. Submit samples from each lot or batch of coating along with Form CS-4171 and Certificate of Analysis to the LTS, when directed. Provide unopened sample kits for testing, when unopened sample kits are not practical sampling will be done according to ASTM D3925 .

9.a. Adhesion Acceptance Testing. Perform adhesion testing, on 10 percent of the total number of coated items, according to Method A of ASTM D3359 when directed. Adhesion ratings meeting condition 2A or better are acceptable. Perform adhesion test on formed or finished (flat) surfaces. Adhesion testing on textured surfaces is not required. Increase testing frequency, as directed, if results are unacceptable.

9.b. Visual Acceptance Testing. Inspect 100 percent of coated surface for color consistency from a distance of 30 feet, unless otherwise specified. Determine color consistency by comparing an approved mock-up sample to each coated surface. Use the same color consistency for the mock-up as the approved test panel, as determined.

10. Unsatisfactory Coating. Coating is unsatisfactory if:

- the coating lifts, blisters, wrinkles, or has excessive runs or sags,
- the adhesion is rated 1A or worse,
- evidence shows application was under unfavorable conditions,
- the workmanship is poor or impure,
- an unauthorized coating has been used,
- the ΔE color variation is 2.0 or more,
- the visual acceptance testing is unacceptable, or
- for other reasons as determined.

11. Repair of Unsatisfactory Coating. Repair each damaged coat according to manufacturer's recommendations. Submit repair procedures for approval before starting repair application.

Remove unsatisfactory coating, clean surface, prepare surface, and recoat according to the manufacturer's specifications. The Representative will approve the completed repair. Evaluate repaired areas from a distance of 30 feet for color acceptance.

12. Stenciling for Coated Concrete. After the final coat of paint has dried to recoat, stencil the following information on the outside face of the fascia members at the near and far abutment ends (two in total) unless directed otherwise:

- Line 1: Month and year of completion and ECMS number
- Line 2: BR Key
- Line 3: BMS Number
- Line 4: Type of coating system, and cleaning method
- Line 5: NEPCOAT number listed in Bulletin 15, and the manufacturers name

Examples:

08-2018, ECMS 88335
BR KEY: 712
02-0051-0110-0000IZEU, SSPC-SP10
SSC(12)-03, Carboline

Stencil using indelible black paint compatible with the coating system and approved by the coating manufacturer. Provide uniform block lettering 2 inches to 3 inches high.

13. Storage, Shipping, and Handling. Protect the coating from damage and staining. Use covering and proper storage, handling, shipping, and erection techniques. Install padding or other acceptable material on dunnage to protect coated surfaces from damage and staining.

Before shipping display in a manner, that will allow the Representative access to all sides of the coated items for inspection and acceptance.

1045.4 MEASUREMENT AND PAYMENT—Square Yard

Construction of the test panel and mock-up is incidental to this work.

SECTION 1046—EPOXY OVERLAY

1046.1 DESCRIPTION - This work is construction of a multiple layer wearing surface of epoxy and aggregate on in-service bridge decks.

1046.2 MATERIAL –

(a) **Polymeric Resin Binder.** Provide a thermosetting polymer resin compound comprised of 100% solids which holds the aggregate firmly in position once all components are combined. All components will come from a single manufacturer listed in Bulletin 15 and conform to Table A. Cure specimens at 73F \pm 2F, relative humidity 50% \pm 2% and test specimens at 73F \pm 2F.

**Table A
Binder Requirements**

Property	Requirement	Test Method
Viscosity (poises)	10 – 70	ASTM D 2556-14, Model RVT Brookfield, Spindle No. 3 at 20 rpm
Gel Time (minutes)	15-45	ASTM C 881, para. 11.2 modified, 70 ml sample
Ultimate Tensile Strength (psi)	2,000-5,000 at 7 days	ASTM D 638
Ultimate Tensile Elongation (%)	30-70 at 7 days	ASTM D 638
Absorption (%)	1 max. at 24-hrs.	ASTM D 570
Compressive Strength (psi)	1,000 min. at 3 hours 5,000 min. at 24 hours	ASTM C 109, 50 mm square mortar cube with plastic inserts
Permeability to chloride ion (coulombs)	100 max. at 28-days	AASHTO T277
Thermal Compatibility (Mixed with aggregate)	No delamination	ASTM C884
Infrared spectrum	Established for each component by the Manufacturer	AASHTO T237, paragraph 4 and 5

(b) **Fine Aggregate.** Provide aggregate approved by the binder manufacturer. This aggregate consists of angular silica sand, basalt, or other highly siliceous metamorphic or igneous rock. Provide aggregate free of dirt, clay, asphalt, and other foreign or organic materials conforming to Table B.

**Table B
Aggregate Requirements**

Property	Requirement	Test Method
Moisture Percentage (%)	Less than 0.2	AASHTO T 255
Mohs Scale Hardness	6.5 min. average	Mohs Hardness Test
Aggregate Gradation Requirements - Sieve Analysis		
Sieve Size	Total Percent Passing	
(No. 4)	100	
(No. 8)	30-75	
(No. 16)	0-5	
(No. 30)	0-1	

(c) **Certification:** Certify binder resin as specified in Section 106.03(b)3.

For aggregate, provide independent testing from an AASHTO certified laboratory to verify the Table B requirements are met. Independent testing must be less than 12 months old at the time aggregate is furnished to the project. Submit the Independent testing results for local approval as specified in Section 106.02(a)2.c.

1046.3 CONSTRUCTION

(a) Qualification of the Installer. Submit a minimum of three projects including the installer's contact information having a cumulative minimum of 1,000 square yards of epoxy overlays placed within the past 3 years. Include contact information for the three projects. An installer not meeting the minimum requirements will be allowed to perform the installation operation if approved in writing by the binder manufacturer.

(b) Quality Control.

1. Quality Control (QC) Plan. As specified in Section 106.03(a)2.a, submit a project specific QC Plan for acceptance before material placement. Include key personnel, equipment, materials, proposed methods of installation and operation, and the following:

1.a Designated QC Plan Administrator. Provide a designated QC Plan Administrator having full authority to institute any action necessary for the successful operation of the QC Plan and is responsible for the following:

- Identify and provide contractor procedures for:
 - Documenting areas and quantities used of binder and aggregate of each layer at each epoxy overlay site to verify application rates conforming to Table C.
 - Documenting the temperature of each component of the binder before use.
 - Moisture control methods for the aggregate.
 - Cleaning and maintenance schedule for machinery and equipment.
 - Corrective actions for unsatisfactory construction practices and deviations from the specifications. Any deviation from the accepted QC Plan will be cause for immediate suspension of operations.
- Contractor performance of required field QC sampling, testing and record keeping in conformance with the approved QC Plan and contract documents.
- Maintain and make available upon request, complete records of sampling, testing, corrective actions, and QC inspection results.

1.b Manufacturer's Technical Representative. A manufacturer's technical representative responsible for the following:

- Train and provide recommendations to construction personnel in the safe handling and proper application of materials before placing the epoxy overlay.
- Required to be onsite for the first 2 days of installation if the installer does not meet the minimum requirements as specified in Section 1046.3(a).
- Required to be onsite if corrective work is necessary.
- Required to be onsite if directed

2. Documentation. Provide the following documentation of the preparation and application of the overlay:

- Deck patching location(s)
- Surface preparation – surface profile level or depth, cleanliness, substrate pull off test locations and results
- Moisture test results
- Environmental conditions at the time of placement – include ambient air temperature, deck temperatures and weather conditions
- Product Data Sheets (PDS)
- Safety Data Sheets (SDS)
- Material information:
 - Resin – manufacturer, component expiration dates, proportioning method and rate, and yield computations for each layer
 - Aggregate – type of aggregate and yield computation as well as visual inspection of surface covering
- Final adhesion testing locations and results
- Document all repairs needed because of defective work

(c) Pre-Epoxy Overlay Placement Meeting. At least 2 weeks before overlay placement, schedule a pre-epoxy overlay placement meeting to review the specification, method and sequence of placement, QC Plan, and protective measures.

(d) Delivery and Storage of Materials. Order, stock, and store material necessary to perform overlay application before field preparation. Store materials in a clean, dry environment according to the manufacturer's recommendations. Do not expose the aggregate to rain or moisture. At the storage area, post SDS, PDS, and other information from the manufacturer pertaining to health hazards, worker protection, and safe practices for the storage, handling, and disposal of the materials.

Provide the manufacturer's name, date of manufacture, batch/lot number, trade name, quantity, and mixing ratio on each binder storage container. Provide producer name, date of shipment, batch/lot number, weight, and independent lab test reference number on containers with aggregate.

(e) Equipment. Equipment is subject to acceptance. Provide the following:

(1) Surface Preparation Equipment.

- Shotblasting equipment capable of removing all loose, disintegrated concrete, dirt, paint, oil, asphalt, laitance, carbonation, and curing materials from the deck surface.
- Sandblasting equipment capable of removing all oxidation, dirt, paint, oil, and asphalt from the metal expansion joints.
- Provide a self-propelled vacuum capable of picking up dust and other loose material from the shotblasting and sandblasting operation.
- Provide air compressors capable of producing a minimum of 180 cubic feet per minute and 80 pounds per square inch of clean, dry compressed air and equipped with an oil/water separator to remove dust and loose material.
- Do not use scarifiers, milling machines, or sandblasting instead of shot-blasting, unless accepted by the Structure Control Engineer.

(2) Mechanical Application Equipment.

- An epoxy distribution system capable of accurate and complete mixing of the epoxy resin and hardening agent, verification of the mix ratio, and uniform and accurate distribution of the epoxy materials at the specified rate on 100% of the work area. Provide equipment approved by the epoxy-based overlay manufacturer. Equip the distribution system with a cumulative type meter that can read the resin compound discharge to the nearest 0.1 gallon.
- A mechanical aggregate spreader capable of uniform and accurate application of the dry aggregate over 100% of the work area.
- Provide a self-propelled vacuum truck;
- An air compressor capable of producing oil free and moisture free compressed air to remove all dust and loose material.
- Hand tools to facilitate the placement of the surface treatment as specified in this specification and the manufacturer's recommendations.

(3) Hand Mixing and Manual Application. Hand mixing is not allowed unless accepted by the Representative.

- Provide calibrated containers for proper proportioning of the base and hardening components.
- Provide a clean, dry container large enough to blend and mix the proper proportions of base and hardening components.
- Provide a powered, paddle-type mixer for blending the base and hardening components.
- Provide squeegees, rollers, or brooms suitable for applying the mixed epoxy-based resin on the bridge deck surface at the specified application rate as specified in Table C.
- Provide shovels, hand spreaders, and other hand tools suitable for applying the aggregate at the specified rate.
- Provide brooms or air compressors equipped with an oil/water separator to remove excess aggregate after each layer of the overlay has cured.

(f) Surface Preparation. Sound the existing bridge deck surface to identify areas of unsound concrete in the presence of the Representative. Record locations of all areas determined to be unsound and provide documentation to the Representative. Remove unsound concrete and repair the areas as specified in Section 1040 and as directed. Do not use patching material containing magnesium phosphate. Do not apply epoxy overlay on concrete surfaces or repairs less than 28 days of age.

Perform pull tests to determine the suitability of the concrete surface according to ASTM C1583. Select locations to perform testing at a minimum of one location per span per lane or maximum of 4,000 square feet per lane, whichever is smaller. Include at least one test on newly repaired deck areas. The minimum acceptable bond strength on normal weight concrete cannot average less than 250 pounds per square inch.

No more than 24 hours before overlay placement begins, clean the bridge deck surface by shotblasting all surfaces to remove all curing compounds, loosely bonded mortar, surface carbonation, and deleterious material. Comply with the International Concrete Repair Institute (ICRI) standard for Concrete Surface Preparation (CSP) Level 5-7. Provide the necessary concrete surface profile chips to visually verify the surface preparation. Before shotblasting the entire deck surface, a test area is required. Perform shotblasting on a 5 foot by 5 foot test area. In the presence of the Representative, verify that ICRI, CSP Level 5-7 has been achieved. Do not proceed with production

shotblasting until test area is accepted. After shotblasting, vacuum sweep or air wash all surfaces to remove all dust, debris, and deleterious material.

In areas inaccessible by the shotblasting equipment use sandblasting, walk behind grinders, or both to prepare the surface to the satisfaction of the manufacturer and Representative.

Remove existing pavement markings. Avoid excessive removal of concrete. Trace amounts of tightly adhering paint in the bottom of the texturing grooves may remain as accepted.

If cracks are present, remove loose material with compressed air and pre-treat cracks 1/4 inch or greater in width with the mixed binder. Do not overfill cracks. If cracks are overfilled shotblast or grind the material to make it flush with the adjacent pavement after the binder material is cured. Install the epoxy overlay after the binder in the pretreated cracks has gelled.

Construct the epoxy overlay so the final surface of the overlay is as shown on the standard drawings for expansion joints and dams. Shotblasting or concrete grinders may be used to create the proper profile. Prepare the concrete surface to provide a profile on both sides of the joint as specified in Section 501.3(o).

(g) Placing the Epoxy Overlay. If required, place a test strip of the overlay off the project site. Test strip should not exceed 100 square feet. Use the test strip for equipment calibration and establishing procedures and techniques for the actual overlay placement on the bridge deck.

Before placement and after priming the distribution pumps, verify the accuracy of the resin compound cumulative meter by performing a volumetric yield test. In the presence of the Representative, perform a volumetric yield test by discharging 1 gallon of the resin compound into a 1 gallon measuring device. The cumulative meter is required to show a discharge of 1 gallon.

Cover exposed areas not receiving overlay, such as curbs, sidewalks, railings, parapets, inlets, expansion dams, and along limits between adjacent lanes, if phasing application, or daily termination point with suitable coverings.

In phased construction, place joints between phases in neat lines parallel to the centerline of roadway. Stagger and overlap joints a minimum of 2 inches between successive layers so no ridges appear.

The deck surface must be dry before the application of the epoxy overlay. Do not place overlay if visible moisture is present on the concrete surface. Affix a sheet of transparent plastic to indicate the presence of moisture for a minimum of 2 hours depending on temperature, cloud cover, and conditions according to ASTM D4263 (modified to a minimum of 2 hours).

Use equipment to continuously mix, meter, and monitor the binder. If recommended by the binder manufacturer, use a heated metering pump. Mix the binder according to the manufacturer's recommendations.

Hand squeegee the mixed binder onto the prepared pavement surface using a serrated edge squeegee at uniform application rates as specified Table C.

Table C
Epoxy Overlay Application Rates

Course	Epoxy Rate	Aggregate Rate*
1	Not less than 0.22 gal./sq. yd	Not less than 10 lbs./sq. yd
2+	Not less than 0.45 gal./sq. yd	Not less than 14.5 lbs./sq. yd

*Apply aggregate to completely cover the epoxy

Immediately after the binder application, mechanically spread the aggregate onto the wet, uncured binder at a uniform rate as specified in Table C. Do not allow loose aggregate or excessive dust onto any part of the adjacent, active travel lanes.

Hand spreading aggregate is allowed as a secondary method if mechanized equipment cannot be used due to access or geometry, as accepted.

Completely cover the wet, uncured binder with aggregate to achieve a uniform surface with no exposed binder remaining visible on the surface. Spread the aggregate without displacing the wet binder film during placement.

Remove excess aggregate from each course after the course has completely cured. Use brooms, vacuums, compressed air free from oil and water, or other approved methods to remove the excess aggregate. Do not remove excess aggregate until removal can be performed without tearing or damaging the surface.

Minimize walking or standing on the binder.

Perform adhesion testing according to ASTM C1583 on the final layer. Test results will be the average of three tests on a test patch not less than 4.5 square feet. The minimum tensile adhesion strength cannot average less than 250 pounds per square inch. Perform a test patch at the same frequency as required for the initial pull tests conducted on the prepared concrete surface. Test each area at least 24 hours after the indicated minimum cure time for the second course.

If a failure occurs on an adhesion test, perform additional adhesion testing immediately before and immediately after the failed area. Continue testing until satisfactory test results are achieved. Remove and replace the failed area(s) at no additional cost to the Department.

(h) Curing. Do not allow vehicular traffic on the first course. Do not allow vehicular traffic on any course during the cure period.

Cure each course for the minimum cure period as specified in Table D unless longer periods are recommended by the manufacturer. Cure times are based on the average temperature of deck surface, resin, and aggregate components.

Table D
Curing Times

Course	60F- 64F	65F-69F	70F-74F	75F-79F	80F-84F	85F +
1	4 hours	3 hours	2.5 hours	2 hours	1.5 hours	1 hour
2+	6.5 hours	5 hours	4 hours	3 hours	3 hours	3 hours

(i) Aggregate Cleanup. Collected aggregate can be reused if it is clean, uncontaminated, and dry. If contaminated aggregate is mixed with virgin aggregate, all the aggregate in the container will be considered contaminated and not acceptable for use in the epoxy overlay.

Between 30 and 45 days after placing the epoxy overlay, reclaim loose aggregate using a vacuum sweeper. Completely clean scuppers and expansion dams of accumulated aggregate. Use means of cleaning that does not damage neoprene glands in strip seal expansion dams. This reclaimed aggregate cannot be reused.

(j) Limitations of Operations. Follow the limits for all temperature and ambient conditions in the accepted QC plan and the manufacturer's requirements. Do not place epoxy overlays from October 1 to April 30, unless allowed in writing by the District Executive.

Do not apply the overlay at surface, air, or resin and aggregate component temperatures lower than 60F. Do not apply the epoxy-based concrete overlay if the temperature is expected to drop below 55F within 8 hours after application or if the mixed epoxy-based resin gels in less than 10 minutes.

(k) Defective Work. Section 105.12 and as follows:

If temperatures fall below 60F, the Representative will require a longer curing period. If, at any time during the curing period, the temperature falls below 50F, the work may be considered unsatisfactory and rejected.

Protect freshly applied overlays from sudden or unexpected rain. Stop all application operations if it starts to rain. The Representative may order removal and replacement of any material damaged by rainfall or contractor operations that cannot be satisfactorily repaired.

Locations identified by the Representative that did not receive a uniform and sufficient application of aggregate will be considered defective work. Remove and replace as directed.

Remove and replace epoxy overlays with an epoxy application rate calculated less than 0.18 gallon per square yard in Course 1 or less than 0.36 gallon per square yard in Course 2.

Remove the rejected or damaged epoxy overlay in rectangular sections by micromilling or saw cutting to the top of the concrete deck surface. Remove and replace at no additional cost to the Department.

(l) Acceptance.

Table E
Acceptance and Payment Factor for Epoxy Overlays

Payment Factor	Calculated Application Rates of Epoxy for Course 1 (gal./sq. yd.)		Calculated Application Rates of Epoxy for Course 2 (gal./sq. yd.)
100% payment	≥ 0.22	and	≥ 0.45
80% payment	< 0.22 but ≥ 0.18	or	< 0.45 but ≥ 0.36

1046.4 MEASUREMENT AND PAYMENT—Square Yard

Payment includes surface preparation, furnishing, applying all courses, and final cleaning.

Repairs to the bridge deck will be paid separately for type of concrete bridge deck repair as indicated.

SECTION 1047 – POLYESTER POLYMER CONCRETE (PPC) OVERLAY

1047.1 DESCRIPTION – This work is construction of a one course wearing surface of Polyester Polymer Concrete (PPC) on in-service bridge decks. The indicated or specified depth of the wearing surface is the minimum.

1047.2 MATERIALS – Provide PPC consisting of polyester resin binder and aggregates with a compatible primer meeting the component and composite material properties specified. Supply components collectively through the same provider, qualified as defined within this Section and referred to as the System Provider.

(a) High Molecular Weight Methacrylate (HMWM) Primer. Provide a wax-free, low odor, HMWM primer, consisting of a resin, initiator, and promoter. Provide a primer conforming to Table A. Store components according to the System Provider's recommendations. Provide initiator for the methacrylate resin consisting of a metal drier and peroxide. Provide resin and initiator pre-mixed from the System Provider. Do not store containers and measuring devices in a manner that allows leakage or spilling to contact the containers or materials of the other.

TABLE A
HMWM Primer Requirements

Property	Requirement	Test Method
Apparent Viscosity*, cps, max	25	ASTM D2196, Test Method A (Brookfield RVT with UL adapter, 50 RPM)
Volatile Content*, %, max	30	ASTM D2369
Specific Gravity* at 77F, min	0.90	ASTM D1963-85 (1996)
Flash Point, F, min	180	ASTM D3278
Vapor Pressure* at 77F, mm Hg, max	1.0	ASTM D323
PPC Saturated Surface-Dry Bond Strength (Adhesive) at 24h ± 15 min, and 70F ± 1F, psi	615	CalTrans Test 551, Part 5 (with initiated PPC at 12% resin content by weight of the dry aggregate), primed surface

*Perform test before initiator is added

(b) Polyester Resin Binder. Provide polyester resin binder conforming to the following properties:

- Be an unsaturated isophthalic polyester-styrene co-polymer.
- Contain at least 1 percent by weight gamma-methacryloxypropyltrimethoxysilane, an organosilane ester silane coupler.
- Be used with a promoter that is compatible with suitable methyl ethyl ketone peroxide (MEKP) and cumene hydroperoxide (CHP) initiators.
- Meet the required values for the material properties as specified in Table B, below.

TABLE B
Polyester Resin Binder Requirements

Property	Requirement	Test Method
Apparent Viscosity*, cps	75 - 200	ASTM D2196, Test Method A (RVT No.1 Spindle, 20 RPM)
Specific Gravity* at 77F	1.05 to 1.10	ASTM D1963-85 (1996)
Elongation, %, min.	35	ASTM D638, Type I specimen, thickness 0.25 ± 0.03 " at Rate = 0.45 inch/minute. Sample conditioning according to ASTM D618 and Condition 18/25/50+5/70
Tensile Strength, psi, min.	2,500	ASTM D638, Type I specimen, thickness 0.25 ± 0.03 " at Rate = 0.45 inch/minute. Sample conditioning according to ASTM D618 and Condition 18/25/50+5/70.
*Perform test before initiator is added		

(c) **PPC Aggregate.** Provide aggregate for PPC conforming to the requirements in Table C and Table D.

TABLE C
Aggregate Requirements

Property	Requirement	Test Method
Fine aggregate composition	Natural sand only	-
Weighted Average Absorption, %, max.	1.0	AASHTO T 84 and AASHTO T 85
Moisture Content by Percent of Aggregate Absorption, at time of mixing with polyester resin, %, max.	0.5	AASHTO T 255
Mohs Hardness, min.	7	-

TABLE D
Aggregate Gradation

Sieve Size	Percent Passing (Min – Max)
3/8"	100
No. 4	62-85
No. 8	45-67
No. 16	29-50
No. 30	16-36
No. 50	5-20
No. 100	0-7
No. 200	0-3

(d) Polyester Polymer Concrete (PPC). The resin content of PPC is to be $12\% \pm 1\%$ of the weight of the dry aggregate. Accelerators or inhibitors may be required to achieve proper setting time of PPC. Use as recommended by the overlay System Provider. Provide PPC composite mixture conforming to the requirements in Table E.

TABLE E
PPC Composite Mixture Design Requirements

Property	Requirement	Test Method
PCC Saturated-Surface Dry Bond Strength (Modulus of Rupture), without primer* (at 24 h ± 15 min and 70 ± 1 F), psi, min.	500	CalTrans Test 551, Part 5
Surface Abrasion Resistance (Abrasion Loss), g, max	2	CalTrans Test 550
Modulus of Elasticity, ksi	1,000 to 2,000	ASTM C469
Chloride Permeability (Charge Passed), coulombs, max.	200	ASTM C1202
*Initiated PPC mixture tested at 12% resin content by weight of dry aggregates.		

(e) Surface Finishing Sand. Provide sand for abrasive sand finish conforming to the following properties:

- Commercial-quality blast sand required.
- Have at least 95% passing the No. 8 sieve and at least 95% retained on the No. 20 sieve when tested according to AASHTO T27.
- Must be dry at the time of application.
- Material components are supplied collectively through the System Provider. Aggregates to be supplied by the System Provider and delivered in packaging to the site clean and dry.

(f) Certification. Certify the PPC overlay system as specified in Section 106.03(b)3. Along with the certification, provide independent testing for the HMWM primer, PPC resin, aggregate, and PPC mixture to verify compliance with the material requirements as specified in Tables A, B, C, D, and E. Provide independent testing for the aggregate and PPC mixture from an AASHTO certified laboratory. Provide independent testing for HMWM primer, PPC resin from an ISO certified laboratory. Perform testing within 12 months of furnishing materials to the project.

1047.3 CONSTRUCTION

(a) Qualifications.

1. Installer. Submit up to three projects demonstrating experience installing PPC. For installers with no PPC installation experience, list a minimum of three projects demonstrating bridge deck or latex overlay placement experience.

2. System Provider. Submit documented evidence of having successfully supplied a complete PPC overlay system on at least five projects of similar size and scope within the last 5 years.

3. System Provider Technical Representative. Submit documented evidence having successfully provided technical support on at least five projects of similar size and scope within the last 5 years.

(b) Submittals.

1. Quality Control (QC) Plan. As specified in Section 106.03(a)2.a, submit a project specific QC Plan for approval a minimum of 30 calendar days before material placement. The onsite System Provider's Technical Representative is required to review and approve the plan. Deviations from the approved QC Plan are to be approved by the Representative. Discuss the QC Plan at the pre-placement meeting. Deviation from the approved QC Plan will

be cause for immediate suspension of operations. The QC Plan is to include key personnel, equipment, materials, mixing procedures, safety, proposed methods of installation and operation, and the following:

1.a QC Plan Administrator. Provide name of person having full authority to institute action necessary for the successful operation of the QC Plan. The QC Plan Administrator is responsible for the following:

1.a.1 Procedures. Identify and provide procedures in the QC Plan for the following:

- Safety Procedures.
- Documenting the storage procedures for PPC resin, HMWM primer and aggregates.
- Documenting areas and quantities used of PPC resin and aggregate at each site.
- Documenting the temperature of each component tank with an infrared thermometer before mixing.
- Moisture control methods of aggregate.
- Cleaning and maintenance schedule for machinery and equipment.
- Corrective actions for unsatisfactory construction practices and deviations from the specifications.

1.a.2 Field Work. Perform required field QC sampling, testing and recordkeeping according to the QC Plan and contract documents.

1.a.3 Recordkeeping. Maintain and make available upon request, complete records of sampling, testing, corrective actions, and QC inspection results.

1.b System Provider's Technical Representative. Provide name of person responsible for the following:

1.b.1 Training. Train and provide recommendations to construction personnel in the safe handling and proper application of materials before placing the PPC overlay.

1.b.2 Required Site Visits.

- Onsite for the trial application and for the first 3 days of installation.
- For installers with no previous PPC placement experience, the System Provider's Technical Representative is required to be onsite for the trial application and the entire placement to ensure proper installation.
- Onsite when corrective action is required.

1.c Placement Plan. Section of QC Plan that includes the following.

1.c.1 Overlay System.

- Safety Data Sheets (SDS)
- Data Sheets from the Manufacturer and System Provider outlining requirements for storage, handling, and mixing of PPC components, HMWM resin, and aggregates
- Data Sheets from the Manufacturer and System Provider including requirements and procedures for surface preparation, application/installation, curing, cure times, site cleanup, cleanup of mixing and placement equipment, and disposal of materials including HMWM resin, PPC and containers
- Test reports for overlay system.
- Mix Design.

1.c.2 Placement Schedule.

- Provide schedule for each structure receiving overlay.
- Provide placement sequence for each structure. Include paving lengths, widths, directions, and phase joint locations. Cold joints between passes within 6 inches of the indicated line striping locations or centered within a lane are not allowed. Limit joints as much as practical. Do not add joints, other than those indicated, unless approved.

1.c.3 Equipment. Provide description of equipment for the following:

- Surface preparation including grinding and shot blasting.
- Applying HMWM primer resin.
- Sketch showing complete details of supports for finishing equipment.

- Measuring, mixing, placing, and finishing.
- Applying surface finish sand.

1.c.4 Placement Operations.

- Chain of command in the event of unforeseen circumstances during construction
- Procedures for surface preparation, application/installation, finishing, and curing
- Method of protecting and finishing around bridge drains
- Method of protecting and finishing along parapets
- Method for controlling, measuring and maintaining overlay thickness, profile, surface tolerance, and texturing.
- Environmental BMP's required to ensure that the overlay materials do not leave the site (including protective measures at inlets, scuppers, barrier drains, etc.)

2. Pre-Placement Meeting. Schedule a pre-placement meeting with the Structure Control Engineer a minimum of 14 calendar days before material placement. The QC Plan Administrator, System Provider's Technical Representative, and Contractor's Representative are to attend the pre-placement meeting.

(c) Delivery and Storage of Materials. Store materials in a clean, dry environment and according to the manufacturer's recommendations. Materials not stored properly will be rejected. Materials that exceed the manufacturer's recommended shelf life will be rejected. Materials are to have a minimum shelf life of 12 months. Store liquid materials out of direct sunlight and at temperatures less than 80F. Store aggregates in a clean, dry location away from moisture. Applicable fire codes may require special storage facilities for some components of the overlay system.

Obtain and post at the storage areas the SDS, Product Data Sheet, and other information from the System Provider regarding the safe practices for the storage, handling, disposal of materials, and health hazards.

Include the System Provider's name, date of manufacture, batch/lot number, trade name, quantity, and mixing ratio printed on the label for each storage container with binder components and primer. Include the producer name, date of shipment, batch/lot number, weight and independent lab test reference number for containers with aggregate as supersack. All materials must be delivered in their original containers with the manufacturer's label.

(d) Application Conditions. Do not apply PPC on a wet surface, when the temperature is below System Provider's recommendation, or when the anticipated weather conditions would prevent the proper application of the surface treatment.

During surface preparation and overlay application, provide shielding as required and directed to protect adjacent traffic from rebound, dust, and construction activities.

During overlay application, provide suitable coverings (i.e. heavy duty drop cloths) as needed to protect exposed areas not to receive overlay, such as curbs, sidewalks, parapets, etc. Clean and/or repair damage or defacement resulting from this application to the satisfaction of the Representative.

(e) Equipment. Provide equipment for cleaning the existing concrete surface and mixing and applying the overlay system according to the Systems Provider's recommendations.

1. Surface Preparation Equipment. Provide appropriate shotblasting or sandblasting equipment to adequately prepare the bridge deck substrate. Provide a self-propelled vacuum capable of picking up dust and other loose material from the shotblasting or sandblasting operation. Provide equipment to supply compressed air free of oil and moisture for final surface preparation.

2. Mixing Equipment. Mixing may be accomplished by a portable mechanical mixer suitable for concrete or by a Continuous Automated Mixer.

2.a Portable Concrete Mechanical Mixer. Provide portable concrete mixer appropriately sized for proposed batches, as recommended by the System Provider.

2.b Continuous Automated Mixer. Provide continuous mixer appropriately sized for proposed batches, as recommended by the System Provider. Provide continuous mixer capable of handling polyester binder resin and

catalyst while sufficiently mixing catalyzed resin with dry aggregate and maintaining proper ratios to achieve set/cure times within the specified limits.

Provide continuous mixer equipped with an automatic metering device that measures and records aggregate and resin volumes, at least every five minutes, including time and date. Submit recorded volumes at the end of the work shift. Have a visible readout gage that displays volumes of aggregate and resin being recorded.

3. Finishing Equipment. Finishing may be accomplished with a vibratory screed or a self-propelled slip-form paving machine. Do not use roller screeds.

3.a Vibratory Screed. Use a vibratory screed riding on preset forms or rails.

3.b Self-Propelled Slip-Form Paving Machine. Use a self-propelled slip-form paving machine, which is modified or specifically built to effectively place PPC. Equip paving machine with a vibrating pan to consolidate and finish PPC. Fit paving machine with hydraulically controlled grade automation to establish the finished profile to match grade when placing lanes adjacent to previously placed PPC. Have sufficient engine power and weight to provide adequate vibration of the finishing pan while maintaining consistent forward placement speed. Be capable of both forward and reverse motion under its own power.

(f) Trial Application. Before constructing the overlay, place one or more trial applications on a prepared surface to demonstrate proper initial set time and the effectiveness of the surface preparation, mixing, placing and finishing equipment proposed. Prepare the surface for the trial application the same as the structure to receive overlay. Place each trial application at least 10 feet long at the indicated overlay thickness and at a profile grade and paving width similar to the structure(s) to receive overlay. Perform trial applications at approved locations.

If the cleaning practice, materials, installation, finishing and/or texturing are not acceptable, remove the failed trial application and reinstall the trial application at no additional cost to the Department until satisfactory results are obtained.

Provide as many trial applications required to demonstrate the ability to construct an acceptable trial overlay section and perform the remaining work. The installer, System Provider and/or proposed equipment/techniques may be rejected if not shown to be acceptable after three (3) failed trial applications.

Test the trial application as specified in Section 1047.3(i).

Repair bond test locations according to the System Provider's recommendations.

(g) Surface Preparation. Before surface preparation, perform a pre-condition survey of the existing concrete bridge deck cracks to locate potential reflective cracks in the wearing surface.

Prepare the surface to the following requirements:

Clean areas that will be in contact with the PPC overlay by shot blasting, or abrasive sandblasting if the shot blaster cannot access certain areas, to remove grease, slurry, oils, paint, dirt, debris, curing compound, rust, membrane, asphalt, weak surface mortar or other contaminants that could interfere with the proper adhesion of the overlay system. Shot blast no more than 24 hours before placement of PPC. Perform scarification, if indicated, before shot blasting. For existing bridge decks, do not begin cleaning for a minimum of 28 days after unsound areas have been repaired as specified in Section 1040. For new bridge decks, do not begin cleaning for a minimum of 28 days after deck placement. Do not allow dust created during cleaning operations to interfere with traffic. Satisfactorily remove and contain contaminants.

Determine the size of shot, flow of shot, forward speed of shot blast machine and number of passes necessary to provide a surface free of weak or loose surface mortar, exposing the aggregates within the substrate concrete and visibly changing the color of the substrate concrete. Exposed mortar after cleaning operations is considered adequate for bond when the mortar has open pores, is sound and is firmly bonded to the coarse aggregate.

Do not expose cleaned surfaces to traffic unless approved. If contamination occurs to the concrete substrate after cleaning, clean again as directed and according to the System Provider's recommendations before placing the overlay

at no additional cost to the Department. The cleaned concrete substrate is to be dry at the time of application of the primer and overlay.

Clean steel surfaces that will be in contact with PPC according to SSPC-SP10.

(h) Application. Do not begin application of primer and PPC overlay until a minimum of 28 days after placement of new substrate or substrate repairs. Before application of primer and PPC overlay, once the surface is free of water, moisture, and is visibly dry, perform moisture test according to ASTM D4263 modified for 2 hours to verify dryness. Do not place primer or PPC unless the substrate surface temperature is between 40-100F.

1. Prime Coat. Use oil free compressed air to completely dry and clean the area before applying the HMWM prime coat. Mix and apply primer according to the System Provider's recommendations. Apply primer within 5 minutes of mixing initiator and resin at a rate of approximately 90-100 SF/gal or as recommended by the System Provider. Apply primer by flooding and uniformly spreading to completely cover surfaces to receive overlay, including adjacent vertical surfaces. Avoid heavy application that results in excess puddling. Remove or distribute excess material to meet the recommended application rate. Reapply primer to areas that appear visibly dry before overlay placement.

2. PPC. Mix and apply PPC according to the System Provider's recommendations. Apply PPC after 15 minutes and within 2 hours of placing the primer. Place PPC before gelling or within 15 minutes following addition of the initiator, whichever occurs first, or as recommended by the System Provider.

An initial set time between 30 minutes and 90 minutes is required for PPC. The initial set is when the in-place PPC cannot be deformed by pressing with a finger. If the initial set is not within 30-90 minutes, remove and replace PPC at no additional cost to the Department.

Place, consolidate, and finish PPC using placement equipment as specified in Section 1047.3(e) to the minimum thickness, grade, and cross-section indicated. Termination edges of the overlay may require application and finishing by hand trowel due to obstructions such as curbs or scuppers. Adequately isolate expansion joints before placing PPC. Unarmored joints may be sawed within four hours after placing PPC, if approved. The exact time of sawing will be determined by the System Provider.

3. Abrasive Finish Sand. Evenly apply abrasive finish sand on the finished overlay surface at a rate of at least 2.2 LB/SY by broadcasting, immediately after the overlay placement before gelling. Provide adequate pavement friction. Ensure the completed overlay surface is free of smooth or glassy areas such as those resulting from insufficient quantities of abrasive finish sand. Repair surface defects as recommended by the System Provider and approved by the Representative.

4. Surface Tolerance and Texturing. After finishing and application of abrasive finish sand, while PPC is still workable, perform straightedge testing and surface correction as specified in Section 501.3(k)3. After the straightedge testing and surface corrections have been completed and before the PPC becomes nonplastic, manually texture/tine the surface as specified in Section 501.3(k)4 if mechanical texturing is not indicated. Terminate texturing 12 inches from gutterlines and scuppers. Terminate texturing within 5 inches, but no closer than 3 inches of bridge joints. Do not overlap tines. After the PPC has hardened, test the surface again as specified in Section 501.3(o). Resound the deck if directed.

When mechanical texturing is indicated, perform mechanical texturing as specified in Section 1001.3(k)6.f, except do not begin grooving operations until directed, until a minimum of 24 hours after placement, the PPC has cured as specified in Section 1047.3(h)5, and until the surface tolerance has been checked and high points are removed as specified in Section 501.3(o). Remove high spots by diamond grinding. Do not remove high spots until a minimum of 24 hours after placement.

5. Curing. PPC is considered cured to a traffic ready state after 4 hours following finishing or when a minimum reading of 3,000 pounds per square inch is achieved on a properly calibrated Schmidt hammer every 10 feet of deck longitudinally.

(i) Acceptance Testing. Acceptance of the surface preparation and PPC overlay will be determined by the Representative based on vertical axis bond tests.

1. Vertical Axis Pull Bond Test. Perform a vertical pull bond test according to ASTM C1583 between 24 hours and 72 hours after each day's placement of the overlay in the presence of the Representative. Perform a minimum of one vertical pull bond test on each bridge or day's placement, whichever is smaller, at a location or locations as designated. If multiple tests are taken in a span, the test result is the average of the tests for that span. The required minimum bond strength between the PPC overlay and substrate is 250 pounds per square inch. If the initial vertical pull bond test results do not meet the minimum requirement of 250 pounds per square inch, perform up to three additional vertical pull bond tests per bridge or day's placement where the minimum requirement of 250 pounds per square inch was not met. After additional testing, if the average of the test results for a bridge or day's placement do not meet the minimum requirement of 250 pounds per square inch, the bond between the substrate and PPC overlay in each bridge or day's placement not meeting this requirement is considered defective work, and the PPC overlay must be removed and replaced at no additional cost to the Department. Repair bond test locations with PPC according to the System Provider's recommendations.

2. Thickness Requirements. Variable thickness overlay placement may be required to account for variations in substrate profile to meet the desired grade and cross-section as indicated. The minimum required thickness is 1 inch. Remove and replace areas where the minimum required thickness was not attained at no additional cost to the Department.

3. Surface Smoothness. Check surface tolerance as specified in Section 1047.3(h)4.

(j) Immediate Corrective Work. As specified in Sections 105.12, 1001.3(u) and as follows:

If PPC overlay exhibits cracking or surface tears, perform an investigation with the Representative to determine the type, source, and extent of cracking. Measure the width, depth, and length of each crack and establish the locations of the ends of each crack with respect to permanent reference points.

Coring may be necessary if crack depths cannot be accurately determined using a mechanical probe. If coring is required, obtain two cores at each location or as directed. Submit for analysis one core to an independent laboratory and one core to the LTS to determine extent of cracking and if the cracks are structural or non-structural.

Remove and replace areas of structural cracks. If the investigation indicates the type of cracking to be nonstructural cracks (plastic shrinkage, drying shrinkage, temperature related, or surface tears caused by finishing and texturing) repair visible surface cracks and tears greater than 1/8 inch depth and from 0.007 inch to 0.016-inch width at no additional cost to the Department. Use HMWM penetrating crack sealer from the same manufacturer of the PPC overlay system to repair the surface cracks and tears. Completely fill cracks until flush with surface of PPC overlay. Immediately following the application of the HMWM resin, coat the wetted surface with surface finishing sand for abrasive finish.

Submit a Corrective Action Plan that includes, at a minimum, the proposed HMWM crack sealing material data sheet from the System Provider and conditions for use, including ambient and substrate temperature and moisture conditions. Do not perform crack sealing before the Corrective Action Plan has been accepted by the Representative and System Provider.

Keep cracks clean, covered, and dry until the crack sealing operation is performed to the satisfaction of the Representative. Unless directed, remove and replace wearing surface deficient in surface tolerance as specified in Section 501.3(o); failing to bond to the substrate; exhibiting nonstructural cracks or tears greater than 1/4-inch depth and greater than 0.016-inch width; or showing surface defects resulting from the effects of rain, improper finish, improper cure, or honeycombing, that cannot be repaired.

Use repair materials and finishing methods for surface defects in the PPC overlay according to those used for the installation of the overlay.

1047.4 MEASUREMENT AND PAYMENT – Square Yard.

The unit price includes the System Provider's Technical Representative's reviews and site visits.

SECTION 1050—STEEL BRIDGE SUPERSTRUCTURE

1050.1 DESCRIPTION—This work is the construction of a steel bridge superstructure and/or the furnishing and installation of fabricated structural steel for repair, rehabilitation, or modification of steel structures.

1050.2 MATERIAL—

(a) Deck and Barriers.

- Cement Concrete Structures—Section 1001.2
- Preformed Neoprene Compression Joint Seal—Section 1008.2
- Pedestrian Railing—Section 1012.2
- Aluminum Bridge Hand Railing—Section 1023.2
- Steel Bridge Hand Railing—Section 1022.2
- Protective Barrier—Section 1015.2
- Protective Fence—Section 1016.2
- Protective Coating for Reinforced Concrete Surfaces—Section 1019.2(a)
- Armored Preformed Neoprene Compression Dam—Section 1021.2
- Tooth Expansion Dam with Drain Trough—Section 1020.2
- Reinforcement Bars—Section 1002.2
- Neoprene Strip Seal Dam—Section 1026.2

(b) Fabricated Structural Steel. Section 1105

(c) Paint.

- Shop Painting—Section 1060.2
- Field Painting—Section 1070.2

(d) Neoprene Bearing Pads. Sections 1113.02 and 1113.03(g)

(e) High-Load Multi-Rotational Bearings. Section 1111

(f) Polymer Modified Mortar for Beam Seat Leveling. Section 1080.2(e)

1050.3 CONSTRUCTION—

(a) General. The superstructure consists of all indicated portions of the bridge above the bridge seat and includes bearings, bearings and anchors set in the substructure, abutment backwalls, cheekwalls, bridge drainage down to but not including the drain box, and portions of wings and appurtenances above the horizontal construction joint nearest the bridge seat. Do not ship fabricated materials without approved shop drawings marked “Accepted”. For fabricated

structural steel repairs, verify dimensions in the field before fabrication. Repair damage due to construction operations to portions of the structure to remain, at no additional cost to the Department.

(b) Superstructure. Construct the superstructure, as indicated, as shown on the Standard Drawings, and as follows:

- Fabricated Structural Steel—Section 1105
- Cement Concrete Structures—Section 1001.3
- Reinforcement Bars—Section 1002.3
- Preformed Neoprene Compression Joint Seal for Bridges—Section 1008.3
- Tooth Expansion Dam with Drain Trough—Section 1020.3
- Neoprene Strip Seal Dam—Section 1026.3
- Armored Preformed Neoprene Compression Dam—Section 1021.3
- Pedestrian Railing—Section 1012.3
- Aluminum Bridge Hand Railing—Section 1023.3
- Steel Bridge Hand Railing—Section 1022.3
- Protective Barrier—Section 1015.3
- Protective Fence—Section 1016.3
- Protective Coating for Reinforced Concrete Surfaces—Section 1019.3(a) or Section 1019.3(c)2 as indicated.

(c) Erection.

1. Handling and Storing Materials. Place material stored at the job site on skids. Keep it clean and properly drained. Place girders and beams upright and shore them. Support long members, such as columns and chords, on skids placed near enough together to prevent injury from deflection. If the contract is for erection only, check material turned over against the shipping lists and promptly report in writing any shortage or injury discovered. The Contractor is responsible for the loss of any material while in the Contractor's care, or for any damage caused to it after being received by the Contractor.

2. Falsework Design and Construction. Design and construct falsework according to AASHTO LRFD Bridge Construction Specification 11.2.2, 11.6.1, AASHTO Publications (Guide Design Specifications for Bridge Temporary Works and Construction Handbook for Bridge Temporary Works) and as specified in Section 105.03(c).

2.a General. Provide all tools, machinery, and equipment necessary to erect the falsework. Falsework is considered to be any temporary structure that supports structural elements of concrete, steel, masonry, or other materials during their construction or erection. Form travelers, as used in segmental cantilever construction, are considered to be a combination of falsework and forms. Have a Professional Engineer registered in the State sign and seal the working drawings for the falsework if the height of falsework exceeds 14 feet or if traffic, other than workers involved in constructing the bridge, will travel under the bridge. Furnish falsework of sufficient rigidity and strength to safely support all forces imposed, and to produce, in the finished structure, the lines and grades indicated.

2.b Design Loads. Ensure that the design load for falsework consists of the sum of dead and live vertical loads, and any horizontal loads. At a minimum, include in the dead loads the gravitational force of the falsework and

all construction material to be supported. Assume the combined density of concrete, reinforcing and prestressing steel, and forms to be not less than 160 pounds per cubic foot of normal density concrete or 130 pounds per cubic foot of low-density concrete that is supported.

For live loads, include the actual force of any equipment to be supported, applied as concentrated forces at the points of contact and a uniform force of not less than 20 pounds per square foot applied over the area supported, plus 75 pounds per linear foot applied at the outside edge of deck overhangs.

For the design of the falsework bracing system, use the sum of the horizontal forces due to equipment, construction sequence, including unbalanced hydrostatic forces from fluid concrete, stream flow when applicable, and an allowance for wind. Use wind loads and distribution of wind loads to girders according to AASHTO Guide Specifications for Wind Loads on Bridges During Construction. However, do not allow the horizontal force to be resisted in any direction to be less than 2% of the total dead load.

Do not exceed the load-carrying capacity of the structure, or portion of structure, according to AASHTO LRFD Specifications Article 3.4.2 by imposing forces on existing, new, or partially completed portions of structures due to construction operations. For the compressive strength of concrete, f'_c , in computations of the load-carrying capacity, use the lesser of the actual compressive strength at the time of loading or the specified compressive strength of the concrete.

2.c Clearances. Unless otherwise provided for roadways that are to remain open to traffic, supply minimum dimensions for clear openings through falsework at least 5 feet wider than the width of the approach traveled way, measured between barriers when used, and 14 feet high, except over interstate routes and freeways use 14.4 feet for the minimum vertical clearance.

2.d Construction. Do not proceed with construction of falsework until the erection plan as specified in Section 1050.3(c)3 is accepted. Construct falsework and set it to grades that allow for its anticipated settlement and deflection, and for the vertical alignment and camber indicated or directed for the permanent structure. Use variable depth camber strips between falsework beams and soffit forms to accomplish this, if directed.

Use suitable screw jacks, pairs of wedges or other devices at each post to adjust falsework to grade, to allow minor adjustments during the placement of concrete or structural steel should observed settlements deviate from those anticipated, and to allow for the gradual release of the falsework. Provide tell-tales attached to the forms and extending to the ground, or other means, for accurate measurement of falsework settlement during the placing and curing of the concrete.

Support falsework or formwork for deck slabs on girder bridges directly on the girders so that there will be no appreciable differential settlement during placing of the concrete. Brace and tie girders to resist any forces that would cause rotation or torsion in the girders caused by the placing of concrete for diaphragms or deck. Do not weld falsework support brackets or braces to structural steel members or reinforcing steel unless specifically allowed.

2.e Removal. Section 1001.3(q)

3. Erection Plan. Submit an erection plan for acceptance, signed and sealed by a Professional Engineer registered in the State. Provide details for all anticipated phases and conditions during erection. Include details of falsework, temporary bents, bracing, guys, dead-men, lifting devices, and attachments to bridge members. Include the sequence of erection, location of cranes and barges, crane capacities, crane operator's license for the operator performing the crane work, location of lifting points on the bridge members, and weights of the members. If required, furnish calculations to demonstrate that allowable stresses are not exceeded and that member capacities and final geometry will be correct. Include delivery plan with erection plan. The delivery plan is to include delivery routes, ingress and egress to the site, and any modifications required for safe transport to the site. List equipment needed to unload or move bridge members. Do not proceed with erection until the erection plan has been accepted. Maintain an accepted copy of the erection plan onsite during erection operations.

3.a Pre-Erection Meeting. Before erecting falsework or permanent bridge members, conduct a pre-erection meeting a minimum of 14 calendar days before erection with the Professional Engineer of record for the erection plan, prime contractor, superintendent in charge of beam setting operation, crane operators or crane company representative, signal personnel, Structure Control Engineer, and onsite Representative to discuss the accepted erection plan. Conduct safety talk with crane operator as specified in Section 108.05(c)6.

3.b Conformance to Erection Plan. Ensure conformance to the erection plan. Any modification to or deviations from the accepted erection plan will require revised drawings, calculations, and verification of stresses and geometry.

3.c Erection Stresses. Account for any erection stresses that are induced in the structure as a result of the use of a method of erection or equipment which differs from that indicated or specified, and which will remain in the finished structure as locked-in stresses. Provide additional material, at no additional cost to the Department, to keep both temporary and final stresses within the allowable limits used in design.

Provide temporary bracing or stiffening devices to accommodate handling stresses in individual members or segments of the structure during erection. Use wind loads and distribution of wind loads to girders according to AASHTO Guide Specifications for Wind Loads on Bridges During Construction.

3.d Maintaining Alignment and Camber. During erection, support segments of the structure in a manner that will produce the proper alignment and camber in the completed structure. Install cross frames and diagonal bracing, as necessary during the erection process, to provide stability and ensure correct geometry. Provide temporary bracing, if necessary, at any stage of erection.

4. Bearings and Anchorage.

4.a General. This work consists of furnishing and installing bridge bearings. Bearing types include, but are not limited to, elastomeric pad, rocker, roller, pot, spherical, disk, and sliding plate bearings. Included as components of bearings are masonry, sole and shim plates, bronze or copper-alloyed bearing and expansion plates, anchor bolts, PTFE sheets or surfacing, lubricants and adhesives. The furnishing and installation of bedding materials used under masonry plates is also included in this work.

Construct bearings according to the indicated details. If complete details are not provided, furnish bearings that conform to the limited, indicated details and provide the design capacities for loads and movements shown or specified and the performance characteristics specified.

4.a.1 Working Drawings. If complete details for bearings and their anchorages are not indicated, prepare and submit working drawings for the bearings. Show all details of the bearings and of the materials proposed for use on such drawings, and have the drawings approved before fabrication of the bearings is begun.

4.a.2 Packaging, Handling, and Storage. Before shipment from the point of manufacture, package bearings in such a manner to ensure that during shipment and storage the bearings will be protected against damage from handling, weather, or any normal hazard. Clearly identify each completed bearing's components; securely bolt, strap, or otherwise fasten its components to prevent any relative movement; and mark on its top its location and orientation in each structure in the project, in conformity with the plans. Do not dismantle bearings at the site unless absolutely necessary for inspection or installation.

Store all bearing devices and components at the work site in an area that provides protection from environmental and physical damage. Ensure that bearings are clean and free of all foreign substances when installed.

4.a.3 Manufacture or Fabrication. Unless otherwise specified or indicated, furnish the surface finish of bearing components that come into contact with each other or with concrete, but are not embedded in concrete, as specified in Section 1105.03(q).

4.a.4 Construction and Installation. Install bearings to the positions indicated. At the time of installation, set bearings to the dimensions prescribed by the manufacturer, the Representative, or as indicated. Adjust bearings as necessary to take into account the temperature and future movements of the bridge.

Set bridge bearings level, in exact position, and to have full and even bearing on all bearing planes.

For bearing surfaces located at improper elevations or set not level and true to plane, either grind the surface, grout pack bearings, or modify the bearing such that intended bearing placement is as originally designed with the least amount of bearing modification.

Use a filler or fabric material as specified in Section 1113.03(h) to bed on the concrete metallic bearing assemblies not embedded in the concrete.

Set elastomeric bearing pads directly on properly prepared concrete surfaces without bedding material.

For bearings seated directly on steel work, machine the supporting surface so as to provide a level and planar surface to place the bearing.

4.b Preparation of Bearing Areas. Prepare bearing areas as specified in Section 1001.3(k)9 and furnish bedding material as specified in Section 1113.03(h).

4.c Elastomeric Bearings. Elastomeric bearings include unreinforced pads (consisting of neoprene only) and reinforced pads with steel or fabric laminates. Furnish bearings with the dimensions, material properties, neoprene grade and type of laminates indicated.

4.c.1 Setting Bearing Pads. Set bearing pads as specified in Section 1080.3(c)2 and as indicated. Where elastomeric bearings are used at piers of continuous bridges, provide full contact between the beam, the bearing pad, and the beam seat, unless the plans indicate that a lift-off condition is expected when the beam is initially set on the pad.

4.c.2 Resetting Bearing Pads. If indicated, reset expansion bearings after all dead loads have been placed. Submit a plan showing and describing the jacking procedure for review and acceptance at least 2 weeks before proceeding with the jacking operations. Provide calculations showing actual and allowable bearing stresses in the bearing plates and bearing areas at the jacking locations. Have the plans and calculations sealed and signed by a Professional Engineer registered in the State.

Before resetting, truck mixers and slip-forming equipment, necessary for placement of barriers and sidewalks, will be allowed on the structure. Do not allow other construction equipment or traffic on the structure until the bearings are reset. Coordinate the resetting operation with the installation of on-bridge hardware, including conduits, utilities, expansion dams, and drainage, to prevent damage to these components when the beams are jacked and lowered.

Furnish jacks with a working capacity at least equal to the jacking forces indicated. Jack beams at expansion bearings to achieve a 1/16-inch gap between the bottom of beam or sole plate and the top of the entire bearing pad. Place jacks at jacking points indicated. Unless indicated otherwise, jack all beams simultaneously. Limit the differential rise between all beams to 1/8 inch during jacking. After jacking, center the pad beneath the sole plate or beam bearing area as indicated. Lower the beams onto the bearings in the same manner as they were jacked.

Reset bearings when the ambient temperature is above 20F and below 85F.

4.d Anchor Bolts.

4.d.1 Fabrication. Furnish threaded and headed anchor bolts to secure a satisfactory grip upon the material used to embed them in the holes.

4.d.2 Setting Anchor Bolts. Set by template to the indicated elevation and alignment. As an alternate, set in preformed holes 3 inches larger than the bolt diameter. Clean the holes, set and fix the bolts, and fill the holes with nonshrink grout, as specified in Section 1001.2(e). Use drilled holes, as a substitute for preformed holes, in abutments and solid piers only. Protect the holes against water entry during freezing periods.

Limit the threaded projection above the nut to between 3/16 inch and 1 inch.

4.e Setting Bearings. As shown on the Standard Drawings and as follows:

Align masonry plates and set them so they will be centered with the rockers, rollers, sole plates, and bearing plates, at 68F and under full dead load. Make adjustment for the difference in temperature, from 68F, at time of erection. Compensate for the change in length of the bottom chord, or flange, due to the later addition of dead loads.

Maximum deviation of the top of rockers from a vertical position, and maximum eccentricity of the parts of sliding bearings, is $0.0001(L) + 0.25$ inch, where L, in inches, is the horizontal distance between the expansion bearing and the fixed bearing.

4.f Spherical Bearings. Fabricate, test, and install spherical bearings as indicated.

4.g Separate Contracts for Substructure and Superstructure. If the substructure and superstructure are built under separate contracts, proceed as follows:

4.g.1 Substructure Contractor. Accurately place the anchor bolts and grind the bearing areas to the correct plane and elevation.

At the completion of the substructure, make an as-built survey to accurately show the as-built versus the

plan location of all substructure centerlines, girder centerlines, anchor bolt group centerlines, anchor bolts, bearing elevations, and any other elements or items that may affect the layout or placement of the work to be furnished by the superstructure contractor. Show all of the pertinent as-built survey information, including dimensions, elevations, and angles on suitable drawings, as specified for shop drawings, together with the corresponding design drawing information for direct comparison. Submit the original drawings, or equal, to the Department as soon as practical after completion of the survey. Conduct the survey and have the survey drawings signed by a Surveyor or Professional Engineer registered in the State.

Provide documented evidence to show that the bearings can be set properly within the tolerances specified in Section 1050.3(c)4.

4.g.2 Superstructure Contractor. Use the as-built survey information, furnished by the substructure contractor, for the accurate layout of the connecting parts of the work.

Verify location, level, and elevation of all bearing seats and anchor bolts as soon as possible. Verify, before the fabrication of any metal work, in cases where the substructure is completed before award of the superstructure contract, or before erection of the metal work, in cases where fabrication has been started before completion of the substructure.

Furnish and install bedding, bearings, and nuts and washers for anchor bolts.

4.h High-Load Multi-Rotational Bearings. If required, construct as follows:

Provide complete erection and installation procedures for acceptance before installation.

Evenly support bearings over their upper and lower surfaces under all erection and service conditions.

Lift bearings by undersides only or by specially designed lifting lugs.

Take care to avoid damage to and contamination of bearing surfaces during installation.

Align the centerlines of the bearing assembly with those of the substructure and superstructure. On guided bearings take special care to properly align the guiding mechanism with the designated expansion direction of the structure.

Leave bearing straps or retaining clamps in place as long as possible to ensure parts of bearing are not inadvertently displaced relative to each other. Take care to remove straps or clamps before any normal structural movement takes place, such as post-tensioning.

Set offsets of upper and lower bearing parts as indicated. Under dead load, the distance between the upper and lower bearing plates will not be out of parallel by more than 1/8 inch measured from edge to edge.

Make the mating surface of the superstructure level within a slope of 100:1. Have no local irregularities exceeding 1/16 inch.

During welding of sole plates to girders, limit the temperature of the metal adjacent to neoprene and PTFE to a maximum of 300F. Use temperature indicating markers.

4.h.1 Bearing Seats. Provide bedding material for steel bearings as specified in Section 1113.03(h).

5. Straightening Material. If allowed, straighten plates, angles, other shapes, and built-up members. Use methods that will not produce fracture or other injury to the metal. Straighten distorted non-fracture critical members by mechanical means or, if allowed, by carefully planned procedures and supervised application of a limited amount of localized heat. Heat-straighten Grades HPS 70W and HPS 100W steel members only under rigidly controlled procedures, each application subject to approval. Do not allow the maximum temperature to exceed the following values:

Steel Grade	Distance from Weld	Max. Temp.
HPS 70W	> 6 inches	1,050F
HPS 70W	< 6 inches	900F
HPS 100W	> 6 inches	1,100F
HPS 100W	< 6 inches	950F

In all other steels, do not allow the temperature of the heated area to exceed 1,150F as controlled by temperature indicating crayons or other approved methods.

Ensure that parts to be heat-straightened are substantially free of stress and from external forces, except stresses resulting from mechanical means used in conjunction with the application of heat.

Evidence of fracture following straightening of a bend or buckle will be cause for rejection of the damaged piece.

6. Field Assembly. Accurately assemble the parts according to the erection plan, and follow any match-marks. Carefully handle the material so that no parts will be bent, broken, or otherwise damaged. Do not hammer members if it will injure or distort them. Clean bearing surfaces and surfaces to be in permanent contact before the members are assembled. Fill one-half of the holes of splices and field connections with bolts and cylindrical erection pins (half bolts and half pins) before installing and tightening the balance of high-strength bolts. Fill three-fourths of the holes of splices and connections carrying traffic during erection before installing and tightening the balance of high-strength bolts.

Fitting-up bolts may be the same high-strength bolts used in the installation. If other fitting-up bolts are used, supply fitting-up bolts of the same nominal diameter as the high-strength bolts, but supply cylindrical erection pins 1/32 inch larger.

7. Connections Using High-Strength Bolts. Make connections as specified in Section 1105.03(j) and as follows: (Note: Do not use ASTM F3125 Grade 490 bolts unless approved for use by the Chief Bridge Engineer or the Chief Bridge Engineer's designee, on a project by project basis.)

7.a General. Obtain the "snug tight" condition as defined in Section 1050.3(c)7.d for any method of final tightening except direct-tension-indicator (DTI) tightening or tightening of alternate design fasteners.

Assemble fasteners of appropriately assigned lot numbers together when installed. Protect such fasteners from dirt and moisture at the job site. Take only as many fasteners as are anticipated to be installed and tightened during a work shift from protected storage. Return fasteners not used to protected storage at the end of the shift. Do not clean lubricant from fasteners that is required to be present in as-delivered condition. Before installation, clean and relubricate fasteners for slip-critical connections which accumulate rust or dirt resulting from job site conditions. If relubrication is required, use a lubricant recommended by the fastener manufacturer.

Provide a Skidmore-Wilhelm Calibrator, or other equivalent bolt tension measuring device, at each job site, during erection. Perform periodic testing (at least once each working day if calibrated wrench method is used) to ensure compliance with the installation test procedures specified herein for turn-of-the-nut tightening, calibrated wrench tightening, installation of alternate design bolts, and direct tension indicator tightening. Bolts that are too short for the Skidmore-Wilhelm Calibrator may be tested using DTI devices. In that case, calibrate the DTI devices in the Skidmore-Wilhelm Calibrator using longer bolts, according to PTM No. 429 as applicable.

Install fasteners together with washers of size and quality specified, located as required below, in properly aligned holes, and tighten by any of the methods specified in Sections 1050.3(c)7.d through 1050.3(c)7.g to at least the minimum tension specified in Table A, when all the fasteners are tight. When it is impractical to turn the nut, tighten the fastener by turning the bolt while the nut is prevented from rotating. If impact wrenches are used, provide adequate wrench capacity and sufficient air supply to perform the required tightening of each bolt in approximately 10 seconds.

Do not reuse ASTM F3125 Grade A 490 fasteners or galvanized ASTM F3125 Grade A 325 fasteners. Reuse other ASTM F3125 Grade A 325 fasteners only if approved by the Representative. Do not consider as reuse touching up or retightening previously tightened bolts that may have been loosened by the tightening of adjacent bolts provided the snugging up continues from the initial position and does not require greater rotation, including the tolerance, than that required by Table B.

7.b Rotational-Capacity Tests. Perform the rotational capacity test on each bolt/nut/washer assembly lot, as specified in Section 1105.02(d)7d, immediately before the start of bolt installation in the fabrication shop or at the project site. Document test results according to PTM No. 427. If testing and installation is performed in the fabrication shop, submit test results to the BDTD, SMS at the MTL. If testing and installation is performed at the project site, submit test results to the Representative. All job-site rotational capacity tests are to be performed by the fabricator or Contractor, as applicable at the site of bolt installation, and witnessed by the Inspector.

Hardened steel washers are required under the turned element (nut) or as directed by the Representative as part of the test, although they may not be required in the actual installation. Mark fastener containers for each assembly lot after testing to indicate their acceptance.

7.c Requirement for Washers. Where the outer face of the bolted parts has a slope greater than 20:1 with respect to a plane normal to the bolt axis, use a hardened beveled washer to compensate for the lack of parallelism.

For American Standard Beams and Channels use hardened beveled washers that are square or rectangular, that conform to ASTM F436, and that taper in thickness.

Where necessary, clip washers on one side to a point not closer than 7/8 of the bolt diameter from the center of the washer.

Hardened washers or plate washers are required for all connections using ASTM F3125 Grade A 325 bolts and ASTM F3125 Grade A 490 bolts unless indicated.

Use hardened washers under the element turned in tightening when the tightening is to be performed by turn-of-the-nut method and calibrated wrench method.

Hardened steel washers are required under the turned element as part of rotational-capacity tests, even if they are not required in the actual installation.

Where ASTM F3125 Grade A 325 bolts equal to or less than 1.0 inch in diameter are to be installed in oversize or short slotted holes in an outer ply, a hardened washer conforming to ASTM F436 will be used.

Where ASTM F3125 Grade A 325 bolts equal to or less than 1.0 inch in diameter are to be installed in long slotted holes in an outer ply, provide a single plate washer or continuous bar of at least 5/16-inch thickness with standard holes. Furnish washers or bars of sufficient size to completely cover the slot after installation. Use a single hardened washer conforming to ASTM F436 with a minimum thickness of 5/16 inch, or use washers or bars of structural grade material but need not be hardened. Do not use multiple hardened washers or bars to achieve a thickness of 5/16 inch.

As an alternate satisfying the requirements for washers, use alternate design fasteners conforming to the requirements specified in Section 1050.3(c)7.c.1, if approved, with a geometry that provides a bearing circle on the head or nut with a diameter equal to or greater than the diameter of hardened washers conforming to the requirements of ASTM F436. Such fasteners may be used in standard size round holes without washers.

7.c.1 Alternate Fasteners. If alternate fasteners are allowed, proceed as specified in Section 1050.3(c)7.f and as follows:

If allowed, use other fasteners or fastener assemblies that conform to the materials, manufacturing, and chemical composition requirements of ASTM F3125 Grade A 325 and that conform to the mechanical property requirements of the same specifications in full-size tests, and that have body diameter and bearing areas under the head and nut, or their equivalent, not less than those provided by a bolt and nut of the same nominal dimensions specified in Section 1105.02(d). Such alternate fasteners may differ in other dimensions from those of the specified bolts and nuts.

7.d Turn-of-the-Nut Tightening. Immediately before the start of bolting operations, perform pre-installation verification testing according to PTM No. 429, and as follows:

Once per project per bolting crew, check a representative sample of not less than three of each diameter, length and grade to be used in the work at the start of work in a device capable of indicating bolt tension.

Using the test, demonstrate that the method for achieving the snug tight condition (see below) and for controlling the turns from snug tight to be used by the bolting crew develops a tension not less than 5% greater than the tension required by Table A. Perform periodic retesting if ordered by the Representative.

Following successful pre-installation testing, perform bolt installation as follows: Install bolts in all holes of the connection and bring them to a snug tight condition. Snug tight is defined as the tightness that exists when the plies of the joint are in firm contact. Use a few impacts of an impact wrench or the full effort of a worker using an ordinary spud wrench to attain the snug tight condition (use the same method that was used for pre-installation verification).

Snug tighten the bolts of the connection by progressing systematically from the most rigid part of the connection to the free edges, and then retighten the bolts in a similar systematic manner as necessary until all bolts are simultaneously snug tight and the connection is fully compacted. Following this initial operation further tighten all bolts in the connection by the applicable amount of rotation specified in Table B. During the tightening operation, do not allow rotation of the part not turned by the wrench. Systematically tighten the bolts progressing from the most rigid part of the joint to its free edges.

7.e Calibrated-Wrench Tightening. Before the start of bolting operations, perform pre-installation torque calibration as stipulated in PTM No. 429 and as follows. Use calibrated wrench tightening only if installation procedures are calibrated on a daily basis and if a hardened washer is used under the element turned in tightening. Standard torques determined from tables or from formulas, which are assumed to relate torque to tension, are not acceptable.

When calibrated wrenches are used for installation, set them to deliver a torque which has been calibrated to produce a tension not less than 5% in excess of the minimum tension specified in Table A. Calibrate the installation procedures at least once each working day for each fastener assembly rotational-capacity lot combination that is being

installed in the work that day. Perform calibration in a device capable of indicating actual bolt tension by tightening three typical fastener assemblies from each rotational-capacity lot, bolts of each diameter, length, and grade, from the bolts being installed and with a hardened washer, from the washers being used in the work, under the element turned in tightening. Recalibrate wrenches if significant difference is noted in the surface condition of the bolts, threads, nuts, and washers. Verify during actual installation in the assembled steel work that the wrench adjustment selected by the calibration does not produce a nut or bolt head rotation from snug tight greater than that specified in Table B. If manual torque wrenches are used, turn nuts in the tightening direction while torque is measured.

When calibrated wrenches are used to install and tension bolts in a connection, install bolts and nuts, with washers in all holes of the connection and bring them to a snug tight condition. Following this initial tightening operation, tighten the connection using the calibrated wrench. Tighten the bolts by progressing systematically from the most rigid part of the joint to its free edges. Use the wrench to again tighten previously tightened bolts that may have been relaxed as a result of the subsequent tightening of adjacent bolts, until all bolts are tightened to the prescribed amount.

7.f Installation of Alternate Design Bolts. When fasteners are to be installed that incorporate a design feature intended to indirectly indicate the bolt tension or to automatically provide the tension specified in Table A and have been qualified as specified in Section 1050.3(c)7.c.1, check a representative sample of not less than three bolts of each diameter, length, and grade, at the job site in a device capable of indicating bolt tension. Include flat, hardened washers in the test assembly, if required in the actual connection, arranged as those in the actual connections to be tensioned. Use the calibration test to demonstrate that each bolt develops a tension not less than 5% greater than the tension specified in Table A. Follow the manufacturer's installation procedure for installation of bolts in the calibration device and in all connections. Perform periodic retesting when ordered by the Representative.

When alternate design fasteners that are intended to control or indicate bolt tension of the fasteners are used, install bolts in all holes of the connection and initially tighten them sufficiently to bring all plies of the joint into firm contact but without yielding or fracturing the control or indicator element of the fasteners. Then further tighten all fasteners, progressing systematically from the most rigid part of the connection to the free edges in a manner that will minimize relaxation of previously tightened fasteners. In some cases, to properly tension the bolts, perform more than a single cycle of systematic partial tightening before final twist-off of the control or indicator element of individual fasteners. Replace any individual fastener assembly if twist off occurs before the final tensioning cycle.

7.g Direct Tension Indicator Tightening. Furnish DTIs conforming to the requirements as specified in Section 1105.02(d)6, and in sufficient numbers to allow for all required testing. When fastener assemblies using DTIs are proposed for use, perform preinstallation verification testing and subsequent fastener installation according to PTM No. 429 as applicable. Three verification tests are required for each combination of fastener assembly rotational-capacity lot, DTI lot, and DTI position relative to the turned element to be used on the project. Unless otherwise approved, install the DTI under the head of the bolt, and turn the nut to tension the bolt.

TABLE A
Required Fastener Tension
Minimum Bolt Tension in Pounds*

Bolt Size inches	ASTM F3125 Grade A 325	ASTM F3125 Grade A 490
1/2	12,000	15,000
5/8	19,000	24,000
3/4	28,000	35,000
7/8	39,000	49,000
1	51,000	64,000
1-1/8	56,000	80,000
1-1/4	71,000	102,000
1-3/8	85,000	121,000
1-1/2	103,000	148,000

* Equal to 70% of specified minimum tensile strength of bolts (according to ASTM Specifications for tests of full-size ASTM F3125 Grade A 325 bolts and ASTM F3125 Grade A 490 bolts with UNC profile threads loaded in axial tension) rounded to the nearest kip.

TABLE B
Nut Rotation from the Snug-Tight Condition^{(1),(2)} Geometry of Outer Faces of Bolted Parts

Bolt length measured from underside of head to end of bolt	Both faces normal to bolt axis	One face normal to bolt axis and other face sloped not more than 20:1. Bevel washer not used.	Both faces sloped not more than 20:1 from normal to bolt axis. Bevel washers not used.
Up to and including 4 diameters	1/3 turn	1/2 turn	2/3 turn
Over 4 diameters but not exceeding 8 diameters	1/2 turn	2/3 turn	5/6 turn
Over 8 diameters but not exceeding 12 diameters ⁽³⁾	2/3 turn	5/6 turn	1 turn

(1) Nut rotation is relative to bolt, regardless of the element (nut or bolt) being turned. For bolts installed by 1/2 turn and less, the tolerance should be ± 30 degrees; for bolts installed by 2/3 turn and more, the tolerance should be plus or minus 45 degrees.

(2) Applicable only to connections in which all material within grip of the bolt is steel.

(3) No research work has been performed by the Research Council Riveted and Bolted Structural Joints to establish the turn-of-nut procedure if bolt lengths exceed 12 diameters. Therefore, the required rotation must be determined by actual tests, in a suitable tension device, simulating the actual conditions.

7.h Lock-Pin and Collar Fasteners. If approved for use, test and install lock-pin and collar fasteners using approved methods and procedures, and as specified in Section 1050.3(c)7.f.

Meet the requirements as specified in Section 1105.02(d)2 for the shank and head of high-strength steel lock-pin and collar fasteners. Provide each fastener with a solid-shank body of sufficient diameter to provide tensile and shear strength equivalent to or greater than that of the bolt indicated and a cold-forged head on one end, of type and dimensions approved; a shank length suitable for the material thickness fastened; locking grooves; breakneck groove; and pull grooves (all annular grooves) on the opposite end. Provide each fastener with a steel locking collar of proper size for the shank diameter used which, by means of suitable installation tools, is cold-swaged into the locking grooves forming a head for the grooved end of the fastener after the pull groove section has been removed. Provide a steel locking collar with a standard product of an established manufacturer of lock-pin and collar fasteners, as approved.

7.i Inspection. In the presence of the Inspector, inspect the tightened bolts using a 1,000 foot-pound manual dial calibrated torque wrench, according to PTM No. 429 and as follows, unless alternate fasteners or direct tension indicator devices are used, allowing verification by other methods: At the Representative's option, this inspection can be performed either by the Inspector or the Contractor. Inspection tests must be conducted daily. Testing performed by the fabricator or Contractor will be witnessed by the Representative.

Individually place three fastener assemblies of the same lot size, grade, size, configuration, and condition as those under inspection in a device calibrated to measure bolt tension. Perform this calibration operation at least once each inspection day. Provide a washer under the part turned in tightening each bolt, if washers are used on the structure. If washers are not used on the structure, furnish the material used in the tension measuring device which abuts the part turned of the same specification as that used on the structure. In the calibrated device, tighten each bolt to the specified tension by any convenient means. Apply the calibrated torque wrench to the tightened bolt to determine the torque required to turn the nut or head five degrees (approximately 1 inch at a 12-inch radius) in the tightening direction. Take the average of the torque required for all three assemblies as the job-inspection torque.

For final acceptance of connections installed using high-strength bolts, inspect 10% (2 minimum) of the bolts in the connection using a calibrated torque wrench. Select bolts to be inspected according to PTM No. 1. Then apply the job-inspection torque to each with the calibrated torque wrench turned in the tightening direction. If this torque turns no bolt head or nut, the bolts in the connection will be considered to be properly tightened. But if the torque turns one or more bolt heads or nuts, apply the job-inspection torque to all bolts in the connection. Tighten and reinspect any bolt whose head or nut turns at this stage, or retighten all the bolts in the connection and resubmit it for inspection.

8. Pin Connections. Use pilot and driving nuts in driving pins. Drive pins so that the members will take full bearing on them. Screw pin nuts up tight and burr the threads at the face of the nut with a pointed tool.

9. Misfits. The correction of minor misfits involving minor amounts of reaming, cutting, and chipping will be considered a legitimate part of the erection. However, errors in the shop fabrication or deformation resulting from

handling and transporting will be cause for rejection.

The Contractor is responsible for all misfits, errors, and damage. Make the necessary corrections and replacements to correct misfits, errors, and damage.

(d) Painting.

1. Fabricated Structural Steel. Apply coating system as specified in Section 1060.

2. Fabricated Structural Steel Repairs. Apply a coating system as indicated. The coating system can be shop applied as specified in Section 1060 or field applied as specified in Section 1070. Prepare and coat faying surfaces as specified in Section 1105.03(j)3. Use the same primer on faying surfaces as the primer being applied in the field to the existing steel. Do not mate surfaces of different primers.

1050.4 MEASUREMENT AND PAYMENT—

(a) Steel Bridge Superstructure. Lump Sum. The price includes the following component items.

- **Fabricated Structural Steel.** Pound. The cost of welds in excess of those indicated and allowed by the District Bridge Engineer, due to the Contractor's request, is incidental to the other fabricated structural steel work. The cost of all nondestructive testing, including equipment, supplies, and technicians is also incidental to the other fabricated structural steel work.
- **Cement Concrete Structures.** Section 1001.4
- **Preformed Neoprene Compression Joint Seal.** Section 1008.4
- **Pedestrian Railing.** Section 1012.4
- **Aluminum Bridge Hand Railing.** Section 1023.4
- **Steel Bridge Hand Railing.** Section 1022.4
- **Protective Barrier.** Section 1015.4
- **Protective Fence.** Section 1016.4
- **Protective Coating for Reinforced Concrete Surfaces.** Section 1019.4
- **Armored Preformed Neoprene Compression Dam.** Section 1021.4
- **Tooth Expansion Dam with Drain Trough.** Section 1020.4
- **Reinforcement Bars.** Section 1002.4
- **Neoprene Strip Seal Dam.** Section 1026.4
- **High Load Multi-Rotational Bearings.** Each. For the type indicated.
- **Neoprene Bearing Pads.** Each. For the type indicated.
- **Reset Expansion Bearings, Steel Superstructure.** Each

(b) Fabricated Structural Steel Repairs. Each or Pound as indicated.

1. Fabricated Structural Steel Repairs. Each. Access to the planned repair locations to perform and inspect the repairs is incidental to this item. Modifications of existing steel for the repairs are incidental to the repairs. Field cutting and grinding, field welding, weld testing, field drilling bolt holes, existing rivet/bolt/weld removal, bolt hole reaming, high strength field bolting, bolts, nuts, washers, welds, and weld materials incorporated into the finished work are incidental to the fabricated structural steel repairs.

2. Fabricated Structural Steel Repairs. Pound. Access to the planned repair locations to perform and inspect the repairs is incidental to this item. Modifications of existing steel for the repairs are incidental to the repairs. Field cutting and grinding, field welding, weld testing, field drilling bolt holes, existing rivet/bolt/weld removal, bolt hole reaming, and high strength field bolting are incidental to the fabricated structural steel repairs. The pay weight is based upon nominal weights for rolled and formed sections, nominal dimensioned plates, and other items, as listed in current AISC handbooks. Payment will be made only for actual new fabricated structural steel permanently installed in the rehabilitated structure excluding the weights listed in the following paragraphs:

The weight of the bolts, nuts, washers, welds, and weld materials incorporated into the finished work are incidental to the weight of the installed fabricated Structural steel.

The weight of the cuts, copes, bolt holes, or other material not incorporated into the finished work are incidental to the weight of the installed fabricated structural steel.

(c) Unforeseen Fabricated Structural Steel Repairs. Dollar. For projects anticipating unforeseen repairs, an item with a predetermined amount of money is included for unforeseen repairs. The item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount. This item includes access to the unforeseen repair locations to perform and inspect the repairs.

Due to the contingent or unpredictable nature of the work being performed, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for, under the Unforeseen Repairs item as follows:

1. Contract Items. The Department will pay for performance of work, identified as having similar items listed in the contract, at the contract unit price.

2. Non-Contract Items. The Department will pay for the items of work not identified in the contract as follows:

- **Negotiated Price.** At price agreed upon with the Department before performing the work. If applicable, agreement is also required with FHWA.
- **Force Account Basis.** Section 110.03(d).

SECTION 1051—DOWNSPOUTING

1051.1 DESCRIPTION—This work is the furnishing and installation of downspouting.

1051.2 MATERIAL—As shown on the Standard Drawings and as follows:

- Fabricated Structural Steel—Section 1105, galvanized as specified in Section 1105.02(s).
- Fiberglass Pipe and Fittings—ASTM D 2996 RTRP with a 30,000 pounds per square inch, minimum short-time rupture strength hoop tensile stress. Use concrete gray as the final color of the reinforced fiberglass pipe, unless otherwise specified. Use a coating that protects the pipe from ultraviolet damage. Use manufacturer recommended paint and fittings.
- PVC Schedule 40 Pipe—ASTM D 1785

1051.3 CONSTRUCTION—Install downspouting, including the drain box, as indicated and as shown on the Standard Drawings.

1051.4 MEASUREMENT AND PAYMENT—Linear Foot

SECTION 1052—METAL CURB DRAIN

1052.1 DESCRIPTION—This work is construction of an aluminum or steel drain facility to dispose of bridge deck drainage by free drop through curb barrier.

1052.2 MATERIAL—

- (a) **Aluminum.** ASTM B308/B308M, Alloy 6061-T6. Certify as specified in Section 106.03(b)3.
- (b) **Structural Steel.** Section 1105.02(a)2
- (c) **Zinc Chromate Primer.** Federal Specification TT-P-645. Certify as specified in Section 106.03(b)3.
- (d) **Galvanizing.** Section 1105.02(s)

1052.3 CONSTRUCTION—Construct in accordance with Standard Drawing BC-751M, as indicated, and as directed.

(a) **General.** Fabricate the drain from either C8 by 4.25 aluminum channels, or C8 by 11.5 steel channels, welded together with full penetration welds to form a rectangular section. Alternatively, fabricate a rectangular section, 8 inches by 4 1/2 inches out of 3/16-inch steel plates.

(b) **Aluminum Drain.** Coat all surfaces of the drain to be in contact with concrete with two coats of asphalt paint or zinc chromate primer.

(c) **Steel Drain.** Galvanize the entire drain after welding according to ASTM A123.

1052.4 MEASUREMENT AND PAYMENT—Incidental to concrete bridge barrier.

SECTION 1060—SHOP PAINTING STRUCTURAL STEEL

1060.1 DESCRIPTION—This work is the preparation and application of a three coat paint system for structural steel using an approved paint system listed in Bulletin 15. Painting operations are to take place in a Bulletin 15 approved coating or fabrication shop. The primer coat is to be applied in the shop while the intermediate and top coats may be applied in the shop or in the field. Any field painting will be covered as specified in Section 1070.

(a) Prequalification. When shop painting structural steel, use only Bulletin 15 approved paint shops that are certified by the AISC under its Sophisticated Paint Endorsement (SPE) quality program or by the Society for Protective Coatings (SSPC) under its QP3 quality program. Use Shops certified to the “enclosed shop” category. Use shops that are fully certified for the duration of time they are performing surface preparation and coating application. Apply complete coating system in an “enclosed shop” except for touch up painting.

For shop removal and disposal of hazardous coating, including but not limited to lead based paint, use only shops certified to SSPC-QP3 and listed in Bulletin 15 as approved paint shops.

1060.2 MATERIAL—

(a) Coating System for Plain Carbon Steel. Use an approved, proprietary, self-curing, inorganic, zinc system, from a manufacturer listed in Bulletin 15, consisting of a self-curing, inorganic zinc primer, an epoxy or urethane intermediate coat, and an aliphatic urethane top coat. Do not mix components or coats from different systems. Use the products from the same manufacturer for the entire system.

When new steel is to be connected to existing steel in the field, the coating system applied in the shop must be the same system applied in the field to ensure compatibility.

(b) Product Approval and Verification Submittal Requirements. Submit the following information for Bulletin 15 evaluation and approval:

- Attenuated Total Reflection – Fourier-Transform Infrared ATR-FTIR curves for each component of each coat and for mixed coat(s); according to ASTM E1252 as modified by AASHTO NTPEP CCS workplan Section 5.14
- Weight per gallon, at 75F, for each component of each coat; according to ASTM D1475
- Viscosity in Krebs Units, at 77F, for each component of each coat; according to ASTM D562
- Percent solids by weight of each component of each coat; according to ASTM D2369
- Percent of metallic zinc by mass (weight) in the cured zinc primer coat, dry film
- Percent of metallic zinc by mass (weight) in the zinc pigment component

(c) District Approval Submittal Requirements. Submit the following information to the Representative a minimum of 21 calendar days before beginning the coating. Begin coating after the Representative accepts the submittals.

- Top coat color chips, of the color indicated for approval by the District Bridge Engineer; and
- Technical data sheets, safety data, and specific application instructions for all coats. In the event of a conflict between the data/instruction sheets and these Specifications, the Chief Structural Materials Engineer will determine the governing specification. Work will not be allowed to proceed until this information is received.

(d) Technical Representation. Furnish the services of a paint or a painting technical representative from the paint manufacturer at the beginning of operations and when required.

(e) Damage Prevention and Repair Procedures. Submit a damage prevention plan with the structural steel shop drawings that describes the procedures and protective materials to be used to prevent damage to paint coats. Have the plan cover the period of time from when paint coats are applied in the shop until erection is completed in the field. Submit the manufacturer's recommended surface preparation methods, coating material, application methods,

and application conditions. Include the manufacturer's recommended methods for correction of damage to one or more coats, including correction of damage caused in handling, shipping, and erection; correction of deficient or excessive coating thickness; correction of runs, sags, peeling, and poorly adhered coating; and removal of zinc salts and other contaminants that would be detrimental to succeeding coats. The Contractor is responsible for performing the proper repair of damage to the coating system caused by handling, shipping, erection, and bridge construction.

(f) Coating System for Galvanized Steel. Use an approved coating system, from a manufacturer listed in Bulletin 15 omitting the primer coat and applying the intermediate and top coats. Select contrasting colors for the intermediate and top coat before fabrication. Do not mix components from different systems. If a wash primer is used, provide the manufacturer's certification of compatibility with the selected paint system.

- Furnish submittals as specified in Section 1060.2(b) and 1060.2(c) for intermediate and top coats. Furnish technical representation as specified in Section 1060.2(d). Furnish damage prevention and repair procedures as specified in Section 1060.2(e).

(g) Coating System for Thermal Spray Coatings (Metallizing). Use an approved thermal spray coating system consisting of an 85/15 zinc/aluminum alloy wire, sealer, and top coat when a duplex system is specified. Use an approved thermal spray coating system consisting of an 85/15 zinc/aluminum alloy wire and a sealer when only a metalizing system is specified.

- Furnish submittals as specified in Section 1060.2(b) and 1060.2(c) for sealer and top coats. Furnish technical representation as specified in Section 1060.2(d). Furnish damage prevention and repair procedures as specified in Section 1060.2(e).

1060.3 CONSTRUCTION—

(a) General.

1. Protection of Structure, Persons, and Property. Conduct work according to applicable occupational and environmental health and safety rules and regulations.

(b) Surface Preparation.

1. Pre-Blasting

1.a Edge Preparation. Before blasting, round edges to be painted, to a radius of $1/16'' \pm 1/32''$.

1.b Weld Preparation. Before blasting, remove slag and weld spatter.

2. Cleaning

2.a Solvent Cleaning. Where oil, grease, lubricants, cutting compounds, petroleum products, and other contaminants are present remove according to the SSPC Surface Preparation Standard No. 1 Solvent Cleaning (SSPC-SP1). Perform cleaning before blasting. If contamination remains after blasting, reclean with solvent and reblast. SSPC-SP1 is a prerequisite to all other SSPC-SP surface cleanliness standards.

2.b Other Cleaning. Remove soil, concrete spatter, drawing compounds, salts, or other foreign matter by brushing with stiff fiber or wire brushes; by scraping; by cleaning with solutions of biodegradable cleaners, provided such cleaners are followed by a fresh water rinse, or by a combination of these methods. Satisfactorily remove detrimental deposits from new weld areas. When directed remove chlorides and other water soluble salts according to NACE WJ-4/SSPC-SP WJ4, by low-pressure water cleaning (gauge pressures less than 5000 pounds per square inch) or high-pressure water cleaning (gauge pressures from 5000 to 10,000 pounds per square inch).

3. Conditions for Blast Cleaning. Blast clean only when the surface temperature is at least 5F above the dewpoint. Determine the dewpoint with the use of a psychrometer and psychrometric tables or Electronic Psychrometer. Check environmental conditions before blasting operations begin and at four hour intervals thereafter.

Blast Cleaning. Blast clean steel to a near-white condition, as defined in SSPC-SP10/NACE No 2 Determine the near-white blast condition by use of SSPC-VIS 1 visual guide. Blast clean to leave an anchor pattern, from 1 1/2 mils to 3 1/2 mils deep, in a dense, uniform pattern of depressions and ridges. Determine the anchor pattern depth by using replica tape, according to ASTM D 4417, Method C. The required number of replica tape tests and frequency are outlined below. Grind laminations raised by the blasting operation to a flush surface and restore the ground area to the specified anchor pattern.

4.a Centrifugal Blast Cleaning using Recyclable Abrasives. Abrasives must be clean, dry, free of oils, grease and other harmful materials as determined by the test methods SSPC-AB1, SSPC-AB2 and SSPC-AB3.

Perform anchor pattern depth testing, using replica tape, as follows:

- Three random replica tape readings on each main member.
- Three random replica tape readings on 20 percent of all secondary members, but not less than three per shift.
- Two random replica tape readings on 5 percent of all miscellaneous items.

4.b Hand Blasting. Utilize clean and dry compressed air. Conduct blotter test(s) according to ASTM D 4285, at the start of each shift and every four hours during blasting operations. Conduct the tests in the presence of the Inspector.

When hand blasting, perform anchor pattern depth testing, using replica tape, as follows:

- Five random replica tape readings on each main member.
- Three random replica tape readings on 30 percent of all secondary members, but not less than six replica tape readings per shift.
- Three random replica tape readings on 10 percent of all miscellaneous items.

5. Preparing Galvanized Surfaces for Painting. Prepare entire surface according to ASTM D6386. High spots and rough edges must be smoothed to avoid paint film gaps as directed according to SSPC-SP2 and SSPC-SP3. Prepare surface for galvanizing by applying a wash primer treatment that is compatible with galvanizing and selected paint system, or by brush-off blasting the entire surface according to SSPC-SP 16. Do not use steel shot for brush-off blast. Use a blast media with a low level of aggressiveness, such as crushed walnut shells, corn cobs or bi-carbonate of soda for example, but not inclusive.

6. Application of Thermal Spray Coating Systems. Complete coating application for thermal spray coatings according to the AASHTO/NSBA Steel Bridge Collaboration's Specification for Application of Thermal Spray Coating Systems to Steel Bridges (S8.2-2017/SSPC-PA 18) with the following exceptions:

- Perform thermal spray coatings applications at a fabrication shop approved according to SSPC QP 6 qualification program.
- Apply Thermal Spray Coating to a coating thickness of at least 8 mils.
- Perform bend test according to Appendix A of the SSPC-CS 23.00/AWS C.2.23/NACE No. 12
- Perform hammer and chisel cut test according to Appendix B of the SSPC-CS 23.00/AWS C.2.23/NACE No. 12
- Companion coupons are permitted for use according to SSPC-CS 23.00/AWS C.2.23/NACE No. 12
- Slip critical faying surfaces requiring a slip B coefficient shall remain unsealed and the thermal spray coating thickness shall not exceed more than 16 mils per element

(c) Painting.

- 1. Handling.** Deliver paint and thinner in original unopened containers with the manufacturer's labels intact. Minor damage may be accepted if container is not punctured.

2. **Storage.** Store paint and thinner according to the manufacturer's recommendations. Store paints and thinners in well ventilated areas not subject to temperatures in excess of the manufacturer's maximum storage temperature. If necessary, store in heated storage areas to maintain material temperature at or above the manufacturer's minimum storage temperature, listed on the product data sheet.
3. **Surface Cleanliness.** Surfaces to be painted must be free of dust, dirt, grease, oil, moisture, overspray, and other contaminants.
4. **Mixing Paints.**

4.a Primer. Mix the primer with a high shear mixer (such as a jiffy mixer), according to the manufacturer's recommendations to a smooth, lump free consistency. Do not use paddle mixers or paint shakers. Mix in the original containers. Continue mixing until the metallic powder or pigment is in suspension. Ensure that the coating solids that might have settled to the bottom of the container are thoroughly dispersed. Strain the mixture through 30 mesh to 60 mesh screen openings to remove large particles. Equip paint containers with a mechanical agitator so the mixture is in motion throughout the application period.

4.b Subsequent Coats. Mix each subsequent coat to achieve and to maintain a homogeneous mixture.

5. Thinning Paint. Thin the paint, only as recommended by the manufacturer. Do not thin once painting application has begun.

6. Conditions for Painting. Apply paint only on clean and dry surfaces. Do not paint when the temperature of the air, paint, or metal is below 40F, and at no time above or below that described in the technical data sheet; when the air is misty; or when conditions are otherwise unsatisfactory. Do not paint when relative humidity is above the limit according to the manufacturer's recommendations. Do not paint damp or frosted surfaces or surfaces hot enough to cause the paint to blister, to produce a porous paint film, or to cause the vehicle to separate from the pigment. Paint only when the surface temperature is at least 5F above the dewpoint. Determine the dewpoint with the use of a psychrometer and psychrometric tables or Electronic Psychrometer. Check environmental conditions before painting operations begin and at four hour intervals. If the dewpoint begins to rise and comes within 10F of the surface temperature, check environmental conditions every 15 minutes.

Allow each coat of paint to cure before applying the succeeding coat. Follow the manufacturer's recommendations for drying time, unless a longer drying time is required.

In damp or cold weather, keep the shop work under cover until thoroughly cured, or until weather conditions allow exposure.

7. Application. Apply primer and subsequent coats immediately after inspection and acceptance of the surface. Apply primer within 8 hours of blast cleaning. If the metal is not painted within 8 hours following blast cleaning; the surface temperature of the metal falls below the dewpoint temperature; or the metal shows signs of flash rust, blast clean it again before priming.

Apply inorganic zinc-rich primer according to the manufacturer's recommendations. Prime any areas that are inaccessible, by spray, with inorganic zinc-rich primer.

For application of the intermediate and top coats, wet prime all edges, bolts, welds, rivets, corners, crevices, and other irregularities either by brush or by a separate and distinct spray operation, before the application of the full coat. Extend the prime coat a minimum of 1" from edges, bolts, welds, rivets, corners, crevices and other irregularities. Provide safe access for inspection, as requested by the Representative, before application of the full coat over the primed areas. Do not apply the full coat until approval of the prime coat is provided.

Apply intermediate and final coats to areas of steel that will be inaccessible before the stage of construction that prevents access.

Other types of prime coats may be substituted for the galvanized coating only if prior approval is received from the Department. Submit the written approval request at the preconstruction conference. Follow the paint manufacturer's recommendations to ensure compatibility between the prime coat and the intermediate coat and to ensure adhesion when the surface of the prime coat has been contaminated, for example, by bolt/nut lubrication.

8. Paint Application. Apply the primer after shop fabrication, inspection and acceptance, but before shipment. Do not apply primer to galvanized surfaces.

Paint field contact surfaces and surfaces to be in contact with concrete with primer only, except in the unpainted area of weathering steel unless indicated. Do not paint within 2 inches of location of design field welds.

Coat machine-finished metal surfaces, subjected to movement, with either corrosion-preventive compound, conforming to the requirements of Military Specification MIL-C-16173D, Grade 2, or other acceptable material, as soon as possible after acceptance and before removal from the shop. Paint other surfaces of metal, either milled or finished, with primer. Certify the coating material as specified in Section 106.03(b)3.

Paint or stencil the required dates, weight markings, and erection markings only on previously primed or painted surfaces. Use a suitable paint that does not react with other primer or paint coats, and one that is not visible after the final field paint coat.

Allow the paint to dry completely before loading and shipping.

Protect the paint from damage and contamination. Use coverings and proper storage, handling, shipping, and erection techniques.

Repair damaged and contaminated coatings according to the manufacturer's recommendations. Repair each coat according to manufacturer's recommendations if more than one coat is damaged.

8.a Spray Painting. If conventional (air) spray is used, provide suitable traps or separators to exclude oil and water from the air. Conduct blotter test(s) according to ASTM D 4285 before paint application begins. Mix paint thoroughly by continuous agitation when applying primer.

8.b Roller Painting. Use rollers that do not leave a stippled texture in the paint film. Use rollers only on flat, even surfaces to produce a paint film of even thickness with no skips, runs, sags, or thin areas.

8.c Brush Painting. Use flat brushes, not wider than 4 1/2 inches, or round or oval brushes. Manipulate the paint under the brush to produce a uniform, even coat. Work the paint into corners and crevices. Move the brush in a series of small circles to thoroughly fill irregularities in the surface, then brush out and smooth by a series of parallel strokes until the paint film has an even thickness. Mix paint thoroughly by continuous agitation when applying primer.

8.d Painting Inaccessible Areas. Thoroughly cover surfaces inaccessible to normal painting methods by use of sheepskin daubers, spray, or other means to ensure thorough coverage. Mix paint thoroughly by continuous agitation when applying primer.

8.e Stenciling. After the final coat of paint has dried, stencil the following information on the outside face of the fascia members at the near and far abutment ends unless directed otherwise:

- Line 1: Month and year of completion and ECMS number
- Line 2: BR Key
- Line 3: BMS Number
- Line 4: Type of coating system, and cleaning method
- Line 5: NEPCOAT number listed in Bulletin 15, and the manufacturers name

Examples:

08-2018, ECMS 88335
 BR KEY: 712
 02-0051-0110-0000
 IZEU, SSPC-SP10
 SSC(12)-03, Carboline

Stencil using indelible black paint compatible with the coating system and approved by the manufacturer. Provide uniform block lettering 2 inches to 3 inches high.

9. Thickness of Coats. Perform dry film thickness measurements on every steel beam/girder according to SSPC-PA2 Appendix 2

For all other fabricated items perform dry film thickness measurements according to SSPC-PA2. For three coat systems, perform dry film thickness measurements after the application of each coat. Determine the dry film thickness of the intermediate and top coats by subtracting the average dry film thickness of the underlying coat(s) from the cumulative reading. Increase the thickness of coating, if directed, to ensure a finish that is uniform in color and appearance.

Apply the three-coat system as follows:

9.a Primer. Spray apply, according to the manufacturer's recommendations, in a single application, employing multiple spray passes, to the dry film thickness according to the paint manufacturer's product data sheet above the anchor pattern. A dense and uniform appearance is required after the applied coating has cured. For areas deficient in coating thickness and areas exhibiting mudcracking, repair, according to the manufacturer's recommendations.

9.b Intermediate Coat. Apply the intermediate coat, above the prime coat to the dry film thickness according to the paint manufacturer's product data sheet.

Use a color that contrasts with the colors of the zinc and top coats.

9.c Top Coat. Apply the top coat, above the intermediate coat, to the dry film thickness according to the paint manufacturer's product data sheet.

10. Removal of Unsatisfactory Paint. The painting is unsatisfactory if rusting occurs; the paint coat lifts, blisters, wrinkles, has excessive coating thickness, has excessive runs or sags, or shows evidence of application under unfavorable conditions; the workmanship is poor; impure or unauthorized paint has been used; or for other reasons determined. Remove unsatisfactory paint, clean the metal, and repaint, as directed.

1060.4 MEASUREMENT AND PAYMENT—Painting structural steel is incidental to the items of work painted.

SECTION 1070—PAINTING EXISTING STRUCTURAL STEEL

1070.1 DESCRIPTION—This work is surface preparation and coating of existing structural steel using a three-coat system. This work includes removal of existing coatings from the entire structure or zones as indicated, cleaning, soluble salt remediation, treatment of pack rust areas, and application of the three-coat system.

1070.2 MATERIAL—

(a) **Coating System.** Provide a three-coat organic zinc rich primer, epoxy intermediate, and urethane finish coat paint system listed in Bulletin 15 and the Northeast Protective Coatings Committee (NEPCOAT) Qualified Products List B. Provide caulking and penetrating sealer produced by the manufacturer supplying the coating for use in pack rusted areas. Provide written confirmation from the coating manufacturer that the caulking and penetrating sealer are compatible with the coating system if used as specified.

Verify the organic zinc rich primer has a Class B certification, certified within the last 7 years, from an AASHTO approved laboratory according to the Research Council on Structural Steel Connections (RCSC) Specification for Structural Joints Using High Strength Bolts Appendix A.

If a NEPCOAT List B three-coat system is proposed, but is not listed in Bulletin 15, obtain acceptance of the coating system as specified in Section 106.02(a)2.b before shipment to the project.

Obtain the coating system from one manufacturer. Do not mix components or coats from different systems of the same manufacturer or other manufacturers.

(b) **Material Submittal Requirements.** Provide the following submittals to the Structure Control Engineer a minimum of 30 calendar days before beginning surface preparation or coating operations. Do not begin surface preparation or coating operations until submittals have been accepted. Include the following:

1. Finish Coat Color Chips. Provide three new color chips conforming to the indicated AMS-STD-595A color number a minimum of 6-inch by 6-inch in size. If the color number indicates a finish other than semi-gloss, provide a semi-gloss finish coat. Do not obtain finish coat material until acceptance of the color and gloss level.

2. Coating Certifications. Provide coating certifications to the Representative and Chief Chemist of CMD.

- Provide Certificate of Testing from an AASHTO approved laboratory confirming the organic zinc rich primer has a Class B rating according to RCSC Specification for Structural Joints Using High Strength Bolts and has been tested within the last 7 years.
- For Bulletin 15 approved coating systems, certify as specified in Section 106.03(b)3 modified as follows: Submit a dated certification, Form CS-4171, from the manufacturer that each batch of the coating system meets specifications. Include in the certification, the product name for each coat of the system being supplied, and the production lot number of the batch being certified.
- If a non-Bulletin 15 approved NEPCOAT List B three-coat system is chosen and accepted, certify the material as specified in Section 106.03(b)3. PennDOT Construction and Material Management System (CAMMS) Test Report is to accompany each shipment to the project. The lot numbers on the CAMMS Test Report are to match the lot numbers shipped to the project.

3. Manufacturer's Technical and Safety Data. Provide current manufacturer's technical/product data sheets (PDS) and Safety Data Sheets (SDS) for each coating component. Additionally, provide PDS/SDS for the following; penetrating sealer, caulking, thinner/cleaners, soluble salt remover, and rust stain remover. Provide specific coating application instructions that list amount of thinning allowed including Volatile Organic Compounds (VOC) if thinned at those levels; minimum/maximum cure to recoat and full cure intervals based on time, temperature and relative humidity. Include manufacturer's information for determining recoat times and full cure times if the potential temperatures and relative humidity combinations are not listed on the technical product data/instruction sheets.

In the event of a conflict between the product data/instruction sheets or procedures and the specifications, the specifications will govern unless directed otherwise.

1070.3 CONSTRUCTION—**(a) General.**

1. Quality Control (QC) Plan. Submit a QC Plan as specified in Section 106.03(a)2 and Section 106.03(b)2 to the Structure Control Engineer a minimum of 30 calendar days before beginning surface preparation or coating operations. Include procedures for inspections, tests, and documentation as specified in Section 1070.3(d)9. Do not begin surface preparation or coating operations until the QC Plan is accepted. Include the following with the QC Plan:

1.a. Cleaning, Painting, Penetrating Sealer and Caulking Installation Plans. Provide procedures for preparing and painting surfaces according to the requirements of this specification, including but not limited to the degree of surface cleanliness and surface profile to be achieved; abrasive type and size to be used; abrasive cleanliness verification; processes and equipment to be used for cleaning and painting limited access areas; mixing and thinning; film thickness, coverage, and continuity of each coat; drying times, cleanliness between coats; and preparation of surfaces with extended times between coats (defined as 80% of the published maximum recoat time or as otherwise defined by the manufacturer) or that have been exposed to out of season weather conditions. Include the equipment that will be used for cleaning and painting. Include the controls that will be exercised when applying coatings, especially zinc, with a roller or brush.

Provide application and installation instructions for penetrating sealer and caulking, including but not limited to the minimum/maximum joint width and depth that can be caulked/sealed; proper size and type of backer rod, if needed; application in lifts, if needed; caulk dry times before painting, and other installation instructions from the manufacturer. Include procedures for the treatment of pack rust including pack rust removal from crevices/gap areas as specified in 1070.3(c)4 and the application of penetrating sealer, stripe coats, and caulking as specified in 1070.3(d)5.

Provide coating repair procedures that comply with this specification and are approved by the coating manufacturer.

Provide a plan for conducting inspections and tests required by this specification and other tests that may be needed to confirm work performed complies with this specification and coating manufacturer requirements. Include a list of instrumentation to be used and confirmation the instruments are calibrated, and accuracy is verified according to the manufacturer's instructions. Include provisions for notifying the Representative when Hold Point inspections are reached and confirmation necessary repairs will be made and inspected. Provide samples of daily inspection reports.

If non-published technical instruction, guidance, letters, or information is submitted, provide a submission from an authorized, technically responsible manufacturer representative with a statement affirming the product warranty will not be affected.

Notify the Representative if a conflict between the manufacturer's technical data sheets, instructions or procedures and the contract specifications is identified. The contract specifications govern unless the manufacturer's technical data sheets, instructions or procedures are more stringent.

1.b Soluble Salt Remediation. Provide procedures for the detection and remediation of soluble salts and for recleaning and preparation of steel after remediation.

1.c Concrete Rust Remover. Provide procedures for removal of rust stains from concrete. Include application and removal of cleaner, alternate methods of removal such as pressure washing/blast cleaning, containment and disposal of the waste and wastewater.

1.d DEP Notification. Submit acknowledgment the regional office of the DEP was notified of the coating operations and is aware of the controls that will be exercised.

2. Technical Representation. Furnish the services of a technical representative from the coatings manufacturer at the Pre-Paint Meeting and as requested throughout operations.

3. Pre-Paint Meeting. Attend a Pre-Paint Meeting to discuss the specifications, QC Plan and surface preparation/coating operations after submittals have been accepted and a minimum of 14 calendar days before beginning operations. The following are required to attend: Prime Contractor Project Manager, Prime Contractor Superintendent, Coatings Contractor Foreman/Supervisor, Coatings Contractor Quality Control Inspector, Technical Representative from coatings manufacturer, Structure Control Engineer, Coatings Inspector and other individuals designated by the Department.

4. Protection of Structure, Persons, and Property. Conduct activities associated with surface preparation and coating work according to applicable Federal (OSHA), Environmental Protection Agency (EPA), State, and local (based on bridge location) safety regulations.

Use scaffolding and rigging conforming to OSHA regulations that provide safe ready access for workers and inspection purposes. The contractor is responsible to identify confined spaces and conform to OSHA regulations if performing work in confined spaces. The contractor is the controlling employer as defined by OSHA.

Protect pedestrian, vehicular, and other traffic on, under, and around bridge superstructures and substructures, as well as surrounding property and buildings against damage or disfigurement from all activities associated with the project work.

Remove paint from surfaces not designated to receive coatings. Remove project debris daily. Clean and remove abrasive blast media found outside of containment immediately. Conduct final removal of all project debris upon completion of the operations. Repair damage resulting from the project work to the satisfaction of the Representative at no additional cost to the Department.

5. Pollution Controls. Prevent environmental pollution including water, air, and soil pollution caused by surface preparation, paint spills or overspray, paint chips, dust, or other harmful materials as specified in Section 1072.

Conform to the regulations of the Pennsylvania DEP, Pennsylvania Fish Commission, Army Corp of Engineers, EPA, and local regulatory agencies.

If abrasive blasting is required, do not begin work until the Department receives and accepts documentation confirming an abrasive blasting permit was obtained. The Department will not extend the contract time for delays caused by a failure to make a timely submission of this acknowledgement.

Conviction of a criminal summary complaint issued by the DEP may be cause for suspension of prequalification.

6. Lighting. Provide artificial lighting both inside and outside containment if natural light is inadequate to allow proper visibility during cleaning, painting and inspection activities according to SSPC Technology Guide 12. Provide a minimum illumination of 50 foot candles (538 lux) for inspection and 20 foot candles (215 lux) for surface preparation and coating application, including working platforms, access, and entryways. Provide a minimum illumination in general work areas of 10 foot candles (108 lux). Design and operate exterior illumination to avoid glare that interferes with traffic, workers, and pedestrians. Provide a light meter for Department use with readings in lux or foot candles to verify the adequacy of illumination.

7. Hold Points. Specific inspection items throughout this Section are designated as a Hold Point. Do not proceed with operations beyond the Hold Point until Representative QA inspections/observations are performed and acceptance is provided. Permission to proceed beyond a Hold Point without QA acceptance will be granted solely at the discretion of the Representative. The Representative has the right to reject work performed without QA inspection/observation and acceptance.

(b) Surfaces to be Coated. Coat previously coated and new steel surfaces. Do not coat aluminum or galvanized metal surfaces, unless indicated. Do not apply intermediate and finish coats to faying surfaces or surfaces that will be in contact with concrete. Coat those surfaces with organic zinc primer only including top flanges and existing shear studs to remain. If new shear studs are indicated for existing stringers, floor beams, or girders, apply primer to the top flange then remove the primer at each shear stud location before installing. Install shear studs then spot prime shear stud welds and surrounding primer damaged by shear stud placement.

All faying surfaces are considered slip critical and primer applied to those surfaces must meet the requirements as specified in Section 1070.2(a) including but not limited to, the dry film thickness and minimum curing requirements listed on the Class B slip coefficient /creep resistance test certification before assembly of the faying connection. If black bolts are used, assemble connection then blast clean and coat bolts with three-coat system. Repair, feather, and recoat all surrounding coatings damaged by over blast as specified in Section 1070.3(d)7. Do not coat utilities or associated utility hangers and brackets unless indicated or directed. Coat limited access areas as specified in Section 1070.3(c)11.

(c) Surface Preparation.

1. Solvent Cleaning. Remove oil, grease, dust, dirt, drawing and cutting compounds, or similar contaminants on steel according to SSPC-SP1 Solvent Cleaning before surface preparation. If contamination remains after surface preparation, re-clean according to SSPC-SP 1 before painting. If grease, oil, dust, dirt, drawing and cutting compounds, or similar contaminants become deposited on any coat that will receive another coat, remove according to SSPC-SP1 before the application of the subsequent coat. If the primer or intermediate coat is exposed to vehicular exhaust, remove all hydrocarbon residue before application of the subsequent coat. If the removal of the contaminants utilizes water, manage and dispose of the water as specified in Section 1072. If water is used in the cleaning procedure, ensure surfaces, pockets, and corners are dry and clean before applying paint. Remove all flash rust resulting from the water cleaning process.

2. Other Surface Cleaning. Supplement solvent cleaning by hand or power tool cleaning as needed to remove

contaminants such as soil, concrete spatter, and other foreign matter. If biodegradable cleaning solutions are submitted and accepted for use, follow with a fresh water rinse. Comply with the requirement for removal of soluble salts as specified in Section 1070.3(c)8.

3. Weld Spatter, Sharp Edges, Flame-Cut Steel, and Holes. Remove slag, flux deposits, and weld spatter from newly installed steel. Grind resulting burrs smooth, including burrs around holes. Grind sharp edges, such as those created by cutting or shearing to an approximate 1/8 inch radius. Grind flame-cut steel to remove the hardened surface layer before blast cleaning. After surface preparation, inspect existing steel for thin, sharp edges (knife-edging). If present, grind edges to approximate 1/8 inch radius.

4. Pack Rust and Rust Scale Removal (Hold Point). Remove heavy corrosion (rust scale) and loose pack rust by hand and power tool cleaning or by abrasive blast cleaning before production abrasive blast cleaning. Ensure pack rust is removed to a minimum of 1/4 inch below the edge(s) of the steel members and the remaining pack rust is tight if probed with a dull putty knife. Exercise extreme care to avoid nicking or gouging the steel during removal. If nicks or gouges occur, the Representative may suspend activities until appropriate adjustments are made to prevent a recurrence. Notify the Representative of steel perforation, deformed steel at joints, broken rivets, or other similar defects revealed during abrasive blast cleaning of heavily rusted areas. The Representative will advise how the areas are to be addressed.

5. Test Areas (Hold Point). Select test section(s) on each structure of at least 9 square feet, in locations considered by the Representative to be representative of existing surface conditions and structural characteristics. Additionally, provide two 12 inch by 12 inch by 1/4-inch-thick carbon steel test plates to the Representative before production blast cleaning. Blast clean test sections and test plates using the same equipment, materials, and procedures that will be used for the production blast cleaning. Once accepted by the Representative, photograph the test sections for use as a jobsite standard, but in the event of a conflict between the jobsite standard and the written SSPC definition of the degree of cleaning required, the written definition prevails. Seal the test plates in plastic or air-tight containers with desiccant to prevent rusting and use to verify the accuracy of the dry film thickness gauges. If the test plates exhibit signs of rusting, reblast.

Additionally, the Representative will select a pack rusted test section. Clean, apply penetrating sealer, intermediate stripe coat, intermediate coat, caulk, and finish coat to pack rust test sections using the same equipment, materials, and procedures that will be used for production work.

If galvanized or black nut/bolt assemblies are to be coated, the Representative will select a representative connection as a test area. Clean and paint the connection as specified using the same equipment, materials, and procedures that will be used for production work.

Do not proceed with the production blast cleaning operations until the Representative accepts the surface preparation of each test section.

6. Blast Cleanliness (Hold Point). Blast clean steel according to SSPC-SP10 Near White Blast Cleaning.

Utilize clean, oil-free dry compressed air for abrasive blast cleaning. Conduct blotter test(s) according to ASTM D4285 a minimum of one time each shift for each compressor system in use to verify the air supply is free of moisture and oil contamination. Conduct the tests in the presence of the Representative. If contamination is evident, make changes as necessary to achieve clean, dry, air and re-inspect all surfaces prepared since the last acceptable test.

7. Abrasives and Surface Profile (Hold Point). Use recyclable abrasives that are clean, dry and properly sized to produce an angular, dense and uniform surface profile as specified in the product data sheets(s) for the coating being applied. Measure the surface profile depth according to SSPC-PA 17 using ASTM D4417 Method B, depth micrometer or Method C, replica tape. If the profile is outside of the specified range, obtain different abrasives and completely re-blast the steel to achieve the specified profile.

Use recyclable abrasives that are clean and dry to create the least amount of waste possible. Submit a technical data sheet from the recyclable abrasive manufacturer indicating the number of recycles possible with the material. Do not recycle abrasives beyond the manufacturer's recommended limits. Acceptable recyclable abrasives are aluminum oxide, silicon carbide, zirconium aluminum oxide, and steel grit. Requests to use expendable one time use abrasives such as garnet or coal slag meeting the requirement of SSPC-AB 1 may be considered on a case-by-case basis. Submit request to use expendable, one-time use abrasives to the Structure Control Engineer. Do not use requested abrasive until accepted. Do not use silica sand.

Use a reclamation system that removes fines, returns properly sized abrasive for reuse, and is equipped with dust collectors to ensure the discharge meets air quality requirements. Test the cleanliness of the recycled abrasive according to SSPC-AB 2. If the abrasive fails the tests, promptly replace the abrasive and make changes to the equipment as necessary to achieve compliance. Reclean contaminated areas.

Grind laminations and slivers in the steel that become visible after blast cleaning operations flush with the surface and re-blast the ground area to obtain the specified anchor pattern and cleanliness.

8. Soluble Salt Remediation. In the presence of the Representative, remediate soluble salts to the following levels:

Chloride	< 7µg/cm ²
Ferrous Ion	< 10µg/cm ²
Sulfate	< 17µg/cm ²

Conduct soluble salt tests across the structure according to NACE SP0716 with special attention to corroded and pitted areas. Use the cell method of SSPC Guide 15 to collect the samples. Conduct this testing after abrasive blasting.

Provide the proposed method of soluble salt remediation in the QC Plan as specified in Section 1070.3(a)1. Include the process that will be used for recleaning the steel after testing.

If the soluble salts are removed using wet methods, remove the resulting flash rust before applying the coating.

9. Cleaning of Galvanized Nut/Bolt Assemblies (Hold Point). Use SSPC-SP 1, Solvent Cleaning, in conjunction with SSPC-SP 2, Hand Tool Cleaning to remove all grease, oil, dirt, dust, nut/bolt lubricant and other contaminants from nut/bolt assemblies (nuts, bolts and washers) before coating. Remove all lubricant, but slight discoloration from dye is allowed to remain, if after cleaning, it is not removed from rubbing vigorously with a white cotton cloth. The acceptance criteria for these areas will be established when conducting the test areas as specified in Section 1070.3(c)5.

10. Cleanliness Before Painting (Hold Point). Before painting, remove abrasive residue, dust, dirt, oil, grease, salts, or other foreign material from the surface. Pay specific attention to pockets and corners. Unless directed, conduct cleaning using standard methods, for example, bristle, fiber, or hair brushes; vacuuming; blowing with clean, dry, compressed air; or a combination thereof. If the paint contains lead or other toxic metals, use vacuums equipped with HEPA filtration. Blowing down with compressed air or brushing is allowed only if performed within a ventilated containment with the ventilation system in operation as specified in Section 1072.

Apply primer within 10 hours after the steel is cleaned. If the steel remains unpainted for longer than 10 hours, or if cleaned steel exhibits evidence of rust back, analyze for soluble salt contamination as specified in Section 1070.3(c)8. If soluble salts are present, remediate as specified in Section 1070.3(c)8. If soluble salts are not present, blast clean again before priming. Apply primer only after the Representative has accepted the prepared surface.

11. Cleaning Limited Access Areas (Hold Point). Perform cleaning to SSPC-SP10 in limited access areas such as inside box girder members or other irregularly shaped, complex configurations. Use short or angled blast nozzles, or other commercially available equipment as necessary, to properly clean the limited access areas. Limits are as indicated.

12. Cleaning Concrete. After completing the superstructure work, clean concrete of rust stains or coatings that resulted from the operations according to the accepted remediation method as specified in Section 1070.3(a)1.c. This can be by abrasive blasting to obtain a condition according to ASTM D4259, use of an acceptable concrete rust remover according to manufacturer's recommendations, or alternate accepted method. If concrete rust remover is used, flush with water after application and contain as specified in Section 1070.3(a)1.c.

13. Caulking Steel and Concrete Interface. If steel is cast into concrete, caulk all sides of steel where it penetrates the concrete surface. Use approved caulking material only.

(d) Coating.

1. Storage of Paints. Store paints under cover, out of direct sunlight and between 40F and 100F. Utilize a continuous temperature recording device to monitor storage temperatures. Should temperatures exceed the specified range, replace coatings at no additional cost to the Department. If the storage requirements of the manufacturer are more restrictive, comply with the more restrictive requirements.

2. Mixing and Thinning (Hold Point). Only use paint within the manufacturer's stated shelf life. Mix and thin paints according to the manufacturer's instructions until solids and metallic powder are thoroughly dispersed and a smooth, lump-free consistency is achieved. Do not over-mix or over-agitate during mixing such that air is entrained into the coating.

The mixing of partial kits is not permitted.

Use thinners and thinning amounts as recommended by the manufacturer. Do not thin such that the VOC of the coating exceeds Federal, State, or local VOC rules/regulations.

Strain mixed coating through a 30 to 60 mesh screen (or as indicated on product data sheet) upon completion of mixing. Comply with pot life and "sweat-in" times according to the coating manufacturer's recommendations before use.

3. Weather Conditions for Application of Coatings (Hold Point). Apply coatings to clean and dry surfaces during periods of favorable weather and if the specified conditions are met. If the requirements of the coating manufacturer are more stringent, comply with those requirements. Keep the coating work contained, protected from the elements, and within the specified temperature range until the coating is fully cured according to the manufacturer's requirements. The use of heating or dehumidification equipment is not allowed. If the potential exists for coatings not to reach full cure as specified in Section 1070.3(d)3.b, submit a plan to the Structure Control Engineer to monitor and maintain ambient conditions.

3.a Seasonal Restrictions. Do not apply coatings in the field between October 31 and April 1 unless allowed in writing by the Structure Control Engineer. For multi-season projects, only primer can remain uncoated until the following season.

3.b Temperature. Do not apply coatings if the temperature of the air, material, or surface inside or outside of the containment is below 40F or greater than 110F or is forecasted to drop below 40F or exceed 110F before the coating dries to full cure according to the times specified in the manufacturers' technical data sheet. If the requirements of the coating manufacturer are more stringent, comply with those requirements.

3.c Dew Point. Do not apply coatings if the temperature of the surface is less than 5F greater than the dew point based on the ambient air outside and inside of containment (both readings are required). If the requirements of the coating manufacturer, are more stringent, comply with those requirements.

3.d Relative Humidity. Do not apply coatings if the relative humidity is below or above the thresholds established in the manufacturer's product data sheets based on the ambient air outside and inside of containment (both readings required).

3.e Dampness. Do not apply coatings if the air is misty, the surfaces are damp or frosted, or if weather conditions outside and inside of containment are unsatisfactory.

In damp or cold weather, keep the coating work contained and protected until the coating is fully cured according to the manufacturer's instructions, before exposing to the elements.

4. Methods of Application. Apply all coats using equipment and methods, as recommended by the manufacturer, that produce a coating film complying with the specified requirements. Do not use a method of application disallowed by the manufacturer.

4.a Spray. Airless spray application is the primary method of application unless directed. If conventional air spray is used, provide suitable traps and separators to remove contamination from the compressed air supply. Conduct blotter test(s) according to ASTM D4285 a minimum of one time each shift for each compressor system in use to verify the air supply is clean and dry. Conduct tests in the presence of the Representative. For spray application of zinc primer, provide continuous mechanical agitation of the coating. Set the agitator to maintain a homogeneous mixture and prevent settling of solids and metallic zinc particles while not over-agitating the coating such that air entrainment occurs.

Do not allow solvents to enter spray lines for cleaning or any other purpose while coating application is in progress. Only use solvents to clean and flush spray lines after coating application is complete.

4.b Roller. Primarily used for stripe coating. May be used for small repair areas if allowed according to the coating manufacturer's product data sheet. Use rollers that do not leave a stippled texture in the paint film. Use rollers only on flat, even surfaces to produce a paint film of even thickness with no skips, runs, sags, or thin areas. Do not use rollers if prohibited by the manufacturer. If rolling with a zinc primer, stir the paint frequently during use to keep the zinc in suspension.

4.c Brush. Primarily used for stripe coating. May be used for small repair areas if allowed according to the coating manufacturer's product data sheet. Manipulate the paint under the brush to produce a uniform, even coat. Work the paint into corners and crevices. Move the brush in a series of small circles to thoroughly fill irregularities in the surface. Then, brush out and smooth by a series of parallel strokes until the paint film has an even thickness. Do not use brushes if prohibited by the manufacturer. When brushing with a zinc primer, stir the paint frequently during use to keep the zinc in suspension.

4.d Limited Access Areas. Use long frame roller handles, angled brushes, extended spray wands, or other means to thoroughly coat surfaces inaccessible to normal painting methods. Do not use methods of application, such as daubers, if prohibited by the manufacturer.

5. Application and Recoating Requirements.

5.a Removal of Contaminants. If concrete, salts, grease, oil, carbon based emissions, dirt, dust, or other

surface contaminations are present on prime, intermediate, or finish coats, clean the surface as specified in Section 1070.3(c)10 and the manufacturer's recommendations. Clean bare steel, prime, and intermediate coats before application of subsequent coats. Clean finish coat of rust stains, embedded debris, and other contamination to the satisfaction of the Representative.

5.b Cleaning After Seasonal Shutdowns or Extended Periods (Hold Point). If intermediate and finish coats are not applied before seasonal shutdowns or there is an extended period of time between coats (defined as 80% of the published maximum recoat time or as defined by the coating manufacturer), thoroughly pressure wash the surface before application of the next coat to remove grease, oil, grime, carbon based emissions, salts, dirt, dust, chalk and other surface contamination. If required by the coating manufacturer, roughen the surface before the application of the next coat.

Use clean, potable water at a minimum pressure of 2,000 pounds per square inch and maximum pressure of 5,000 pounds per square inch to remove dirt, dust, chalk, insect and animal nests, bird droppings and other foreign matter. Perform solvent cleaning according to SSPC-SP 1 if grease, oil, carbon-based emissions or other contaminants are on the surface.

If approved detergents are used in the cleaning water, rinse the surface clean with potable water and allow thorough drying before coating. Control the water used for cleaning on the project as specified in Section 1072.

5.c Stripe Coats – All Areas Except Crevice/Gaps Receiving Pack Rust Treatment (Hold Point). Stripe coats are required to be a contrasting color. Follow manufacturer's requirements for tinting. Before or after application of the production prime coat, brush apply a stripe coat of primer to all nuts, bolts, welds, rivets, corners, crevices, and other irregularities. Thoroughly brush/work in stripe coat ensure complete coverage. Apply stripe coat of primer to remaining edges by brushing or rolling before or after application of production prime coat. Extend stripe coat 1 inch beyond the areas to be striped. Complete the stripe coat of primer within 48 hours of production prime coat application, if applying after production prime coat.

Before the application of the intermediate coat, apply a stripe coat of the intermediate coating to the same surfaces and in the same manner as the primer stripe coat. Do not apply the stripe or full coats until the previous stripe or full coat has dried to recoat according to the manufacturer's instructions.

A stripe coat is not required for the finish coat.

5.d Treatment of Pack Rust Areas (Hold Point). After pack rust removal and production blast cleaning, perform the following in crevices/gaps scheduled for pack rust treatment. In all cases, allow the caulking, penetrating sealer, and paint coats to dry according to manufacturer's recommendations before proceeding to the next step. Apply production primer application to surrounding steel while trying to avoid the crevice/gap to receive pack rust treatment. Overspray into the crevice/gap with primer is allowed. Do not apply the stripe coat of primer to the crevice/gap. Flood apply the penetrating sealer into the crevice/gap, so the material flows and wicks in. Remove excess penetrating sealer after flooding.

Brush apply a stripe coat of intermediate to the entire crevice/gap area before or after applying the full intermediate coat. After stripe and production intermediate coat application, caulk the crevice/gap to fully bridge and seal the area from moisture intrusion. If applied to multi-sided surfaces, apply caulk to the top and sides of crevice/gaps only. Allow a downward facing or bottom crevice/gap to remain uncaulked so moisture that may enter the crevice/gap can escape.

Apply finish coat.

6. Coating Thickness and Continuity (Hold Point). Apply each coat of the system according to the manufacturer's data sheet including the thickness ranges for each coat and dry times before the application of the next coat or stripe coat. Achieve a surface free of shadow-through, runs, sags, overspray, dry spray, pinholes, skips, misses, and other film discontinuities. Obtain a dense and uniform appearance for each coat.

Determine the dry film thickness of each coat according to SSPC-PA2 Coating Thickness Restriction Level 3, except measure each 100-square foot increment of the surface. Determine the thickness of each coat by subtracting the thickness of the underlying coats from the cumulative thickness measurements. If the thickness of an individual coat is in question, perform destructive dry film thickness measurements according to ASTM D4138 Procedure A, using a grooved cutting instruments such as a Tooke Gauge, or equal. Repair damage created by the cutting instrument at no additional cost to the Department.

If the thickness of any coat is less than specified, unless otherwise allowed, apply additional coating to achieve the specified thickness before applying the next coat.

If the thickness of any coat exceeds the specified maximum, or the surface exhibits runs, sags, dry spray, overspray, pinholes, or other discontinuities, remove the excessive thickness or discontinuity by sanding or abrasive blast cleaning. If the thickness is reduced to below the specified minimum, recoat the area. If the excessive thickness or discontinuity being removed is in the finish coat, apply a thin coat of finish material to achieve a smooth uniform appearance.

6.a Prime Coat. Apply the primer coating to a total dry film thickness (above the surface profile) in a single application, employing multiple spray passes, according to the manufacturer's technical data sheet.

6.b Intermediate Coat. Apply intermediate coating to a dry film thickness (above the primer) according to manufacturer's specified dry film thickness. Use an intermediate coat color that contrasts with the colors of the prime and finish coats.

6.c Finish Coat. Apply the finish coating to a dry film thickness (above the intermediate) according to manufacturer's recommendations.

Ensure touch up and repairs to outside face of fascia beams are uniform in nature blending into existing topcoat and void of flashing or checkerboard appearance. If spot touch up on the fascia is visible, apply a full finish coat as directed to create a uniform and continuous appearance.

7. Removal/Repair of Defective Coating (Hold Point). A coat of paint is defective if: it is damaged; it lifts, blisters, peels, or wrinkles; it has runs or sags; the film exhibits any defect as specified in Section 1070.3(d)6, it shows evidence of application under unfavorable conditions; it does not meet the coating thickness and continuity requirements; rusting occurs; the workmanship is poor; impure or unauthorized paint has been used or if the coating has been damaged through the course of the project.

Remove/repair defective paint and recoat damaged or defective areas according to the manufacturer's technical data sheet, approved repair procedure, and as directed. If the defective paint or damage extends to bare steel or bare steel is exposed, clean the surface according to SSPC-SP10 or SSPC-SP11 as approved.

If the damage or defective paint does not expose the underlying steel, repair according to the manufacturer's technical data sheet and approved repair procedure.

For all repairs, roughen the existing coating around the repair area to ensure good adhesion. Feather the surrounding coating to expose a minimum of 1/2 inch of each coat or according to the manufacturer's approved repair procedure and provide a smooth transition into intact, adherent material for all coats.

8. Stenciling of Final Product. After the final coat of paint has dried to recoat, stencil the following information on the outside face of the fascia members at the near and far abutment ends (two in total) unless directed otherwise:

- Line 1: Month and year of completion and ECMS number
- Line 2: BR Key
- Line 3: BMS Number
- Line 4: Full or zone paint, type of coating system, and cleaning method
- Line 5: NEPCOAT number listed in Bulletin 15, and the manufacturers name

Examples:

Full Paint:
08-2018, ECMS 88335
BR KEY: 712
02-0051-0110-0000
FULL-OZEU, SSPC-SP10
SSC(04)-03, Sherwin Williams

Zone Paint:
09-2007, ECMS 70202
BR KEY: 1436
02-1019-0060-0149
ZONE-OZEU, SSPC-SP10
SSC(12)-04, Carboline

Stencil using indelible black paint compatible with the coating system and approved by the coating manufacturer. Provide uniform block lettering 2 inches to 3 inches high.

9. Contractor QC Inspection and QC Plan. Perform QC inspections and tests as described in the accepted QC Plan as specified in Section 1070.3(a)1. Document inspections and submit electronic daily QC reports to the Representative within 48 hours of inspection.

Provide a QC inspector that has a minimum NACE Level 1 certification, is solely dedicated to QC inspection, and does not engage in any production related activities.

Do not replace the QC inspector(s) assigned to the project without advanced notice to the Representative and acceptance of the replacement by the Representative.

During work, perform QC inspections necessary to ensure work is performed according to specifications and the manufacturer's instructions.

At a minimum, perform the following QC inspections:

- Ambient conditions;
- Compressed air cleanliness;
- Suitability of protective coverings and containment;

- Abrasive cleanliness (SSPC-AB 2);
- Surface cleanliness and profile;
- Soluble salt testing and removal;
- Coating storage, mixing, and application;
- Dry film thickness and continuity of each coat;
- Dry time, curing, and cleanliness of each coat;
- Touch up and repair of damaged or defective coats;
- Daily inspection of project site for cleanliness as defined in this specification including but not limited to blast media, hazardous/non-hazardous waste, and general refuse;
- Rust stain removal;
- Attend hold point inspections defined in Section 1070.3(a)7 and designated throughout this specification;
- Final condition and appearance;

10. Access for Representative Inspection. Facilitate Representative QA inspections/observations as required including providing safe access in close proximity to the work surface(s) where the inspections/observations need to be performed. Allow ample time for inspection activities.

1070.4 MEASUREMENT AND PAYMENT—Lump Sum.

(a) Painting Existing Structural Steel. Lump Sum. The price includes surface preparation and coating removal, pack rust/rust scale removal, soluble salt remediation, grinding of sharp edges, slivers, weld spatter, removal of concrete slurry, cleaning and application of the three-coat paint system. The price also includes removal of coatings from surfaces not designated to be painted; repair of damage resulting from the coating operation; removal of coating that does not meet specifications and recoating of those surfaces; and controls necessary to comply with the requirements of all applicable regulatory agencies.

(b) Penetrating Sealer and Caulking Application. Dollar. For projects including a separate item for penetrating sealer and caulking, the proposal will include a predetermined amount of money for furnishing and application of penetrating sealer and caulking. The contract item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount. This item includes access to the repair locations to perform and inspect the work. For projects that do not include a separate item for penetrating sealer and caulking, the material and work are incidental to the Painting Existing Structural Steel, Lump Sum Item.

Due to the contingent or unpredictable nature of the work being performed, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for, under the Penetrating Sealer and Caulking Applications item as follows:

- 1. Contract Items.** The Department will pay for the performance of work, identified as having similar items listed in the contract, at the contract unit price.
- 2. Non-Contract Items.** The Department will pay for items of work not identified in the contract as follows:
 - **Negotiated Price.** At price agreed upon with the Department Representative before performing the work. If applicable, agreement is also required with FHWA.
 - **Force Account Basis.** Section 110.03(d).

SECTION 1071—SPOT PAINTING EXISTING STRUCTURAL STEEL

1071.1 DESCRIPTION—This work is spot painting existing structural steel as indicated and directed.

1071.2 MATERIAL— Section 1070.2 except as follows:

Section 1070.2(a) Coating System, replace with the following:

(a) Coating System. Provide a three-coat, aluminum-filled mastic paint system from a manufacturer listed in Bulletin 15. For faying surfaces, provide an organic, zinc-rich primer listed in Bulletin 15 and the Northeast Protective Coatings Committee (NEPCOAT) Qualified Products List B. Verify the organic, zinc-rich primer has a Class B certification, certified within the last 7 years, from an AASHTO approved laboratory according to the Research Council on Structural Steel Connections (RCSC) Specification for Structural Joints Using High Strength Bolts Appendix A.

Section 1070.2(b)1. Finish Coat Color Chips, replace with the following:

1. Finish Coat Color Chips. Provide three new color chips matching the existing structure color in its current condition to a color number from the AMS-STD-595A color chart. Provide samples that are a minimum of 6 inch by 6 inch in size. If the color number indicates a finish other than semi-gloss, provide a semi-gloss finish coat. Do not obtain finish coat material until acceptance of the color and gloss level.

1071.3 CONSTRUCTION— Section 1070.3 except as follows:

Section 1070.3(c)5. Test Areas (Hold Point), replace with the following:

5. Test Areas. Test Areas are not required for Spot Painting.

Section 1070.3(c)6. Blast Cleanliness (Hold Point), replace with the following:

6. Blast Cleanliness (Hold Point). Blast clean steel according to SSPC-SP10 Near-White Metal Blast Cleaning. Alternately, steel may be cleaned according to SSPC-SP11 Power Tool Cleaning to Bare Metal if surface profile requirements outlined in the product data sheet are followed. Utilize clean, oil-free, dry compressed air for abrasive blast cleaning. Conduct blotter test(s) according to ASTM D4285 a minimum of one time each shift for each compressor system in use to verify the air supply is free of moisture and oil contamination. Conduct the tests in the presence of the Representative. If contamination is evident, re-inspect all surfaces prepared since the last acceptable test. Roughen the existing coating around the area to be coated to ensure good adhesion. Feather the surrounding coating to expose a minimum of 1/2 inch of each existing coat and provide a smooth transition into intact, adherent material for all coats.

Section 1070.3(c)7. Abrasives and Surface Profile (Hold Point), replace with the following:

7. Abrasives and Surface Profile (Hold Point). Expendable, one-time use abrasives such as garnet or coal slag meeting the requirements according to SSPC-AB 1 may be used that produce a surface profile according to the product data sheet(s) for the coating being applied. Submit expendable, one-time use abrasives to the Structure Control Engineer for acceptance. Do not use silica sand.

Recyclable abrasives may be used that are clean, dry, and properly sized to produce a surface profile according to the product data sheet(s) for the coating being applied. Use recyclable abrasives that create the least amount of waste possible. Submit a technical data sheet from the recyclable abrasive manufacturer indicating the number of recycles possible with the material. Do not recycle abrasives beyond the manufacturer's recommended limits. Acceptable recyclable abrasives are aluminum oxide, silicon carbide, zirconium aluminum oxide, and steel grit.

Use a reclamation system that removes fines, returns properly sized abrasive for reuse, and is equipped with dust collectors to ensure the discharge meets air quality requirements. Test the cleanliness of the recycled abrasive

according to SSPC-AB 2. If the abrasive fails the tests, promptly replace the abrasive and make changes to the equipment as necessary to achieve compliance. Reclean contaminated areas.

Measure the surface profile depth according to SSPC-PA 17 using ASTM D4417 Method B, depth micrometer or Method C, replica tape. If the profile is outside of the specified range, obtain different abrasives and completely re-blast the steel to achieve the specified profile.

Grind laminations and slivers in the steel that become visible after blast cleaning operations flush with the surface and re-blast the ground area to obtain the specified anchor pattern and cleanliness.

1071.4 MEASUREMENT AND PAYMENT—Lump Sum

Penetrating Sealer and caulking are incidental.

SECTION 1072—COATINGS WASTE MANAGEMENT, CONTAINMENT, ENVIRONMENTAL PROTECTION, AND SAFETY

1072.1 DESCRIPTION— This work is waste management, containment, environmental protection, and protection of workers during removal of existing coatings and application of new coatings. This work includes the following:

- Properly collecting, handling, storing, classifying, transporting, and disposing of hazardous and non-hazardous waste according to applicable Federal, State, and Local regulations.
- Furnishing and installing containment systems to control emissions of dust, lead, and other toxic metals that may be present in the coatings being removed or abrasive blast media being used to remove coatings.
- Having a program in place for the safety and protection of workers from over exposure to lead and other toxic metals that may be present in the coatings being removed or abrasive blast media being used to remove coatings.
- Conducting environmental monitoring during removal of existing coatings, and ensuring the site is properly cleaned after coatings operations are complete.

1072.2 MATERIALS—

(a) Waste Containers. Maintain containers in good operating condition with lids and closing mechanisms intact and operational to prevent the escape of debris by wind, spilling of the contents, or access by unauthorized personnel.

1. Hazardous and Residual Waste. Provide DOT-approved containers of the appropriate size and type for the hazardous and residual waste generated on the project. Use containers that are resistant to rust and corrosion (coated, if constructed of steel), that have tight fitting lids or covers, and are water resistant and leak proof.

2. Municipal/Construction Waste. Provide containers for non-hazardous municipal/construction waste. Use containers that are free of loose debris when brought on-site.

3. Spent Solvents. Provide containers for spent solvents. Do not mix spent solvents with spent abrasives, coating debris, water, or other waste.

4. Wastewater. Provide containers capable of holding the water recovered from pressure washing activities, hygiene facilities, and laundry facilities if cleaning of protective clothing is performed on site.

(b) Containment.

1. Containment Materials. Supply materials needed to contain project debris according to SSPC Guide 6 and applicable Federal, State, and Local regulations. Only use containment materials that are flame retardant.

2. Cleanliness. Use materials and equipment that are free of loose dust and debris when brought onto each bridge site, and upon removal.

3. Instrumentation. Provide the Representative with a portable light meter with a scale of 0.0 - 538 LUX (0.0 - 50.0 foot-candles).

(c) Worker Health and Safety.

1. Instrumentation. Supply the instrumentation needed for the monitoring of worker and area exposures including equipment needed for its operation.

2. Boat/Skiff. When working over water, provide a life-saving skiff and operator when required.

3. Personal Protective Equipment (PPE). Provide personal protective clothing and equipment needed for contractor workers, and for two Representatives each shift, including proper cleaning, training in use, and disposal. Repair or replace PPE as required to ensure that it continues to provide its intended purpose.

4. Hygiene Facilities. Use hygiene facilities that are free of loose dust and debris when brought onto each bridge site, and upon removal. Properly handle and dispose of hygiene water, cleaning materials, and PPE that cannot be cleaned for reuse.

(d) Environmental Monitoring.

1. Instrumentation. When there are coatings and abrasives containing lead or other toxic metals, and sensitive receptors are located within 500 feet of the work areas, supply the instrumentation needed for monitoring ambient air. Install multiple monitors, when necessary, to ensure the protection of public health according to SSPC Technology Update No. 7 (SSPC TU-7), as determined by the Sensitive Receptor Survey provided in the Environmental Compliance Plan, and according to Local permit requirements. Provide additional monitors to ensure coverage of all areas where multiple, separate dust-generating activities are simultaneously being performed.

2. Cleanliness. Use equipment free of loose dust and debris when brought onto each bridge site, and upon removal.

3. Permit Requirements. For abrasive blasting operations that require a local permit, provide Total Suspended Particulate (TSP) ambient air monitors as required in the permit. Provide all materials and equipment required by the permit.

1072.3 CONSTRUCTION—

(a) General.

1. Generator Designation. If waste streams generated on the project are classified as hazardous, the Department will be the generator for permitting purposes, and will provide the EPA provisional identification number. However, the Contractor is responsible for the collection, handling, storage, testing, transportation and disposal of all wastes.

2. Waste. Recover waste products generated during cleaning and painting work, including but not limited to rags, tape, disposable coveralls, filters, coating debris, and paint cans. Contain the waste within the legal right-of-way.

3. Waste Storage Area. Determine and obtain acceptance of the location of the secured waste storage area for hazardous waste. Once a container of hazardous waste in the work area is full, transport the waste to the secured storage area within three days, or at an approved frequency.

4. Regulations. Conduct work according to Federal, State, and Local regulations governing the collection, handling, transportation and disposal of hazardous, non-hazardous, and residual waste and wastewater. When collecting and storing waste, prevent the dispersion of debris or dust during filling or moving containers and comply with the worker protection requirements as specified in Section 1072.3(h).

(b) Submittals. Submit the following plans, programs, and documentation for review and acceptance a minimum of 30 calendar days before the start of coating removal operations.

1. Waste Handling Plan.

1.a Disposal of Waste. A written program that addresses the proper handling and disposal of waste. Include the procedures that will be followed for the collection of representative samples of the waste; the procedures for the site handling, storage, and packaging of the waste; and contingency plans in the event of a spill.

1.b Executive Summary. Include an executive summary and contingency plan. The summary should be readily available at the project site. At a minimum, the Summary is to include the types of hazardous and non-hazardous waste expected to be generated at the site and the associated hazards, an estimate of the quantity of hazardous and non-hazardous waste generated, a description of the waste accumulation location, a map or description of the access/evacuation routes in case of a spill of hazardous waste or emergency, and the name and contact information of the emergency coordinator according to 40 CFR 262.

1.c Transporter Information. The names, addresses, license or permit numbers, insurances, and qualifications of the proposed haulers of hazardous waste, non-hazardous waste, and wastewater.

1.d Disposal Facility. Advise legally permitted recycling or waste disposal facilities that bridge coating debris will be generated and identify the toxic metals that the waste will likely contain. Based on that information, request a letter from the hazardous waste recycling or disposal facilities stating that the facility can accept this type of waste, is authorized to accept the waste under the laws of the state of residence, has the required capability to treat and dispose of the materials, and will provide or assure the ultimate disposal method indicated on the Uniform Hazardous Waste Manifest.

1.e Municipal Landfill. Submit the name and address of the permitted municipal waste landfill that will accept the non-hazardous and residual waste generated by the Contractor.

1.f Wastewater. Provide a letter from the proposed facility that will be accepting the wastewater for disposal, indicating that the facility has the capability to handle and properly dispose of the water. Advise the facility of any toxic metals that may be present in the water.

1.g Laboratory Qualifications. Provide the name, address, experience, and qualifications of the laboratory and firm that will be used for the waste sampling and analysis required under this Section.

2. Containment Plan.

2.a Design and Loading Calculations. Include calculations, data, and assumptions used for the design of the containment and ventilation system and the imposed loads on the existing structure. Do not allow the containment system to induce a load on the existing structure that will create an overstress condition or otherwise effect the structural integrity of the structure. For SSPC Guide 6 abrasive blasting containments, include calculations of the design air flows within the containment, descriptive information and fan curve for the dust collector(s), and the locations and sizes of duct work and air inlets. Include calculations for system static pressure losses through the dust collector, duct work, and containment. Provide analysis for the anticipated dead and live loads including but not limited to material to be stored on the containment, waste, equipment, workers, and the effects of wind forces on the containment system and existing structure. Provide the maximum allowable load for the floor/platform. Design cables not to exceed 5% sag over the length of the span once in their final secured position. Include sag calculations. Determine attachment points. Make attachment points to substantial framing members only. Drilling or welding to structural steel is prohibited. Do not make permanent attachments or fastenings to the structure. Analyze both global and localized loading at all attachment points. Do not allow the system to encroach upon the required clearances.

2.b Engineering Drawings. Provide detailed containment drawings stamped by a Professional Engineer registered in the State. Include the maximum allowable load for the floor/platform and required clearances in the drawings. Provide details and procedures for staging, installation, moving, and removing the containment. Provide attachment locations, details, and installation procedures.

2.c Inclement Weather. Provide provisions for dropping the containment in inclement weather, for movement out of navigation lanes, and the controls exercised to prevent excessive sagging during cable installation to ensure the protection of traffic. Include calculations for an allowable wind speed which will be used in the field to determine the threshold for dropping the containment. Include the procedures to be followed for ensuring that waste is not released when the containment is dismantled as a result of inclement weather.

2.d Technical Data. Include technical data sheets, catalog cut sheets, specification sheets, any other information needed to thoroughly describe the containment plan and materials proposed for use. Provide the

manufacturer's specifications for the proposed enclosure material(s) including information on light transmittance, flame spread, burst strength, abrasion durability, and unit weight.

2.e Lighting. Plans for providing lighting according to SSPC Guide 12 and for maintaining navigational lighting during the work.

2.f Access. Provide a description of how the containment and platform is to be accessed. Identify the fall protection, edge protection, and prevention systems to be utilized inside the containment.

3. Lead (Toxic Metal) Health and Safety Compliance Program. When the paint and abrasives contain lead or other toxic metals, submit a written project-specific compliance program prepared under the direction of, and signed by a Certified Industrial Hygienist (CIH) according to 29 CFR 1926.62. Verify that Subcontractors are included in the program or in a separate program. If Subcontractors are operating under a separate program, include the program with the submittals. Revise and update the program(s) a minimum of every six months during the portion(s) of the project which involve the disturbance of toxic metals. Verify that the CIH signs off on six-month reviews and revisions. Upload revisions and CIH sign-off to project files for review and approval. Include in the Compliance Plan, a detailed checklist for site inspections by the competent person.

3.a Personnel Qualifications. Provide the name, experience, and qualifications of both the CIH overseeing the development of the compliance program, and the competent person assigned to the project conducting routine inspections. The competent person is required to have successfully completed the SSPC-C3 training course. On projects where the contractor is required to maintain a SSPC QP-2 certification (field removal of hazardous coatings), the competent person is required to have received the 8-hour SSPC C5 refresher training within the past 12 months.

3.b Outside Laundry. Provide the name, address, and qualifications of the launderer, if one will be used, for the cleaning of reusable clothing. Provide a letter from the launderer indicating that it is permitted to handle clothing contaminated with lead and other toxic metals of concern.

3.c Laboratory Qualifications. Provide the name of the laboratory and firm that will be used for the worker and area exposure monitoring. Verify that the analytical laboratory is American Industrial Hygiene Association (AIHA) accredited for metals analysis and has successfully participated (previous 12 months at a minimum) in the AIHA Environmental Lead Proficiency Analytical Testing (ELPAT) program.

3.d Personal Protective Equipment for Department Use. Acknowledge that protective clothing and equipment, laundering or disposal, fit testing as needed, and hygiene facilities will be provided for two Representatives at each site for each shift.

3.e Training for Representatives. Acknowledge that site training according to 29 CFR 1926.62 will be provided for two Representatives at each site per shift if there is the potential for lead exposures on the project. Include training as appropriate for other toxic metals that are present in the coating or abrasive being used.

4. Environmental Compliance Plan. Submit a plan that establishes programs for the monitoring activities and includes provisions for complying with the results of monitoring and analysis. Include the following:

4.a Sensitive Receptor Survey (for hazardous coatings/abrasives). Provide a map or written narrative identifying sensitive receptors. Sensitive receptors include, but are not limited to, schools, hospitals, childcare facilities, nearby residences, and locations where the public has access (bridge sidewalks, parks, ball fields, recreational waterways).

4.b Assessments of Visible Emissions and Releases (for hazardous and non-hazardous coatings/abrasives). Submit a written program for the observation of visible emissions during project activities, and inspections for releases or spills of dust and debris that become airborne and deposited on surrounding equipment and property. Include the frequency of observations and inspections that will be made, areas or work activities that will be observed, and methods of observation and inspection that will be utilized. Include the name(s) and qualifications of the personnel conducting the observations and inspections.

4.c High Volume Ambient Air Monitoring (for hazardous coatings/abrasives). Submit a written program for the instrument monitoring of emissions to assure compliance with this Section and any applicable City, Township, County, State or Federal regulations. Include procedures to confirm that the monitoring equipment is properly calibrated, sited, and operated; filters are properly handled and transported; the laboratory analysis is performed by an accredited laboratory; and that monitoring calculations, documentation, and forms will be uploaded directly to the project files. Include information on monitoring frequency, as well as the proposed number and locations of ambient air monitors. Submit the name of the independent third-party monitoring firm who will be performing the ambient air monitoring.

4.d Ground (Soil) Evaluations (for hazardous and non-hazardous coatings/abrasives). Submit a written program for the visual inspection of the ground before commencement of the project and upon completion to determine whether the ground was impacted by project activities.

4.e Water/Sediment Evaluations (for hazardous and non-hazardous coatings/abrasives). Submit a written program for the visual inspection of the water and sediment before commencement of the project and upon completion to determine whether the water or sediment was impacted by project activities. Include plans for the collection and removal of debris from the surface of water when working over streams, rivers, lakes, and other bodies of water.

4.f Compliance with Environmental Monitoring (for hazardous and non-hazardous coatings/abrasives). Include corrective action measures that will be implemented if the results of monitoring and analysis show that violations of emissions criteria are occurring.

4.g Remediation of Ground (Soil), Water, and Sediment. Include corrective action measures that will be implemented if the post-project inspections show unacceptable results, and how debris from the ground (soil), water, and sediment will be removed.

4.h Final Cleaning/Clearance Evaluations. Include the procedures and methods that will be used to conduct final project clean up, and final cleanliness inspections and evaluations. Clearance tests ensure the project area and surrounding surfaces have been properly cleaned.

5. EPA ID Number. The Department will provide an EPA provisional ID number and signatures on the hazardous waste manifest.

6. Additional items provided by the Contractor.

- Containerizing, testing (classifying), handling, and storage of all waste.
- Contracting with licensed and permitted waste transporters for the transportation of hazardous, residual, and non-hazardous waste, as well as wastewater.
- Contracting with licensed and permitted recyclers or disposers of waste.
- Locations for waste storage together with appropriate measures to ensure that the area is secure.
- Completed Waste Characterization Data Sheets for Department signature.
- Completed hazardous and residual waste manifests for Department signature.
- Bill of Lading for non-hazardous waste and wastewater.

(c) Waste Management (Hazardous, Non-Hazardous, Residual, and Wastewater).

1. Samples.

- Collect representative samples of the coating debris generated by project activities. Collect samples under the observation of the Representative.
- Collect samples according to SW-846, "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods." Describe the sampling methods in the Waste Handling Plan.
- For paint containing lead or other toxic metals, handle and treat the waste generated using steel abrasives as hazardous regardless of the TCLP results. Collect and analyze a minimum of one representative sample of the steel grit debris to identify the composition of the waste.
- Collect and have analyzed, a minimum of four representative samples of other waste streams (i.e., waste streams which do not contain steel abrasives). Use a random sampling technique to collect the samples.
- Complete the initial sampling of each waste stream immediately and send samples to the laboratory for analysis.
- Unless directed or required by state regulations or the waste recycling or disposal facility, once each waste stream is sampled, tested, and classified, additional sampling and analysis are not required for subsequent shipments unless the waste stream changes.

2. Testing.

2.a Laboratory. Direct the laboratory to test the waste according to 40 CFR 261, Appendix II, Method 1311 Toxicity Characteristic Leaching Procedure (TCLP), to determine if it is hazardous.

2.b TCLP. Analyze the samples from each waste stream by TCLP for all eight RCRA metals and other hazardous substances. If expendable abrasives are used, also analyze the samples for arsenic. When chemicals strippers are used, test liquids and sludge. Include pH to determine corrosivity.

3. Classification.

3.a RCRA Metals. Coating debris is classified as hazardous waste if the leachate contains any of the 8 RCRA metals or other hazardous substances in concentrations at or above the limits established in 40 CFR 261. The presence of these substances at lower concentrations classifies the waste as residual.

Arsenic -	5.0 mg/L
Barium -	100.0 mg/L
Cadmium -	1.0 mg/L
Chromium -	5.0 mg/L
Lead -	5.0 mg/L
Mercury -	0.2 mg/L
Selenium -	1.0 mg/L
Silver -	5.0 mg/L

3.b Use of Steel Abrasives. Where lead-containing paint is being removed, debris that is generated by steel abrasives has been classified by the Department as hazardous for lead even though it passes the TCLP test. In Box 9b of the waste manifest, identify this waste as "paint chips-hazardous."

3.c Other Hazards. The above includes only those elements typically associated with coatings. Other substances may be present which can cause debris to be classified as hazardous waste as defined in 40 CFR 261.

4. Laboratory Report.

4.a Timeline. Have the laboratory send the test results directly to the Representative with copies of the test results to the Contractor. Issue reports no later than ten (10) calendar days after the representative samples are collected, and no later than 40 days after project start-up.

4.b Test Results. At a minimum, include the following information in each report: Identity of the waste stream(s) analyzed, the number of samples collected and tested, dates of sampling and testing, laboratory test procedures utilized, the names and signatures of the individuals collecting the samples and conducting the laboratory tests, and an interpretation of the test results. Include copies of the chain-of-custody forms in the documentation.

4.c Waste Characterization Data Sheet (WCDS). Prepare the Waste Characterization Data Sheet and provide to the Representative for review and signature. Once approved, submit the original WCDS to the Department.

5. Waste Handling, Packaging, and Storage. Comply with 40 CFR 262 and Pennsylvania Title 25, Chapters 260a-266a, 266b and 268a-270a for the on-site handling, packaging, and storage of hazardous waste generated by the project. Comply with Pennsylvania Title 25, Chapters 285 and 299 for the handling, packaging, and storage of residual and municipal construction non-hazardous waste. Comply with additional Federal, State, County and City regulations including PennDOT's Publication 611 Waste Management Guidance Manual.

Do not place hazardous or residual waste on the unprotected ground. Utilize impermeable tarpaulins or similar under all waste storage. Locate in a secure area with signs around the perimeter and shield adequately to prevent dispersion of the waste by wind or water. If the waste is determined to be hazardous, enclose in fenced area with locking gate until transport. If using a roll off style dumpster with a locking lid, or hermetically sealed vacuum box, a fence is not required. Contact the Representative for approval of the storage location(s).

Collect and store all waste at the end of each working day in storage drums or containers such that no waste is left exposed overnight, at a minimum. Use DOT-approved containers for hazardous and residual waste storage.

Cover containers immediately upon filling and confirm that lids are attached except when filling. Verify that labels remain intact.

Store non-hazardous, residual, and hazardous waste separately. Do not co-mix hazardous waste with non-hazardous waste. Do not mix different types of hazardous waste together unless specifically approved by the Representative and the disposal facility.

Arrange containers in the storage area for easy accessibility. Stage the containers together in lots no greater than two rows of five containers each. Maintain a minimum lane clearance of 36 inches between each lot of ten containers.

Provide written documentation to verify that waste (hazardous, residual, and non-hazardous) is transported to the appropriate recycling or disposal facility in the required timeframe based on PennDOT's Waste Management Guidance Manual (Publication 611). Large Quantity Generators (LQGs) can accumulate hazardous waste on the site for up to 90 days.

Improper waste storage is cause for immediate project shut down until appropriate corrective action is completed.

Train personnel in the proper handling of the hazardous waste at the work site according to 40 CFR 265.16. Include procedures in the Waste Handling Plan that will be followed in the event of a release or spill, required notifications, and methods to be used for cleanup. Maintain training records on-site.

Do not fill container or roll-off in excess of the capacity marked on the container.

If soil remediation is required, place the soil into separate containers and assume costs for disposal.

Do not place contaminated reusable materials (i.e., tarps, duct hoses) on the unprotected ground. Clean, seal, or cover to prevent release of contaminants onto the ground.

Inspect the residual and hazardous waste storage area(s) for compliance with the specifications and State regulations. Inspect storage areas on a weekly basis. Document inspections.

6. Labeling of Containers. Label containers of project waste and debris immediately to identify the contents. Label containers of spent abrasive as "BRIDGE BLAST ABRASIVE WASTE". Include the Contract Number and the Bridge Identification Number or SR and SEC Number. Provide similar labels on containers of other project waste and debris.

Apply hazardous waste labels after the TCLP test results are received, if the waste tests hazardous. Label each container or roll-off of hazardous waste according to 40 CFR 262, 49 CFR 171-179, and Pennsylvania Title 25, Chapters 260a-266a, 266b and 268a-270a. Include the following minimum information:

- Hazardous Waste. Federal law prohibits improper disposal. If found, contact the nearest police, or public safety authority, or the U.S. Environmental Protection Agency.
- Proper DOT Shipping Name
- Manifest Document Number
- Generator Name, Address, and EPA ID Number
- Date of Accumulation
- EPA Waste Number

Affix a label to the container indicating the hazards associated with exposure to the contents of the container. If the container contains lead, then affix the following label according to the latest OSHA guidelines:

**DANGER: LEAD MAY DAMAGE FERTILITY OR THE UNBORN CHILD
CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM**

Label containers of used protective clothing as lead-contaminated clothing if the clothing is disposable. Apply hazardous waste labels as appropriate after testing.

Apply non-hazardous, municipal, or residual waste classification labels, as applicable, on other project waste according to Pennsylvania Title 25, Chapter 285 and 299.

Enter the above information using permanent marking material, printed in English, and displayed on a background of contrasting color unobscured by other labels or attachments. Locate labeling away from other markings that could substantially reduce its effectiveness.

Complete the labeling, marking, and placarding activities under the observation of the Representative, before storing or transporting container or roll off.

7. Waste Transportation and Disposal.

7.a Hazardous Waste.

- Upon receipt of TCLP results, prepare Waste Characterization Data Sheet(s) and provide to the Department for review and signature.
- Prepare the hazardous waste manifest for each shipment and provide to the Representative for review and signature.
- Arrange for the transportation of hazardous waste by a licensed transporter according to 40 CFR 263, 49 CFR 171-179, and Pennsylvania Title 25, Chapters 260a-266a, 266b and 268a-270a. Also comply with applicable County or City regulations. Verify that waste is completely covered during transport.
- Arrange for the recycling or disposal of hazardous waste according to 40 CFR 264, 40 CFR 268, and Pennsylvania Title 25, Chapters 260a-266a, 266b and 268a-270a. Verify that only licensed recycling or TSD facilities are used.
- Comply with the manifesting, certification, labeling, and reporting requirements for hazardous waste according to 40 CFR 262, 40 CFR 268 and Pennsylvania Title 25, Chapters 260a-266a, 266b and 268a-270a, including certificates of final disposal for each shipment.
- Upload to project files a certification for each manifested shipment that the waste was accepted by the recycling or disposal facility, and properly treated and disposed.
- Provide copies of bills of lading within 7 days of shipment.

7.b Residual and Non-Hazardous Municipal/Construction Waste.

- Transport and dispose of residual and non-hazardous municipal construction waste according to Pennsylvania Title 25, Chapters 271, 273, 279, 285, and 299.
- Verify that waste is completely covered during transport.
- Verify that the truck is properly designated with a residual waste sign measuring 6 inches in height when transporting residual waste.

- Verify that the transportation vehicle has a Pollution Prevention and Contingency Plan and carries the following information: County and state where waste originated, name and address of the carrier, name and location of disposal facility, and fire extinguisher.
- Comply with additional County and City regulations as applicable.

7.c Special Handling and Disposal Conditions for Wastewater.

- Provide containers for the collection and retention of wastewater, including but not limited to the water used for hygiene purposes, laundering of clothing if done on site, pressure washing, and cleanup activities.
- Filter visible paint chips and particulate from the water before placing it into the containers. Before disposal, test the water for total toxic metals and provide ample filtration of 5 microns or better through a multi-stage filtration system until the water is not classified as hazardous. Provide documentation of waste water sampling results to the Representative, including: the number of samples collected and tested, dates of sampling and testing, laboratory test procedures utilized, the names and signatures of the individuals collecting the samples and conducting the laboratory tests, and an interpretation of the results. Include copies of the chain-of-custody forms with the documentation. Unless directed or required by the disposal facility, once the initial wastewater sample has been analyzed, additional sampling and analysis is not required unless the waste stream changes.
- Make disposal arrangements with the local publicly owned treatment works (POTW), sanitation company, or other appropriate permitted facility. Provide the Representative with documentation signed by an official of the facility stating that the facility will accept the waste, and that the levels of lead remaining in the water are acceptable.
- Provide the Department with the name and address of the transporter and disposal facility for acceptance before use.
- Provide copies of bills of lading within 7 days of shipment.

7.d Recordkeeping. Provide the following information to the Representative: documentation of laboratory analyses, waste characterization data sheets, manifests and bills of lading, a listing of the type and quantity of waste generated, certificate of disposal, and the transportation and disposal facilities used for waste.

(d) Containment.

1. General. Use a containment system that maintains the work area free of emissions of dust and debris. Follow the containment requirements as specified in this Section, and as stipulated in SSPC Guide 6 for the selected method of removal.

Erect and maintain containment systems based on the coating removal method as follows:

- | | |
|--|---|
| • Abrasive blast cleaning..... | SSPC Class 1A (lead); Class 2A (non-lead) |
| • Wet abrasive blast cleaning..... | SSPC Class 1W (lead); Class 2W (non-lead) |
| • Power tool cleaning..... | SSPC Class 1P (lead); Class 3P (non-lead) |
| • Power tool cleaning with vacuum attachment.... | SSPC Class 3P (lead); ground tarps (non-lead) |
| • Pressure washing/water jetting..... | SSPC Class 2W (lead); Class 4W (non-lead) |

For abrasive blasting projects in Allegheny County, in addition to the containment requirements as specified in this Section, comply with permit requirements as stipulated in the Allegheny County Health Department, Bureau of Environmental Quality Abrasive Blast Cleaning Permit. Complete and submit Part B of the “Abrasive Blasting Project Notice and Permit Application” to the Allegheny County Health Department, Bureau of Environmental Quality for approval. The Department is to complete Part A of the permit.

For abrasive blasting projects in the City of Philadelphia, complete and submit for approval the City of Philadelphia Department of Public Health, Air Management Services “Process Equipment Installation Permit Application for Minor Emission Source”.

2. Certification of Installation. After each containment system is installed in the field, have a registered and licensed Professional Engineer field verify and certify in writing that the containment system has been assembled as

shown on the approved, signed and sealed drawings. Verification through review of photographs and third-party reviewers is prohibited.

Submit the written certification of containment installation to the Department before starting any work within the containment.

If deviations from the accepted containment drawings are present, have the Professional Engineer note deviations from the design in the certification letter and indicate that the deviations will not affect the intended performance of the containment system or safety; or submit revised drawings and calculations for acceptance showing the deviations. Do not begin surface preparation or coating removal activities until the certification or revised drawings have been received and accepted.

3. Special Restrictions. Comply with the project-specific vertical clearance requirements established by the Department.

Do not allow equipment and workers to be present or to operate over lanes that are open to traffic, unless specifically approved.

4. Enclosure System. Cover the containment floor or ground beneath the structure being prepared with air and dust impenetrable materials such as solid panels of plywood or flexible materials such as tarpaulins, if it serves as the base of the containment. Maintain the materials throughout the project to avoid losing debris through rips, tears, or breaks in the coverings.

Tarpaulins are not required on the decking/containment platform unless the platform is not preventing the release of spent abrasive, dust, and debris. If spent abrasive, dust, or debris is observed falling through gaps in the decking, seal the decking so that emissions are controlled or install tarpaulins over the decking.

Verify that the platform and its components are designed and constructed to support at least 4 times its maximum intended load without failure with wire cables capable of supporting at least 6 times their intended load without failure, if a suspended or elevated platform is constructed to serve as the base of the containment. Follow applicable OSHA regulations regarding scaffolding.

Design each SSPC Guide 6 Class 1A or 2A containment system to meet minimum air flow velocities of 60 feet per minute down-draft or 100 feet per minute cross-draft.

Remove debris from the containment materials and equipment before relocation to another point along the structure. Clean to the extent that debris or dust are not dislodged by winds or physical contact during handling and transportation.

5. Work Over Water - Containment Restrictions and Water Booms. Provide the necessary material and equipment on site to contain inadvertent spills or releases of dust and debris, when working over or near water. Materials and equipment that are typically acceptable include water booms and boats with skimmers. Remove project-related dust and debris from the surface of the water or from sediment immediately

6. Outside Agency Notification. Provide the Department and the Coast Guard with the distance that the containment will extend below the bottom of the bridge (i.e. below the bottom chord) when operating in the navigation channel. Maintain this distance to the absolute minimum required.

Obtain advance approval from the Coast Guard any time that the work necessitates partial or total restrictions to the movement of vessels beneath the bridge. Provide the Coast Guard with the request at least 30 days before the need to commence such activities.

Design the containment to allow it to be moved out of the navigation channel within 24 hours of notification that ships needing additional clearance require passage, unless otherwise directed by the Coast Guard.

Provide the Representative and the Coast Guard with a 24-hour telephone number and contacts for discussions regarding the containment system.

Notify the Army Corps of Engineers and PA Fish and Boat Commission, where applicable, of the intended work, and comply with any restrictions or conditions.

(e) Maintenance of Bridge Lighting Systems and Containment Lighting Requirements

1. Navigational Lighting. Maintain navigational lighting throughout the project. Provide the lighting plan to the Department for approval in advance.

2. Work Area Lighting. Provide adequate lighting for surface preparation, coating application, and inspection work according to the guidelines established in SSPC TU-12. Increase the lighting if workers or inspectors have difficulty in seeing. Use explosion-proof lighting.

(f) Protection of Drainage Systems. Protect storm sewers and drains from the entrance of debris from project activities. Keep protective systems clean and operational throughout the entire project. Remove visible debris from the protective devices or from areas where rainwater could carry the debris into drains or storm sewers at the end of each workday at a minimum. Conduct more frequent cleaning as directed.

Identify the methods that will be used to route run-off from the existing deck drains through the containment enclosure. Do not close bridge deck drains without approval.

(g) Cleaning of Materials and Equipment During Relocation and Demobilization. Use compressed air for cleaning only inside a contained area equipped with an operating ventilation system capable of capturing the dust and debris.

Remove equipment and materials upon completion of project activities.

Thoroughly HEPA vacuum, wash, or otherwise decontaminate reusable items until loose surface dust and debris have been removed. These items include, but are not limited to, coating removal equipment, containment materials, ground covers, and scaffolding.

Treat materials as a separate waste stream and dispose of properly, if adequate cleaning is not possible. Collect water used for cleaning and dispose of as specified in this Section.

(h) Worker Health and Safety.

1. General. Conduct the work according to Federal, state, and local regulations governing the protection of workers from all jobsite hazards. Worker protection requirements apply to Contractor and Subcontractor personnel working for the Contractor. Requirements identified are based primarily on the OSHA Lead in Construction Standard, 29 CFR 1926.62, however, protection of employees from exposure to other toxic metals which may be present in the coating, abrasive or substrate is required by law.

Establish methods for complying with this Section and OSHA standards published for the toxic metals present in the coating or abrasive being used. Include statements that the workers will not be exposed above the PEL established for the metal as identified in 29 CFR 1926.55, when toxic metals are present in the coating for which OSHA has not developed a comprehensive health and safety standard.

Identify the methods of compliance that will be used to reduce worker exposures to toxic metals. Rely on respiratory protection only after feasible engineering and work practice controls have been first implemented to reduce airborne exposures.

2. Exposure Monitoring/Initial Protection. Collect representative personal air samples at the beginning of the coating removal work (at project start-up) for each exposure producing activity to determine employee exposures to lead and other toxic metals that might be present in the coating or abrasive. Collect full shift (minimum of 7 hours) air samples for each job classification in each exposure area, including Representatives. Submit results of the analysis within the same five-day notification period required for the employees, but no later than 14 days after collection.

Protect workers during the initial monitoring to the anticipated exposure levels as dictated by 29 CFR 1926.62 and as specified below when lead is present. Activities in addition to those dictated by OSHA are included. Use the same level of protection when other toxic metals are found in the coating, unless OSHA has developed a comprehensive health and safety standard for that metal. In those cases, implement the protection requirements of the standard for that metal.

Before receiving the personal air monitoring test results, employers must assume that workers are subject to the following exposures (based on work task according to OSHA 29 CFR 1926.62)

- Assume an exposure of at least 50 µg/m³ during manual demolition of structures (e.g. drywall), manual scraping, manual sanding, heat gun applications, power tool cleaning with dust collection systems, and spray painting with lead containing coating. Although not identified in 29 CFR 1926.62, include chemical stripping, water washing, and the operation of abrasive grit recovery equipment in this category.

- Assume an exposure of at least 500 $\mu\text{g}/\text{m}^3$ when using lead containing mortar, lead burning, or conducting the following activities where lead containing coatings are present: rivet busting, power tool cleaning without dust collection systems, cleanup activities where dry expendable abrasives are used, and the movement and removal of abrasive blasting enclosures. Although not identified in 29 CFR 1926.62, include water jetting and wet abrasive blasting removal of coating in this category.
- Assume an exposure of more than 2,500 $\mu\text{g}/\text{m}^3$ during activities involving lead containing coatings on structures disturbed by abrasive blasting, welding, cutting, and torch burning.

Provide appropriate respiratory protection, personal protective clothing and equipment, change areas and washing facilities, blood lead and zinc protoporphyrin monitoring, and employee training during the above activities. Maintain the protection as specified above until the test results are received, then modify the protection measures as necessary.

Collect and analyze air samples according to the appropriate National Institute for Occupational Safety and Health (NIOSH) method, or equivalent, for the metal of concern.

Conduct periodic worker and Representative exposure monitoring and provide written employee notifications within five days of receipt of results according to the applicable OSHA standard for the metal of concern. This requires monitoring at project start up and after changes in work practices are made that could have an effect on airborne exposures. Conduct the monitoring and employee notification based on OSHA 29 CFR 1926.62. Provide the Department with the results of subsequent monitoring within the same five-day notification period required for the employee, but no later than 14 days after collection.

3. Action Level. The 8-hour Time Weighted Average (TWA) Action Levels for lead and other toxic metals that may be present in the coating being disturbed or the abrasive being used are as follows:

- Lead - 30 $\mu\text{g}/\text{m}^3$
- Cadmium - 2.5 $\mu\text{g}/\text{m}^3$
- Inorganic arsenic - 5 $\mu\text{g}/\text{m}^3$
- Beryllium – 0.1 $\mu\text{g}/\text{m}^3$
- Hexavalent chromium – 2.5 $\mu\text{g}/\text{m}^3$

For other metals that are found in the coating, and for which no Action Level exists, establish the Action Level at 1/2 of the PEL.

Invoke the following protective measures when the airborne exposure to a toxic metal found in the coating exceeds the Action Level:

- Exposure Monitoring
- Housekeeping
- Employee Medical Surveillance and Medical Removal Protection
- Employee Information and Training
- Signs and Regulated Areas
- Record keeping

4. Permissible Exposure Limit. The 8-hour Time Weighted Average (TWA) Permissible Exposure Limit for lead and other toxic metals that may be present in the coating being disturbed or the abrasive being used are as follows:

- Lead – 50 $\mu\text{g}/\text{m}^3$
- Cadmium – 5.0 $\mu\text{g}/\text{m}^3$
- Inorganic arsenic - 10 $\mu\text{g}/\text{m}^3$
- Beryllium – 0.2 $\mu\text{g}/\text{m}^3$
- Hexavalent Chromium – 5.0 $\mu\text{g}/\text{m}^3$

The PELs for other metals can be found in 29 CFR 1926.55.

In addition to complying with the requirements identified when exceeding the Action Level, invoke the following protective measures when the airborne exposure to a toxic metal found in the coating exceeds the PEL:

- Compliance Program
- Respiratory Protection
- Protective Clothing and Equipment
- Hygiene Facilities and Practices

5. Respiratory Protection. Use respiratory protection if necessary, to maintain employees' exposures to lead and other toxic metals below the PEL after feasible engineering controls and work practices have been implemented. Require the use of respirators for employees, inspectors, observers, or other personnel who enter areas where airborne exposures exceed or are expected to exceed the PEL, or when entering regulated areas.

Provide respiratory protection for two Representatives at each site for each shift, including fit tests. The Department is responsible for verifying that the Representatives are medically fit to wear respirators.

Develop a written Respiratory Protection Program in compliance with 29 CFR 1926.103, including commitments to provide the necessary medical examinations. Include the provisions of the associated OSHA standards for each toxic metal that is present in the coating being disturbed or the abrasive being used. Address the selection, use, maintenance and inspection of respirators, and qualifications for respirator users.

Treat used respirator cartridges as hazardous waste and dispose of according to this Section and Federal regulations.

6. Protective Clothing and Equipment. Provide protective clothing and equipment and ensure they are worn by employees whose exposures exceed the PEL. Provide required protective clothing and equipment for use by two Representatives at each site for each shift.

Do not allow workers to wear street clothing beneath protective clothing in areas where exposures to toxic metals exceed the PEL.

Clean or replace the protective clothing as required by the appropriate OSHA standard for the toxic metal that is present. In the case of lead, clean or replace the clothing weekly if the airborne exposure levels are less than 200 µg/m³ as an 8-hour TWA, or daily if the exposure levels are greater than or equal to 200 µg/m³. In the case of inorganic arsenic, the threshold for daily versus weekly cleaning is 100 µg/m³. Do not use disposable clothing for longer than one day.

Do not remove or clean the clothing by means which reintroduces the toxic metals into the ambient air such as brushing, shaking, or blowing. Use vacuums equipped with HEPA filters for cleaning.

Store the used clothing in sealed containers.

If the clothing is to be laundered and has been exposed to lead, label the containers with the following:

"DANGER: CLOTHING AND EQUIPMENT CONTAMINATED WITH LEAD. MAY DAMAGE FERTILITY OR THE UNBORN CHILD. CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM. DO NOT EAT, DRINK, OR SMOKE WHEN HANDLING. DO NOT REMOVE DUST BY BLOWING OR SHAKING. DISPOSE OF LEAD CONTAMINATED WASH WATER IN ACCORDANCE WITH APPLICABLE LOCAL, STATE, OR FEDERAL REGULATIONS"

Modify the above text accordingly if the clothing has been exposed to other toxic metals.

7. Housekeeping. Clean accumulations of dust or debris containing lead (or other toxic metals) daily, at a minimum. Clean more frequently if visible accumulations are observed that could be carried outside of the regulated area by wind, workers shoes, rainwater, or other means. If grit, dust, or debris containing lead or other toxic metals is discovered outside of containment, clean immediately. Containerize the debris for proper disposal.

Conduct cleaning with HEPA-filtered vacuums and deposit dust and debris in sealed containers. Do not use compressed air for housekeeping purposes unless it is used in conjunction with a ventilation system capable of capturing the resulting airborne particulate.

8. Personal Hygiene Facilities and Equipment. Provide clean lavatory and hand washing facilities according to OSHA sanitation standard 29 CFR 1926.51. Locate the hand washing facilities near the coating removal

operation, in an area that is convenient for washing before eating or smoking. Provide showers when exposures exceed the PEL. Confirm that employees whose exposures exceed the PEL shower before leaving the project site.

Testing and disposal requirements for wastewater are as specified in Section 1072(a)12. Prohibit eating, drinking, smoking, chewing of food or tobacco products, or the application of cosmetics in areas where the exposure to toxic metals exceeds the PELs or within regulated areas, and confirm that workers thoroughly wash hands and face before undertaking these activities.

Provide clean lunch and break areas for use by employees and maintain airborne concentrations in these areas below the Action Levels.

Provide clean change area(s) for employees whose exposures exceed the PELs. Equip the change area(s) with separate storage facilities for street clothing that are adequately segregated to prevent cross-contamination from work clothing. Ensure that employees do not leave the project site wearing clothing that was worn while performing activities where exposures exceeded the PELs.

Clean the decontamination facilities, lunch area, and hand wash station(s) at least daily.

9. Medical Surveillance and Medical Removal Protection. Provide employees with initial and periodic blood and zinc protoporphyrin (ZPP) sampling and analysis, and medical surveillance as required by the published OSHA health and safety standards that exist for the metal of concern. Verify that the blood analysis is conducted by laboratories certified by the PA Department of Health and meets OSHA accuracy requirements in blood lead proficiency testing (PT). For employees exposed to hexavalent chromium, inorganic arsenic, silica or beryllium, provide the specialized medical surveillance required by the associated OSHA comprehensive health standard.

Conduct blood sampling and analysis at a minimum of once every two months for the first six months of exposure, and at six-month intervals thereafter when lead is present. Conduct exit blood tests for each worker upon completion of his/her project activities which involve exposure to lead, even if this occurs before the completion of the Contractor's work on the project.

Do not use workers with initial blood lead tests of 40 µg /dl for work activities involving exposure to lead above the Action Level.

Provide for the temporary removal of employees from exposures above the Action Level for the metal of concern when the blood analysis indicates that unacceptable results are occurring. Protect employee's benefits during period of medical removal and conduct tests required by the appropriate OSHA standards during the removal period. In the case of lead, return workers to exposures above the PEL only after two consecutive blood tests are below 40 µg /dl.

Provide physical examinations as required by the appropriate OSHA standards for metal(s) of concern and verify that examinations are performed by or under the direct supervision of the licensed physician.

Provide exam information and test results to the employees in writing within 5 days of receipt.

Submit a letter report signed by a CIH or physician that summarizes examination results. Provide the reports within 10 days of testing.

10. Employee Training and Information. Provide initial and annual refresher training for employees who will be exposed to toxic metals above the respective Action Levels on any one day in a 12-month period. Include the elements of training that are required by the appropriate OSHA standard. Use the training outlined in 29 CFR 1926.62 as the basis of the training program highlighting the differences as appropriate for the other metals of concern, if a standard for the metal does not exist. Provide the necessary training for two Representatives at each site for each shift in addition to the training of the Contractors' personnel.

Notify other contractors or employers of the nature of the lead exposure work, the need to remain out of exposure areas, the warning signs and labeling system in effect, and the potential need for them to take measures to protect their employees according to the applicable OSHA regulations when they are present at the site.

11. Signs and Regulated Areas. Establish zones (regulated areas) around areas or activities that might generate airborne emissions of lead, cadmium, chromium, inorganic arsenic, or other toxic metal in excess of the Action Level. Use ropes, ribbons, tape, or other visible means to define the areas and prohibit entrance into the regulated areas by unprotected or untrained personnel to ensure that they are not exposed to toxic metals from project activities.

Unless directed, until test results are available to establish the perimeter of the regulated area, initially establish the boundary a minimum of 4.6 m (15 feet) away from equipment or operations that might generate airborne emissions of toxic metals.

Post caution signs around the regulated area. If a regulation does not exist for the metal of concern, use the legend for the CAUTION sign as found in 29 CFR 1926.62 as the basis, inserting the name(s) of the other toxic metals. Sign requirements for lead, cadmium, and inorganic arsenic are as follows:

DANGER
LEAD WORK AREA
LEAD MAY DAMAGE FERTILITY OR THE UNBORN CHILD.
CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM.
DO NOT EAT, DRINK OR SMOKE IN THIS AREA

Use signs that are a minimum of 215 mm (8 ½ inches) by 275 mm (11 inches) in size with black block lettering on a white, yellow, or orange background. Do not use caution ribbons as a substitute for signs.

Conduct sampling according to NIOSH Method 7082 or equivalent for lead and other metals of concern at the pre-established boundaries of the regulated area(s). Collect the samples throughout an entire work shift upon commencement of the coating removal activities (at project-start-up).

If the monitoring confirms that project emissions at the established boundary do not exceed the Action Level as an eight-hour TWA, establish the boundary at that location and discontinue monitoring.

If the monitoring shows that the emissions exceed the Action Level, modify and improve work practices and containment to provide better controls over the emissions or reestablish the boundary at a different location. Repeat the monitoring in either case.

After the boundaries have been established through instrument monitoring, additional monitoring is not required unless directed, if suspect visible emissions occur, or there are changes to the work practices or equipment being used within the regulated areas. In these cases, conduct additional monitoring to confirm the adequacy of the control systems in place, and to verify the suitability of the existing regulated area(s).

Verify that cassettes are only analyzed by laboratories that have been accepted for use by the Department. Have the laboratory provide results within 72 hours of the field sampling. Provide the test results to the Department verbally within one day of receipt, and in writing within one week thereafter.

Verify that workers who enter the regulated area have had the proper training, blood analysis and medical examinations, and are wearing the required protective clothing and equipment. Prohibit eating, drinking, smoking, and chewing of food or tobacco products in areas where the exposures exceed the Action Level.

12. Histoplasmosis. Histoplasmosis is an infectious disease caused by inhaling the spores of a fungus called *Histoplasma capsulatum*. Protect workers exposed to bird manure (e.g. pigeon) or bat droppings according to National Institute for Occupational Safety and Health (NIOSH) Publication Number 2005-109.

13. Recordkeeping. Retain records related to training, medical examinations, blood analysis, exposure monitoring, respirator fit testing, inspections by a competent person, and other related project documentation on file at the project site.

Provide the Department with letter reports signed by a CIH that summarize examination results that are indicative of worker exposures to (or which demonstrate proper protection from) toxic metals. In the case of lead, summarize the blood lead and ZPP results, indicate observed trends, and identify worker removal provisions that were invoked based on the results. Workers should be identified by a unique identification number and not by name. Provide summary reports of the test results before worker exposures to project activities, periodic surveillance results, and results upon completion of site exposures. Provide a copy of each signed report within 10 calendar days after issuing the test results to the employees, and no later than 21 days of testing. Retain records for the duration of employment plus 30 years.

(i) Environmental Protection.

1. General. Conduct the work according to the Environmental Compliance Plan and Federal, state, and local regulations governing the protection of the public and the environment.

Remove visible abrasives, paint chips, and debris from the project site, even if the abrasives, paint chips, and debris were a pre-existing condition. Include the cost for clean-up of pre-existing debris in the bid.

Comply with Title 3 of the Philadelphia Code, the Air Management Code, for work occurring in Philadelphia County.

Comply with Philadelphia County Air Management Regulation II, Section VIII, (relating to Fugitive Dust), for work occurring in Philadelphia County.

Comply with Allegheny County - Article XXI, Rules and Regulations of Allegheny County Bureau of Environmental Quality, Section 2105.51 (relating to Abrasive Blasting), for work occurring in Allegheny County.

2. Assessment of Visible Emissions and Releases. Conduct fugitive emissions assessments as established in this Section according to 40 CFR 60, Appendix A, Method 22, Visual Determination of Fugitive Emissions from Material Sources and Smoke Emissions from Flares. These assessments are based on total fugitive emissions and cannot be used to determine the opacity of the emission.

Conduct visual inspections for releases or spills of dust and debris that have become airborne even when the paint being removed does not contain lead or other toxic metals.

Conduct visual inspections for releases or spills of dust and debris that have become deposited on surrounding property, structures, equipment or vehicles, and bodies of water, with special consideration of sensitive receptors identified in the Plan.

Comply with Federal, State, City, or County regulations and statutes regarding emissions of hazardous, visible or fugitive air contaminants, in addition to, but not as a replacement for, the requirements as specified in this Section.

3. Acceptance Criteria for Visible Emissions Assessments. Limit random visible (fugitive) emissions from project activities to an SSPC Level 0 (any sustained visible emission regardless of its duration) according to SSPC Technology Update No. 7. Conduct visible emission assessments according to 40 CFR 60, Appendix A, Method 22.

Immediately shut down the emission-producing activities if emissions in excess of the criteria stipulated in this Section are observed. Do not resume the emission-producing operations until the cause of the violation is corrected.

Immediately shut down the project and initiate corrective action if there are violations of high-volume ambient air monitoring, even if the visible emissions results are acceptable.

Clean up releases of dust and debris outside of the work area that have become deposited on surrounding property; on the unprotected ground, soil, water or sediment; around storm sewers or drains; or in areas where rainwater could carry the debris into storm sewers or drains immediately.

4. Frequency and Location of Visible Emission Assessments and Inspections. Conduct visual assessments according to this Section and SSPC Technology Update No.7.

Conduct the visible emissions assessments to account for locations where emissions might be generated, including but not limited to, the containment, dust collection and abrasive recovery equipment, and waste containerizing areas for at least a 15-minute duration during each observation period. Document the name of the assessor, the date and time, and the results of observations, even if no emissions are observed. Have the daily records available on site for Department review.

Conduct casual observations and corrections of visible and fugitive air contaminant emissions and releases of dust or debris on an ongoing daily basis but conduct the specialized assessments as described in this Section at least once per hour during dust producing activities.

Conduct casual observations at the project perimeter and adjacent and nearby properties, especially those identified in the Sensitive Receptor Survey, and correct fugitive emissions and releases of dust or debris on an ongoing daily basis.

5. Reporting of Visible Emissions. Report the results of the daily assessments in a logbook or other report form. Record the results of the assessments as soon as possible following the observations, but no later than the end of the work shift on that day. Maintain the logbook or reports on site for review by the Department.

Document cases where work has been halted due to unacceptable emissions or releases of visible, fugitive, or hazardous air contaminants or material, the cleanup activities invoked, and the corrective action taken to avoid a reoccurrence. Provide the written report to the Department within 48 hours of the occurrence.

6. High Volume Ambient Air Monitoring. When the work involves lead or other toxic metals in the paint or abrasive, conduct high volume ambient air monitoring for lead during coating removal and clean-up activities using the procedures specified in 40 CFR 50 Appendix B & G, and in compliance with this Section. Comply with the acceptance criteria established in City, Township, County, State or Federal regulations when applicable. Comply with the criteria below if there are no local regulations governing high volume ambient air monitoring for lead.

Ambient air monitoring is to be performed by an independent third-party monitoring firm.

TSP-Lead (Total Suspended Particulate-Lead) – The National Ambient Air Quality Standard for TSP-lead is 0.15 µg/m³ as a 90-day rolling average. However, for the purposes of evaluating the effectiveness of the containment system in limiting emissions, do not exceed 1.5 µg/m³ averaged over the specified sampling period detailed below. For the purposes of establishing a daily allowable limit, the acceptance criteria are extrapolated using the formulas identified in SSPC TU-7. Note that some local agencies establish their own acceptance criteria - do not exceed these criteria.

Place TSP-Lead ambient air monitors at the nearest location(s) required to ensure that the public's health is protected and to reduce public concerns, as specified in the Plan, and in the location(s) acceptable to the Representative or designee. In many cases, and as determined in the Sensitive Receptor Survey, more than one monitor may be required because the designated monitoring targets may be located at different distances and different directions from the work areas. On large structures, the required monitoring locations may change as the work areas change. The third-party monitoring firm will select air monitoring locations, subject to review and approval by the Representative or designee.

Conduct background ambient air monitoring daily for a period of 3 days before blasting. The 3 days of background ambient air monitoring is to be conducted for 8 hours each day, during the hours of the day when dust generating activities such as abrasive blasting will typically be performed. Identify the proposed background monitoring locations in the Environmental Compliance Plan. Background concentrations of TSP-lead may be subtracted from the acceptance criteria identified above.

Conduct daily full-time continuous ambient air monitoring for TSP-lead during dust producing operations that are performed within 500 feet of potential public receptors. After review of a minimum of two weeks of monitoring data, the Representative may approve suspension of the daily monitoring requirement. Resume daily ambient air monitoring if control problems with blasting emissions become apparent, as determined by visual assessments of the operation.

Instruct the third-party monitoring firm to provide analytical laboratory results within 72 hours after field sampling has been performed, unless local requirements are more stringent. Instruct the laboratory to analyze the filters according to 40 CFR 50, Appendix G and report results directly to the Department in micrograms per cubic meter. The report shall identify the monitoring locations and work activities performed for each sample collected.

If monitoring is conducted and the above criteria is violated, immediately stop work and make changes to the containment and work practices to achieve compliance. Note that exceedances may also result in City, Township, County, State or Federal violations.

7. Restrictions on Emissions to Ground (Soil), Water, and Sediment. Conduct activities so that releases to the soil, water, sediment, or storm sewers do not occur.

If particulate matter or debris is released beyond the containment or ground protection, immediately shut down the emission-producing operations until the cause of the emissions is corrected.

8. Cleaning Requirements. Remove project debris and litter from the project site and surrounding property, equipment, and structures.

When cleaning paint chips and dust that contain lead or other toxic metals, use vacuuming equipment equipped with HEPA filters, wet washing, or other means that will effectively remove the dust and debris without re-dispersing it into the air. Do not use compressed air for cleanup activities unless it is used in conjunction with a ventilation system designed to capture the airborne particulate.

Collect water used for cleaning and dispose of as specified in this Section.

9. Final Cleaning/Clearance Evaluations. Conduct a visual inspection of the project site and surrounding property and surfaces located within the likely dispersion zone of project dust and debris upon completion of project activities, and after equipment and materials have been removed.

Visually inspect the property and surfaces for the presence of debris including, but not limited to spent abrasives or other coating removal media, paint chips, materials of construction, fuel, and other litter.

Conduct a final visual inspection with the Representative after clean-up activities are completed.

Conduct additional cleaning identified by the Department. Consider the site properly cleaned when visible paint chips, spent abrasives and other coating removal media, fuel, materials of construction, litter, or other project debris are not visible on or around the project site.

Remove visible dust from the surface of the completed structure as well as from surrounding structures and equipment.

10. Report on Clearance Inspections. Prepare a letter report presenting the results of the inspections conducted to verify the final cleanliness of the project site, surrounding property, waterways, equipment, buildings, and structures. Provide the report to the Department within 7 days following the inspection.

Include a summary of problems or releases that occurred during the project, and the clean-up and corrective action measures that were taken to resolve the problem.

11. Reportable Releases.

11.a Clean Water Act. Reportable quantities of hazardous substances in waterways are addressed in Section 311 of the Clean Water Act. Report such releases to the Representative, the EPA according to 40 CFR 117 and 40 CFR 355, and the DEP. Notify the Fish and Boat Commission, and the Coast Guard, when applicable.

11.b CERCLA. Reportable quantities under CERCLA are found in 40 CFR 302. In the case of lead, the reportable quantity is a release of 4.5 or more kilograms (10 or more pounds) in a 24-hour period. If such releases occur, stop work immediately and notify the Representative, the DEP, and the National Response Center (800/424-8802).

11.c City of Philadelphia. If reportable releases or emissions pose an imminent danger to public health, safety, welfare, or the environment, or violate permit conditions, immediately notify the Department of Public Health, Air Management Services.

1072.4 MEASUREMENT AND PAYMENT—

(a) Waste Management. Lump Sum

Includes collection, testing, handling, storage, transportation and disposal of waste (hazardous, residual, and non-hazardous including wastewater). Partial payment may be made for this item. Payment will be made only after the Department receives properly executed waste disposal documentation, including certificates of disposal. If there are discrepancies in quantities or in any of the documentation requirements, payment will be withheld until the discrepancies are resolved.

(b) Containment. Lump Sum

Price includes containment and ventilation materials and equipment, engineering, drawings, and equipment or facilities needed to install, operate, move, clean, dismantle, and remove the containment system from the project site. Partial payments for containment will be made based on the percentage of the structure that has been prepared and fully primed. Environmental monitoring and protection are incidental to containment.

(c) Worker Health and Safety. Lump Sum

Price includes protection of Contractor personnel, including protective clothing and equipment, medical surveillance, hygiene facilities, laundering, establishment and maintenance of regulated areas, and documentation. Price also includes protective clothing and equipment for two Representatives at each site for each shift, as well as lead training according to 29 CFR 1926.62. Partial payments for worker protection will be made based on the percentage of the structure that has been prepared and fully coated.

SECTION 1080—PRESTRESSED CONCRETE BRIDGE SUPERSTRUCTURE

1080.1 DESCRIPTION—This work is the construction of a prestressed concrete bridge superstructure.

1080.2 MATERIAL—

(a) Deck and Barriers.

- Cement Concrete Structures—Section 1001.2
- Preformed Neoprene Compression Joint Seal for Bridges—Section 1008.2
- Pedestrian Railing—Section 1012.2
- Aluminum Bridge Hand Railing—Section 1023.2
- Steel Bridge Hand Railing—Section 1022.2
- Protective Barrier—Section 1015.2
- Protective Fence—Section 1016.2
- Protective Coating for Reinforced Concrete Surfaces—Section 1019.2(a)
- Armored Preformed Neoprene Compression Dam—Section 1021.2
- Tooth Expansion Dam With Drain Trough—Section 1020.2
- Reinforcement Bars—Section 709.1
- Neoprene Strip Seal Dam—Section 1026.2

(b) Beams and Bearings.

- Prestressed Concrete Bridge Beams—Section 1107.02
- Plain Steel Bars—Section 709.1(a)2
- Closed Cell Neoprene Sponge—Sections 1107.02(p)1 and 1107.03(e)3
- Plain and Laminated Neoprene Bearing Pads—Sections 1113.02 and 1113.03(g)
- Bedding Material for Bridge Shoes—Section 1113.03(h)
- Steel Bearings—Section 1107.02(j)
- Post Tensioning, when required—Section 1108.02
- Nonshrink Epoxy Grout for Shear Keys—Section 1080.2(g)
- Nonshrink Grout for Studs, Dowels, and Anchor Bolts—Section 1001.2(e)
- Epoxy Resin Protective Coating—Section 1019.2(b)

- High Load Multi-Rotational Bearings—Section 1111

(c) **Nonshrink Grout.** Use either a premixed, nonshrink grout, from a manufacturer listed in Bulletin 15 and certified as specified in Section 106.03(b)3, or mix as follows:

- One part Non-shrink Grout Admixture—Bulletin 15. Certify as specified in Section 106.03(b)3.
- Two parts Cement, Type IP, IS or II—Section 701
- Three parts Fine Aggregate, Type A—Section 703.1
- Water—Section 720.1

Required minimum compressive strength:

- 1,000 pounds per square inch at 24 hours
- 4,000 pounds per square inch at 28 days

Combine dry materials in the mixer, then agitate to mix. Add water slowly and mix for 3 minutes or less, or according to the manufacturer's instructions.

Mix as closely as possible to the site of the work and use each batch within 20 minutes. Do not retemper. Mold daily test cylinders according to PTM No. 521. Test cylinders according to PTM No. 604.

(d) **Fabricated Structural Steel.** Section 1105. At least 2 weeks before the start of fabrication, furnish to the Inspector-in-Charge a complete list of the names and addresses of firms that are to fabricate or supply incidental, fabricated structural steel items to be used in conjunction with, or as a part of, the prestressed concrete members.

(e) **Modified Mortar for Beam Seat Leveling.** Use mortar from a manufacturer listed in the Miscellaneous Section – Polymer Modified and Special Cements, Mortars, and Concrete in Bulletin 15 conforming to the following specifications:

- Polymer modified
- Non-shrink
- Non-sag consistency
- Application thickness range 1/8 inch to 1/2 inch
- Properties

Initial set time (AASHTO T 131)	1/2 hour minimum
Compressive strength (AASHTO T 106)	2,500 pounds per square inch—24 hours 3,500 pounds per square inch—7 days 5,000 pounds per square inch—28 days
Slant shear bond test (ASTM C882, Modified)	2,000 pounds per square inch—7 days
Freeze-thaw resistance (PTM No. 633)	8%—maximum loss by weight

Certify as specified in Section 106.03(b)3.

(f) Post-Tensioning Strand. Section 1108.02(g)

(g) Nonshrink Epoxy Grout for Shear Keys in Adjacent Prestressed Concrete Box Beam Bridges. Use Nonshrink Epoxy Grout as specified below:

Required minimum compressive strength:

- 4,000 pounds per square inch at 24 hours
- 5,000 pounds per square inch at 28 days

1080.3 CONSTRUCTION—

(a) General. The superstructure consists of all indicated portions of the bridge above the bridge seat and includes bearings, bearings and anchors set in the substructure, abutment backwalls, cheekwalls, shear blocks, bridge drainage down to, but not including, the drain box, and portions of wings and appurtenances above the horizontal construction joint nearest the bridge seat.

At the bridge site, beams will be inspected for possible damage, cracking, and twisting during shipment, and for camber, tolerances, and dimensions. Replace beams damaged by improper storing, handling, transporting, or erecting at no additional cost to the Department.

(b) Superstructure. Construct the superstructure as indicated, as shown on the Standard Drawings, and as follows:

- Fabricated Structural Steel—Section 1105
- Cement Concrete Structures—Section 1001.3
- Preformed Neoprene Compression Joint Seal for Bridges—Section 1008.3
- Pedestrian Railing—Section 1012.3
- Aluminum Bridge Hand Railing—Section 1023.3
- Steel Bridge Hand Railing—Section 1022.3
- Protective Barrier—Section 1015.3
- Protective Fence—Section 1016.3
- Tooth Expansion Dam with Drain Trough—Section 1020.3
- Reinforcement Bars—Section 1002.3
- Neoprene Strip Seal Dam—Section 1026.3
- Armored Preformed Neoprene Compression Dam—Section 1021.3
- High Load Multi-Rotational Bearings—Section 1050.3(c)4.h

(c) Erection.

1. Erection Plan. Submit an erection plan for acceptance, signed and sealed by a Professional Engineer registered in the State. Provide details for all anticipated phases and conditions during erection. Include details of falsework, temporary bents, bracing, guys, dead-men, lifting devices, and attachments to bridge members. Include the sequence of erection, location of cranes and barges, crane capacities, crane operator's license for the operator

performing the crane work, location of lifting points on the bridge members, and weights of the members. If required, furnish calculations to demonstrate that allowable stresses are not exceeded and that member capacities and final geometry will be correct. Include delivery plan with erection plan. The delivery plan is to include delivery routes, ingress and egress to the site, and any modifications required for safe transport to the site. List equipment needed to unload or move bridge members. Do not proceed with erection until the erection plan has been accepted. Maintain an accepted copy of the erection plan onsite during erection operations.

1.a Pre-Erection Meeting. Before erecting falsework or permanent bridge members, conduct a pre-erection meeting a minimum of 14 calendar days before erection with the Professional Engineer of record for the erection plan, prime contractor, superintendent in charge of beam setting operation, crane operators or crane company representative, signal personnel, Structure Control Engineer, and onsite Representative to discuss the accepted erection plan. Conduct safety talk with crane operator as specified in Section 108.05(c)6.

1.b Conformance to Erection Plan. Ensure conformance to the erection plan. Any modification to or deviations from the accepted erection plan will require revised drawings, calculations, and verification of stresses and geometry.

1.c Erection Stresses. Account for any erection stresses that are induced in the structure as a result of the use of a method of erection or equipment which differs from that indicated or specified, and which will remain in the finished structure as locked-in stresses. Provide additional material, at no additional cost to the Department, to keep both temporary and final stresses within the allowable limits used in design.

Provide temporary bracing or stiffening devices to accommodate handling stresses in individual members or segments of the structure during erection. Use wind loads and distribution of wind loads to girders according to AASHTO Guide Specifications for Wind Loads on Bridges During Construction.

1.d Maintaining Alignment and Camber. During erection, support segments of the structure in a manner that will produce the proper alignment and camber in the completed structure. Install cross frames and diagonal bracing, as necessary during the erection process, to provide stability and ensure correct geometry. Provide temporary bracing, if necessary, at any stage of erection.

2. Bearings. When elastomeric bearings are used under beams, temporarily remove or relocate waterproofing and other material as required to expose all sides of the pad. If a gap between the pad and bearing surfaces is present, proceed as follows unless the contract plans indicate that a lift-off condition is expected when the beam is initially set on the pad:

- **Gap Thickness > 3/8 inch.** If a gap along any edge of the pad exceeds 3/8 inch, grind the bearing surface of the substructure to eliminate the gap, except gaps along the front edge of the pad (edge toward the midspan of the beam) will be allowed as specified in Steps 1 and 2 below. Provide a rough textured bearing surface after grinding. Verify that the minimum required vertical clearance to the bottom of beams, as indicated, is maintained after grinding.
- **Gap Thickness ≤ 3/8 inch.** If gaps along any edge of the pad are less than or equal to 3/8 inch, proceed as follows:

Gap Along Rear Edge of Pad Only. If a gap occurs anywhere along the rear edge of the pad (edge toward the end of the beam), eliminate the gap by placing a leveling bed of polymer-modified mortar beneath the pad as specified in Section 1080.3(c)2.a.

Gap Along Side Edges of Pad. If a gap occurs along the side edges of the pad, and there is full contact at the front and rear edges, eliminate the gap by placing a leveling bed of polymer-modified mortar beneath the pad as specified in Section 1080.3(c)2.a.

Gap Along Front Edge of Pad. If a gap occurs along the front edge (edge toward the midspan of the beam of the bearing pad), proceed as follows:

Step 1: Determine the area of non-contact between the pad and beam. If the amount of non-contact is less than 20% of the pad area, proceed to Step 2; otherwise eliminate gap by grinding

of bearing surface. A leveling bed of polymer-modified mortar beneath the pad as specified in Section 1080.3(c)2.a may be used instead if approved by the Structural Control Engineer.

Step 2: Measure the maximum gap thickness along the front edge and proceed as follows:

Spans < 100 feet

Gap Thickness $\leq 3/32$ inch:

Leave gap in place.

$3/32$ inch < Gap Thickness $\leq 3/8$ inch:

Eliminate the gap by placing a leveling bed of polymer-modified mortar beneath the pad as specified in Section 1080.3(c)2.a.

Spans \geq 100 feet

Gap Thickness $\leq 1/8$ inch:

Leave gap in place.

$1/8$ inch < Gap Thickness $\leq 3/8$ inch:

Eliminate the gap by placing a leveling bed of polymer-modified mortar beneath the pad as specified in Section 1080.3(c)2.a.

2.a Leveling Bed of Polymer-Modified Mortar, Placement Procedure.

1. Immediately before lifting beam, prepare mortar according to the manufacturer's recommendations. Do not extend mortar by adding coarse aggregate.
2. Lift beam as necessary.
3. Remove pad.
4. Apply a bed of mortar to the beam seat, covering an area approximately 2 inches beyond the perimeter of the bearing pad. Apply the mortar in a thickness approximately $1/8$ inch greater than the maximum actual gap thickness.
5. Place the pad on the mortar.
6. Reset the beam on the pad while the mortar remains plastic.
7. Cure the mortar, as applicable, according to the manufacturer's recommendation.
8. Replace all previously removed preformed cellular polystyrene and closed cell neoprene sponge material around bearing area.

Place mortar according to temperature restrictions recommended by the manufacturer.

Do not place a leveling bed of mortar before the initial setting of beams.

(d) Shear Key Joints Between Adjacent Box Beams.

1. General. Check shear keys for widths. Maximum allowable gap between beams will be the tolerance for horizontal alignment plus $1/2$ inch, as specified in Section 1107.03(e)1.b.

2. Preparation of the Joints. Before shipping, intentionally roughen and clean entire sides of beams where shear keys are present to provide a rough and bondable surface and to remove oil, grease, dirt, or material that would prevent bonding. Just before erection, clean the roughened surface with oil free compressed air, clean stiff-bristle fiber brushes, or vacuum. Seal joints at the bottom of beams below the shear keys with caulking, suitable backer rod, and/or closed cell neoprene sponge as shown on the Standard Drawings.

3. Filling Joints. Fill the longitudinal joints between adjacent beams with nonshrink epoxy grout as specified in Sections 910.2(b) and 1080.2(g). Place grout quickly and continuously into the joints. Follow the manufacturer's recommendations for filling in hot or cold weather.

Do not allow construction activity or other loadings on the bridge for at least 24 hours after the grout has been placed. For vehicular loading, Section 1080.3(d)5 applies.

4. Curing. Start curing immediately after the grout has been placed. Use a double thickness of water-saturated burlap. Keep the burlap wet during the curing period for at least 24 hours. During cold weather, prevent freezing of the grout. Provide curing temperatures of 50F or above.

5. Opening to Traffic. After grouting shear keys, do not allow any traffic on a span until grout compressive strength is 3,200 pounds per square inch minimum.

(e) Protective Coating for Prestressed Concrete Beams. Where indicated, apply an epoxy-resin protective coating, as specified in Section 1019.3(b). Apply coating as specified in Section 1019.3(b). Cure the coating according to the manufacturer's recommendations.

(f) Waterproofing at Abutments. As indicated, place closed cell neoprene sponge on top of abutments, then erect the beams.

Use a wire brush and clean vertical end notches in beams of adjacent box beam bridges, then seal by caulking with a suitable backer rod. Wet the backer rod 1 hour before grouting. Fill the notches with nonshrink grout. Cure with wet burlap for at least 24 hours.

(g) Resetting Expansion Bearings. Where indicated, reset expansion bearings as specified in Section 1050.3(c)4.c.2.

(h) Post-Tensioning Adjacent Box Beams. Post-tension adjacent box beams as indicated and as specified in Section 1108.03.

1080.4 MEASUREMENT AND PAYMENT—Lump Sum. The price includes the following component items.

- **Prestressed Concrete Bridge Beams.** Linear Foot
- **Preformed Neoprene Compression Joint Seal for Bridges.** Section 1008.4
- **Pedestrian Railing.** Section 1012.4
- **Aluminum Bridge Hand Railing.** Section 1023.4
- **Steel Bridge Hand Railing.** Section 1022.4
- **Protective Barrier.** Section 1015.4
- **Protective Fence.** Section 1016.4
- **Protective Coating for Reinforced Concrete Surfaces.** Section 1019.4
- **Tooth Expansion Dam with Drain Trough.** Section 1020.4
- **Armored Preformed Neoprene Compression Dam.** Section 1021.4
- **Reinforcement Bars.** Section 1002.4
- **Neoprene Strip Seal Dam.** Section 1026.4
- **Cement Concrete Structures.** Section 1001.4
- **Fabricated Structural Steel.** Section 1050.4
- **High Load Multi-Rotational Bearings.** Section 1050.4
- **Reset Expansion Bearings, Prestressed Concrete Superstructure.** Each

SECTION 1085—PRECAST REINFORCED CONCRETE BOX CULVERT

1085.1 DESCRIPTION—This work is the manufacture, storage, delivery, installation, and assembly of precast reinforced concrete box culvert segments into one continuous unit.

1085.2 MATERIAL—

- (a) **Cement Concrete.** Section 704, Section 1085.2(e)
- (b) **Deformed Welded Wire Fabric.** Section 709.4
- (c) **Galvanized Specialized Assembly and Tightening Hardware, Sleeves, Lug Plates, Bolts, Nuts, and Washers.** Section 1105.02(d)
- (d) **Nonshrink Grout.** Section 1080.2(c)
- (e) **Precast Reinforced Concrete Box Culvert Segments.** From a manufacturer listed in Bulletin 15. Furnish, test, and place cement concrete as specified in Section 714.7; except, with a minimum 28-day compressive strength of 5,000 pounds per square inch or as shown on the approved shop drawings. Provide concrete as specified in Section 704 and meeting the specified compressive strength or other requirements shown on the approved shop drawings. AASHTO M 259/M 259M or M 273/M 273M; except, modify Section 11, Permissible Variations according to Form TR-28 and as follows:

- **11.1 Internal Dimensions**—Do not allow the internal dimensions to vary from design by more than 1% with a maximum variation of 1 inch. Do not allow the internal diagonal dimensions to vary by more than 1 inch. Do not allow the haunch dimensions to vary more than 1/4 inch from design dimensions.
- **11.2 Slab and Wall Thickness**—Do not allow slab and wall thickness to vary from design dimensions by more than plus 1/2 inch or minus 3/16 inch.
- **11.3 Length of Opposite Surface (square segments only)**—Do not allow laying length of any opposite or opposing surfaces of the box segment to vary more than 1/8 inch/foot of the internal span, with a maximum of 5/8 inch.
- **11.5 Position of Reinforcement**—Do not allow the position of the reinforcement to vary from the approved shop drawings by more than 1/2 inch in any direction. Place reinforcement so the indicated cover clearance does not deviate more than $\pm 1/4$ inch. Provide 1 1/2 inch minimum cover at the mating surface, as measured to the end of the joint.

Certify as specified in Section 106.03(b)3.

- (f) **Reinforcement Bars.** Section 1002.2
- (g) **Waterproofing.** Section 680.2
- (h) **Selected Borrow Excavation - Structure Backfill.** As shown on the Standard Drawings.
- (i) **Concrete Bonding Compound.** Section 706

(j) **Rock Protection.** Section 850.2(a) and as indicated.

(k) **Joint Sealing Compound.** Section 705.4(e)

(m) **Neoprene Joint Material.** Identify neoprene material according to the type, class, and grade. Print, stencil, or otherwise affix this code to each pad at intervals of not more than 24 inches and in letters and numerals of not less than 1/4-inch height. Additional information such as lot or batch numbers, date, plant and place of manufacture, trademark, or name of manufacturer may also be added. Certify as specified in Section 106.03(b)3.

1. Closed-Cell Neoprene Sponge. Pads may be manufactured as sponge neoprene or expanded neoprene and may be composed of laminations. Use material conforming to the following:

- ASTM D1056, Type 2, Class C, Grades 2, 3, 4, and 5, including the requirements of suffixes B3 and F1
- ASTM D 1171, Quality Retention Rating of 100% after 6 weeks exposure

(n) **Post Tensioning Strands.** Section 1108.02(g)

1085.3 CONSTRUCTION—Construct as indicated and according to Article 12.11 of the AASHTO LRFD Specifications.

(a) **Design.** Design according to AASHTO specifications, as supplemented by PennDOT Design Manual, Part 4.

(b) **Shop Drawings.** Obtain approval of shop drawings before fabricating precast box culverts.

Show segment length on drawing. Provide segments of maximum length compatible with hauling equipment in order to minimize the number of joints.

Provide shop drawings as specified in Section 105.02(d).

Provide shop drawings clearly showing all items incorporated into the box culvert including all reinforcing. List items such as chairs and inserts by source, type, and supplier.

(c) **Inspection.** The Department will inspect precast segments during the entire fabrication process. The necessary facilities for inspection include a plant office as specified in Section 714.5(a).

(d) **QC**

1. General. Establish a level of QC based on uniform production practices. Submit the plant's QC Plan and mix design(s) to the Structural Materials Engineer, BDTD, for review and approval. Include with the QC Plan a company organizational chart indicating a separate chain of command from the QC Manager to the Owner/Plant Manager, independent of the Production Manager. Resubmit the QC Plan, mix design, and organizational chart if processes, materials, or personnel change.

2. QC Manager. Provide a QC Manager who has overall responsibility for the adequacy of production facilities, QC, sampling and testing, and fabrication of the product, and who will ensure that items are fabricated as designed and as specified. QC Managers are required to maintain an active ACI Grade I Field Technician Certification.

3. QC Personnel. Assign sufficient qualified personnel with precast concrete experience, to be responsible for QC and sampling and testing during the complete fabrication process, storage, and shipment. Technicians responsible for concrete sampling and testing are required to provide written evidence that they successfully completed the certification requirements for an ACI Grade I, Field Technician or have approval from the Structural Materials Engineer as a technician-in-training. Do not proceed with production until qualified personnel are present and approved.

4. Plant Acceptance. Section 714.4, except, register and certify the plant under either the National Precast Concrete Association (NPCA), American Concrete Pipe Association (ACPA) box culvert or Prestressed Concrete Institute (PCI), box culvert plant certification program. Submit an annual endorsed copy to the Chief Structural Materials Engineer for continued qualification.

(e) Handling and Storage. Handle and store precast reinforced concrete box culvert segments so that damage will not occur to the concrete or reinforcing steel. Provide suitable lifting devices for handling and installing precast reinforced concrete box culvert segments. Galvanize metal devices as specified in Section 1105.02(s). Before shipping, verify gasket material is sufficiently adhered to the joint. Verify gaps are not present between strips of adjacent gasket material. If gaps are present, a minimum of 6 inches must be replaced to assure material is tight.

(f) Delivery. Repair or replace precast reinforced concrete box culvert segments damaged by improper storing, handling, transporting, or erection. Minor damage may be repaired in the field according to Publication 145. Submit major repair procedures beyond the scope of Publication 145 to the Chief Structural Materials Engineer for evaluation and acceptance. Replace any segment that cannot be repaired to the satisfaction of the Representative.

The Representative will inspect the segments at the site for possible damage and cracking during shipment and for tolerances and other dimensions required for acceptance.

Do not ship segments until the 28-day minimum compressive strength is attained.

Provide 24-hour advance notice of loading and shipping schedule. Have the Representative verify Form CS-4171 and properly tag segments before shipping. Do not ship unapproved items.

Before shipping, patch lifting or handling devices that were temporarily used by the fabricator. Repair with Bulletin 15 approved patching material. If temporary lifting or handling devices are deemed necessary to be used during shipping and/or handling at the project site, provide details on the shop drawings for review and acceptance. Repair temporary lifting or handling devices with Bulletin 15 approved patching material.

(g) Architectural Treatment (When Indicated). As specified in Section 1086.3(d) and as indicated:

1. Prefabrication Meeting. Two weeks prior to fabrication, conduct a pre-fabrication meeting at the Fabricator's location to verify shop drawing, catalog cuts, staining materials, and fabrication information.

2. Test Sections (samples). Fabricate samples for acceptance before normal fabrication and after acceptance of the shop drawings and catalog cuts for the architectural treatment. Fabricate samples using the same process and materials that will be used for production. Erect samples at place of manufacture and store outdoors to allow for proper lighting for comparisons during manufacturing and inspection.

Apply penetrating stain, where specified, to one half of sample, to show the final finish after the sample wall is constructed.

Once test sections are fabricated, notify the Department, at least seven days before normal fabrication, so the appropriate Representatives may be present to determine acceptability of the test sections. Representatives may include the Environmental Manager, Project Manager, Design Staff, Construction Staff, Structural Materials Section representative and any other project team member designated by the Department.

Use test sections to determine the acceptability of the various surface treatments based on quality and overall appearance. Provide surfaces uniform in color and free of surface blemishes.

View architectural treatments for the sample and subsequent production pieces for acceptance at a distance of 30 feet, unless otherwise specified.

Produce additional samples until an acceptable product is produced if initial test sections are found to be unacceptable.

Accepted test samples will be used for comparative purposes for accepting production pieces. Additional test sections may be required if test sections are needed at the project site location.

Acceptable samples fabricated to the accepted shop drawings are allowed to be incorporated into the project in the final stage of construction, after all production has been completed and accepted.

(h) Installation Requirements. Submit erection plan for acceptance. Include crane locations, crane capacities, crane operator's license for the operator performing the crane work, setting devices, rigging, and communication

system to be employed during beam setting operations in the erection plan. Maintain an accepted copy of the erection plan onsite during erection operations. Erect culvert according to the accepted erection plan and accepted shop drawings. Have a Professional Engineer registered in the State sign and seal the erection plan. At the project site, the culvert will be inspected for tolerances, dimensions, and damage during shipment. Replace culvert segments damaged by improper storing, handling, transporting, or erecting at no additional cost to the Department. Before setting the culvert, conduct a pre-erection meeting a minimum of 14 calendar days before erection with the Professional Engineer of record for the erection plan, prime contractor, superintendent in charge of culvert setting operation, crane operators or crane company representative, signal personnel, Structure Control Engineer, and onsite Representative to discuss the accepted erection plan. Conduct safety talk with crane operator as specified in Section 108.05(c)6.

1. Foundation Material. Construct foundation as specified in Section 206, excluding Section 206.2(a)1.e. Provide uniform bedding material within 1/4 inch of the elevations shown on the plans. Use templates, screeds, and/or string lines to grade bedding within tolerance.

If unsuitable foundation material or rock is encountered, remove all unsuitable material at least 12 inches or rock at least 24 inches below bottom of box culvert and backfill with No. 2A or AASHTO No. 8 Coarse Aggregate, as shown on the Standard Drawings, graded in close conformity with the stream bed grade to provide proper bedding conditions. Accurately shape bedding material with a template to provide uniform contact (90% of bearing).

2. Grouting. Grout hand holes, pockets, bolt sleeves, tie rod holes, and lifting lugs after joints are sealed and hardware is installed.

3. Placement. Place box culverts as indicated. Do not disturb the bedding or damage the box culvert. Prevent aggregate from entering box culvert segment joints during placement. Place box culvert segments by matching the interior floor, haunches, and wall lines from segment to segment.

4. Backfill. Backfill reinforced concrete box culverts as shown on the Standard Drawings. Backfill trench as specified in Section 601.3(f).

5. Compaction of Cover. If cover or fill is indicated, do not traverse top of box culverts with construction equipment until after cover or fill has been placed, unless cover exceeds 5 feet. Do not use vibratory rollers to compact cover or fill over, or directly adjacent to, box culverts.

6. Waterproofing. Apply waterproofing as specified in Section 680.3 and as shown on the Standard Drawings. Submit a plan to the Department to correct exterior joints that exceed 1/2 inch difference across two adjacent box segments. Ensure waterproofing membrane will have full support and contact across the joint after correction and prior to membrane installation.

(i) Guide Rails. If indicated, install guide rail over box culverts as follows:

For fill heights greater than 24 inches at post locations, provide type 2 strong post guide rail as shown on the Standard Drawings.

For fill heights 24 inches or less at post locations, provide structure mounted guide rail as shown on the Standard Drawings and furnish a Class A cement concrete headwall.

(j) Cutoff Walls. If indicated, provide cast-in-place or precast cutoff walls of 12-inch thick by 42-inch deep Class A cement concrete, or less if directed, and install upstream and downstream. If indicated, install alternate cut off wall with grouted rock.

(k) Wingwalls. If indicated, provide cast-in-place Class A cement concrete wing walls.

(l) Aprons. If indicated, provide aprons of 6-inch thick Class A cement concrete, reinforced as shown on the Standard Drawings.

(m) Concrete Bonding Compound. If cutoff walls or wing walls are indicated, bond to box culvert by coating the contact surfaces with concrete bonding compound.

(n) Protective Coating. If indicated, apply two spray coats of coal tar epoxy, conforming to the requirements of SSPC-PS 16-82, to the top of the box and exposed end faces and to the entire height of the outside walls.

(o) Curing. Section 714.8; except, maintain box culvert segments, after stripping and during secondary curing, in a minimum 50F environment until they have reached a compressive strength of 70% of the required 28-day minimum concrete design strength shown on the approved shop drawings.

(p) Post-Tensioning. Install precast culvert segments as shown on the Standard Drawings, as indicated, and as specified in Section 1108 and as described below:

1. Post-Tensioning Sequence. Provide a post-tensioning sequence that will not cause misalignment of box culvert segments. Skewed segments may require tensioning of corners prior to internal post-tensioning locations. Determine post-tensioning sequence, staging, etc. based on the weight of segments being tensioned. Deviating from the established post-tensioning sequence, due to field adjustments, must be approved by the District Bridge Engineer, or their designee.

2. Gasket Material. Provide full contact of the gasket material around the perimeter of each joint. Remediate joints that are not sealed, to the satisfaction of the Representative.

3. Grouting Strand Ducts. If grouting is not going to be performed during the same day the tendons are stressed, then within 4 hours after stressing, protect the tendons and grout ducts against corrosion and debris by temporarily sealing all openings and vents, cleaning rust and other debris from all metal surfaces to be covered by the grout cap; and placing the grout cap, including a seal, over the anchor plate until the tendon is grouted.

Grout ducts within 3 calendar days after tensioning.

Failure to grout the ducts within 3 calendar days after tensioning will require the contractor to demonstrate the ducts are unobstructed to achieve complete grouting. If obstruction(s) are present, clean ducts to remove obstructions and re-inspect prior to grouting.

1085.4 MEASUREMENT AND PAYMENT—

(a) Precast Reinforced Concrete Box Culvert. Lump Sum

The price includes the following component items:

- **Cement Concrete.** Section 1001.4(a)
- **Deformed Welded Wire Fabric.** Section 1001.4(b)3
- **Precast Reinforced Concrete Box Culvert Segments.** Linear Foot
The unit price includes post-tensioning, if indicated.
- **Reinforcement Bars.** Section 1002.4
- **Membrane Waterproofing.** Section 680.4
- **Selected Borrow Excavation - Structure Backfill.** Section 1001.4(g)
- **Rock Protection.** Section 850.4(a)
- **Protective Coating (Coal Tar Epoxy).** Square Yard

(b) **Guide Rail.** Section 620.4

(c) **Excavation for Unsuitable Material or Rock.** Section 204.4

(d) **Backfill for Unsuitable Material or Rock Excavation.** Cubic Yard
The Department will pay as specified in Section 110.03.

SECTION 1086—SOUND BARRIERS

1086.1 DESCRIPTION—This work is the construction of either structure mounted, ground mounted, or offset sound barrier walls.

1086.2 MATERIAL—

(a) Wall Posts.

1. Structural Steel Posts.

- Structural Steel Shapes and Plates - Section 1105.02(a)2
- Structural Steel Tubing - ASTM A53/A53M, Grade B, Type E
- Anchor Bolts, Nuts, and Washers - Section 1105.02(c)3 galvanized as specified in Section 1105.02(s).
- Oversize Washers - Section 1105.02(a)2 galvanized and painted after fabrication as specified in Section 1105.02(s) and Section 1060.2(b).
- Welded Studs - Section 1105.02(e)
- Welding Material - Section 1105.02(t)
- Galvanizing- Section 1105.02(s)
- Paint - Section 1060.2(b)

2. Precast Reinforced Concrete Posts. Section 714

- Class AA Cement Concrete, Modified - Provide cement concrete as specified in Section 704; except, with a minimum 28-day compressive strength of 5,000 pounds per square inch.
- Structural Steel Base Plates - Section 1105.02(a)2 galvanized after fabrication as specified in Section 1105.02(s).
- Anchor Bolts, Nuts, and Washers - Section 1105.02(c)3 galvanized as specified in Section 1105.02(s).
- Oversize Washers - Section 1105.02(a)2 galvanized after fabrication as specified in Section 1105.02(s).
- Deformed Reinforcement Bars - Section 1002
- Deformed Welded Wire Fabric - Section 709.4

(b) Wall Panels.

1. Precast Reinforced Concrete Panels and Offset Wall Panels. Section 714

- Class AA Cement Concrete, Modified: Provide cement concrete as specified in Section 704; except, with a minimum 28-day compressive strength of 5,000 pounds per square inch.
 - Provide light weight concrete in the structure mounted sound barrier panels when specified to achieve a maximum oven dry density of 115 pounds per cubic foot. Verify the oven dry density of concrete in accordance with ASTM C567 during qualification of the mix design. Following mix design approval, perform oven dry unit weight testing in accordance with ASTM C567 for each lot. Proportion mix design in accordance with ACI 211 for structural lightweight concrete.
- Deformed Reinforcement Bars - Section 1002
- Steel Welded Wire Fabric - Section 709.3

(c) Finish. Provide texture (architectural surface treatments) and color of panels as specified in the proposal. Color and texture to be uniform from panel to panel and post to post.

(d) Penetrating Stain (Where Indicated). See Special Provisions in the proposal.

(e) Foundations.

1. Drilled Caissons. Section 1006.2

2. Spread Footings.

- Class A Cement Concrete - Section 704
- Deformed Reinforcement Bars - Section 1002

(f) Steel Cables (in precast concrete panels) and Accessories for Structure Mounted or Ground Mounted Sound Barrier Walls.

- Bolts - Section 1105.02(c)1
- Nuts - Section 1105.02(c)2.a
- Washers - Section 1105.02(c)2.b
- Galvanize and Paint all bolts, nuts, washers, and other hardware as specified in Section 1105.02(s) and Section 1060.2(b).
- Galvanized Steel Flexible Wire Rope - 3/8 inch 7 x 19 with a minimum breaking strength of 35.6 8 kips.
- Thimbles - Galvanized Heavy-Duty for 3/8 inch wire rope meeting the requirements of Federal Specification FF-T-267B, Type II.
- Galvanized Wire Rope Clips - 3/8 inch.
- Steel Pipe - ASTM A53/A53M, Grade B, Type E galvanized as specified in Section 1105.02(s).

(g) Steel Cables and Accessories for Offset Sound Barrier Walls.

- Stainless Steel (Type 302 or 304) Flexible Wire Rope (Aircraft Cable) - 3/8 inch 7 x 19 in accordance with MIL-W-83420 with a minimum breaking strength of 12 kips.
- Stainless Steel (Type 302 or 304) Internally Threaded Terminals - 5/8 inch outside diameter, swaged to cable, in accordance with MIL-T-6117. Provide compression fittings with a minimum breaking strength equal to or greater than the cable.
- Stainless Steel (Type 304) Hex Head Cap Screws - 1/2 inch - 13 UNC.
- Stainless Steel (Type 304) Washers.
- PVC Pipe (Schedule 40) - Section 1101.09(b)1.

(h) End Panel Connection for Offset Sound Barrier Walls.

- Structural Steel Angles - Section 1105.02(a)2 galvanized after fabrication as specified in Section 1105.02(s).
- Anchor Bolts, Nuts, and Washers - Section 1105.02(c)2 galvanized as specified in Section 1105.02(s).
- Thru Bolts - Section 1105.02(c)1 galvanized as specified in Section 1105.02(s).
- Nuts - Section 1105.02(c)2.a galvanized as specified in Section 1105.02(s).
- Washers - Section 1105.02(c)2.b galvanized as specified in Section 1105.02(s).
- PVC Pipe (Schedule 40) - Section 1101.09(b)1

(i) Access Door in Precast Concrete Panels (Where Indicated).

- Door and Frame - As manufactured by Windsor Republic Doors, Steelcraft, Pioneer Industries, or and approved equal. Refer to Standard Drawings for additional information.

(j) Other Material.

- Adhesive - as required and as specified by the manufacturer.
- Joint Sealing Material - Section 705.4(a)
- Caulking Compound - Section 705.8(b)
- Joint Backing Material (Backer Rod) - Section 705.8
- Epoxy Bonding Compound - Section 706.1

- Non-shrink Grout - Section 1080.2(c)
- Closed Cell Neoprene Sponge - Section 1085.2(m)
- Unreinforced, Plain Neoprene Bearing Pads - Sections 1113.02(a), 1113.03(a), 1113.03(d), and 1113.03(g). Mark each bearing pad in indelible ink or flexible paint with at least one of the following: order number, lot number, or any unique identifier marking traceable to a specific lot of bearing pad material. Markings may be on any surface of the bearing pad. Sample the completed bearing pads according to PTM No. 312, except reduce the sampling rate to three bearing pads per structure.
- Integral Color Pigmentation (Where Indicated) - See Special Provisions in the proposal.
- Lifting Inserts - Galvanized and as specified by Fabricator.
- Paint Color (Where Indicated) - See Special Provisions in the proposal.

(k) Certification. Section 106.03(b)3

1086.3 CONSTRUCTION—Before fabrication, obtain acceptance of shop drawings. Construct as indicated on the contract drawings, Standard Drawings, as shown on the accepted shop drawings, and as follows:

(a) Design.

1. General. Provide fire hydrant openings and other highway access (doors) as indicated. Provide adequate reinforcement around panel openings to prevent cracking. Show reinforcement details, in accordance with the Standard Drawing, on the shop drawings.

Submit design calculations, for acceptance, for the precast concrete panels in accordance with the requirements of the Standard Drawings.

Submit design calculations, for acceptance, for the panel and post lifting inserts for actual strength of concrete at time of stripping, transportation, and erection in accordance with the requirements of the Standard Drawings.

2. Ground Mounted and Offset Sound Barrier Walls. Refer to the contract drawings for the finished ground and acoustical profile elevations. Protect final ground elevations, established in the field, for the duration of the project and do not adjust without prior acceptance.

3. Structure Mounted Sound Barrier Walls. Refer to the contract drawings for the top of barrier/wall and acoustical profile elevations.

(b) Shop Drawings. Before beginning fabrication, submit, for acceptance, shop drawings showing fabrication details and handling and transportation procedures for all wall elements including connections. Submit shop drawings for the posts and panels concurrently.

(c) Erection and Construction Procedure. Submit erection and construction procedures for acceptance with the shop drawings.

(d) Catalog Cuts. Prepare and submit the following catalog cuts, for acceptance, with the shop drawings (if applicable):

1. Architectural Surface Treatments (When Indicated) indicating the following minimum information:

- Name of Manufacturer
- Pattern name and number
- Minimum, maximum, and average relief
- Joint Widths
- Liner material type
- Schematic drawing of Form Liner layout for each panel type

2. Lifting inserts indicating the following minimum information:

- Name of Manufacturer
- Specification
- Product Name, number and lifting capacity
- Minimum concrete strength for lifting insert
- Design information and calculations

3. Integral Color Pigmentation (When Indicated) indicating the following minimum information:

- Name of Manufacturer
- Product number and color number
- Specification

4. Caulking Compound/Joint Sealing Material indicating the following minimum information:

- Name of Manufacturer
- Product number and color number
- Specification

5. Provide any other catalog cuts required for other products used in the construction of the Sound Barrier Wall.**(e) Installation Requirements.****1. Foundations.**

1.a. Drilled Caissons. Construct drilled caisson foundations as specified in Section 1006.3, and as follows:

Construct embankments and/or cut existing grade to the top of caisson elevations before construction of the caissons.

Provide vertical and tie reinforcement for the full height of the shaft. If the bottom of the caisson elevation is lower than required, then either provide additional vertical and tie reinforcement, at no additional cost to the Department, or suspend the reinforcement cage such that the reinforcement is in the proper position relative to the top of caisson elevation.

Provide test holes and probe holes only as indicated.

When permanent casing is used, drill, drive, or vibrate casing so soil is in full contact with the outside of the casing. Alternatively, place casing in an oversized hole and grout the annular space between the permanent casing and the surrounding soil to establish lateral support. Grout after the concrete has obtained its initial set but no later than 24 hours after placement of the concrete. Where excavation is stable and not subject to rapid degradation, the 24 hour period may be extended to 72 hours, as allowed. Use a pressurized grouting method capable of completely filling the open area. Provide grout as specified in Section 1108.03(f)1, except testing is not required.

When temporary casing is used, remove casing as specified in Section 1006.3(i). If unexpected construction conditions require the casing to remain in place, perform grouting as specified for permanent casing to fill cavities surrounding the casing.

Place caisson concrete within 24 hours of the completion of excavation and within 3 hours of final inspection of the drilled shaft. Where excavation is stable and not subject to rapid degradation, the 24 hour period may be extended to 72 hours, as allowed.

1.b. Spread Footings. Construct concrete spread footings as indicated, as specified in Section 1001.3, and as follows:

Construct embankments and/or cut existing grade to the top of footing elevations.

Excavate and backfill foundation areas as specified in Section 204.3; and compact using a mechanical tamper.

If unsuitable foundation material is encountered, remove all unsuitable material at least

12 inches or as specified or directed below the bottom of spread footing elevation and backfill with compacted No. 2A Coarse Aggregate or Class C Cement Concrete as specified or directed.

2. Fabrication.

2.a. Precast Concrete Posts and Panels. Fabricate precast concrete posts and panels as specified in Section 714, as indicated on the accepted shop drawings, and as follows:

Use only pre-approved Fabricators listed in Bulletin 15.

Obtain acceptance of the concrete mix design before fabrication.

Obtain initial acceptance of any architectural surface treatments before production of Test

Posts and Panels.

Fill all holes in the precast concrete posts and panels, resulting from fabrication, with an accepted non-shrink grout (color to match panel/post).

Ensure that precast concrete posts and panels are cast in one continuous lift to eliminate cold joints.

Fabricate panels in a manner that will produce a secure and vibration free installation.

Provide a smooth finish on the portions of panels, being placed in post flanges or in contact with adjacent panels, as shown in the Standard Drawing.

Furnish full height panels or stacked panel sections with tongue and groove or interlocking joints that provide "light tight" conditions at the joints and prevent direct transmission of sound.

Furnish top panels with a smooth finish on the top side.

Furnish bottom panels with a smooth finish on the bottom side.

Repair defects in accordance with Publication 145.

Replace cracked or damaged posts and panels which cannot be repaired to the satisfaction of the Representative.

2.b. Steel Cables (in precast concrete panels) and Accessories. Assemble three sample connections and submit for testing and acceptance before panel fabrication. Samples must be assembled by the same process that is used for production panels.

Galvanized Wire Rope Clips: Tighten nuts evenly in accordance with the manufacturer's recommendations. Confirm tension via torque verification.

2.c. Threaded Reinforcement Bars in Precast Concrete Posts with Base Plate Connections. Provide either epoxy coated or galvanized reinforcement bars. Thread end of bar or provide upset threads as specified. Fabricate in accordance with the following procedure:

Cut threads on one end of bar.

Clean any cutting lubricant from threads and bar and apply two coats of zinc oxide paint meeting the requirements of ASTM A780 to the threaded portion of the bar.

Assemble reinforcement and base plate assembly. Overtap nuts, if required, to accommodate the additional material on the bolt threads.

2.d. Structural Steel Posts. Fabricate steel posts as specified in Section 1105.03, as indicated on the accepted shop drawings, and as follows:

Use only pre-approved Fabricators listed in Bulletin 15.

Furnish posts which are galvanized and painted as specified in Section 1105.02(s) and Section 1060.2(b).

Furnish paint color as indicated or directed.

2.e. Steel Cables and Accessories for Offset Sound Barrier Walls. Assemble three sample connections and submit for testing and acceptance before panel fabrication. Samples must be assembled by the same process that is used for production panels.

2.f. Test Posts and Panels. Fabricate Test Posts and Panels (samples) for acceptance before normal fabrication and after acceptance of the shop drawings and catalog cuts for the panels and posts.

Ground Mounted Sound Barrier Walls and Structure Mounted Sound Barrier Walls: Fabricate and erect a sample wall consisting of a minimum of three posts and two panel sections. Provide post

heights that meet or exceed the average post height for the sound barriers on the project. Provide sufficient number of panels in order to match the height of the posts.

Offset Sound Barrier Walls: Fabricate and erect a sample wall consisting of a minimum of three panel sections (lengths). Provide sections that meet or exceed the average wall height for the sound barriers on the project.

Fabricate samples using the same process and materials that will be used for production. Erect sample walls at the place of manufacture and store outdoors to allow proper lighting for comparisons during manufacturing and inspection.

Apply penetrating stain, where specified, to one half of wall, per side, to show the final finish after the sample wall is constructed.

Use test sections to determine the acceptability of the various surface treatments, uniform color, free of surface blemishes, quality of construction, and overall appearance of both the roadway and residential sides of the sound barrier wall. Provide integrally colored posts and panels that are uniform in color consistency and free from discoloration and blemishes. Galvanize and paint structural steel posts as specified.

View architectural treatments for the sample wall and subsequent production for acceptance at a distance of 30 feet, unless otherwise specified.

Notify the Department, at least 14 days before the construction of the Test Panels and Posts, so the appropriate Department representatives may be present to determine acceptability. Department representatives may include the Environmental Manager, Project Manager, Design Staff, Construction Staff, and any other project team member designated by the Department.

Department representatives will determine whether the color and various surface treatments of the posts and panels are acceptable. Produce additional samples until an acceptable product is produced if initial test sections are found to be unacceptable.

Acceptable samples fabricated according to the accepted shop drawings are allowed to be incorporated into the project in the final stage of construction, after all production has been completed and accepted. Production panels and posts not conforming to the accepted test sections will be rejected.

3. Erection. Install sound barrier wall as indicated, as shown on the accepted shop drawings, and according to the manufacturer's recommendations.

Provide cranes that are sized to handle the posts and panels safely at the required height and reach.

Erect posts truly vertical.

Erect panels truly vertical in a manner that will provide a secure and vibration free system installation.

Pack or place non-shrink grout in locations as shown. Do not pour or inject grout.

Provide joints and connections with no visible openings or gaps to decrease sound attenuation.

Fill all lifting inserts, in all concrete panels and posts, with an accepted non-shrink grout (color to match panel/post).

Seal all open joints and holes with joint sealing material or caulking compound.

Apply penetrating stain when indicated. Stain to extend a minimum of 6 inch below finished ground line.

Construct finished ground as indicated or directed. Use only hand-operated compaction equipment within 4 feet of the sound barrier when backfilling.

Contractor is responsible for overall fit of wall.

4. Removal of Falsework and Bracing. Keep falsework and bracing that supports posts in place for at least 48 hours after placing the final portion of the foundation.

(f) Tolerances.

1. Fabrication Tolerances.

1. a. Reinforced Precast Concrete Posts and Panels. Section 714 and as indicated in Publication 145.

1. b. Structural Steel Posts – ASTM A6

1. c. All Others.

ENGLISH

<u>Panels</u>	<u>(inch)</u>	<u>Post</u>	<u>(inch)</u>
Height:	±1/4	Length:	±1/4
Length:	±1/4	Width:	±1/4
Thickness:	±1/4	Depth:	±1/4
Out of Flatness:		Slot Depth:	±1/8
• Lengths to 8 feet:	1/8	Slot Width:	±1/8
• Lengths over 8 feet:	1/4	Out of Flatness:	
		• Lengths to 8 feet:	1/8
		• Lengths over 8 feet:	1/4

1.d. Steel Base Plate Flatness. Machine surfaces to within 0.01 inch of flatness. Determine flatness as specified in Section 1111.03(c).

1.e. Galvanized Lifting Inserts. Set inserts within ± 1 inch of the indicated location.

1.f. Steel Pipe in Precast Concrete Panels. Set steel pipe, for thru bolt, in precast concrete panels within ± 1/8 inch of the indicated location.

1.g. PVC Pipe in Offset Sound Barrier Panels. Set PVC pipe, for cable connection, in precast concrete panels ± 1/2 inch of the indicated location.

2. Architectural Surface Treatment Tolerances.

2.a. General. Provide architectural surface treatment patterns that are continuous and uninterrupted across horizontal joints in stacked panels.

2.b. Vertical Alignment for Stacked Panels (top-to-bottom). Provide a tolerance of ± 1/2 inch for the vertical alignment of the architectural surface treatment pattern between stacked panels.

2.c. Horizontal Alignment between Adjacent Panels (side-by-side panels). Provide a tolerance of ± 2 inch for the horizontal alignment of the architectural surface treatment pattern at adjacent panels.

2.d. Seam Lines between Form Liners. Assemble non-continuous form liner sections such that seams lines or match lines are not apparent when viewing the completed panels.

3. Erection Tolerances.

3.a. Vertical Alignment.

Height of Wall	Vertical Alignment of Walls and Posts
≤ 10 feet	1/4 inch
≤ 20 feet	1/2 inch
> 20 feet	3/4 inch

3.b. Horizontal Alignment. Horizontal alignment for walls and posts to be within ± 1/2 inch of the indicated location.

3.c. Posts. Set posts within ± 1/2 inch of the indicated location.

3.d. Post Rotation. Set orientation of post within ± 2 degrees of the indicated location.

3.e. Anchor Bolts. Set anchor bolts within ± 1/4 inch of the indicated location.

3.f. Top of Barrier, Wall, Caisson, Footings, Pedestals, and Raised Panel Seat

Elevations. Set elevations within $\pm 1/2$ inch of the indicated location.

3.g. Grout Depth under Base Plate. Set grout depth within $\pm 1/4$ inch of the indicated

thickness.

(g) Reject Individual Posts and Panels for any of the following:

- Production panels and posts not conforming to the accepted test sections.
- Fractures and cracks passing through the panel or post.
- Defects that indicate proportioning, mixing, and molding not in compliance with the specifications or as indicated.
- Honeycombed open texture.
- Damaged ends where such damage would prevent making a satisfactory joint.
- Twenty-eight day cylinder strength is less than design concrete strength.
- Defective welding.
- Dimensions not conforming to the allowable tolerances specified.

Panels and posts may be rejected either at the fabrication shop or at the construction site, even after installation, but before acceptance of project.

Mark the rejected post or panel "Rejected for the Department's Use" with waterproof paint.

1086.4 MEASUREMENT AND PAYMENT—**(a) Wall Posts.** Each

The price includes excavation, foundation, post, base plate, bearing pads, and all associated hardware.

(b) Wall Panels. Square Foot

Measured to equal the total area of the panel including areas concealed by posts or finished ground. The unit price includes all joint sealing materials and all associated hardware.

(c) Offset Sound Barrier Wall. Square Meter (Square Foot)

Measured to equal the total area along the Sound Barrier Control line disregarding the offset. The barrier height will be measured from the top of wall to the bottom of wall (top of footing). The barrier length will be measured from begin to end of wall. The price includes excavation, foundation, bearing pads, joint sealing material, and all associated hardware.

(d) Sound Barrier Access Door. Each

The price includes installation of door in wall panel and all associated hardware.

(e) Excavation for Unsuitable Material. Section 204.4

Class 3 Excavation required for the over excavation of unsuitable material below the bottom of spread footing elevation as indicated or directed.

(f) Backfill for Unsuitable Material. Section 1001.4

Backfill over excavated area with compacted No. 2A Coarse Aggregate or Class C Cement Concrete as indicated or directed.

SECTION 1088—PA TYPE 10M BRIDGE BARRIER

1088.1 DESCRIPTION—This work is the construction of a PA Type 10M Bridge Barrier.

1088.2 MATERIAL—Unless otherwise specified, galvanize steel materials as specified in Section 1105.02(s). Before fabrication, submit shop drawings as specified in Section 105.02(d) for review and acceptance.

(a) Railing.

- Steel Cold Formed Tubes. ASTM A500, Grade B or C
- Threaded Welded Anchor Stud for Barrier Rail Tube. ASTM A108
- Sidewalk Rail Tubes. Section 1022.2(a)
- Toggle Bolts for Sidewalk Rail Tube. Section 1022.2(b)
- Railing Posts. ASTM A709, Grade 50 or 50W or ASTM A992
- Base Plates. ASTM A709, Grade 50 or 50W
- Test Requirements for Post Welds. At least 10% of the posts in a lot as defined in AWS D1.5-D1.5M-2008, Section 6.7.1(c), will be inspected. A visual inspection and magnetic particle testing will be performed over the full length of the welds on all posts inspected. Ultrasonic testing of the complete joint penetration welds will also be performed. If unacceptable discontinuities are found in more than 20% of the welds tested, an additional 10% of the posts in the same lot will be inspected. If unacceptable discontinuities are found in more than 20% of the welds tested in the second group of posts, all of the remaining posts in the lot will be inspected.
- Welding Material. Section 1105.02(t)
- Miscellaneous. Section 1105.02(a)2

Certify as specified in Section 106.03(b)3.

(b) Anchor Bolts, Nuts, and Washers. Section 1105.02(c)(3), galvanized as specified in Section 1105.02(s).

(c) Delineation Devices. Section 937.2

(d) Caulking Compound. Section 705.7

1088.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated, and as follows:

(a) General. Coat surfaces of posts in contact with concrete thoroughly, using caulking compound, before erection. Use caulking compound and seal openings between metal surfaces and concrete after erection and alignment.

Remove blemishes and scratches from exposed surfaces. For areas that have been damaged, exposing base metal, paint with two coats, according to ASTM A780.

Place joints, as indicated.

At bend area, do not vary the diameter of rail tubes by more than 5% of the outside dimension when rail tubes are

bent to the radii indicated.

Do not open bridge to traffic until bridge railing is placed.

(b) Welding. Section 1105.03(m)

1088.4 MEASUREMENT AND PAYMENT—Linear Foot, measured from end to end of barrier.

Caulking compound as specified in Section 705.7 is incidental.

SECTION 1089—PA BRIDGE BARRIER

1089.1 DESCRIPTION— This work is the construction of a PA Bridge Barrier.

1089.2 MATERIAL— Unless otherwise specified, galvanize steel materials as specified in Section 1105.02(s). Before fabrication, submit shop drawings as specified in Section 105.02(d) for review and acceptance.

(a) Railing.

- Steel Cold Formed Tubes. ASTM A 500, Grade B
- Threaded Welded Anchor Studs for Barrier Rail Tube. ASTM A 108
- No Thread Welded Anchor Studs for Barrier Rail Splice. ASTM A 108
- Sidewalk Rail Tubes. Section 1022.2(a)
- Threaded Welded Anchor Studs for Sidewalk Rail Tube. ASTM A 108
- Sidewalk Rail Rod. Section 1105.02(a)2
- Sidewalk Rail Rod Splice. ASTM A513 or A519
- Railing Posts. ASTM A709, Grade 50 or 50W or ASTM A992
- Base Plates. ASTM A709, Grade 50 or 50W
- Test Requirements for Post Welds. All welds on all posts will be visually inspected. In addition, at least 10% of the posts in a lot as defined in AWS D1.5/D1.5M-2008, Section 6.7.1.2(2)(c), will be inspected as follows: Magnetic particle testing will be performed over the full length of the welds on all posts inspected. Ultrasonic testing of the complete joint penetration welds will also be performed. If unacceptable discontinuities are found in more than 20% of the welds tested, an additional 10% of the posts in the same lot will be inspected. If unacceptable discontinuities are found in more than 20% of the welds tested in the second group of posts, all of the remaining posts in the lot will be inspected.
- Welding Material. Section 1105.02(t)
- Miscellaneous. Section 1105.02(a)2

Certify as specified in Section 106.03(b)3.

(b) Anchor Bolts, Nuts, and Washers. Section 1105.02(c)3, galvanized as specified in Section 1105.02(s).

(c) U-Shaped Washer. Section 1105.02(a), galvanized as specified in Section 1105.02(s).

(d) Delineation Devices. Section 937.2

(e) Caulking Compound. Section 705.7

1089.3 CONSTRUCTION—As shown on the Standard Drawings, the Contract Drawings, and as follows:

(a) **General.** Coat surfaces of posts in contact with concrete thoroughly, using caulking compound, before erection. Use caulking compound to seal openings between metal surfaces and concrete after erection and alignment.

Remove blemishes and scratches from exposed surfaces. For areas that have been damaged, exposing base metal, repair galvanizing according to ASTM A780.

Place joints, as indicated.

At bend area, do not vary the diameter of rail tubes by more than 5% of the outside dimension when rail tubes are bent to the radii indicated.

Do not open bridge to traffic until bridge railing is placed.

(b) **Welding.** Section 1105.03(m)

1089.4 MEASUREMENT AND PAYMENT—Linear Foot, measured from end to end of barrier.

Caulking compound as specified in Section 705.7 is incidental.

SECTION 1090 – BRIDGE PRESERVATION AND REHABILITATION

1090.1 DESCRIPTION – This work is bridge preservation and rehabilitation as follows:

(a) Preformed Neoprene Compression Seal Replacement. This work is the replacement of compression seals for unarmored and armored joints.

(b) Expansion Dam Replacement. This work is the furnishing and installation of neoprene strip seal expansion dams for bridge joints of the indicated movement classification, including the necessary fabricated structural steel. This work also includes the removal of existing expansion dams, cover plates, railing, barrier, sidewalk, and portions of bridge deck for the installation of new neoprene strip seal expansion dams.

(c) Neoprene Strip Seal Replacement. This work is the removal of existing neoprene strip seal gland and replacement with a new neoprene strip seal gland of the indicated movement.

(d) Prestressed Concrete Beam Repairs. This work is repairing unsound and spalled areas of prestressed concrete beams.

1090.2 MATERIAL –

(a) Preformed Neoprene Compression Seal Replacement. Section 1008.2.

(b) Expansion Dam Replacement. Section 1026.2 and as follows:

- Class AAAP Cement Concrete – Section 704, except use No. 8 coarse aggregate.
- Class AA Cement Concrete – Section 704, except use No. 8 coarse aggregate.
- Accelerated Structural Concrete (ASC) – Section 704, except use No. 8 coarse aggregate.
- Reinforcement Bars – Section 709.1
- Epoxy Bonding Compound – Type II, Grade 2, ASTM C 881 epoxy as specified in Section 706
- Forms – Section 1001.2(h)
- Mechanical Splice System – Section 1002.2(c)

(c) Neoprene Strip Seal Replacement. Section 1026.2(e)

(d) Prestressed Concrete Beam Repairs.

- Galvanized Spray – ASTM A780
- Concrete Bonding Compound – Section 706, ASTM C881, Type II, Grade 2 from a manufacturer listed in Bulletin 15 compatible with patching material
- Steel Expansion Anchor Pins – Section 1105.02(c), 3/8 inch diameter, galvanized according to ASTM B633
- Welded Wire Fabric (WWF) – Section 709.3(b), 4x4-W2.1xW2.1 min.
- Polymer Modified Rapid Hardening Concrete Patching Material – From a manufacturer listed in Bulletin 15
- Penetrating Sealer – Section 1019

1090.3 CONSTRUCTION – As shown on the Standard Drawings and as follows:

(a) Preformed Neoprene Compression Seal Replacement. Remove existing sidewalk cover plates, barrier cover plates, seal material, foam, and joint filler. Retain cover plates and re-install after joint has been re-sealed. During removal operations, do not damage portions of the structure to remain. Repair areas damaged beyond the removal limits at no additional cost to the Department.

1. Unarmored Joint Seal Replacement. If minor spalling is present along the joint, sawcut a new seal groove as specified in Section 1008.3(c). If spalling cannot be removed by sawcutting a new seal groove, perform repairs as directed and as specified in Section 1040. Install seal as specified in Section 1008.3(d).

2. Armored Joint Seal Replacement. Before installing the seal, clean metal surfaces according to SSPC-SP6 in direct contact with the seal. Install seal as specified in Section 1021.3.

(b) Expansion Dam Replacement.

1. Standard Method. Follow standard method if indicated:

1.a Removal. Install falsework and shielding before removal. Remove barrier railings and posts as required to perform the indicated repairs. Do not damage or cut. Set aside for reuse. Remove existing barrier and sidewalk cover plates, dam and portions of existing deck, barrier, and median to the limits indicated or delineated by the Representative. Provide a 1 inch sawcut at all removal limits to create a neat removal line. Use pneumatic hammers not exceeding an impact rating of 30 foot-pounds or hand tools to remove concrete. Do not use excavators or large equipment with hammer attachments to remove concrete. During removal operations, do not damage portions of the structure to remain. Do not cut existing reinforcement that is to remain. Repair areas damaged beyond the removal limits at no additional cost to the Department.

1.b Preparation. Abrasive blast or wire brush exposed existing reinforcement that is to remain to near white metal and to remove loose concrete chips. Coat existing reinforcement to remain with an approved epoxy paint before placing new concrete.

1.c Repair. Install formwork and place reinforcement as indicated and specified in Section 1002.3. Apply epoxy bonding compound according to the manufacturer's specifications. Place Class AAAP Cement Concrete at blockout in bridge deck as indicated and against contact surface while epoxy bonding compound is still tacky to ensure bond between contact surface and fresh concrete. Place Class AA Cement Concrete in barrier as indicated. Cure concrete as specified in Section 1001.3(p)3.b.2. Clean extrusion and install neoprene seal as specified in Section 1026.3. Reset barrier rail once barrier concrete has hardened sufficiently to support the rail.

2. Accelerated Method. Follow accelerated method if indicated:

2.a Removal. Install falsework and shielding before removal. Remove barrier railings and posts as required to perform the indicated repairs. Do not damage or cut. Set aside for reuse. Remove existing barrier and sidewalk cover plates, dam, and portions of existing deck, barrier, and median to the limits indicated or delineated by the Representative.

Provide two sawcuts. Provide first sawcut 6 inches from the removal limit (dam side) to a depth of 1 inch from existing beams. Remove concrete using an excavator with hammer attachment not exceeding an impact rating of 500 foot pounds. Provide second sawcut, 1 inch maximum depth at the removal limit and remove the remaining concrete with pneumatic hammers not exceeding an impact rating of 30 foot-pounds to expose 6 inches of the existing longitudinal reinforcement to accommodate a mechanical coupler. During removal operations, do not damage portions of the structure to remain. Repair areas damaged beyond the removal limits at no additional cost to the Department.

2.b Preparation. Section 1090.3(b)1.b.

2.c Repair. Install formwork and place reinforcement as indicated and specified in Section 1002.3. Using mechanical couplers, install longitudinal reinforcement. Install transverse reinforcement and all barrier reinforcement damaged during the removal operations. Apply epoxy bonding compound according to the manufacturer's specifications. Place ASC at blockout in bridge deck as indicated and against contact surface while epoxy bonding compound is still tacky to ensure bond between contact surface and fresh concrete. Place ASC in barrier as soon as bridge deck concrete in blockout can support the barrier concrete and as indicated. Cure as specified in Section 1001.3(p)3.d. Clean extrusion and install neoprene seal as specified in Section 1026.3. Reset barrier rail once barrier concrete has hardened sufficiently to support the rail.

(c) Neoprene Strip Seal Replacement. Field measure existing extrusion and upturn locations. Provide field measurements to seal manufacturer and provide replacement seals for the movement classification indicated and according to the manufacturer's recommendations. Remove existing barrier and sidewalk cover plates. Remove existing strip seal gland. Abrasive blast or wire brush areas of rust on the extrusion to clean white metal. Use galvanizing spray to coat blasted or brushed areas. Clean extrusion and install seal as specified in Section 1026.3. Reinstall barrier and sidewalk cover plates.

(d) Prestressed Concrete Beam Repairs. Perform repairs as shown on the Standard Drawings.

1. Equipment.

1.a Hand Tools. Use hand tools for removal including hammers and chisels.

1.b Pneumatic Hammers. Use pneumatic hammers for removal not exceeding 15 foot-pounds.

- Do not operate pneumatic hammers at an angle in excess of 45 degrees relative to the surface of the beam.
- Do not place pneumatic tools in direct contact with reinforcement bars or strands.

1090.4 MEASUREMENT AND PAYMENT –

(a) Preformed Neoprene Compression Seal Replacement. Linear Foot.

For unarmored joints, the unit price includes sawcutting a new seal groove. Repairs as specified in Section 1040 will be paid separately.

(b) Expansion Dam Replacement. Linear Foot.

For the method and movement indicated. Measured out-to-out along the centerline of the exposed surfaces of the seal and the steel plates, including sidewalks if applicable, following the vertical and sloped faces of curbs and barriers, resulting in a true length, not a horizontally projected length.

(c) Neoprene Strip Seal Replacement. Linear Foot.

Length measured along centerline of seal including bends and upturns.

(d) Prestressed Concrete Beam Repairs. Square Foot.

Penetrating sealer is incidental to this item.

SECTION 1091—EPOXY INJECTION CRACK SEAL

1091.1 DESCRIPTION—This work is the preparation and sealing of cracks with epoxy resin mixture, excluding overhead sealing.

1091.2 MATERIAL—

(a) **Epoxy Resin System.** Provide a system conforming to the strength requirements of ASTM C 881, Type I, Grade 1, Section 706.1, for epoxy injection and from a manufacturer listed in Bulletin 15.

(b) **Surface Seal.** Provide a surface seal as recommended by the manufacturer and of adequate strength to hold injection fittings firmly in place and to resist injection pressures adequately to prevent leakage during injection.

(c) **Injection Fittings.** As recommended by the manufacturer.

(d) **Certification.** Section 106.03(b)3

1091.3 CONSTRUCTION—Construct as directed and as follows:

(a) **Preliminary Work.** The Representative will mark areas to be sealed.

(b) **Preparation for Sealing.** Thoroughly clean the surfaces of rust, scale, grease, loose and disintegrated particles, and material. Remove unsound concrete and mortar as directed. Glue injection ports in place at spacings as recommended by the manufacturer. Bevel cracks, as directed, to facilitate installation of injection ports. Seal the surface and areas surrounding the entry ports with surface seal. Apply seal so that the epoxy injection resin is sealed until initially cured.

(c) **Mixing Epoxy Resin System.** Mix the epoxy resin system according to the manufacturer's instructions with a minimum 180 second mixing time using a low speed (400 rpm to 600 rpm) electric drill with an approved mixing paddle. The mixing may also be accomplished by an injection machine capable of metering and mixing the specific proportions of components within a tolerance of $\pm 5\%$.

(d) **Injection Procedure.** Do not inject the cracked area until after the surface sealer has hardened. Inject the epoxy with a hand held gun, pressure pot, or injection machine or as recommended by the manufacturer. Start injection at the lowest point on the crack. When the material begins to flow from the next higher entry port, remove the nozzle, plug the port, and insert the nozzle in the next higher entry port. Continue the operation until the crack is completely filled. After the epoxy material has achieved an initial cure, remove the entry ports and, if necessary, patch the areas with the same material used to seal the rest of the crack surface.

(e) **Application Limitations.** Do not apply or inject epoxy materials if the ambient or concrete temperature is below 50F.

1091.4 MEASUREMENT AND PAYMENT—

(a) Linear Foot or

(b) Dollar

The proposal will include an item and a predetermined amount of money for Epoxy Injection Crack Seal. The contract item will have a unit of measure of Dollar, a unit price of \$1.00, and a quantity equal to the predetermined amount.

Due to the contingent or unpredictable nature of the work being performed, the provisions of Section 110.02(d) are not applicable to this item.

Measured and paid for, under the Epoxy Injection Crack Seal item as follows:

1. Negotiated Price. At an agreed upon price. This price will be agreed upon with the Department, before performing the work. When applicable, agreement is also required with the FHWA.

2. Force Account Basis. Section 110.03(d)

SECTION 1092—EPOXY PROTECTION FOR STRUCTURAL STEEL

1092.1 DESCRIPTION—This work is the coating of surfaces of structural steel with an electrostatically applied, fusion-bonded epoxy.

1092.2 MATERIAL—

(a) Coating System. Use powdered epoxy coating material from a manufacturer listed in Bulletin 15. Certify as specified in Section 106.03(b)3.

Provide fusion-bonded epoxy coating that is a one-part, heat-curable, thermosetting, powdered coating conforming to ASTM A775, modified as follows:

- Wherever the terms “deformed steel reinforcing bar(s),” “plain steel reinforcing bar(s),” “reinforcing steel,” “bar(s),” or “reinforcing bar(s)” appear, substitute the terms “structural steel member(s),” “structural steel,” or “member(s)” as applicable.
- Unless otherwise indicated, coating color to match Federal Standard No. 595, Color No. 14223 (Foliage green).
- Section 4—Reinforcing Steel. Revise the title of the section and the section to read:

4. Structural Steel.

4.1 Furnish structural steel to be coated conforming to the requirements of applicable AASHTO standard specifications, as indicated or specified, and free of contaminants such as oil, grease, paint, and silvers. Structural steel exhibiting any silver-like defects after the heating and coating process will be rejected unless satisfactorily repaired. A single recorded coated steel member thickness measurement is defined as the average of three individual readings obtained from three immediately adjacent areas on the body of the member. Obtain a minimum of five recorded measurements approximately evenly spaced along each side of the test specimen (i.e., a minimum of ten recorded measurements per specimen). The film thickness limits do not apply to patched areas.

- Section 7.3—Adhesion. Delete this section.
- Section 8—Test Methods. Revise this section as follows:

Revise the first sentence in Subsection 8.1 to read:

Measure the thickness of the coating on the body of the member as specified in Section 4.1.

Subsection 8.3—Adhesion of Coating. Delete this section.

- Section 12—Repairs Due to Handling. Revise Subsection 12.2 to read:

Satisfactorily repair damage to the epoxy coating that occurs during fabrication, shipping, or installation either according to Section 11.1 or by mechanical wire brush cleaning and painting with an approved epoxy paint using the paint manufacturer's approved procedure. Repair any member with visible signs of rust according to Section 11.1. Do not cover more than 5% of the total surface area with patching material.

- Section 15—Fabrication of Steel Reinforcing Bars After Coating. Delete this section.

- Section A1.3—Specimens for Test. Revise this section as follows:

Revise Subsection A1.3.1 to read:

Submit the following type and number of test specimens for test:

- (1) Two steel plates 4 inches by 4 inches by 1/2 inch, cleaned, and uncoated.
- (2) Four steel plates 4 inches by 4 inches by 1/2 inch, and coated with a film thickness of 10 mils.
- (3) Three films of epoxy (of the minimum thickness proposed for use during production coating of structural steel) for the chloride permeability test.

Revise the last sentence in the first paragraph in Subsection A1.3.3 to read:

Measure the thickness of the film on the body of the member.

- Section A1.4.4—Flexibility of Coating. Delete this section.
- Section A1.4.5—Bond Strength to Concrete. Delete this section.
- Section A1.4.7—Impact Test. Revise the third sentence to read:

Have impact occur on those areas that will be subject to impact when member is used for its intended purpose, if this can be determined. Otherwise, have impact occur on any areas.

- Section A1.4.8—Hardness Test. Revise the last sentence to read:

Meet or exceed a Knoop Hardness Number of 16 when averaging four individual hardness measurements made on at least two specimens.

1092.3 CONSTRUCTION—

(a) General. Apply coating in an environmentally controlled plant that is fully enclosed. Provide a fully automatic coating system with the capability of preheating and post-baking. Use a fully automatic grit-blast cleaning machine, enclosed in an environmentally controlled plant.

(b) Surface Preparation. Free all surfaces of oil or any mill coating.

Gritblast the steel to white metal, as defined in SSPC-SP5, using a mixture of steel shot and grit. Protect clean surfaces from conditions of high humidity, rainfall, or surface moisture. Do not allow the steel to flash rust before coating. Provide a uniform, angular anchor blast profile from 2 mils to 5 mils deep. Determine anchor pattern depth by the Keane-Tator Surface Profile Comparator or Testex Replica Tape.

(c) Application of Coating. Apply the coating material according to the manufacturer's recommendation as to application procedure and curing schedule. In no case allow the over temperature, or temperature of the steel during any part of the curing process, to exceed 500F.

Provide a cured coating of uniform color, gloss, and thickness, and free of blisters, pinholes, fish eyes, sags, runs, and other irregularities.

Provide a finished coating thickness of 10 mils \pm 2 mils tested according to ASTM G12.

(d) Inspection. The coater is responsible for all QC checks including visual inspection, thickness measurements,

and holiday testing, and for keeping records on the results of all such inspections in an approved form.

Provide access to each part of the process to the Inspector. Allow the Inspector to witness any QC tests, and perform such tests himself or herself on a random sampling basis, if requested by the Inspector.

After cure, check the coating for continuity using a 67.5 V wet sponge detector to check for holidays, pinholes, and voids. Allow no more than an average of 6 holidays per meter. Satisfactorily repair all defects.

(e) Touch-Up System. Provide a compatible two-part epoxy touch-up system designed and color-matched for patching the epoxy coating used on the structural steel. Satisfactorily patch all defects in the epoxy coating, areas damaged during erection, and all visible uncoated areas. Do not cover more than 5% of the total surface area with patching material.

1. Surface Preparation. Apply coating directly to the metal for maximum performance. Ensure that metal is clean, dry, and free of rust and scale. Blast clean to NACE near white where possible. Remove grease, oil, and other substances with suitable solvents. Coat cleaned surface before oxidation occurs.

2. Mixing. Mix Part A and Part B of the two-part system in the proportions recommended by the manufacturer. Mix the two parts thoroughly until a uniform color is obtained. If required, thin each part separately, with thinner recommended by the system manufacturer, to minimize loss of pot life. Furnish material having a pot life of at least 8 hours. Discard material that is not used within the pot life specified by the manufacturer.

3. Application. Apply material with ordinary brush or roller, according to the manufacturer's instructions, and as directed. Achieve a track free surface in 2 hours to 3 hours at 72F. Achieve full cure in 3 days to 5 days at 72F. Exercise care in handling pieces before they are fully cured.

1092.4 MEASUREMENT AND PAYMENT—Epoxy protection for structural steel is incidental to the items of work protected.

SECTION 1100 MANUFACTURED MATERIAL

SECTION 1101—HIGHWAY LIGHTING

1101.01 GENERAL REQUIREMENTS—Design, manufacture, and test lighting material and equipment according to the latest applicable standards of IEEE, ASTM, NEMA, ANSI, and the currently adopted AASHTO “LRFD Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals” (AASHTO Specifications).

Fabricate highway lighting structural materials according to AWS, the AASHTO Specifications, and as specified in Section 1105 (steel members only); except, applying water to the base metal is permitted for the air plasma arc cutting process. Bulletin 15 listing, shop inspection, and AWS certified welding inspectors (CWI) are required for welded aluminum pole manufacturers and for welded steel pole manufacturers. Bulletin 15, shop inspection, and Section 1105 do not apply to cast aluminum poles, cast steel poles, cast iron poles, painting of aluminum poles, or poles without welds on any areas subject to tensile stress.

Design calculations are required for all poles. Submit design calculations and fatigue analysis within 60 days of contract award, or as directed. If the Bureau of Design has previously approved identical lighting material and equipment, submission of design calculations and fatigue analysis may not be required. Provide calculations signed and sealed by a Professional Engineer registered in Pennsylvania.

Provide steel poles that are fabricated from material according to the current AASHTO Specifications. The Charpy V-Notch toughness test is required for load carrying tension members 1/2 inch and greater in thickness, including base plates and arm connection plates, as required for Zone 2 in Table S1 according to AASHTO Specifications. The Charpy V-Notch toughness test is not required for high mast handhole frames. Bend testing is required for material less than 1/2 inch in thickness.

Provide steel poles that are either round or multisided with a minimum of eight sides.

Use radiographic test methods when inspecting complete penetration welds on steel poles with material less than 5/16 inch in thickness, and use radiographic or ultrasonic test methods when inspecting complete penetration welds on steel poles with material 5/16 inch in thickness and greater. Perform and evaluate all non-destructive testing according to cyclically loaded, non-tubular tension criteria. Use radiographic, ultrasonic, or magnetic particle test methods when inspecting other welds on steel poles.

Provide aluminum poles that are round. Provide aluminum welds and aluminum welding material according to ANSI/AWS D1.2, Structural Welding Code for Aluminum. Use radiographic test methods when inspecting complete-penetration welds on aluminum poles. Use radiographic or dye penetrant test methods when inspecting other welds on aluminum poles.

Provide testing and test methods according to ANSI/AWS D1.1 (Steel) D1.2 (Aluminum) and as determined by the LTS. Contact the LTS to arrange for proper pole manufacturing inspection. Inspection will include 100% of the length of each complete penetration weld and a minimum of 25% of the length of each other weld. The portion of the other welds to be tested will be selected by the Representative. Certify lighting poles, nuts, bolts, and associated hardware as specified in Section 106.03(b)3, including Charpy VNotch- test results, bend test results, and weld inspection reports. Provide catalog cuts or shop drawings for approval, instead of certification, for all other highway lighting items. The Department may select test samples at the source of supply before shipping or at the project site after delivery.

Submit for approval, before purchase and at no additional cost to the Department, catalog cuts, drawings, and manufacturer’s specifications for all lighting material including; lighting poles, luminaires, junction boxes, conduits, cables, and power supply components proposed for the project.

Do not alter or modify any material unless authorized, in writing, by the manufacturer. Inform the Department of any alterations or modifications made outside of the manufacturer’s facilities, and furnish proof of authorization from the manufacturer.

Provide poles, which are less than 70 feet in height in two sections or less.

Provide poles, which are between 70 feet and 100 feet in height in three sections or less.

Provide poles, which are over 100 feet in height in four sections or less.

Furnish minimum pole section lengths of 12 feet for high-mast poles and 15 feet for conventional poles. Obtain approval to furnish shorter section lengths.

Provide all units of any one item; such as luminaires, lamps, cable, and poles; that are of similar type and from the same manufacturer unless approved as a substitute.

1101.02 POLES AND BASES (CONVENTIONAL LIGHTING)—Furnish Type A poles with non-breakaway bases or Type S poles with breakaway bases, as indicated, as shown on the Standard Drawings, and as follows:

(a) General.

1. Poles.

- Manufacture shafts of steel or aluminum, with the shaft uniformly tapered approximately 0.14 inch per foot. Fabricate multi-piece shafts to allow field assembly by overlapping sections.
- Design for Service I, Strength I, and Extreme I Limit States and the wind load calculation shall be according to Section 3.8 of the AASHTO LRFD Specifications.
- Provide a handhole finished without rough edges and with a reinforcing frame and cover designed to maintain the required pole strength.
- Weld a 2 3/8-inch to 3-inch O.D. vertical tenon, fabricated from the same grade metal as the shaft, at the top of poles with post top luminaire mounting, and on the same axis as the pole.
- Compute the ice load on cobra head luminaires using a surface area equal to six times the Effective Projected Area (EPA). As specified in Section 1101.06(b) for cobra head luminaire EPA and weight.
- Design decorative light poles (with no significant arms) for Service I, Strength I, and Extreme I Limit States and the wind load calculation shall be according to Section 3.8 of the AASHTO LRFD Specifications. For square cross section poles only, include a design for fatigue according to AASHTO LRFD Specifications Section 11.5.1.

Furnish poles capable of sustaining loadings as follows:

- Horizontal load of 500 pounds applied 18 inches from the shaft top in any direction with no failure of any component part. Deflection of the shaft from vertical is limited to 7.5% of the shaft length.
- Horizontal load of 50 pounds applied at the luminaire attachment point and normal to the pole bracket member plane, with a vertical load of 30 pounds on the luminaire supporting arm. Rotation of individual sections of two-section poles is not allowed. The horizontal deflection is limited to 10% of the luminaire supporting arm's horizontal length.
- Vertical load of 100 pounds applied at the luminaire attachment point. The vertical deflection is limited to 5.5% of the pole arm's horizontal length.
- Vertical load of 250 pounds applied at the luminaire attachment point. Collapse or rupture of any portion of the structure is not allowed.
- Pole arm and luminaire dead load. The deflection from vertical at the top of the pole is limited to 1% of the total shaft length. The pole deflection from vertical is defined as the horizontal distance between the pole top centerline, when the pole alone is installed plumb, and the pole top centerline, after the arm and luminaire combination are installed on the previously plumb pole, measured without additional shaft adjustment.

2. Anchor Bases.

- Finish clean, smooth, and of the dimensions required for adequate pole mounting and structural support.
- Provide holes for anchor bolts.

- Telescope the base over the shaft and secure in place by electric arc welding at the pole bottom and at the top of the base plate.

3. Anchor Bolt Covers. Furnish a cover for each anchor bolt and use 1/4-inch, stainless steel, Phillips-head, or hex-head screws.

4. Frangible or Breakaway Bases. Provide transformer bases. Furnish bases according to the AASHTO Specifications. Perform non-destructive testing of all welds at the pole fabricator location. Submit a copy of the FHWA acceptance letter with the catalog cut or shop drawing information for approval. Other base types are not allowed unless specifically approved for the application.

5. Labels. Provide pole identification, date, and Lighting Management System (LMS) key tags with 1-inch high reflective aluminum characters and slide in aluminum holders, width as required to accommodate the characters. Provide 1/8-inch diameter holes for attachment with stainless steel rivets or screws. Provide black characters on white or gray background or white characters on black background. Do not use ID tags with decorative poles.

(b) Steel Poles.

1. Shaft.

- Fabricate from material according to ASTM A595 or ASTM A572 and not less than No. 11 gage, or from hot rolled, low carbon, high-strength steel according to the following requirements:

Minimum yield strength—50 kips per square inch
 Minimum ultimate tensile strength—65 kips per square inch
 Carbon content—0.15% min., 0.25% max.
 Maximum phosphorus content—0.04%
 Maximum sulfur content—0.05%
 Maximum silicon content—0.05%

Do not use equivalent steel types unless approved.

- Form into a continuously tapered shaft with one automatic electric arc welded, longitudinal joint per piece.
- Do not use transverse intermediate welds.
- It is permitted, after forming and welding, to use longitudinal cold rolling with sufficient pressure to tighten the weld, form a round shaft, and to increase the metal's minimum yield strength to 50 kips per square inch.
- Grind or bevel longitudinal weld beads and mating edges of two-piece shafts to avoid binding during section assembly.
- Provide complete-penetration longitudinal welds in the slip-joint area (1.5 times the inside diameter of the exposed end of the female section) plus 6 inches beyond, for the female section only.
- Provide a grounding nut for a 1/2-inch x 13 UNC threaded bolt or stud, when applicable, on the inside of the shaft, accessible from the handhole.
- Poles octagonal in shape, with flat or fluted faces, may be substituted for round steel poles. Furnish octagonal poles at least equal to round poles in thickness of metal and strength of pole, and meeting the requirements for round poles.
- Provide tapped holes for attaching anchor bolt covers.

2. Anchor Bases. Fabricate one-piece bases of cast steel according to ASTM A27, Grade 65-35, or steel plate according to AASHTO M 270 and according to ASTM A709, Grade 36.

3. Finish.

- Hot-dip galvanize the inside and outside surfaces of poles and bases as specified in Section 1105.02(s) and according to ASTM A123 after fabrication and before shipment.
- Clean the welds on poles by sandblasting or by an alternate, approved method before galvanizing.

(c) Aluminum Poles.

1. Shaft.

- Spin shafts to provide Alloy 6063-T6 according to the AASHTO Specifications.
- Provide a satin finish.
- Weld an aluminum grounding nut or lug for an 1/2-inch x 13 UNC threaded bolt or stud, when applicable, on the shaft inside, opposite the handhole.
- Furnish stainless steel hardware, unless otherwise directed.
- Provide poles with a J-Hook at the top of the shaft.

2. Anchor Bases. Fabricate one-piece bases of cast Aluminum Alloy SG70A-T6 (356-T6), ASTM B26 or ASTM B108. Provide tapped holes for attaching anchor bolt covers.

1101.03 POLE ARMS (CONVENTIONAL LIGHTING)—Furnish steel bracket arms and connections as shown on the Standard Drawings, and furnish clamp connections for aluminum truss arms and poles, and as follows:

(a) General.

- Manufacture arms of steel or aluminum.
- Install the arm with a weather-resistant connection to the shaft, with a smooth raceway for wiring.
- Furnish arms of the same material as the pole.
- Provide ASTM F3125 Grade A325 connecting bolts as specified in Section 1105.02(d) for steel poles.

(b) Bracket Type.

- Furnish arm assemblies, consisting of an upper member and a lower member, rigidly secured by vertical struts (truss), or consisting of a cantilever-type arm (single member).
- Provide a fitting on the pole end of each type arm to allow the bracket-arm assembly to be secured to the pole.
- Do not use gusset plates for truss arm connections to the clamp plate for arms less than or equal to 15 feet.

1. Truss Arms.

1.a Steel. Fabricate arms to have a minimum nominal diameter of 2 inches. Finish as specified in Section

1101.02(b)3.

1.b Aluminum. Fabricate upper and lower members using 2-inch or larger nominal diameter aluminum pipe, or using a combination of pipe and elliptical sections. Provide Alloy 6063-T6 according to the AASHTO Specifications.

2. Single-Member Arms.

2.a Steel. Fabricate arms to have the same taper and a minimum nominal diameter of 2 inches. Finish as specified in Section 1101.02(b)3.

2.b Aluminum. Fabricate using 2-inch or larger nominal diameter tapered aluminum tube or using tapered aluminum section, oval in shape, at the pole end and tapering to the luminaire end. Provide Alloy 6063-T6 according to AASHTO Specifications.

1101.04 ANCHOR BOLTS, NUTS, AND WASHERS (CONVENTIONAL AND HIGH MAST LIGHTING)—

Provide a preassembled high mast anchor bolt arrangement. Mark the anchor bolt assembly for matching with the corresponding high mast pole base plate. Use an identification mark that will be visible after embedment in concrete.

Furnish structural steel anchor bolts, hex-head bolts, nuts, and washers for conventional and high mast lighting as specified in Section 1105.02(c)3, the following requirements, and as shown on the Standard Drawings:

(a) Hex Head Bolts. Provide hot-dipped galvanized bolts according to ASTM F3125 Grade A325 for anchor bolts with yield strength of 55 kips per square inch and ASTM A354, Grade BC, for anchor bolts with yield strength of 105 kips per square inch.

(b) Galvanizing. As specified in Section 1105.02(s) and as follows:

Galvanize the top 12 inches minimum of anchor bolts and all associated hardware according to ASTM A153, or another acceptable method according to ASTM A153. Brushing of the threaded area to remove excess zinc is allowed, according to the American Hot-Dip Galvanizers Association's recommended procedures for galvanizing of threaded parts.

1101.05 POLES (HIGH MAST LIGHTING)—Furnish poles as shown on the Standard Drawings, as specified in Section 1101.01, and the following:

(a) General.

- According to the AASHTO LRFD Specifications. Design for Service I, Strength I, and Extreme I Limit States. Design for fatigue to resist the combined wind effect according to AASHTO LRFD Specifications 11.7.2. Consider Fatigue Design Case according to Table 11.7.2-1 for Fatigue Category I.
- Design poles to provide a maximum deflection equal to 10% of the shaft length.
- Design based on ten luminaires per pole with each luminaire exerting a downward force equal to 75 pounds and having an EPA of 2.0 square feet. Include EPA and downward force for the head frame assembly being used. Compute the ice load on the luminaire using a surface area equal to six times the APA.
- Fabricate pole shafts and base plates from high-strength, low-alloy structural steel according to AASHTO M 270 -and according to ASTM A709 Grade 50. Do not use equivalent steel types unless approved.
- Galvanize poles and base plates as specified in Section 1101.02(b)3.
- Grind or bevel mating edges of multi-section poles to avoid binding during section assembly.
- Do not use transverse welds.

- Provide base plates with a minimum thickness of 3-inch unless otherwise approved.
- Provide bottom shaft sections with an 0.625 inch minimum thickness.
- Provide a complete joint penetration weld for the connection of the shaft to the base plate according to the AASHTO LRFD Specifications Table 11.9.3.1-1 Section 4.4.
- Provide complete-penetration longitudinal welds in the slip-joint area (1.5 times the inside diameter of the exposed end of the female section) plus 6 inches beyond, for the female section only. Provide 6-inch complete penetration longitudinal welds at the base plate connection.
- Join each pole section by telescoping the individual sections. Overlap a minimum of 6 inches and maximum of 12 inches. Do not field weld.
- Mark corresponding pole sections for field mating and assembly.
- Mark the inner telescoping section to show the minimum required telescoping length.
- Clearly mark and identify each pole base plate for matching to the corresponding anchor bolt assembly, to ensure proper fit in the erection of each pole.
- Permanently inscribe each pole with manufacturing identification and reordering information, or show on a nameplate attached to the pole.
- Provide four-conductor copper No. 10 AWG minimum, 600 V, electrical cable, of the type and length required, with a watertight electrical plug and receptacle suitable for use.
- Provide a matching watertight power receptacle having sufficient cord length to be brought outside for energizing the lowered luminaire mounting ring and the electrical power drive.
- Provide a low resistance grounding lug at the top of the pole for grounding the lightning rod to the pole shaft.
- Provide stainless steel hardware; such as nuts, bolts, screws, and washers.

(b) Head Frame Assembly. Provide a head frame assembly with each high-mast pole, to support the luminaire ring with its required number of luminaires, and as follows:

- Mount pulleys and mechanisms on the head-frame assembly; cover with a protective non-corrosive housing.
- Make necessary cable openings as small as practical to prevent the entry of birds.
- Provide a housing that can be easily removed from the head-frame assembly for servicing of pulleys and other mechanisms.
- Provide a 24-inch, nickel-tip copper lightning rod on each pole, extending not less than 20 inches above the head-frame cover and located on or near the pole centerline.
- Ground the lightning rod to a grounding lug at the pole top, using No. 1/0 AWG braided copper wire, adapters, and cable connectors. Provide a grounding lug furnished by the lightning rod manufacturer.
- Mount the lightning rod with brass or bronze hardware.
- Provide pulleys large enough to contain the various required cables, without exceeding the recommended

bending radii.

- Fabricate pulleys of either cast steel with a nylon bushing or aluminum with a bronze bushing, both with a stainless-steel shaft Type 304, and both equipped with guards to prevent the cable from jumping off the pulley.
- Furnish a head frame that provides three-point suspension and positive centering and engagement between the mating parts of the head frame and the luminaire ring assembly.
- Hot-dip galvanize the head frame, after fabrication, as specified in Section 1105.02(s) and according to ASTM A123, or completely zinc-electroplate with an additional 5-mil minimum thickness of approved zinc-rich paint or an epoxy powder coating.

(c) Latching. Furnish each high mast pole assembly with either a latching device or two safety cables to secure the luminaire ring in the fully raised position after tension is removed from the winch hoist cable.

- If a latching device is furnished, the mechanism is required to release either automatically or by manual pull of a cable after the luminaire ring has been raised from the latching pins or fingers. Provide a mechanically operated indicator for each of the three luminaire ring latches to indicate positive latching at each point on the luminaire ring.
- If two safety cables are furnished, anchor the cables to the winch-mounting frame or to eyebolts embedded in the foundation. Attach the safety cables to the cable terminator securing the luminaire ring in the fully raised position removing tension from the winch hoist cable. Provide a mechanically operated indicator for each of the three cables to indicate a fully seated ring.

(d) Luminaire Ring Assembly.

- Equally space 2-inch luminaire tenons around the ring for the indicated number of luminaires.
- Hot-dip galvanize the entire luminaire ring assembly after fabrication as specified in Section 1105.02(s) and according to ASTM A123.
- Provide a weatherproof male plug wired to the terminal box, for energizing the luminaires in the servicing position.
- Provide a 30 A, four-wire type watertight plug to mate with the power receptacle.
- Provide a ring-mounted enclosure as specified in Section 1101.11(c) to house a terminal block, fuse block, and lightning arrester.
- Provide guide rollers or pads to cushion excess swing during raising and lowering operations.

(e) Winch Assembly. Provide a self-locking, permanently lubricated, worm gear winch assembly, enclosed within the pole mast, capable of raising and lowering the entire luminaire ring at a rate of approximately 15 feet per minute when driven by a portable winch drive. Provide a drive unit of a size and speed determined by the lifting and lowering force required, and the required raising and lowering speed, without exceeding 50% of the capacity of the worm gear assembly or the drive unit. Provide a winch that remains locked in any position to prevent the luminaire ring assembly from falling under its own gravitational force if the operator interrupts the raising or lowering operations. Provide a winch designed to ensure proper spooling of the cable upon the drum at all times.

(f) Electrical Winch Drive. Furnish, for each project, one portable, heavy-duty, industrial-rated, reversible, electrical winch drive as follows:

- Provide the drive with a torque limiter that causes drive slipping at a predetermined torque to prevent damage to the system.

- Provide sufficient length of cable and mating plug to directly utilize the power supply.
- Equip the drive to attach to the winch drive shaft and the pole so the drive is completely self-supporting.
- Furnish a drive that operates from a remote switch, with sufficient cable length so the operator can stand a safe distance outside the radius of the luminaire ring assembly.
- A 120 V drill motor and transformer may be provided instead of a 240 V drill motor. The maximum transformer weight allowed is 50 pounds. Provide a transformer enclosure, carrying handle, and connectors.

(g) Hoist Cables. Furnish hoist cables made from stainless steel aircraft cable, according -to Military Specification MIL-W-83420J.

- Attach the support cables to a self-leveling yoke, to which is attached the winch cable from the winch drum.
- Provide guide cables or other acceptable means to prevent cable entanglements in the pole shaft.

(h) Miscellaneous Hardware. Furnish miscellaneous hardware of stainless steel, Type 304.

1101.06 LUMINAIRES (CONVENTIONAL LIGHTING)—Furnish luminaires complete including lamps, ballasts, decals, associated hardware, and necessary wiring.

(a) General.

- Furnish materials incorporating the latest available ratings and design improvements.
- Provide NEMA 5- or 7- pin photocell receptacle and shorting cap. Omit shorting cap if individual photocell control is indicated.
- Provide individual NEMA 5- or 7- pin remote monitoring and control module as specified in Section 1101.11(b), when indicated.
- Furnish warranty and luminaire certification of UL approval, as applicable.
- Furnish a sample luminaire for review and acceptance, if directed, when data is submitted for a product that has not previously been accepted by the Department.
- Furnish luminaire photometric data and ballast or driver data with catalog cut information.
- Install glare shields, where indicated.
- Furnish clear high pressure sodium lamps for HPS luminaires. Provide lamps with a date marking code on the base. The nominal lamp voltage for less than 150 W is 55 V, and for 150 W and greater is 100 V.
- Provide HPS luminaires with internal pre-wired ballasts, regulator or auto-regulator, capable of operating within $\pm 10\%$ of the specified supply voltage. Furnish ballasts that provide dependable starting of the lamp at a temperature of -20F, with a power factor of not less than 90%, and according to the latest ANSI specifications.
- For LED luminaires, provide documentation that demonstrates that the proposed model of LED luminaire has been tested for electromagnetic compliance following the measurement protocols according to ANSI standard C63.4-2003 and 47 CFR 15.31.

(b) Arm Mount Luminaires – HPS (Cobra Head).**1. Housings.**

- Provide a precision cast or formed housing of aluminum, with a refractor holder and an integral 2-inch slip-fitter, capable of adapting to the mounting tenons.
- Provide a gasketed, thermal, shock-resistant glass prismatic refractor accurately molded to give the specified light distribution pattern, held in position in the lower housing with retaining clips.
- Provide a detachable reflector of processed aluminum, with a sealed anodic coating over an electrolytically or chemically brightened surface.
- Install the reflector with a gasket between it and the refractor, designed for easy removal from the housing. Silicone rubber gaskets are acceptable for luminaires up to and including 1000 W, and ethylene propylene (EPT or EPDM) gaskets are acceptable for luminaires up to and including 400 W. For cobra head and other luminaires where the housing provides a drip-proof protection, refractor gaskets of high density, filtering type, non-wicking PET not less than 1/4 inch thick are also permitted. Die cut gaskets and overlay at joints.
- Include an adjustable mogul lamp socket.
- Furnish a luminaire capable of accommodating the appropriate lamps, properly positioned relative to the optical system. Provide a slip-fitter designed to prevent linear creep or rotation of the luminaire on the tenon.
- Provide a frame size for conventional High-Pressure Sodium Luminaires as follows, or equal:

Watts	American Electric	Cooper Lighting	General Electric	Hubbell
Less than 200	115	OVZ	M-250	RM 150
200, 250 & 400	125	OVF	M-400R	RL 400

- Provide luminaires with a maximum EPA of 1.5 square feet, and a maximum weight of 55 pounds.

(c) Arm Mount Luminaires – LED – (Cobra Head).**1. Housings.**

- Provide a precision cast or formed housing of minimum 96% copper-free aluminum, minimum shell thickness of 0.050-inch, with stainless steel or zinc plated steel fastening hardware and an integral 2-inch slip-fitter capable of adapting to the mounting tenons and adjustable for 1-1/4-inch or 2-inch mounting pipe. Provide integral die cast mounting pipe stop feature and integral levelling means..
- Provide ANSI/NEMA C136.31 Vibration Test Level 3G.
- Provide factory installed LED array thermally sealed to heat sink. Chip on board LEDs will not be accepted.
- Driver to be accessible and removable without the use of tools. Enclosure to be sealed to prevent entry of animals and insects.
- Provide luminaire assembled in the USA, according to US Steel Certifications, and as specified in Section 106.10.

- Provide luminaires with an EPA between 0.6 square feet and 1.5 square feet, and a weight between 20 pounds and 55 pounds.

2. Optical.

- Provide UV stabilized refractor for each individual diode.
- Provide IP66 optical chamber and IP65 driver.
- Provide minimum 70 CRI, verified according to LM-79.
- Provide nominal correlated color temperature (CCT) of 4,000 K, according to LM-79.

3. Electrical.

- Provide luminaire with a minimum L85 of 60,000 hours tested according to TM-21. Testing data must indicate minimum testing period of 8,400 hours.
- Provide 0-10 V dimmable electronic driver with minimum rated life of 60,000 hours at 77F.

4. Warranty.

- Luminaire to be free from defects and operate as indicated for a period of 10 years from the date of delivery

(d) Post Top Mount Luminaires – HPS (Offset). Furnish as specified in Section 1101.06(b) and as follows:

- Furnish a precision cast aluminum housing, with a refractor holder.
- Provide a gasketed, thermal, shock-resistant glass prismatic refractor accurately molded to give the specified light distribution pattern, held in position in the lower housing with retaining clips.
- Join the upper and lower housings by stainless steel hinges and provide with twin trigger latches for access to internal components.
- Install gaskets at critical points to prevent entry of moisture and contaminants.
- Provide a detachable reflector, of processed aluminum, with a sealed anodic coating over an electrolytically or chemically brightened surface.
- Permanently attach the lamp socket to the reflector, to ensure correct lamp positioning. Provide the socket with a quick disconnect for easy removal of the reflector/socket assembly.
- Provide the luminaire with a slip-fitter designed to accept a 2 3/8-inch to 3-inch O.D. vertical tenon for lateral orientation.
- Provide external adjustments for horizontal luminaire leveling.
- Provide infinite angular fixture adjustment in the vertical plane for proper luminaire aiming.

(e) Wall Mount Luminaires (Underpass). Furnish as specified in Sections 1101.06(b) and (c) and as follows.

Furnish luminaires that provide total available downward street side lumens, between one mounting height and three mounting heights transverse distance, of not less than 20% of the bare lamp lumen output.

(f) Overhead Mount Luminaires (Underpass). Furnish as specified in Sections 1101.06(b) and (c).

1101.07 LUMINAIRES (HIGH-MAST LIGHTING)—Furnish open-type, cutoff luminaires complete with lamps, ballasts, associated hardware, and necessary wiring as specified in Sections 1101.06(a), (b), and (c), and as follows:

(a) Luminaires – HPS – (High-Mast Lighting).

- Provide with adjustable slip-fitters designed for a 2-inch tenon to allow a positioning adjustment of ± 3 degrees about the tenon axis.
- Provide with a heavy-duty, porcelain-enclosed, lamp socket, with the brass shell impregnated to prevent thermal freezing with the lamp base.
- Provide a lamp-stabilizing clamp that is non asbestos-lined, heat-resistant, and stainless steel.
- Equip luminaires with ballasts, as specified in Section 1101.06(a).
- Furnish 400 W, high-pressure sodium lamps with a minimum initial output rating of 50,000 lumen and a minimum rated life of 24,000 hours based on 10 hours of operation per start.
- Furnish lamps that burn in a vertical (base-up) position.
- Provide luminaires with a maximum luminous intensity angle nominally 60 to 65 degrees from nadir.
- Furnish luminaires having a projected area not exceeding 3.5 square feet, an EPA not exceeding 2.0 square feet, and exerting a gravitational force not more than 75 pounds.
- Provide glare shields, when indicated.
- Furnish luminaires that provide the following nominal initial luminous intensity at the angles specified below:

Vertical Angle (degrees)	Luminous Intensity (candelas)
20	2,850
30	4,170
40	4,760
50	7,500
55	9,550
60	12,900
65	13,800
70	9,250*
72 1/2	7,350*
75	4,350*

* These are minimum values at the respective angles. Other candelas are nominal values.

Furnish vertical luminous intensity trace data to ascertain compliance with luminous intensity distribution requirements.

(b) Luminaires – LED – (High-Mast Lighting).

1. Housings.

- Provide a precision cast or formed housing of minimum 96% copper-free aluminum, minimum shell thickness of 0.050-inch, with stainless steel or zinc plated steel fastening hardware and an integral 2-inch slip-fitter, capable of adapting to the mounting tenons and adjustable for 1-1/4-inch or 2-inch mounting pipe. Provide integral die cast mounting pipe stop feature and integral levelling means.
- Provide ANSI/NEMA C136.31 Vibration Test Level 3G.
- Provide factory installed LED array thermally sealed to heat sink.
- Driver to be accessible and removable without the use of tools. Enclosure to be sealed to prevent entry of animals and insects.
- Provide luminaire that is assembled in the USA, according to US Steel Certifications, and as specified in Section 106.10(a).
- Furnish luminaires having a projected area not exceeding 3.5 square feet, an EPA not exceeding 2.0 square feet, and exerting a gravitational force not more than 75 pounds.

2. Optical.

- Provide UV stabilized refractor for each individual diode.
- Provide IP66 optical chamber and IP65 driver.
- Provide minimum 70 CRI, verified according to LM-79.
- Provide nominal CCT of 4,000 K, verified according to LM-79.
- Provide luminaires with a maximum luminous intensity angle nominally 60 to 65 degrees from nadir.

- Provide glare shields, when indicated.
- Furnish luminaires that provide the following nominal initial luminous intensity at the angles specified below:

Vertical Angle (degrees)	Luminous Intensity (candelas)
20	2,850
30	4,170
40	4,760
50	7,500
55	9,550
60	12,900
65	13,800
70	9,250*
72 1/2	7,350*
75	4,350*

* These are minimum values at the respective angles. Other candelas are nominal values.

Furnish vertical luminous intensity trace data to ascertain compliance with luminous intensity distribution requirements.

3. Electrical.

- Provide luminaire with a minimum L85 of 60,000 hours tested according to TM-21. Testing data must indicate minimum testing period of 8,400 hours.
- Provide 0-10v dimmable electronic driver with minimum rated life of 60,000 hours at 77F.

4. Warranty.

- Luminaire to be free from defects and operate as expected for a period of 10 years from the date of delivery

1101.08 CABLE—Furnish cable as follows:

(a) General.

- Provide 600 V conductors with insulation, and jacket as applicable, according to ICEA S-95-658/NEMA WC-70. Provide insulated equipment grounding conductors. Provide bare grounding electrode conductors.
- Provide color-coded cables. Color code by surface markings, pigmented insulation, or tape. If surface markings are used, place marks at intervals not exceeding 24 inches, located so as not to conflict with the required NEC markings. Provide cable with surface markings, except as specified in Section 1101.01. If taping is provided, overlap the tape for a minimum of 6 inches on the cable, at all access locations, and for each conductor.
- Conductors for all types of cables, including ground wire, as follows:

	Copper
Conductor	Soft Drawn

	ASTM B3
Stranding	ASTM B8 5.26 to 33.6 mm ² (10-2): 7 Strand 42.4 to 107.2 mm ² (1-4/0): 19 Strand

(b) **Underground Cable.** Furnish with insulation and jacket, as required, according to the following:

	Rubber-Neoprene	XLP
Insulation	**SBR Rubber ***Ethylene Propylene (EP) Rubber Thickness (in.) 12-10: 3/64 or 0.045 8-2: 4/64 or 0.060 1-4/0: 5/64 or 0.080	Cross-Linked Thickness (in.) 12-10: 3/64 or 0.045 8-2: 4/64 or 0.060 1-4/0: 5/64 or 0.080
Jacket	Neoprene ASTM D4247 Thickness (in.) 12-2: 2/64 or 0.030 1-4/0: 3/64 or 0.045	None
Max. Normal Operating Temperature	**167F ***194F	Wet: 167F Dry: 194F
Code	**RHW ***RHW, RHH, USE	RHW, RHH, USE

(c) **Aboveground Cable.** The cables specified for Underground applications may be used for above ground applications.

Furnish with PVC insulation without nylon jacket or thinner XLP-insulated, as applicable, and as follows:

	PVC (Without Jacket)	XLP
Insulation	Thickness (in.) 12-10: 3/64 or 0.045 8-2: 4/64 or 0.060 1-4/0: 5/64 or 0.080	Cross-Linked Polyethylene Thickness (in.) 12-10: 0.030 8-2: 0.045 1-4/0: 0.055
Jacket	None	None
Max. Normal Operating Temperature	Wet: 167F Dry: 194F	Wet: 167F Dry: 194F
Code	THW	XHHW

(d) **Cable Duct.** When indicated, furnish cable, preinstalled in a polyethylene Schedule 40 plastic conduit according to NEMA TC-7. Provide cable conductors and stranding according to Underground Cable, with cable insulation RHW/RHH/USE, and with insulation thickness as specified above.

(e) Application, Testing, and Shipping.

- Utilize acceptable cable as follows:

With luminaires	194F
Other uses	167F

- Show the name of the manufacturer, conductor size in AWG or MCM, and cable voltage rating on the outer cable covering with the code clearly printed or molded on the sheath.
- Manufacture, inspect, and test cable, according to the latest issues of ICEA Publications.
- Submit certification of these tests identifying each cable reel with the test data supplied.
- Ship cable on reels, plainly and indelibly marked with the name of the manufacturer, gross, net and tare masses, size, type, voltage rating, and length of cable per reel.
- Ship on a reel having a minimum drum diameter not less than 14 times the nominal cable diameter.
- Seal cable ends against entrance of moisture.
- Provide a covering of heavy cardboard, burlap, or lagging to protect the cable during handling or shipping.

1101.09 CONDUIT—Furnish conduit and protective coating for conduit.

(a) General. Furnish PVC and fiberglass conduit, conduit fittings, and conduit elbows and expansion fittings from the same manufacturer. Provide expansion/deflection fittings required for structures as shown on Standard Drawing BC-721M. Clean PVC conduit in join area according to manufacturer's recommendation. Use PVC cement labeled by or recommended by the conduit manufacturer.

If metal conduit bodies and fittings are specified and hot dipped galvanized parts are not available, apply two coats of zinc paint as specified in Section 910.3(r).

Provide manufactured sweep bends or as specified in Section 910.3(g).

(b) Direct Burial.

1. Polyvinyl Chloride (PVC) Conduit. Provide Schedule 40; 194F, UL-listed conduit according -to NEMA Standard TC-2 (EPC-40PVC), with fittings according -to NEMA Standard TC-3 (EPC-40-PVC).

2. Fiberglass Reinforced Epoxy Conduit. Provide UL-rated conduit according -to NEMA Standard TC-14, Part B; and as follows:

- Filament wound
- Minimum glass content of 68%
- Minimum tensile strength of 11,000 pounds per square inch
- Containing carbon black for ultra-violet protection.

(c) Concrete Encased or Exposed. Provide one of the following:

1. Rigid Steel Conduit. Hot-dipped galvanized, inside and outside; and according -to ANSI C80.1, UL Standard 6, and UL Standard 1242. Provide hot-dipped- galvanized conduit bodies and fittings.

2. Polyvinyl Chloride (PVC) Conduit. Section 1101.09(b) for Direct Burial Conduit.

3. Fiberglass Reinforced Epoxy Conduit. Section 1101.09(b) for Direct Burial Conduit.

(d) Conduit Sleeve – Jacked, Augered, or Bored Conduit. Rigid steel conduit, as specified in Section 1101.09(c).

1101.10 JUNCTION BOXES AND BURIED CABLE AND CONDUIT MARKERS—

(a) Junction Boxes. Furnish as shown on the Standard Drawings for the type indicated, and as follows:

- **Concrete Junction Boxes.** Provide cast-in-place boxes made from Class A cement concrete as specified in Section 704; or provide precast boxes as specified in Section 714. Provide frames as specified in Section 605. Refer to Standard Drawings RC-81M and RC-82M for details of junction boxes JB-1, 2, 11, and 12.
- **Cast iron or Welded Steel Plate Junction Boxes.** Provide boxes as specified in Section 605. Provide boxes hot-dipped galvanized as specified in Section 1105.02(s) and according to ASTM A123 after fabrication. Provide a cover with a closed cell neoprene gasket with screws to secure cover. Provide a factory installed grounding stud and hex nut in rear of the box, as applicable. Refer to Standard Drawing BC-721M for junction box JB-25 details.

(b) Buried Cable and Conduit Markers. Furnish cast-in-place or precast, Class A cement concrete markers as shown on the Standard Drawings. Form letters and arrows by making depressions in the plastic concrete. Refer to Standard Drawing RC-84M for marker details.

1101.11 POWER SUPPLY—Furnish the power supply, consisting of:

(a) Service Poles.

- According to ANSI specifications.
- Of Western Red Cedar, Southern Yellow Pine, or equal.
- Minimum size, as listed under Class 4.
- Minimum length of 30 feet.
- Impregnate with nonleaching, waterborne preservative Chromated Copper Arsenate (CCA), Type C, according to AWWA-P5, preservative applied in closed cylinder by pressure process according to AWWA-C4. Provide retention of CCA dry salts of 0.60 pounds per cubic foot (Oxide basis). Approved trade names: -Chrom-Ar-Cu-; Osmose K33C; Wolman CCA, and Wolmanac- CCA. Include treatment certification with each shipment.

(b) Photoelectric Control Device.

- Photo cell of the cadmium-sulphide type with fail-safe in the “On” position.
- Weatherproof phenolic, cycloac, or acrylic plastic housing, not susceptible to distortion, discoloration, cracking, or crazing.
- Adaptable for pole-top- or cross-arm mounting in a plugin, locking-type receptacle, according to UL Specification 773.
- Provide solid brass plug blades.

- Relay rated 1,800 VA and 15 amps for all HID lamps.
- Control unit, with a built-in surge protective device for protection from induced high voltage and follow-through currents, and having a turn-off time delay to prevent false turn-off, due to lightning, stray lighting, or flashing lights.
- Designed to operate at the required voltage, and to operate satisfactorily at -20F ambient temperature, with performance characteristics according to EEI and NEMA standards.
- Load switching capability of 5,000 operations minimum at rated load.

A separate photoelectric cell conforming to the above requirements may be installed as an integral part of each luminaire assembly, as a substitute for the above, when indicated.

(c) Control Cabinet (Enclosure). As shown on the Standard Drawings and as follows:

1. Cabinet Construction. According to one of the following:

- Code gage stainless steel, ASTM A240/A240M-15a, Type 304.
- Code gage aluminum sheet alloy, No. 5052H32, having mechanical properties according- to ASTM B209.

2. Other Requirements.

- NEMA 3R or 4.
- Having closed cell neoprene gasket, welded seams, continuous hinge with stainless steel pin, and stainless steel external hardware.
- Having a backboard for mounting apparatus.
- Having two weep holes in the bottom.
- Equipped for padlocking. Provide acceptable outdoor, tumbler-type padlocks, keyed as directed. Furnish two keys with each lock.
- Having manufacturer's nameplate.

(d) Main Disconnect. Provide a main disconnect in a separate NEMA 3R or a 4 enclosure that is labeled 'suitable for use as service equipment'. Provide with a lockable cover and no external handle. The disconnect may be provided integral to the control cabinet if the cabinet is dead front. Provide a 2pole, 10000 A.I.C. minimum, -moldedcase- circuit breaker, with line and load lugs and capacity to accommodate the specified conductors and current, and according to Federal Specification W-C-375b. If greater interrupting capacity is required by the local utility, the main disconnect may be a fused device.

(e) Lightning Arrester.

- According to IEEE C62.45-2002 Category B.
- UL 1449, 3rd Edition listing.
- Minimum MCOV: 120/240 VAC service rating: 150/300V. 240/480 VAC service rating: 300/600V.
- Minimum Short Circuit Current Rating (SCCR): 200,000A.

- With bracket for mounting on the control cabinet backboard.

(f) Lighting Contactor. Magnetic, 600 V, twopole lighting contactor with coil and contacts rated as indicated on Plans-.

(g) Selector Switch (for the Photoelectric Control Contactor). Provide a 600 V, three position (automatic-off-manual), maintained-contact control station.

(h) Distribution Circuit Breakers.

- Minimum rating of 10,000 A.I.C line and load lugs..
- No fuse, quick-make, quick-break type; having tumbler mechanism, full contact, and positive pressure until opening, whether operated automatically or manually.
- Stationary contacts as an integral breaker part and non-welding contacts when operating.
- Trip free from handle so the contacts cannot be held closed against short circuit or abnormal overload.
- Mounted individually on DIN rail or similar.
- Handle position, indicating the breaker contact position.
- Size and capacity, as indicated

(i) Circuit Breaker Panels. Enclosure mounted panel with solid neutral; and with bus bars and solderless lugs of large enough rating and size to accommodate the required voltage, current, and conductors.

(j) Ground Rod. Copper-clad steel, UL listed. Provide with bronze clamp or exothermic weld for connection to the grounding electrode conductor.

(k) Transformers (Less Than or Equal to 25 KVA).

- Secondary windings for three-wire unbalanced circuits.
- Step-up or step-down as indicated.
- Copper or aluminum windings.
- Totally enclosed non-ventilated outdoor type.
- Enclosure degreased, primed, and finished with a coat of outdoor enamel.
- Core and coil assembly encapsulated with an epoxy compound for transformers rated 25 KVA and less.
- Insulation of Class F material that does not exceed 239F raise above a 104F ambient, when tested according to ANSI and NEMA Standards.
- Terminal compartment located in the transformer bottom, with provisions for side or bottom, conduit entrance.
- Certified copy of results required for transformer temperature, performance, and sound tests, according to ANSI and NEMA Standards.

(m) Guy Anchor Assembly. Single down guy consisting of:

- A cone-type anchor having a diameter of not less than 12 inches.
- A 3/4-inch thimble-eye, anchor rod.
- A 1/2-inch, seven-strand, galvanized steel, guy wire.
- Three bolt, heavy-duty, guy clamps.
- A strain insulator.
- Strain and load plates on the pole.
- An angle thimble-eye through bolt of the required length.
- Curved washer and nuts.
- Hardware, galvanized as specified in Section 1105.02(s) and according to ASTM A123 or other acceptable method according to ASTM A153.

1101.12 REMOTE MONITORING AND CONTROL SYSTEM—Furnish a complete outdoor lighting network for remotely monitoring and controlling highway lighting luminaires, consisting of:

(a) Central Management System (CMS).

- Provide graphical user interface for operation of the remote monitoring and control system, to be compatible with the individual control nodes as specified in Section 1101.12(b) and segment controller as specified in Section 1101.12(c).
- Capable of multiple user access with assignable restrictions to user functionality.
- Capable of exporting records to .xls or .csv spreadsheets with a predetermined format.
- Capable of running custom reports for feedback of system status and operation.
- Capable of selecting on or a group of fixtures in a graphical site map format and modifying on/off status or dimming level.

(b) Individual luminaire control nodes.

- Provide one control node per arm mounted luminaire.
- Capable of normal operation over an ambient temperature range of -40F to 122F.
- Operation from 120-277 V (nominal $\pm 10\%$) universal AC input (RMS volts).
- Mechanical and electrically connected to luminaire using NEMA C136.41 standard 5- or 7- terminal polarized twist-lock receptacle for both electrical and dimming control signal connectivity.
- Capable of:
 - Actuating the on/off status of a luminaire.
 - Actuating a luminaire OFF state that results in a ZERO watt power requirement for the luminaire. It is understood that the controller will require power to remain online.

- Actuating a luminaire DIMMED state by creating a 0-10 V control signal.
- Measuring and monitoring, over time, for the luminaire:
 - RMS input voltage (volts).
 - RMS input current (amps).
 - Apparent power (VA).
 - True input power (watts).
 - Power factor.
- Measuring energy consumption with an accuracy and precision of $\pm 2\%$ over the ambient temperature range and a load range of 0.1% to 100% relative power, and according to ANSI C136.50.
- Integrally sensing GPS location.

(c) Segment Controller.

- Provide one or more Segment Controllers as necessary to ensure communication with all luminaire controllers. Separate segment controllers are not required if the conditions in this section are met by the luminaire controller.
- Provide a segment controller capable of logging cumulative hours in the luminaire ON state for each luminaire controller.
- During online operation, provide a segment controller capable of reporting the following online luminaire controller parameters:
 - Controller Status (Online time, Offline time, Warning or Error codes)
 - Luminaire Status (Online time, Offline time, Warning or Error codes)
 - Average RMS input voltage (volts) in the ON state
 - Average RMS input current (amps) in the ON state
 - Average true input power (watts) in the ON state
 - Average input power factor in the ON state
 - Cumulative ON state time (hours)
 - Cumulative energy consumption (kWh)
 - LED Driver status (Warning or Error codes)
- During online operation, provide a segment controller capable of reporting all control point parameters for all luminaire controllers at a maximum reporting frequency of once every 60 minutes.

1101.13 MISCELLANEOUS MATERIAL—Furnish as follows:

- (a) Hardware** Stainless-steel or hot-dipped galvanized, as directed.

(b) **Shims.** Stainless steel, nonmagnetic, 300 Series, or acceptable aluminum.

(c) **Pulling Lubricant.** According to cable manufacturer.

(d) **Cable Tags.** Acceptable, non-conducting.

(e) **Plastic Marking Tape.** Provide one of the following or approved equal:

- “Allen Marking Tape” (Allen Systems Inc.)
- “Brady Identoline Tape” (W.H. Brady Co.)
- “Terra Tape” (Reef Industries Inc.)

(f) **Ground Rod.** As specified in Section 1101.11(j).

SECTION 1102—SIGN LIGHTING

1102.01 GENERAL REQUIREMENTS—Section 1101.01

1102.02 LUMINAIRES—

(a) **Light Fixture.** Furnish a light fixture as follows:

- LED or metal halide
- LED – As specified in Section 1101.06 and 7,500 lumens minimum
- Aluminum mounting bracket, when specified.
- Positive door closure by use of stainless steel latches and hinges.
- Cast aluminum housing and door assembly.
- Refractor and door assembly with nonpermanent-set gasket material.
- Thermal and shock resistant borosilicate glass refractor.
- Weep holes in the lowest area of the luminaire housing bottom when mounted.
- Polished aluminum reflector.
- Conduit entries in the luminaire assembly.
- Constant-wattage ballast, either integral or remote mounted.
- Aluminum, cast aluminum, or stainless steel enclosures for remote ballasts.

(b) **Metal Halide Lamps.** Furnish lamps as follows:

- 100 watt coated ceramic.
- 20,000 hours minimum rated life.
- Universal operating position.
- Rated 7,500 initial lumens minimum.

(c) **Ballasts.** Furnish electronic ballasts as follows:

- Fully enclosed aluminum housing.
- Power factor greater than 90%
- Lamp starting down to -22F ambient temperature and an operating case temperature up to 176 F.
- Thermally protected.
- End-of-life and output short-circuit protection.

- Output frequency less than 200 Hz.
- Lamp wattage regulation less than $\pm 5\%$ for a $\pm 10\%$ change in rated line voltage.

(d) Fittings. Furnish:

- Washers to level and adjust the luminaires on the supports, and made of the same material as the supports.
- Fittings at the entry into the luminaires made of a standard, factory-made, watertight design.

1102.03 CIRCUIT BREAKERS, PANELS, AND ENCLOSURES—Furnish the following:

(a) Circuit Breakers. Section 1101.11(h)

(b) Circuit Breaker Panels. Section 1101.11(i)

(c) Enclosures. Section 1101.11(c), (d), and as follows:

Provide enclosures with dimensions that provide code clearance and wiring space for the specified control apparatus.

1102.04 CONTROLS—Furnish the following controls:

(a) Photoelectric Control Device. Section 1101.11(b)

(b) Control Contactor. Magnetic control contactor, 600 V, two-pole, 60 A, with a 120 V or 240 V operating coil.

(c) Selector Switch. Section 1101.11(g)

1102.05 LIGHTNING ARRESTER—Section 1101.11(e)

1102.06 JUNCTION BOXES—Section 1101.10:

1102.07 CABLE—Section 1101.08 and as follows:

Provide Type TC, Tray Cable, with XHHW insulation and a PVC jacket, for cable from the sign enclosure to the luminaire.

1102.08 CONDUIT—Section 1101.09

1102.09 MISCELLANEOUS MATERIAL—Section 1101.13 and as follows:

(a) Service Poles. Section 1101.11(a)

(b) Ground Rod. Section 1101.11(j)

(c) Guy Anchor Assembly. Section 1101.11(m)

(d) Fittings. Provide standard, factory-made, watertight fittings at enclosures, junction boxes, conduits, and service heads.

SECTION 1103—TRAFFIC SIGNING AND MARKING

1103.01 GENERAL REQUIREMENTS—Certify material, as specified in Section 106.03(b)3.

1103.02 EXTRUDED ALUMINUM CHANNEL SIGNS (FOR POST MOUNTED SIGNS, TYPES A AND E AND STRUCTURE MOUNTED)—

(a) Extruded Aluminum Channels. As shown on the Standard Drawings.

Use channels according to ASTM B 221, Alloy 6063-T6.

Use continuous-channel sections equal to the sign width. The channel section is nominal. An alternate extruded channel section of equal or greater section moduli with dimensions suitable to utilize the mounting hardware may be used with written permission.

(b) Coating Treatment. Use a chemical conversion coating, such as Alodine No. 1200, Alodine No. 1200S, or Bonderite No. 781.

Apply the coating to the channel surfaces to ensure a good bond between the reflective sheeting material and the surface. Coat according to Military Specification, MIL-C-5541E, "Chemical Conversion Coatings on Aluminum and Aluminum Alloys." Do not handle with bare hands between the chemical conversion coating process and the application of the reflective sheeting. Handle by special devices or by hand wearing clean PVC gloves.

(c) Reflective Sheeting. Use precolored Type III, IV, VIII, IX, or XI sheeting, according to the Department's Specification for Retroreflective Sheeting Materials and Process Inks for Traffic Control.

Apply the sheeting to the face and a 3/8-inch width along both edges of the channel sections, using a procedure specified by the sheeting material manufacturer. Apply free of bubbles or wrinkles greater than 3 inches in length and with total sheeting shrinkage of not more than 1/8-inch. A maximum of one splice may be made in the sheeting for any channel section. Make the splice perpendicular to the longitudinal centerline of the channel, with the edges of adjacent pieces butted together throughout the entire seam length, without any overlap or separation. If covered sections are stacked before sign fabrication, then use microfoam between sign faces and store sections in a vertical position.

(d) Legend and Border. Use direct-applied cutout Type VIII, IX, or XI reflective sheeting material for letters, numerals, accessories, borders, and symbols.

(e) Sign Fabrication. Apply the reflective sheeting, then firmly bolt channels together with the webs in the same plane, to form a smooth and uniform surface. Adjust channel ends for correct position so the edges are free from projections.

Securely fasten assembled sign panels to a rigid framework, before application of legend and before shipment. Lay out the legend and border on the sign face as indicated.

Apply cutout Type VIII, IX, or XI legend and border to sign face according to manufacturer's instructions.

Fabricate signs in a single unit. If necessary, ship large signs sectionalized in panels. When shipping sectionalized signs, slit any legend and border, which overlaps the panels.

(f) Sign Identification. Fabricate the plaques of aluminum, plastic, or fiberglass of sufficient thickness to provide the necessary stiffness and to resist vandalism, or stencil directly on the sign panel with weather-resistant paint. Indicate sign number and the month and year of erection in 1 inch high characters of a contrasting color to the background, and affix to the rear of the sign in the lower righthand corner when viewed from the back. If rivets are used to attach plaques, use 1/8-inch aluminum rivets inserted from the sign face.

1103.03 FLAT SHEET ALUMINUM SIGNS WITH STIFFENERS (FOR POST MOUNTED SIGNS, TYPES A, D, AND E; AND STRUCTURE MOUNTED SIGNS)—

(a) Flat Sheet Aluminum. Use aluminum as specified in Section 1103.04(a) with a minimum thickness of 0.080 inch.

Fabricate panels from a single aluminum sheet or from a number of pieces, making every effort to minimize the total length of joints. Locate joints so the legend does not straddle two or more aluminum sheets, whenever possible.

Use sheets with a minimum width of 48 inches, wherever possible. Use continuous sheets for the full width of signs less than 12 feet wide or for the full height of signs less than 12 feet high. Use sheets free of buckles, warps, or dents. Remove burrs.

(b) Coating Treatment and Reflective Sheeting. Sections 1103.02(b) and (c), except as follows:

Apply the sheeting only to the face of the sign. A maximum of one splice in the reflective sheeting will be allowed on an aluminum sheet.

(c) Legend and Border. Section 1103.02(d)

(d) Extruded Aluminum Stiffeners, and Splice Bars. As shown on the Standard Drawings and as follows:

Manufacture channels from aluminum, according to ASTM B 209, Alloy 6061-T6.

Use large stiffener sections in 16-foot lengths and medium stiffener sections in 12-foot lengths. An alternate cross section of equal or greater section modulus than that indicated may be used with written permission.

(e) Sign Fabrication. Stiffener sections may end at a maximum of 3 inches from each sign edge. If the sign is more than 6 inches wider than the length of a full-length stiffener section, then splice two sections together, using 3/16-inch rivets, as shown on the Standard Drawings, to form a longer composite section. Position the splice so it is not on or within 15 inches of a sign post or within the center half of the span between sign posts. Stagger splices on adjacent sign stiffeners as much as possible. The aluminum sheeting may extend above the top stiffener or below the bottom stiffener for a maximum distance equal to one-third of the spacing between the stiffeners. If using an exit panel, use a stiffener on both the primary sign top and on the exit panel bottom.

Use 3/16-inch aluminum rivets at a maximum spacing of 6 inches and end rivets within 1 inch of the end of the stiffener. Hold the aluminum sheet firmly against the stiffener section while holes are drilled and rivets are expanded.

If the aluminum sheets are placed with the long dimension vertical or if a single large section stiffener or a single flanged medium section stiffener is used to join two panels together, then it may be necessary to have the flat sheet aluminum clamped to the stiffener section while the holes are drilled. Then, disassemble the sign for shipping. If disassembled, then remove burrs around the drilled holes to facilitate handling and to ensure a tight connection.

If exit panels cannot be supported by two sign posts, brace the panel with one or more auxiliary supports. Bolt the supports to a minimum of three stiffeners on the primary sign by use of clips.

If a single stiffener section is not used to join two adjacent panels together use butting plates, as shown on the Standard Drawings. Place butting plates at the left and right edges of the sign and at intervals not greater than 36 inches throughout the length of horizontal joints between the posts. Use either twist-in bolts or standard-connection bolts and plastic inserts to fasten the butting plates.

For joints between aluminum sheets, without a stiffener on the joint, fasten lightweight aluminum sheets with 1/8-inch aluminum rivets to the sign back.

Use twist-in toggle and buckle straps, or post clips, on stiffener sections at each post.

Lay out the legend and border on the sign face according to the sign fabrication drawings.

Apply cutout Type VIII, IX, or XI legend and border to sign face according to manufacturer's instructions.

Fabricate signs in a single unit. If necessary, ship large signs sectionalized in panels. Slit any legend and border, which overlaps the panel, when shipping sectionalized signs.

(f) Sign Identification. Section 1103.02(f).

(g) Internally Illuminated Signs.

System must conform to 47 CFR Part 15.

Mount to traffic signal support using a minimum of two bracket connections. Secure each bracket to the traffic signal or luminaire support using double stainless steel banding. Connect wiring from Internally Illuminated Sign to a circuit breaker in the electrical service disconnect box. Provide maintenance demonstration to municipal official responsible for maintaining the sign.

Construct sign using a weatherproof housing with drain holes in the bottom of the sign and corrosion resistant stainless steel for all fasteners and hardware.

Sign must be UL listed and approved.

Use transparent reflective sheeting capable of being internally illuminated and retroreflective when not energized. Use Clearview W2 font or as indicated on the plan. The designated display message should be dimmable to adjust to ambient light conditions to ensure legibility from at least 400 feet. Internally illuminate with Light Emitting Diodes (LEDs). Sign display message character color, dimensions, and layout must be according to Publication 236 and the

MUTCD.

For Street Name Signs show approved street name on both faces (double-sided), unless otherwise approved by the Representative in writing.

Supply a weather-tight wire entrance junction box with the sign assembly. Mount the box on the exterior or interior of the sign. Use an appropriately sized 3-conductor (minimum 14 AWG) cable between the sign and the controller assembly.

For Street Name Signs mounted on the mast arm, provide brackets that allow the sign to swing freely. Use a two-point support assembly to mount the Internally Illuminated Street Name Sign to a mast arm that is perpendicular to the street, or use a single-point support assembly if the Internally Illuminated Sign is attached to a mast arm that is diagonal to the street.

Mount a photocell on the top of each sign.

Provide all warranty documentation as specified in Section 950.3(j) to the Representative at final acceptance.

(h) School Zone Speed Limit Flashing Warning Sign.

System must conform to 47 CFR 15.

Sign display message character color, dimensions, and layout must be followed according to Publication 236 and the MUTCD.

Utilize approved yellow LED indications as specified in Section 955.2(c).

For Type II and Type III sign, use LED-illuminated “15” speed limit message.

Include all hardware to provide a functional assembly. Functional assembly includes specified structural support with foundation, mounting hardware, weather resistant NEMA rated enclosure, an approved solid state flasher - dual circuit controller assembly, an approved solid state time clock, wireless/cellular communications if applicable, and wiring for the indications.

Provide and label an on/off switch in the controller assembly to operate the flashing yellow LED lenses and the speed limit message while retaining power to the time clock.

LED or steady “15” speed limit messages must not be visible when extinguished.

Provide a hardwired or solar powered capable system as indicated.

If solar powered, ensure the panel dimensions and battery capacity is sized to provide continuous 24/7 hour, 365 day operation. Provide a lockable enclosure for the batteries. The design of the enclosure must allow batteries to be easily removed and replaced. All power inputs must be fuse or other current limiting device protected.

If hardwired, connect wiring from sign to a circuit breaker in the electrical service disconnect box.

Solar powered and hardwired systems must be able to recover from power loss and return to their operation state independent from user intervention.

Provide all warranty documentation as specified in Section 950.3(j) to the Representative at final acceptance.

(i) Flashing Warning Sign.

System must conform to 47 CFR 15.

Utilize approved yellow LED indications as specified in Section 955.

Include all hardware to provide a functional assembly. Functional assembly includes specified structural support with foundation, mounting hardware, an approved solid state flasher - dual circuit controller assembly, an approved solid state time clock and wiring for the indications.

Provide and label an on/off switch in the controller assembly to operate the flashing yellow LED lenses while retaining power to the time clock.

Provide a hardwired or solar powered capable system as indicated.

If solar powered, ensure the solar power system is properly sized to provide continuous 24 hour, 365 day operation. Provide a lockable enclosure for the batteries. The design of the enclosure must allow batteries to be easily removed and replaced. All power inputs must be fuse or other current limiting device protected.

If hardwired, connect wiring from LED Blank-Out sign to a circuit breaker in the electrical service disconnect box.

Both solar powered and hardwired systems must be able to recover from power loss and return to their operation state independent from user intervention.

Provide all warranty documentation as specified in Section 950.3(j) to the Representative at final acceptance.

(j) LED Blank-Out Signs.

System must conform to 47 CFR 15.

Provide LED Blank-Out Signs according to Publication 236; MUTCD; the current ITE Standard for “Vehicle Traffic Control Signal Heads - Light Emitting Diode (LED) Circular Signal Supplement”

Sign display message symbols and characters must be according to Publication 236 and the MUTCD.

Provide sign assembly capable of working in coordination with signal controller, flashing beacons, or illuminated messages as indicated. Sign assembly includes the appropriate equipment and cabling to allow communications, photoelectric cells, and mounting hardware.

Include all hardware to provide a functional assembly capable of operating under all weather conditions.

When applicable, the assembly will include internally illuminated messages in an opaque housing with a face of translucent plastic. Signs will be capable of maintaining illuminated LED message if power failure occurs. LED message must not be visible when extinguished. LED message should be dimmable to adjust to ambient light conditions and vehicle headlights to ensure legibility from at least 400 feet.

Provide sign assembly capable of obtaining power from traffic signal cabinet.

Provide successful laboratory test results verification from manufacturer.

Provide all warranty documentation as specified in Section 950.3(j) to the Representative at final acceptance.

(k) LED Border Lit Signs.

System must conform to 47 CFR 15.

Utilize approved LEDs, ensuring that all LEDs are operable from a solar or electrical self-contained source capable of supplying power to the device.

LEDs modules are to be placed around the perimeter outer edge of the sign. The LED modules cannot be placed within the background area of the sign except for "Stop" and "Yield" signs where LEDs may be placed within one border distance within the background of the sign. Border distance dimensions must be according to Publication 236.

The LEDs are to be wired so that all other LEDs will continue to operate if one were to fail. If LEDs are flashed, all LEDs must flash simultaneously and have a flash rate of more than 50 and less than 60 times per minute.

LEDs must match the following colors based on the sign type.

- White or red if used with "Stop", "Yield", "Do not enter", and "Wrong Way" signs.
- White if used with other regulatory signs.
- White or yellow if used with warning signs and school area signs.
- White if used with guide signs.
- White, Yellow, or Orange if used with temporary traffic control signs.

All LEDs used on an individual sign must be of the same production batch for uniformity. Chromaticity range requirements of individual LEDs are as follows.

- Red: 615-635 nm wavelength.
- Yellow: 585-595 nm wavelength.
- White: 4,000-6,500 K correlated color temperature.
- White if used with other regulatory signs.
- White or yellow if used with warning signs and school area signs.

LEDs should be dimmable to adjust to ambient light conditions and vehicle headlights to ensure legibility from at least ½ mile during daylight or nighttime conditions.

Include all hardware to provide a functional assembly capable of operating under all weather conditions. Assembly includes specified structural support with foundation, mounting hardware, an approved solid-state flasher - dual circuit controller assembly, Americans with Disabilities Act (ADA) compliant pedestrian push button detection if applicable, wireless communication if applicable, and an approved solid-state time clock and wiring for the indications. All wiring for sign components is to be concealed by raceways or other compartments to protect from damage by weather and vandalism.

The assembly will be capable of detecting advancing traffic and flashing in sequence with other LED Border Lit Signs when applicable and to the satisfaction of the Department.

Provide a hardwired or solar powered capable system as indicated.

If solar powered, ensure the solar power system is properly sized to provide continuous 24-hour, 365-day operation. Provide a lockable enclosure for the batteries. The design of the enclosure must allow batteries to be easily removed and replaced. All power inputs must be fuse or other current limiting device protected.

If hardwired, connect wiring from sign to a circuit breaker in the electrical service disconnect box.

Both solar powered and hardwired systems must be able to recover from power loss and return to their operation state independent from user intervention.

Provide successful laboratory test results verification from manufacturer.

Provide all warranty documentation as specified in Section 950.3(j) to the Representative at final acceptance.

(l) LED Red Signal Ahead Signs.

System must conform to 47 CFR 15. Sign display message character color, dimensions, and layout must be

according to Publication 236 and the MUTCD.

Provide sign assembly capable of working in coordination with signal controller as indicated. Sign assembly includes specified structural support with foundation, all mounting hardware, wiring, photoelectric cells, and hardware to provide a functional assembly capable of operating under all weather conditions.

“red” LED message must not be visible when extinguished. Message will be activated externally, only when traffic signal controller is in the appropriate red phase condition.

Provide successful laboratory test results verification from manufacturer.

Provide all warranty documentation as specified in Section 950.3(j) to the Representative at final acceptance.

(m) Permanent Speed Display Signs.

System must conform to Sections 5.82 Nighttime Dimming, 6.4.3 Environmental Tests, and 6.4.6.3 Electronic Noise of the June 2007 ITE Standard for “Vehicle Traffic Control Signal Heads – LED Circular Signal Supplement.” The display sign must satisfy an International Protection rating of IP14. System must conform to 47 CFR 15.

Include all hardware to provide a functional assembly capable of operating under all weather conditions. Assembly includes specified structural support with foundation, mounting hardware, wiring, controller assembly with programmable schedule option, light sensor, dynamic display panel, “Your Speed” sign if applicable, and solar components if applicable.

Dynamic display panel must consist of a modular display panel capable of displaying a two-digit vehicle speed with characters a minimum of 12 inches in height. The display should be dimmable to adjust to ambient light conditions and vehicle headlights to ensure legibility from at least 400 feet. The display must appear completely blank when not energized. Phantom characters and ghosting are prohibited under any ambient light conditions. Ghosting is where non-illuminated LED bulbs are visible while other LED bulbs in the display are illuminated making the display less legible. The speed displayed must flash at a rate of no less than 60 cycles per minute once the display is activated. Acceptable indication colors must be yellow or white and must have a viewing angle of 30 degrees. A “Your Speed” sign must be mounted to the top of the dynamic display panel. The sign must be made with Type III High Intensity sheeting and must be capable of being easily removed and replaced. Alternately, a “Your Speed” lighted display inside the sign system is acceptable.

System must be posted beneath an approved flashing warning sign system, school zone speed limit flashing warning sign system, and/or static Publication 236 approved speed limit sign.

The dynamic display panel portion of the display must receive input from an internal speed detection device. The speed detection device determines the speed of a target and must be used for the oncoming approach. The speed detection device should measure in miles per hour with an accuracy of ± 1.5 miles per hour and a target speed range of 10 to 99 miles per hour. The speed detection device must feed directly to the dynamic display panel portion. The SDS system must be programmable for the posted speed limit and the maximum speed to display. When detected speed exceeds the maximum programmed speed threshold determined by the Department the display will automatically blank. Alternately, the display may show “slow down” when speeds exceed the maximum programmed speed threshold.

Provide a housing that is weather, shatter, and tamper resistant including weather tight cable entry or connection points. The front face of the display must be anti-reflective polycarbonate, or a material acceptably comparable in performance. The front face must be resistant to ultraviolet light, fading and discoloration. The housing must be NEMA 3R rated and must be accessible only by authorized personnel.

Provide a hardwired or solar powered capable system as indicated. If solar powered, ensure the solar power system is properly sized to provide continuous 24 hour, 365 day operation. Provide a lockable enclosure for the batteries. The design of the enclosure must allow batteries to be easily removed and replaced. All power inputs must be fuse or other current limiting device protected.

If hardwired, connect wiring from sign to a circuit breaker in the electrical service disconnect box.

Both solar powered and hardwired systems must be able to recover from power loss and return to their operation state independent from user intervention.

Provide successful laboratory test results verification from the manufacturer.

Provide all warranty documentation as specified in Section 950.3(j) to the Representative at final acceptance.

(n) Temporary Speed Display Signs. 1103.04(m).

(o) Rectangular Rapid Flashing Beacon Assembly.

System must conform to 47 CFR 15.

Include all hardware to provide a functional assembly. Assembly includes specified structural support with foundation, mounting hardware, weather resistant NEMA rated enclosure, wiring, controller assembly, RRFB unit,

wireless communication system for RRFB units, crossing sign(s), pedestrian confirmation light, backplate (optional), ADA compliant pedestrian push button if applicable, pedestrian push button sign if applicable, passive pedestrian detection (if applicable), and solar components (if applicable).

RRFB must conform to MUTCD, chapter 4L and Interim Approval for the Optional Use of Pedestrian-Actuated Rectangular Rapid-Flashing Beacons at Uncontrolled Marked Crosswalks (IA-21).

Provide a RRFB unit with two rectangular-shaped yellow indications, each with an LED-array-based light source. Each indication must be at least 5 inches wide by at least 2 inches high. The two indications must be aligned horizontally with the longer dimension horizontal and a minimum space of at least 7 inches between the nearest edge of each indication. The outside edges of the two indications, including any housings, must not project beyond the outside edges of the crossing warning sign that it supplements. The two indications must be located between and immediately adjacent to the bottom of the crossing warning sign and the top of the supplemental placards or within 12 inches above the crossing warning sign.

Provide a RRFB unit capable of rapidly flashing at a sequence of 75 flashes per minute when actuated. The flash rate of each individual indication, as applied over the full flashing sequence, must avoid the flashing between 5 and 30 flashes per second. The RRFB indications initiate operation only upon pedestrian actuation. The RRFB indications cease operation at a predetermined time determined using MUTCD Section 4E.06 guidance.

Provide two yellow indications that meet the minimum specifications for Class 1 yellow peak luminous intensity in the SAE Standard J95 current version and are capable of automatically dimming.

At minimum, provide an ADA compliant pedestrian push button for each RRFB unit even if passive pedestrian detection is installed. Include a “push button to turn on warning lights” (R10-25) sign with the pedestrian push button installation. Provide a pedestrian confirmation light, visible by pedestrians waiting to utilize the crosswalk, for either push button actuation or the combined push button and passive pedestrian detection actuation. The pedestrian confirmation light must initiate and commence operation in concert with the rapid flashing beacon indications. If an audible push button is utilized, a “Yellow Lights are Flashing” audible message should be repeated twice at the start of the rapid flashing beacon sequence.

Provide RRFB units capable of rapid-flashing simultaneously with all other RRFB units associated with the crosswalk or intersection as indicated. All RRFB units at the associated crosswalk or intersection must initiate and commence rapid-flashing operation simultaneously.

Provide a hardwired or solar powered capable system as indicated.

If solar powered, ensure the solar power system is properly sized to provide continuous 24 hour, 365 day operation. Provide a lockable enclosure for the batteries. The design of the enclosure must allow batteries to be easily removed and replaced. All power inputs must be fuse or other current limiting device protected.

If hardwired, connect wiring from sign to a circuit breaker in the electrical service disconnect box.

Both solar powered and hardwired systems must be able to recover from power loss and return to their operation state independent from user intervention.

Provide successful laboratory test results verification from manufacturer.

Provide all warranty documentation as specified in Section 950.3(j) to the Representative at final acceptance.

1103.04 FLAT SHEET SIGNS (FOR POST MOUNTED SIGNS, TYPES B, C, AND F; AND DISTANCE MARKER(S))—

(a) Blanks. Use aluminum blanks. For signs furnished under Section 901, use plywood, aluminum, acrylonitrile butadiene styrene (ABS), aluminum/plastic laminate, corrugated polypropylene, or polyethylene blanks.

Physical and chemical properties of plywood and aluminum blanks according to Publication 306.

(b) Coating Treatment. Prepare sign faces with appropriate coating according to Publication 306.

(c) Reflective Sheeting. Section 1103.02(c).

1. General. Apply the sheeting to the sign face using a procedure according to the sheeting manufacturer, free of bubbles or wrinkles greater than 3 inches in length, and with total sheeting shrinkage of not more than 1/8-inch.

On signs larger than 48 inches on the shorter side, sheeting may be spliced with the edges of adjacent pieces butted together throughout the entire seam length without any overlap or separation.

Use Type III, IV, VIII, IX, or XI sheeting for all signs.

(d) Ink. As recommended by the manufacturer of the reflective sheeting.

(e) Electronic Cuttable (EC) Film. Use film as recommended by the manufacturer of the reflective sheeting. Apply the sheeting to the sign face using a procedure according to the sheeting manufacturer, free of bubbles or wrinkles greater than 1 inch in length.

(f) Legend and Border. Apply legend and border of the color, size, and dimensions according to Publication 212, Publication 213, and the MUTCD or as indicated. Use silk screens with a mesh of 12XX or finer for reverse screening. Use stencils with sharp clear-cut edges, uniform curvature, and straight lines. Silk screen in a manner resulting in uniform color and tone, with sharply-defined edges and without blemishes on the sign background. Air dry or bake signs after silk screening to achieve a smooth hard finish. Blisters appearing during the drying process will be cause for rejection. If direct-applied legend is indicated for any directional or destination sign, use Type III, IV, VIII, IX, or XI reflective sheeting. Slip-sheet and pack signs to ensure delivery in an undamaged condition.

1103.05 DELINEATION FOR PERMANENT AND TEMPORARY IMPACT ATTENUATORS, CRASH CUSHIONS, AND TERMINAL SECTION, SINGLES—

(a) Reflective Sheeting. Use sheeting from a manufacturer listed in Bulletin 15.

1. General. Apply the sheeting to the head of the product according to the manufacturer's recommendation and as shown on the Standard Drawings. Apply the sheeting to be free of bubbles or wrinkles greater than 3 inches in length.

Sheeting may be spliced with the edges of adjacent pieces butted together throughout the entire seam length without any overlap or separation.

1103.07 STEEL S OR W BEAM POSTS AND BREAKAWAY SYSTEM (FOR POST MOUNTED SIGNS, TYPE A)—

(a) Steel S or W Beam Posts. As shown on the Standard Drawings.

(b) Breakaway System. As shown on the Standard Drawings and as follows:

1. Couplings. Alloy steel AMS 6378D with:

- Minimum tensile yield stress of 130,000 psi.
- Ultimate tensile strength of 150,000 psi.
- Minimum Rockwell C hardness of 32.
- Capable of withstanding a tensile breaking load of 41,000 pounds.

2. Hinge Plates. Alloy steel AISI 4130, 4340, or an equivalent material with a minimum tensile yield stress of 70,000 pounds per square inch, an ultimate tensile stress range of 90,000 pounds per square inch to 108,000 pounds per square inch, and a tensile breaking load, in pounds, as follows:

Model SBHB1B	51 min. (11,450 min.)
Model SBHB2B	73 min. (16,400 min.)

3. Brackets. Aluminum alloy ASTM B 221, Alloy 6061T6 or equal, with a load concentrating boss of stainless steel, ASTM A 582, Type 416, or equal.

4. Bolts, Nuts, and Washers.

4.a Hinge Plates. AISI 4130 Steel. Galvanized as specified in Section 1105.02(s) and according to ASTM A 153.

4.b Brackets. ASTM B 209; Alloy 6061-T6.

5. Anchor. Type 304 stainless steel ferrule with 1053 steel rod and coil.

6. Coupling Bolts. AMS 6378D, galvanized as specified in Section 1105.02(s) and according to ASTM A 153.

(c) Fabrication. Cut, drill or punch holes in parts or members, before galvanizing. Furnish a statement, before the beginning of galvanizing, showing the carbon content of the steel to be galvanized. Hot-dip galvanize posts and hardware after fabrication, as specified in Section 1105.02(s). Bolts, nuts, and washers to be galvanized according to ASTM B 695 and B 696 and according to the coating thickness, adherence, and quality requirements of ASTM A 153 (AASHTO M 232).

1103.08 BREAKAWAY STEEL POSTS (FOR POST MOUNTED SIGNS, TYPE B AND DISTANCE MARKERS)—

(a) Steel Channel Bar Posts. As shown on the Standard Drawings. Use steel channel bar post, according to the Department's specification for Breakaway Channel Bar Posts, from a manufacturer listed in Bulletin 15.

(b) Steel Square Posts. As shown on the Standard Drawings. Use steel square post, according to the Department's specification for Breakaway Steel Square Posts, from a manufacturer listed in Bulletin 15.

1103.09 TREATED WOOD AND COMPOSITE POSTS (FOR POST MOUNTED SIGNS, TYPES C AND E)—

(a) Treated Wood Posts (for Post Mounted Signs, Types C and E).

1. Posts. S4S No. 1 Dense or No. 1 Dense SR Southern Yellow Pine or No. 1 Douglas Fir-Larch, seasoned to a maximum of 19% moisture.

Grade and grade mark each post, before treatment, with an official grade stamp or inspection agency mark, certified by the Board of Review, American Lumber Standards Committee. Cut and drill before preservative treatment.

2. Treatment. Treat with Ammoniacal Copper Arsenite (ACA) or Chromated Copper Arsenate (CCA) Type A, B, or C meeting AWP Standard P5. Use a minimum preservative retention of 0.40 pound per cubic foot by assay (oxide basis). Treat and quality mark according to AWP C2. Inspect according to AWP Standards M1 and M2.

Include a treatment certificate with each shipment.

(b) Composite Posts (for Post Mounted Signs, Type E).

1. Posts. Unsaturated polyester resin reinforced with E-glass and lightweight aggregate concrete not greater than 110 pounds per cubic foot to form a rigid structural support member. Tensile modulus of tube to be not less than 2,500 kips per square inch. Posts to be equal to or greater in strength to Schedule 40 steel of the same diameter according to ASTM A 53.

2. Weathering. Post shall have less than 10% loss of strength after 3,600 hours of accelerated weathering exposure to moisture and lamps according to ASTM G 152, G 155, and G 154.

3. Color. Specified post color will be permanent throughout the FRP tube with not less than 1.5 mil dry film thickness. After 3,600 hours exposure according to ASTM G 152, G 155, and G 154, posts will exhibit 90% adhesion, ASTM D 4541 and a maximum color change of 25, Delta -E.

1103.10 DELINEATOR POSTS—Not used.

1103.11 MISCELLANEOUS MATERIALS—

(a) Hex Head Bolts, Nuts, and Washers for Extruded Panel Sign Post-Clips. Galvanized steel as specified in Section 1105.02(s):

1. **Hex Head Bolts.** ASTM A 307, Grade A or B.
2. **Nut.** ASTM A 563 DH or ASTM A 194 Grade 1 or 2.
3. **Washer.** Carbon steel helical coil or ASTM F 436 or ASTM F 844 (Note 1).

Note 1: If either ASTM F 436 or ASTM F 844 flat washers are used, bolt must be fastened either using two nuts or a single nut with the threads galled adjacent to the nut to prevent loosening.

(b) Post-Clips- For extruded panel signs, aluminum, according to ASTM B 108, Alloy 356-T6. For flat sheet aluminum signs with stiffeners, stainless steel, Type 304, 14 gage.

(c) Auxiliary Supports for Exit Panels. Aluminum according to ASTM B 211, Alloy 6061-T6. 3 inches by 3 inches by 3/16-inch angle, 6 1/2 feet long or long enough to attach to three stiffeners on the main sign.

(d) Lag Screws. 5/16-inch round head, galvanized steel as specified in Section 1105.02(s), and according to ASTM A 307.

(e) Rivets. Aluminum, self-plugging or hollow-core, as follows:

- 3/16-inch for mounting reflective units and distance plaques—Alloy 5056 with 7178 mandrels.
- 3/16-inch for mounting flat aluminum sheets to stiffeners sections— Alloy 5056 with carbon steel mandrels.

Rivet size specified is the minimum shank diameter. Use rivets with sufficient grip range to attach to background sign material, stiffeners, or posts. Use a No. 10 drill for 3/16-inch rivets for attachment of stiffeners and splice bars.

(f) Bolts, Nuts, and Washers for Flat Sheet Aluminum Signs with Stiffeners. Stainless steel, Type 304 bolts. Use 5/16-inch by 1 inch long for butting plates and 5/16 -inch by 2 inches long for post-clips. Use standard connection bolts or twist-in bolts.

(g) Twist-in Toggle and Buckle Straps. Stainless steel, Type 201, and 0.75-inch wide and 0.03-inch thick, with rounded edges. Spot welded, twist-in type toggle on end of strap. Spot welded, antirotational buckle on other end of strap. Toggles and buckles shall be stainless steel, Type 304, and 1/16 -inch thick.

(h) Butting Plates. Fabricate from stainless steel, Type 304.

(i) Anchors. Section 1105.02(c)2.

(j) Anti-Theft Sign Hardware.

1. System A.

- **Bolts.** Section 1105.02(c)1 and as follows:
Provide 5/16-inch by 2 1/2-inch or 5/16-inch by 3 inch steel carriage bolts with minimum 11/16-inch diameter round head, square neck, and threads to within 1 inch of head.
Furnish bolts having a mechanically deposited cadmium coating, ASTM B 696, or zinc, Type I coating as specified in Section 1105.02(s).
- **Nuts.** Square, pyramidal-shaped nuts with all four sides sloping at an angle of 41 degrees; 5/16-18 UNC threads; C-1010 cold-rolled steel, case hardened to Rockwell hardness of 55 to 60.
Furnish nuts having a 0.002-inch to 0.005-inch thick, mechanically deposited, zinc, Type II yellow chromate coating as specified in Section 1105.02(s) according to ASTM B 695, tested according to ASTM B 201.

2. System B.

- **Bolts.** Section 1103.11(m) and as follows:
Provide 5/16-inch by 2 1/2-inch and 5/16-inch by 3-inch bolts with minimum 9/16-inch diameter one-way heads and threads to within 1 inch of head.
- **Nuts.** Section 1103.11(n) and as follows:
Provide nuts, Aluminum Alloy 2011-T3 according to ASTM B 211, double-chamfered hexagon with self-locking conical shape 9/16-inch - 3/8-inch by 3/16-inch unit under the nut with 5/16-18 UNC threads. Hexagon portion should break away from self-locking unit with 5/16-18 UNC to 40 inch-pounds to 80 inch-pounds of torque.
- **Washers.** Nylon 1/8-inch thick by 1-inch minimum outside diameter with 480 inch-pounds maximum allowable applied torque.

(k) Banding. Stainless steel, Type 201, 0.750-inch wide by 0.030-inch thick, with rounded edges for handling ease and safety. Buckles and other necessary hardware shall be of stainless steel, Type 304.

(m) Aluminum Bolts. ASTM B 211. Alloy 2024-T4, thread fit, ANSI Class 6g, and threads shall be within two threads of the head or a minimum of 1 3/4-inches.

(n) Aluminum Nuts. ASTM B 211. Alloy 2024-T6, thread fit, ANSI Class 6H (ANSI Class 2B, 18 UNC threads).

1103.12 SIGN AND DISTANCE MARKER SUPPORTS—

(a) General. Hot-dip galvanize steel, except stainless steel, after fabrication, as specified in Section 1105.02(s). Drill or punch holes and cut before galvanizing. If attaching to a vertical support or overhead structure as specified in Sections 935.1 and 936.1, support color must match the color of the vertical support or overhead structure.

(b) Brackets for Post Mounted Signs, Types C, D, and F. ASTM A 283.

(c) Bars for Post Mounted Signs, Types C, D, and E. ASTM A 709Grade 36.

(d) Shims for Post Mounted Sign, Types C and E. ASTM A 709Grade 36.

(e) Steel Pipe Supports for Post Mounted Signs, Types D and E. ASTM A 53.

(f) Shapes and Plates for Post Mounted Signs, Type D. ASTM A 709Grade 36.

(g) Angles (Aluminum) for Post Mounted Signs, Type E, and Structure Mounted Signs. ASTM B 308, Alloy 6061-T6.

(h) Shim Bars and Plates for Post Mounted Signs, Type E. ASTM A 709Grade 36.

(i) Brackets, Bars, Clamps, Strips, and Gussett Plates (for Erecting Distance Markers on Bridge Railing). Stainless Steel, ASTM A 240.

1103.13 DELINEATOR BRACKETS—Not used.

1103.14 REFLECTIVE GLASS BEADS—

(a) General. Furnish reflective glass beads according to AASHTO M 247, except as follows:

1. **Gradation.** Satisfies the following gradation for type indicated:

Sieve Size	Percent Beads Passing
------------	-----------------------

	Type A	Type B	Type C	Type D	Type E
2.0 mm (10)	-	100	-	-	-
1.7 mm (12)	-	95 to 100	100	-	-
1.4 mm (14)	-	80 to 95	95 to 100	-	100
1.18 mm (16)	100	10 to 40	80 to 95	100	-
1.0 mm (18)	-	0 to 5	10 to 40	-	65 to 80
850 µm (20)	-	0 to 2	0 to 5	95 to 100	-
710 µm (25)	-	-	0 to 2	65 to 90	-
600 µm (30)	75 to 95	-	-	-	30 to 50
500 µm (35)	-	-	-	10 to 45	-
300 µm (50)	15 to 35	-	-	0 to 10	0 to 5
150 µm (100)	0 to 2	-	-	0 to 5	-

2. Rounds. Provide glass beads with a minimum of 75% true spheres overall, a minimum of 70% true spheres per sieve, and not more than 3% angulars overall. Type E beads must meet a minimum of 80% true spheres for all sieve fractions when measured according to AASHTO T 346.

3. Coating. Supply Type A, B, D, and E glass beads with coatings to enhance moisture resistance, embedment, and adherence with the binder. Supply Type C with coatings to enhance embedment and adherence. Evaluate coatings to referee methods according to AASHTO T 346.

4. Color-Clarity. Provide glass beads that are colorless/clear and visually free of carbon residue and/or inclusions containing no greater than 0.004% carbon by weight when measured according to ASTM D 4239 combustion infrared.

5. Refractive Index. Minimum 1.51 by oil immersion or equivalent method premeasured according to AASHTO T 346.

6. Air Inclusions. <5% by visual inspection.

7. Hardness. Beads above the No. 30 sieve are to exhibit an average hardness of C70.5 when measured using the Rockwell C scale method with a minimum sample of 100 glass beads.

8. Crushing Strength. Beads above the No. 30 sieve are to exhibit an average crushing strength of not less than 60,000 pounds per square inch when measured with L/D² method with a minimum sample of 100 glass beads.

9. Chemical Resistance. Chemical resistance to hydrochloric acid, water, calcium and other chlorides and sodium sulfides tested according to sections 4.3.6 to 4.3.9 of TT-B Federal Specification 1325D.

10. Performance Properties. The Department will benchmark bead performance properties according to NCHRP 743 to ensure continued quality and retroreflectivity in markings.

11. Recycled Postconsumer Glass. Incorporate recycled postconsumer glass into glass used for beads at a minimum of 2% for direct melt processes up to a maximum of 100% by weight for non-direct melt production. Type E beads will contain a minimum of 50% of direct melt glass.

SECTION 1105—FABRICATED STRUCTURAL STEEL AND ALUMINUM

1105.01 GENERAL REQUIREMENTS—

(a) Prequalification. Structural steel and aluminum fabricators performing work for the Department are required to prequalify according to the American Institute of Steel Construction's (AISC) Quality Certification Program and obtain approval from the Chief Structural Materials Engineer. Plants and shops must be registered and certified under the AISC program with SBR: Certified Bridge Fabricator-Simple; IBR: Certified Bridge Fabricator-Intermediate; ABR: Certified Bridge Fabricator-Advanced; or CPT: Certified Component Manufacturer - Bridge, as applicable, and must submit a valid certificate to the Chief Structural Materials Engineer, at 81 Lab Lane, Harrisburg, PA, 17110. Annual submission of an endorsed copy of the certificate is required for continued prequalification. Fabricators applying for initial Bulletin 15 approval or approved fabricators wishing to upgrade certification must obtain approval to fabricate structures which have Publication 408 Section specific Bulletin 15 fabricator listings or to fabricate High Performance Steel (HPS) members and are required to furnish acceptable references for which the fabricator has successfully completed fabrication of similar members. If unable to furnish acceptable references, the fabricator must satisfactorily produce a sample member to obtain Department approval and listing in Bulletin 15.

Only fabricators having ABR certification, including the Fracture Critical endorsement, may fabricate the following:

- Main members for arches, continuous span trusses, cable-stayed bridges, and suspension bridges.

Only fabricators having either IBR or ABR certification, including the Fracture Critical endorsement, may fabricate the following:

- Fracture critical members and attachments, except as specified in Section 1105.01(a).

Only fabricators having either IBR or ABR certification may fabricate the following:

- Main bridge members, except for certain rolled beams
- Welded floor beams
- Cross frames and diaphragms for curved bridges
- Bracing, portals, and stiffening members for arches, trusses, cable-stayed and suspension bridges
- Rolled beams with butt welds, or that are heat-curved, heat-cambered, or cold cambered

Fabricators having either SBR, IBR, or ABR certification may fabricate the following:

- Rolled beams with bearing stiffeners and diaphragm connection or cover plates²
- Cross frames and diaphragms for straight bridges
- Shop-fabricated material for reinforcing existing bridges¹
- Lateral bracing except for arches, trusses, cable-stayed, and suspension bridges¹

Note 1: Fabricate in an IBR or ABR certified plant if welding is required.

Note 2: SBR certified plants must qualify for initial approval from the Chief Structural Materials Engineer to perform heat cambering or cold cambering on rolled beams.

Fabricators having SBR, IBR, ABR, or CPT certification may fabricate the following:

- Expansion dams
- Bridge drainage material
- Welded bearings
- Inspection walks
- Steel grid flooring
- Overhead sign structures
- Welded sound barrier supports

- Bridge railing
- Pedestrian railing
- Structure mounted guide rail
- Welded protective barrier
- Traffic, lighting or camera poles

AISC certification is not required for the following:

- Castings, forgings, and machined parts not welded
- Non-metallic bearing
- Protective fence
- Material not requiring shop fabrication or shop welding, such as plates and shapes for strengthening existing bridges and manufactured items accepted by certification

Prequalification of ‘machine shops’ (who provide services and materials to approved fabricators) for listing in Bulletin 15 is required. Approved fabricators are not required to prequalify as machine shops. Approved machine shops may perform one or more of the following operations³:

- Cutting or shearing materials to finish size
- Grinding
- Drilling or punching
- Cold bending
- Machining
- Flattening

Note 3: Individual shop operations may be limited. Refer to Bulletin 15 for limitations.

Machine shops cannot produce fracture critical members without project specific approval from the Chief Structural Materials Engineer except if the material is being produced for and shipped to a fabricator having AISC IBR or ABR certification, including Fracture Critical endorsement.

(b) Coordination of Plans and Specifications. Section 105.04

(c) Shop Drawings. Section 105.02 and as follows:

Shop drawings stamped “Accepted as Noted” allow fabrication only. The fabricator will make the noted changes to the drawings and resubmit for final acceptance before shipping. “ACCEPTED” Drawing are required for shipment to project.

Bridge members and other structures are generally designed in lengths, depths, and widths that can be transported from the fabrication source to the project. Field splices, if required, must be indicated and detailed on the shop drawings. If required by the District Executive, submit design computations prepared by a Professional Engineer registered in the State according to the Design Manual, Part 4, Structures. The District Executive will not review requests for elimination of field splices unless a notice is included from the BOMO that a hauling permit can be obtained to ship beams exceeding the dimensions shown on the structure drawings.

(d) Erection Drawings. Section 1050.3(c) 2.d

(e) Inspection.

1. General. The BDTD’s Structural Materials Section will oversee and manage in-plant QA inspection. The fabricator is responsible for notifying their assigned consultant inspection firm a minimum of 48 hours (excluding weekends and holidays) before the beginning of work so that arrangements can be made for inspection.

The Representative may waive shop inspection and make a complete inspection at a later stage in the construction sequence. Furnish certified mill reports, in duplicate, covering the structural steel used.

2. Facilities for Inspection. Furnish necessary facilities for the inspection of material and quality of work. Furnish an Inspector’s Field Office, Type C, as specified in Section 714.5(a), except provide a four-drawer, -fire-resistant (-Dlabel) metal file cabinet in place of a -two-drawer, -fire-resistant (-D-label-) metal file cabinet and a

wired broadband Internet service, for exclusive use by Department personnel. Choose a service that provides the fastest available highspeed broadband internet access, with a minimum connection of 5 Mbps per inspector, to the account by means of a Cable or Digital Subscriber Line (DSL). Provide a wireless broadband router, with a minimum-security setting of WPA2, to connect to the provided wired broadband. Based on the specific type of high-speed connection provided, furnish a compatible modem with built-in hardware firewall protection. If such high-speed wired broadband connection is not attainable at the Inspector Office desk area, alternate internet connectivity options must be submitted to the Chief Structural Materials Engineer for review and acceptance. Demonstrate connectivity with the Internet Service Provider once the service is initiated. To ensure reliability and continued access, audits of this connection may be done at any time by qualified PennDOT/OA IT Personnel.

Allow inspectors employed by the Department unrestricted access to work in process and stored material during plant working hours.

3. Plant Inspector's Authority. Plant Inspectors have the authority to reject any material or work not conforming to the requirements of these Specifications. In case of dispute, the Contractor may appeal to the Representative, whose decision will be final.

4. Rejections. Material, quality of work, or finished members accepted by the inspector at the shop may be rejected later if they do not conform to the specifications. Repair or replace rejected material or members.

5. Testing. If directed, furnish test specimens of material, as well as equipment, tools, and labor necessary to prepare the specimens and to make the tests.

6. Mill Orders and Shipping Statements. Furnish copies of mill orders and shipping statements as directed. Show the weights of the individual members on the statement. Ensure that the fabricator submits a copy of the shipping invoice to the Department's Shop Inspector to be stamped for verification of inspection and acceptance of steel items before shipment. Forward the stamped copy of the shipping invoice with the shipment for the project file. The Shop Inspector will review and accept mill certifications and return them to the fabricator.

(f) Storage of Materials. Section 106.05 and as follows:

Store materials on platforms, skids, or other supports. Place and support materials to avoid overstress, deformation, or damage. Exercise special care for curved members. Keep materials free from dirt, grease, and other foreign materials. Ensure proper drainage and protect materials from corrosion.

(g) QC.

1. General. Establish and maintain a level of QC based on uniform fabrication practices. Do not initiate fabrication without an approved QC plan.

2. QC Plan. Shops seeking prequalification must submit a QC Plan to the Chief Structural Materials Engineer for review and approval. Develop the plan according to the criteria established in AASHTO-NSBA Steel Bridge Collaboration document S4. 1-2002 "Steel Bridge Fabrication QC/QA Guide Specification" (refer to Publication 135 for an outline of the QC plan criteria). Facilities performing welding that require non-destructive testing must submit their written practice according to the current version of ASNT- SNT-TC-1A. Pre-qualified shops must submit an updated QC Plan to the Chief Structural Materials Engineer if there are any changes in materials, processes, or personnel.

3. QC Personnel. Assign sufficient qualified personnel with structural steel and/or aluminum fabrication experience to be responsible for QC during the fabrication process, storage, and shipment. Do not proceed with fabrication until qualified QC personnel are present and approved by the Department. Provide an AWS Certified Welding Inspector (CWI) on site as the Fabricator's designated QC Representative to oversee all processes of fabrication that involve welding, application of heat, or straightening of material.

1105.02 MATERIAL—

(a) Structural Steel and Aluminum.

1. General. ASTM A6

2. Carbon Steel. AASHTO M 270 (ASTM A709), Grade 36, Grade 50S, ASTM A36 and ASTM A992 (Structural Steel Shapes).

2.a Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes. ASTM A500, Grade A, B, or C. or ASTM A1085 Grade A.

2.b Hot-Formed Welded and Seamless Carbon Steel Structural Tubing. ASTM A501

3. High-Strength Low-Alloy Structural Steel for Welding.

3.a High-Strength Low-Alloy, Quenched and Tempered High Performance Steel (HPS) Structural Steel Plate. AASHTO M 270 (ASTM A709), Grade HPS 70W and Grade HPS 100W including requirements for Non-Fracture Critical Material Toughness Testing or Fracture Critical Material Toughness Testing, for Zone 3, as applicable. Identify Fracture Critical Material (FCM) on the shop drawings. Grade substitution for any HPS material indicated on the plans is not allowed.

Provide mill test reports that indicate either Quenched and Tempered (Q&T) or Thermo-Mechanical Control Process (TMCP) and also indicate on the accepted shop drawings. Mill orders must stipulate that no welded repairs are to be performed by the producing mill.

Limit plate length to 50 feet maximum mill delivery length for Q&T plate.

3.b High-Strength Low-Alloy TMCP Structural Steel Plate. AASHTO M 270 (ASTM A709), Grade HPS 70W, up to 2 inches thick and meeting the requirements as specified in Section 1105.02(a)3.a.

3.c High-Strength Low-Alloy Structural Steel. AASHTO M 270 (ASTM A709), Grades 50, 50W, or HPS 50W, ASTM A572, Grade 50, of a quality suitable for welding.

3.d High-Strength Low-Alloy Columbium-Vanadium Steel of Structural Quality. AASHTO M 270 (ASTM A709), Grade 50, ASTM A572, Grade 50.

3.e High-Strength Low-Alloy Structural Steel with 50,000 pounds per square inch Minimum Yield Point to 4 inches Thick. AASHTO M 270 (ASTM A709), Grade 50W, ASTM A588 (Grades A, B, and C only⁴).

Note 4: Plate thicknesses greater than 4 inches are required to conform to the physical properties listed in the specification for plate thicknesses 4 inches and under.

3.f High-Yield Strength, Quenched and Tempered Alloy Steel Plate.

3.f.1 High-Yield Strength, Quenched and Tempered Alloy Steel Plate, Suitable for Welding. AASHTO M 270 (ASTM A709), Grade HPS 100W.

3.f.2 High-Strength Alloy Steel Plates, Quenched and Tempered, for Pressure Vessels. ASTM A517. Conforming to the supplementary notch toughness requirements of ASTM A20.

3.f.3 Quenched and Tempered Alloy Steel Structural Shapes and Seamless Mechanical Tubing. Products conforming to all of the mechanical and chemical requirements of ASTM A709, Grade HPS 100W steel, except with a maximum tensile strength of 140,000 pounds per square inch for structural shapes and 145,000 pounds per square inch for seamless mechanical tubing, are to be considered as ASTM A709.

3.g. Stainless Steel. As indicated on the plans. Use only prequalified base metals listed in AWS D1.6M/D1.6 – 2007.

4. Aluminum. As indicated on the plans. Use only prequalified base metals listed in AWS D1.2M/D1.2 – 2014

5. Supplemental Requirements for Notch Toughness. Unless otherwise indicated, provide structural steel conforming to the supplementary notch toughness requirements for the longitudinal Charpy V-notch tests specified for Zone 2 of the applicable AASHTO Materials Specifications. Unless otherwise indicated, the supplemental requirements are mandatory for the following Primary Member Components subject to tensile stress:

- Girders, beams, stringers, floorbeams, bent caps, bulkheads, and straddle beams
- Truss chords, diagonals, verticals, and portal and sway bracing members
- Arch ribs and built-up or welded tie girders
- Rigid frames
- Gusset plates and splice plates in trusses, arch ribs, tie girders, and rigid frames
- Splice plates and cover plates in girders, beams, stringers, floorbeams, bent caps, and straddle beams
- Bracing members supporting arch ribs
- Permanent bottom-flange lateral bracing members and mechanically fastened or welded bottom-flange lateral connection plates in straight and horizontally-curved bridges
- Diaphragm and cross-frame members and mechanically fastened or welded crossframe gusset plates in horizontally-curved bridges or straight girder bridges if the skew is less than 70 degrees.
- Mechanically fastened or welded longitudinal web and flange stiffeners
- Mechanically fastened or welded batten plates and stay plates, lacing, and continuous nonperforated or perforated plates in built-up members
- Eyebars and hanger plates
- Miscellaneous structural components or attachments not mentioned above joining two primary members

The requirements are not mandatory for Secondary Member Components:

- Top flange lateral bracing members or struts and top flange lateral connection plates in horizontally-curved bridges or straight girder bridges if the skew is 70 degrees or greater
- Diaphragm and cross-frame members and mechanically fastened or welded cross-frame gusset plates in straight bridges if the skew is 70 degrees or greater
- Bearings, filler plates, sole plates, and masonry plates
- Mechanically fastened or welded transverse intermediate web stiffeners, transverse flange stiffeners, bearing stiffeners, and transverse connection plates
- Miscellaneous nonstructural components or attachments (e.g., expansion dams, drainage material, brackets, other miscellaneous attachments)

If directed, provide samples for Charpy V-Notch testing from steel used in fabricating plates and shapes. Submit the samples to the Chief Structural Materials Engineer, BDTD - Structural Materials Section, 81 Lab Lane, Harrisburg, PA 17110. Obtain the samples from plates delivered to the fabricator.

(b) Bedding Material for Bridge Shoes. Section 1113.03(h)

(c) Bolts, Nuts, and Washers. From a manufacturer listed in Bulletin 15 and as follows, unless otherwise indicated or specified:

1. Bolts for General Application.

- ASTM A307, Grades A or B

1.a Nuts. Use ASTM A563 nuts of the Grade and Style conforming to the Grade and Diameter of ASTM A307 bolts, of all surface finishes, as follows, unless otherwise specified:

<u>Bolts (inch)</u>	<u>Nuts</u>
Grade A, 1/4 to 1 1/2	Grade A, Hex
Grade A, over 1 1/2 to 4	Grade A, Heavy Hex
Grade B, 1/4 to 4	Grade A, Heavy Hex

Nuts of other grades and styles having specified proof load stresses (ASTM A563, Table 3) greater than the grade and style of nuts shown above are also suitable. Overlap and lubricate galvanized nuts in conformance with ASTM A563.

1.b Washers. ASTM F436, Type 1 or ANSI B18.22M

2. Anchor Bolts. AASHTO M 270 (ASTM A709), Grade 36, anchor bolts (headed or non-headed, either straight or bent) and cap screws, hot dip or mechanically galvanize as specified in Section 1105.02(s).

2.a Nuts. ASTM A563, of suitable style according to the contract documents. Hot dip or mechanically galvanize to match anchor bolt coating process as specified in Section 1105.02(s). Galvanized nuts must be Grade DH. Overlap and lubricate galvanized nuts according to ASTM A563. Overlap only to the minimum extent necessary to allow assembly on the bolt threads.

2.b Washers. ASTM F436, Type 1, hot dip or mechanically galvanize as specified in Section 1105.02(s).

3. Anchor Bolts. ASTM F1554, Grades 36, 55, 105, anchor bolts (headed or non-headed, either straight or bent) and cap screws (fully threaded shank), hot dip or mechanically galvanize as specified in Section 1105.02(s).

3.a Nuts. ASTM A563, of suitable style according to ASTM F1554, Section 6.7, unless otherwise specified in the contract documents. Hot dip or mechanically galvanize to match anchor bolt coating process as specified in Section 1105.02(s). Galvanized nuts must be Grade DH. Overlap and lubricate galvanized nuts according to ASTM A563. Overlap only to the minimum extent necessary to allow assembly on the bolt threads.

3.b Washers. ASTM F436, Type 1, hot dip or mechanically galvanize as specified in Section 1105.02(s).

(d) High-Strength Bolt Assemblies. Provide high-strength, heat treated, steel structural bolts, suitable nuts, hardened washers and, if specified, direct tension indicator devices (DTIs) for structural joints, from manufacturers listed in Bulletin 15, and unless otherwise indicated or specified, conforming to the following requirements:

For painted, galvanized or metalized steel structures, including coated portions of weathering steel structures, use Type 1 bolts, nuts, and washers mechanically galvanized (except ASTM F3125 Grade A490 assemblies) according to ASTM B695 as specified in Section 1105.02(s). ASTM F3125 Grade A490 bolts, if approved for use, must not be galvanized under any circumstances. Galvanized bolts, nuts, and washers of an assembly must each be galvanized by the same process. For uncoated, bare AASHTO M 270 (ASTM A709), Grades 50W, HPS 50W, HPS 70W, or HPS 100W weathering steel structures, use plain (uncoated) Type 3 bolts, nuts, and washers conforming to atmospheric corrosion resistance requirements of AASHTO M 270 (ASTM A709), Grade 50W.

Perform testing of bolts, nuts, and washers, including initial rotational capacity testing of assemblies, as specified in Section 1105.02(d)7 below.

1. Identifying Marks. Permanently mark all bolts, nuts, and washers by the respective manufacturers in conformance with the “Product Marking” section of the applicable AASHTO or ASTM standards.

2. Dimensions. Ensure bolt and nut dimensions conform to the requirements for Heavy Hex Structural Bolts and for Heavy Hex Nuts given in ANSI/ASME Standards B18.2.6 and B18.2.2, respectively. Conform to the

requirements of ASTM F436 for washer dimensions.

3. Bolts. F3125 Grade A325 or Grade A490, except as amended and revised below: (Grade A490 bolts are prohibited unless specifically approved for use by the Chief Bridge Engineer.)

Provide a lot number on the supplier's certification corresponding to that appearing on the shipping package and certification Form CS-4171. Note on the supplier's certification when and where all testing was done, including the rotational capacity tests specified. If galvanized Grade A325 bolts are used, include the zinc thickness on the supplier's certification.

Furnish bolts with diameters of 1/2 inch to 1-1/2 inch inclusive. ASTM F3125 Grade A325 bolts must have a maximum hardness of 33 HRC. Provide plain (uncoated) bolts "oily" to the touch when installed.

4. Nuts. Heavy Hex ASTM A563 or AASHTO M 292 (ASTM A194), as applicable, except as otherwise specified.

Use only the Grade and finish of nuts corresponding to the bolt Type and finish as listed below:

<u>F3125 Bolts</u>	<u>Nuts</u>
Grade A325 Type 1, uncoated	ASTM A563 Grades C, C3, D, DH, DH3; or A194 Grade 2H; uncoated
Grade A325 Type 1, galvanized	ASTM A563 Grade DH; or A194 Grade 2H; galvanized
Grade A325 Type 3, uncoated	ASTM A563 Grades C3, DH3; uncoated
Grade A490 Type 1, uncoated	ASTM A563 Grades DH, DH3; or A194 Grade 2H; uncoated
Grade A490 Type 3, uncoated	ASTM A563 Grade DH3; uncoated

Mechanically galvanize all nuts according to ASTM B695 as specified in Section 1105.02(s). Lubricate all galvanized nuts. Use a lubricant containing a dye of any color that contrasts with the color of the galvanizing so that a visual check can be made for the lubricant at the time of field installation. At a minimum, apply lubricant to the threaded portions and to both bearing faces of each nut.

Plain nuts must have a minimum hardness of 89 HRB. Maximum hardness cannot exceed the limits in ASTM A563.

Furnish galvanized nuts that are tapped oversize only to the minimum extent necessary to allow assembly on the bolt thread in the coated condition. Tap oversize before galvanizing. When ASTM A194 Grade 2H nuts are supplied, the zinc coating, overtapping, lubrication, and rotational capacity testing must be according to these specifications and ASTM A563. Furnish plain (uncoated) nuts "oily" to the touch when installed.

5. Washers. Hardened steel washers, ASTM F436, except as otherwise specified. When indicated, mechanically galvanize according to ASTM B695 as specified in Section 1105.02(s). Use Type 1 washers with Type 1 bolts and Type 3 washers with Type 3 bolts.

6. Direct Tension Indicator (DTI) Devices. When contract documents specify the use of DTIs, use ASTM F959, except as amended as follows:

Each lot of DTIs delivered to a PennDOT project must be sampled and tested by PennDOT before use. Select at random, according to PTM No. 1, a minimum of 16 samples from each lot and forward these, along with Form TR-447, to the LTS for testing.

Provide DTIs with each having a hardness not greater than 109 HRB (35 HRC) and within ± 2 HRB of the lot's target HRB (as indicated on the CS-4171 certification provided by the manufacturer). Furnish Type 325 or Type 490 DTIs for use with ASTM F3125 Grade A325 Type 1 or ASTM F3125 Grade A490 Type 1 bolts, respectively. Furnish Type 325-3 or Type 490-3 DTIs with ASTM F3125 Grade A325 Type 3 or ASTM F3125 Grade A490 Type 3 bolts, respectively. Where galvanized DTIs are specified, mechanically galvanize according to ASTM B695 as specified in Section 1105.02(s).

Ship each lot in protective containers marked with the type, lot number, quantity, and total lot size. Include a copy of the certification with each shipment.

Handle and store DTI devices according to the manufacturer's recommendations.

7. Testing. Test bolts, nuts, washers, and assemblies according to their applicable ASTM standards and as follows:

7.a Bolts. Perform proof load tests according to ASTM F606, Section 3.2.1, Method 1. Perform wedge tests according to ASTM F606, Section 3.5. Perform the tests on full size bolts unless otherwise approved by PennDOT,

and at the minimum frequency according to ASTM F3125 Section 9.5 for Grade A325 or Grade A490, and Section 11.4 for ASTM F1852 and ASTM F2280, as applicable.

If ASTM F3125 Grade A325 bolts are to be galvanized, perform testing after galvanizing. Determine the thickness of zinc coating on galvanized bolts by taking measurements on the wrench flats or on the top of the bolt head.

7.b Nuts. Perform proof load tests according to ASTM F606, Section 4.2, at the minimum frequency specified in ASTM A563, Section 9.3, or AASHTO M 292 (ASTM A194), Section 4.4, as applicable.

If nuts are to be galvanized, perform testing after galvanizing, overtapping, and lubricating. Determine the thickness of zinc coating on galvanized nuts by taking measurements on the wrench flats.

7.c Washers. If galvanized washers are supplied, perform hardness testing after galvanizing. Remove the galvanized coating before taking hardness measurements.

If galvanized washers are supplied, measure the thickness of zinc coating.

7.d Assembly Testing and Installation. Manufacturers and suppliers of bolt, nut, and washer assemblies are required to perform initial rotational-capacity tests on all plain (uncoated) and galvanized bolt, nut, and washer assemblies before delivery to the fabricator or contractor. Test galvanized assemblies after galvanizing. Washers are required as part of the test, even if not required as part of the installation procedure. Perform rotational capacity testing according to ASTM F3125, except as modified by the AASHTO Bridge Construction Specifications (2017, Edition 4) Section 11.5.5.4.2, PTM No. 427, and as follows, unless otherwise approved by PennDOT:

- When DTIs are planned for use in the assembly, omit the DTIs from the rotational capacity test.
- Test each bolt production lot, nut lot, and washer lot in combination as an assembly. If washers are not required as part of the installation procedure, do not include in the lot identification.
- Assign a rotational-capacity lot number to each combination of lots tested.
- Test a minimum of two assemblies per rotational-capacity lot.
- Test the bolt, nut, and washer assembly in a Skidmore-Wilhelm Calibrator or an acceptable equivalent device. Test bolts too short to test in a calibrator according to PTM No. 427.

7.d.1 Installation. Install, test, and inspect high strength bolt assemblies as specified in Section 1050.3(c)7, according to PTM No. 427, and PTM No. 429, unless otherwise specified.

8. Documentation. Report the results of all tests (including zinc coating thickness) on the appropriate test reports as required in the applicable PennDOT, AASHTO, and/or ASTM standards and as specified below. Report the location where tests were performed and date of testing. Ensure that the manufacturer or distributor performing tests certifies that the results recorded are accurate.

8.a Mill Test Report (MTR). Furnish a MTR for all mill steel used in manufacturing bolts, nuts, and washers. Indicate where the material was melted and manufactured.

8.b Manufacturer Certified Test Report (MCTR). Provide a MCTR for each item furnished. Ensure that the manufacturer performing the rotational-capacity test include the following on the MCTR:

- The Lot Number of each of the items tested.
- The Rotational-Capacity Lot Number.
- The results of required tests.

- The location where tests were performed and date of testing.
- Certification that the MCTR's for the items conform to this specification and the applicable AASHTO or ASTM standards.
- The location where the bolt, nut, and washer assembly components were manufactured and coated.

8.c Distributor Certified Test Report (DCTR). Ensure that the distributor performing tests furnish a certified test report including the following:

- The MCTR for the various bolt, nut, and washer assembly components.
- The results of all required tests, including the rotational-capacity test if performed by the distributor instead of the manufacturer.
- The location where tests were performed and date of testing.
- The Rotational-Capacity Lot Number.
- Certification that the MCTR's conform to this specification and the applicable AASHTO or ASTM standards.

(e) Welded Stud Shear Connectors.

1. Materials. Provide shear connector studs conforming to AASHTO M 169 (ASTM A108), cold drawn bars, Grade 1015, 1018, or 1020, either semi-or fully-killed. If flux retaining caps are used, furnish caps of low carbon grade steel suitable for welding and conforming to ASTM A109.

2. Testing. Determine tensile properties of either bar stock after drawing or of finished studs according to the applicable sections of ASTM A370. Perform tensile tests of finished studs on studs welded to test plates using a test fixture similar to that shown in Figure 7.2 of AASHTO/AWS D1.5M/D1.5 - 2015. If fracture occurs outside of the middle half of the gage length, repeat the test.

The required tensile properties are:

Tensile Strength	60,000 psi (min.)
Yield Strength*	50,000 psi (min.)
Elongation	20% in 2 inches (min.)
Reduction of area	50% (min.)

* As determined by a 0.2% offset method.

3. Finish. Provide finished studs of uniform quality and condition, free from injurious laps, fins, seams, cracks, twists, bends, or other injurious defects. Produce finish by cold drawing, cold rolling, or machining.

4. Certification. Provide the manufacturer's certification that the studs, as delivered, conform to the material requirements of this section. Furnish certified copies of in-plant QC test reports to the Representative upon request.

5. Check Samples. If required, provide check samples of studs of each type and size used under the contract. The Representative will select the samples.

(f) Steel Forgings and Steel Shafting.

1. Steel Forgings. Furnish steel forgings conforming to AASHTO M 102 (ASTM A668), Classes C, D, F, or G.

2. Cold-Finished Carbon Steel Shafting. Furnish cold-finished carbon steel shafting conforming to AASHTO M 169 (ASTM A108), UNS Designations G10160-G10300, inclusive, unless otherwise indicated or specified.

(g) Steel Castings.

1. Mild Steel Castings. Furnish steel castings for use in highway bridge components conforming to AASHTO M 103 (ASTM A27). Provide steel of Grade 70-36, Class 1 or 2 as indicated, unless otherwise specified.

2. Chromium-Alloy Steel Castings. Furnish chromium, alloy-steel castings conforming to AASHTO M 163 (ASTM A743), Grade CA 15, unless otherwise indicated or specified.

3. Quality of Work and Finish. Furnish castings true to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blow-holes, and other defects in positions affecting the castings' strength and value for the service intended. Provide boldly filleted angles and sharp and perfect arrises.

The Contractor may correct defects not affecting the strength and value of the casting for the service intended if allowed in writing by the Chief Bridge Engineer. The Representative may reject castings containing:

- A blow-hole having a length greater than 1 inch, a cross-sectional area greater than 1/2 square inch, or a depth greater than 1/2 inch.
- A group of holes in a straight line with a total length greater than or equal to 1 foot, measured on the surface of the casting, and with an aggregate length greater than 1 inch.

4. Testing.

4.a Major Castings. Major castings are those subject to high loading whose failure in service would cause major damage (e.g., bridge bearings or machinery parts in movable bridges). All castings over 1,000 pounds are major castings. Test major castings by radiographing with x-ray or gamma ray apparatus according to ASTM E1030 and E186, E280 or E446, as applicable, and according to Table A below.

4.b Minor Castings. Minor castings are those whose failure would not lead to failure of main bridge members (e.g., scuppers or gratings). Test minor castings by suspending them and hammering them all over.

4.c Rejection. The Representative may reject castings that contain cracks, flaws, or other defects that appear during or after testing.

(h) Iron Castings.

1. Gray Iron Castings. Furnish gray iron castings conforming to AASHTO M 105 (ASTM A48), Class 35B, unless otherwise indicated or specified.

For castings subject to traffic loads furnish gray iron castings conforming to AASHTO M 105 (ASTM A48), Class 35B and AASHTO M 306, unless otherwise indicated or specified.

2. Malleable Iron Castings. Furnish malleable iron castings conforming to ASTM A47, Grade 32510, unless otherwise indicated or specified.

3. Ductile Iron Castings. Furnish ductile iron castings conforming to ASTM A536, Grade 60-40-18, unless otherwise indicated or specified. In addition to the specified test coupons, test specimens from parts integral with the castings, such as risers, for castings having a weight more than 1,000 pounds. Ensure that the required quality is obtained in the castings in the finished condition.

TABLE A
Severity Levels - Radiographically Inspected Castings*

Specification ASTM Designation	Discontinuity Type Designation	Acceptable** Severity Level	Remarks
E446 up to 2 inches	A	3	
	B	3	
	Ca	3	
	Cb	3	
	Cc	3	
	Cd	3	
	D	-	None Allowed
	E	-	None Allowed
	F	-	None Allowed
E186 2 inches to 4 1/2 inches	G	-	None Allowed
	A	3	
	B	3	
	Ca	2	
	Cb	3	
	Cc	3	
	D	-	None Allowed
E280 4 1/2 inches to 12 inches	E	-	None Allowed
	F	-	None Allowed
	A	3	
	B	3	
	Ca	2	
	Cb	3	
	Cc	3	
	D	-	None Allowed
	E	-	None Allowed
	F	-	None Allowed

* Radiograph all critical areas, but not less than 25% of each casting, or 25% of all castings, as indicated or as directed.

** If unacceptable defects are found in more than 10% of the radiographs, radiograph 100% of castings until the accumulated rejection level falls to 10% or less. The Contractor may then resume testing 25% of castings.

4. Quality of Work and Finish. Furnish iron castings true to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blow holes, and other defects in positions affecting the castings' strength and value for the service intended. Provide boldly filleted angles and sharp and perfect arrises.

5. Cleaning. Remove scale and sand from all castings to provide a smooth, clean, and uniform surface.

(i) Bronze Bearing and Expansion Plates. AASHTO M 107 (ASTM B22), Alloy No. C91100 or C91300, except with a maximum of 2 1/2% lead, unless otherwise indicated or specified.

If indicated, make surfaces permanently self-lubricated. Provide a coefficient of friction of less than 0.10 or as indicated.

(j) Steel Pipe.

1. Pipe and Couplings. ASTM A53

2. Flanges and Pipe Fittings. ASTM A338

3. Welded Fittings. ASTM A234

4. Threaded Parts. Apply one coat of primer to all threads immediately before assembly. Wipe clean after assembly.

(k) Low-Alloy Steel Pipe.

1. Pipe and Couplings. Manufactured from low-alloy steel AASHTO M 270 (ASTM A709), Grade 50 or Grade 50W, Type 2 or AASHTO M 270 (ASTM A709) Grade 50W, and conforming to either ASTM A53, or to ASTM A714, Class 4, Grade V.

2. Flanges and Pipe Fittings. ASTM A338

3. Welding Fittings. ASTM A234

4. Threaded Parts. Apply one coat of primer to all threads immediately before assembly. Wipe clean after assembly.

(l) Not Used.

(m) Steel Tubing. ASTM A500 or ASTM A501

(n) Cast Iron Pipe. ASTM A74 or ASTM A377

(o) Not Used.

(p) Sheet Copper. ASTM B152, and conforming to the requirements of the Embrittlement Test, ASTM B152 Section 11.2 and ASTM B577.

Make lapped joints by soldering or by riveting and soldering.

(q) Sheet Zinc. ASTM B69, Type II.

Make lapped joints by soldering.

(r) Sheet Lead. Common desilverized lead A, according to ASTM B29 for pig lead.

(s) Galvanizing. From a galvanizer listed in Bulletin 15 and as follows:

1. General. If indicated or specified, galvanize materials according to the applicable material specifications. If the applicable material specifications do not include galvanizing, galvanize according to ASTM A153; ASTM B633; ASTM A392, Class 2 coating; ASTM B695 and B696; AASHTO M 111 (ASTM A123); or AASHTO M 232 (ASTM A153), as applicable.

Test for the specified weight of galvanizing according to AASHTO T 65 (ASTM A90).

Comply with ASTM A143 and ASTM A385.

Before galvanizing, blast beams and girder to SSPC-SP6 (commercial blast). Solvent wipe to SSPC-SP1 prior to blast cleaning as necessary. Grind cut edges as needed to remove any skim, scale or deleterious material that is present.

2. Repair of Damaged Galvanizing. After erecting galvanized material in place, repair according to ASTM A780.

3. Quenching after Galvanizing. Quenching after galvanizing is allowed for the following items:

- Non-welded secondary bridge members
- Railings
- Drainage Scuppers
- Downspouts
- Inlet grates

- Utility brackets
- Angle Supports
- Embedded plates

Quenching after galvanizing is not allowed for the following items without approval of the Engineer:

- Primary bridge members
- Welded secondary members
- Sign Structures
- Traffic and lighting poles
- Any member to be painted after galvanizing

Items not listed may not be quenched without approval of the Engineer.

(t) **Welding Material.** AASHTO/AWS D1.5M-D1.5-2015, modified as specified in Section 1105.03(m)1.

(u) **Paint.** Section 1060.2

(v) **Certification.** Section 106.03(b)3

(w) **Eyebars.** Acceptable grades include:

- Structural steel for bridges, AASHTO M 270 (ASTM A709), Grade 36, ASTM A36.
- Structural steel for bridges, AASHTO M 270 (ASTM A709), Grades 50, 50W, and HPS 50W, ASTM A572, Grade 50, ASTM A588, Grades A, B, and C only.

1105.03 FABRICATION—

(a) **Straightening Material and Curving Rolled Beams and Welded Girders.** Section 1050.03(c)5 and as follows:

1. Materials.

1.a General. Flanges of curved, welded girders may be cut to the radii as indicated or curved by the application of heat as specified in Sections 1105.03(a)2 through 1105.03(a)8. Do not heat straighten or heat curve steels that are manufactured to a specified minimum yield point greater than 50,000 pounds per square inch without approval.

1.b. High Performance Steel. Section 1105.02(a)3.a. Use procedures approved by the Chief Structural Materials Engineer when applying short term application of heat to High Performance Steel for heat curving, heat straightening or camber and sweep adjustments. Limit heat to 1,100F maximum unless otherwise approved.

2. Type of Heating. Curve beams and girders by either continuous or V-type heating, unless otherwise approved.

2.a Continuous Heating. For the continuous method, heat a strip or intermittent strips along the edge of the top and bottom flange approximately simultaneously depending on flange widths and thicknesses. Use a strip of sufficient width and temperature to obtain the required curvature.

2.b V-type Heating. For the V-type heating, heat the top and bottom flanges in truncated triangular or wedge-shaped areas having their base along the flange edge and spaced at regular intervals along each flange. Use the spacing and temperature necessary to obtain the required curvature and to allow heating to progress along the top and bottom at approximately the same rate. Terminate the apex of the truncated triangular area applied to the inside flange surface just before the junction of the web and the flange is reached. When heating the inside flange surface (the surfaces that intersect the web), do not apply heat directly to the web. If the radius of curvature is 1,000 feet or more, extend the apex of the truncated triangular heating pattern applied to the outside flange surface to the juncture of the flange and web. If the radius of curvature is less than 1,000 feet, extend the apex of the truncated triangular heating pattern applied to the outside flange surface past the web for a distance equal to one-eighth of the flange or 3 inches, whichever is less. For the truncated triangular pattern, provide an included angle of approximately 15 to 30 degrees, but do not exceed 10 inches for the base of the triangle. Do not make variations in the patterns prescribed above unless allowed.

For both types of heating, heat the flange edges that will be on the inside of the horizontal curve after cooling. Heat both the inside and outside flange surfaces only if the flange thickness is 1 1/4 inches or greater. Heat the two surfaces concurrently.

3. Geometric Limitations for Heat Curving. Heat curving of rolled beams and constant depth welded I-section plate girders will be allowed if all of the following criteria specified in Section 1105.03(a)3.a through Section 1105.03(a)3.d below are satisfied.

3.a Cross-Sectional Criteria.

- $R > 1,000$ feet, if $(t_f > 3.0 \text{ in.})$ or $(b > 30.0 \text{ in.})$, otherwise $R > 150$ feet
- $\Psi \leq 2.0$
- $\Psi_f \geq 0.20$
- $t_{nf} \leq t_f$

in which:

$$\Psi = \frac{b_{nf}t_{nf} + bt_f + D_w t_w}{b_{nf}t_{nf} + bt_f}$$

$$\Psi_f = \frac{b_{nf}t_{nf}}{bt_f} \leq 1.0$$

where:

R = horizontal radius of curvature measured to the centerline of the girder web

b = width of wider flange (inch)

b_{nf} = width of narrower flange (inch)

D_w = clear distance between flanges (inch)

t_f = thickness of wider flange (inch)

t_{nf} = thickness of narrower flange (inch)

t_w = web thickness (inch)

3.b Minimum Radius for Doubly-Symmetric Beams and Girders. The horizontal radius of curvature measured to the centerline of web, in inches, for heat curved doubly-symmetric beams and girders cannot be less than a value calculated from the following:

- If $\frac{D_w}{t_w} > \frac{592}{\sqrt{F_{yw}}}$, then

$$R = 0.0365 \frac{b}{\Psi} \left(\frac{D_w}{t_w} \right)^2$$

- Otherwise

$$R = \frac{12,800b}{F_{yw}\Psi}$$

where:

F_{yw} = specified minimum yield strength of a web (kilopound per square inch)

3.c Minimum Radius for Singly-Symmetric Beams and Girders. The horizontal radius of curvature measured to the centerline of web, in inches, for heat curved singly-symmetric beams and girders cannot be less than that calculated for doubly-symmetric members in Section 1105.03(a)3.b. Additionally, for singly-symmetric girders with Ψ greater than or equal to 1.46, and with Ψ_f less than Ψ_{fo} , the radius cannot be less than the value calculated from the following:

$$R = \left[1.43\Psi \left(1 - \frac{\Psi_f}{\Psi_{fo}} \right)^2 + 1 \right] \left(\frac{12,800b}{F_{yw}\Psi} \right)$$

in which:

$$\Psi_{fo} = 0.68\Psi - 0.79$$

3.d Minimum Radius for Hybrid Girders. Heat curving of hybrid girders which meet the following criteria will be allowed:

- $\eta_w \leq \eta_f$, and
- $\eta_w = \eta_f$ if $\eta_f < 1$
- $b_{yf} > b_{yfw}$ if $\eta_f < 1$

in which:

$$\eta_f = \frac{F_{yfw}}{F_{yf}}$$

$$\eta_w = \frac{F_{yw}}{F_{yf}}$$

where:

F_{yfw} = yield stress of flange with lower yield stress (kilopound per square inch)

F_{yf} = yield stress of flange with higher yield stress (kilopound per square inch)

F_{yw} = yield stress of web (kilopound per square inch)

b_{yfw} = width of flange with lower yield stress (inch)

b_{yf} = width of flange with higher yield stress (inch)

For hybrid sections with $\eta_f = 1$ and $\eta_w < 1$, the horizontal radius of curvature measured to the centerline of the girder, in inches, cannot be less than the minimum radius determined from Section 1105.03(a)3.b and Section 1105.03(a)3.c, with F_{yf} substituted for F_{yw} in Section 1105.03(a)3.c.

For hybrid sections with $\eta_f < 1$, the horizontal radius of curvature measured to the centerline of the girder, in inches, cannot be less than the minimum radius determined from Section 1105.03(a)3.b. Additionally, for girders with Ψ_{fo} greater than or equal to $0.2\sqrt{\eta_f}$ and with Ψ_f less than $\frac{\Psi_{fo}}{\sqrt{\eta_f}}$, the radius cannot be less than that determined as:

$$R = \left(1.43 \left(1 - \frac{\Psi_f \sqrt{\eta_f}}{\Psi_{fo}} \right)^2 * \Psi + 1 \right) \left(\frac{12,800b}{F_{yw}\Psi} \right)$$

4. Temperature. Conduct the heat-curving operation in such a manner that the steel temperature does not exceed 1,150F as measured by temperature indicating crayons or other suitable means. Do not artificially cool the girder until after it naturally cools to 600F. Obtain approval for the method of artificial cooling.

5. Position for Heating. Heat-curve the girder with the web in either a vertical or a horizontal position.

If curved in the vertical position, brace or support the girder in such a manner that the tendency of the girder to deflect laterally during the heat-curving process will not cause the girder to overturn.

If curved in the horizontal position, support the girder near its ends and at intermediate points, as necessary, to obtain a uniform curvature. Do not allow the bending stress in the flanges due to the dead weight of the girder to exceed the usual allowable design stress. Maintain intermediate safety catch blocks at the mid-length of the girder within 2 inches of the flanges at all times during the heating process to guard against a sudden sag due to plastic flange buckling.

6. Sequence of Operations. Heat-curve the girder in the fabrication shop before it is painted. Conduct the heat curving operation either before or after all the required welding of transverse intermediate stiffeners is completed. However, unless provisions are made for girder shrinkage, locate and attach connection plates and bearing stiffeners after heat curving. If longitudinal stiffeners are required, heat-curve or oxygen-cut them separately and then weld them to the curved girder. When cover plates are to be attached to rolled beams, attach them before heat curving if the total thickness of one flange and cover plate is less than 2 1/2 inches and the radius of curvature is greater than 1,000 feet. For other rolled beams with cover plates, heat-curve the beams before the cover plates are attached; either heat-curve or oxygen-cut cover plates separately, then weld them to the curved beam.

7. Camber. Camber girders before heat curving. Obtain camber for rolled beams using approved heat-cambering or cold cambering methods. For plate girders, cut the web to the prescribed camber with suitable allowance for shrinkage due to cutting, welding, and heat-curving. However, if permitted, correct moderate deviations from specified camber by a carefully supervised application of heat. Correct deviations from the specified camber according to Publication 135.

8. Measurement of Curvature and Camber. Measure horizontal curvature and vertical camber after all welding and heating operations are completed and the flanges have cooled to a uniform temperature. Check horizontal curvature with the girder in the vertical position.

(b) Finish. Finish exposed work. Shear, flame cut, and chip carefully and accurately. Make sharp corners and round edges by grinding or other acceptable means.

When AASHTO M 270 (ASTM A709), Grade 50W, Grade HPS 70W, Grade HPS 100W, or ASTM A588, Grades A, B, and C weathering steels are specified for beams or girders, blast clean only the fascia side of exterior beams or girders according to SSPC-SP6, Commercial Blast Cleaning. At a minimum, blast clean from the top outside (fascia) edge of the top flange to the inside edge of the bottom flange including the bottom of the bottom flange. Blast clean the faying surfaces of splices and connections of all structural elements according to SSPC-SP-10-85. Re-blast unpainted elements that remain unassembled for a period of 12 months following the initial cleaning.

(c) Bolt Holes.

1. General. Unless otherwise specified, only punch or drill holes for bolts as indicated below. Provide a standard hole diameter for bolts smaller than 1.0 inch in diameter as the nominal diameter of the bolt plus 1/16 in. For bolts 1.0 inch in diameter and larger, provide the hole diameter as the nominal diameter of the bolt plus 1/8 in.

Unless subpunching and reaming is specified, holes may be punched full-size, 1/16 inch larger than the nominal diameter of the bolt, in material forming parts of a member composed of not more than five thicknesses of metal 1/16 inch larger than the nominal diameter of the bolts whenever the thickness of the material is not greater than 3/4 inch for structural steel, 5/8 inch for high-strength steel or 1/2 inch for quenched and tempered alloy steel. If there are more than five thicknesses or if any of the main material is thicker than 3/4 inch for structural steel, 5/8 inch for high-strength steel, or 1/2 inch for quenched and tempered alloy steel, either subdrill and ream or drill all holes full size.

When subpunching and reaming is specified, either subpunch (or subdrill if thickness limitation governs) all holes 3/16 inch smaller than the nominal diameter of the bolts and, after assembling, ream to 1/16 inch larger than the nominal diameter of the bolts.

Holes in fillers, cross frames, lateral bracing components and corresponding holes in connection plates between girders and cross frames or lateral components not designated as primary members may be punched full size. Do not punch full size holes in longitudinal main load carrying members, transverse floor beams and any components designated as fracture critical (FCM); this restriction does not apply to fillers used in connections of FCMs. Where punching full size is permitted, holes may also be formed by plasma cutting or water-jetting as approved by the Chief Structural Materials Engineer.

If reaming is not specified, drill all holes full size.

When indicated, provide enlarged or slotted holes with high-strength bolts. Obtain advance approval from the Chief Structural Materials Engineer to produce round or slotted holes using plasma, laser, water jet, or oxygen-acetylene methods. Provide samples when requested, to verify dimensional accuracy and edge quality in advance of fabrication for the size of places to be used in production.

2. Punched Holes. Furnish dies with diameters that do not exceed the diameter of the corresponding punch by more than 1/16 inch. Ream any holes that must be enlarged to admit the bolts. Cut holes clean without torn or ragged edges. The slightly conical hole that naturally results from punching operations is considered acceptable.

3. Reamed or Drilled Holes. Furnish reamed or drilled holes perpendicular to the member, cylindrical, and conforming to the size requirements specified in Section 1105.03(c)1. Where practical, direct reamers by mechanical means. Remove burrs on the outside surfaces. Use twist drills, twist reamers, or rotobroach cutters for reaming and drilling. Assemble and securely hold connecting parts while they are being reamed or drilled. Match mark the connecting parts before disassembling.

4. Accuracy of Holes. Furnish holes not more than 1/32 inch larger in diameter than the true decimal equivalent of the nominal diameter. The slightly conical hole that results from punching operations is acceptable. Ensure that the width of slotted holes produced by flame cutting or a combination of drilling and flame cutting or punching and flame cutting are not more than 1/32 inch greater than the nominal width. Grind the flame cut surface smooth to obtain a maximum surface roughness of ANSI 1 mil.

5. Computer Numerically Controlled Drilled Field Connections. Instead of reaming sub-sized holes or drilling full-sized holes while assembled, the Contractor may use computer numerically controlled (CNC) drilling or punching equipment to drill or punch full-sized bolt holes in unassembled pieces, connections, and templates. The Contractor may use CNC equipment to either drill or punch holes through individual pieces or drill through any combination of pieces held tightly together. Provide full-size punched holes that meet the requirements of Section 1105.03(c)2.

If CNC drilling or punching equipment is used, demonstrate the accuracy of the drilling or punching procedure by means of check assemblies as specified in Section 1105.03(g).

6. Holes for Turned Bolts or Other Approved Bearing Type Bolts. Subpunch or subdrill all holes 3/16 inch smaller than the nominal diameter of the bolt for turned bolts or other approved bearing-type bolts. After assembling, either ream, drill to a steel template, or drill from the solid. Provide a driving fit for the finished holes as indicated or according to the special provisions.

(d) Preparation of Field Connections. Unless otherwise approved, prepare bolt holes for field connections and field splices as follows:

- Field connections and field splices of main members of trusses, arches, continuous beam spans, bents, towers (each face), plate girders, and rigid frames – subpunch or subdrill and subsequently ream while assembled or drill full size through a steel template while assembled.
- Holes in cross frames, lateral bracing components and the corresponding hole in connection plates between girders and cross frames or lateral components not designated as primary member material may be punched full size. Do not punch holes in longitudinal main load carrying members, transverse floorbeams and any components designated as fracture critical members (FCMs).
- Field splices of rolled beam stringers continuous over floor beams or cross frames – the fabricator may drill full size unassembled to a steel template.
- Floor beams or cross frames – the fabricator may drill full size unassembled to a steel template.
- Floor beam and stringer field end connections – subpunch and ream while assembled or drill full size to a steel template while assembled.

For any connection, instead of subpunching and reaming, or subdrilling and reaming, the fabricator may drill holes full size with all thicknesses of material assembled in proper position.

When using a steel template, ream and drill full size all field connection holes through the template after the template has been placed in the proper position and angle and firmly bolted into place. Use templates that are exact duplicates for reaming matching members or the opposite faces of a single member. Accurately locate templates used for connections on like parts or members so that the parts or members are duplicates and require no match-marking.

(e) Accuracy of Hole Group.

1. Accuracy Before Reaming. Punch full size, subpunch, or subdrill holes such that after assembling, and before any reaming is done, a cylindrical pin 1/8 inch smaller in diameter than the nominal size of the hole may be entered perpendicularly to the face of the member without drifting in at least 75% of the contiguous holes in the same plane. The Representative will reject pieces that do not conform to this requirement. Also, the Representative may reject any piece that contains at least one hole that will not pass a pin 3/16 inch smaller in diameter than the nominal size of the hole.

2. Accuracy After Reaming. After holes are reamed or drilled, ensure that the offset between adjacent thicknesses of metal is no greater than 1/32 inch for at least 85% of the holes in any contiguous group.

For all steel templates, provide hardened steel bushings in holes accurately dimensioned from the centerlines of the connection as inscribed on the template. Use the centerlines to accurately locate the template from the milled or scribed ends of the members.

(f) Bolting. Clean surfaces of metal in contact before assembling. Assemble, pin, and firmly draw together the parts of a member before drilling, reaming, or bolting. If necessary, dismantle assembled pieces to remove burrs and shavings produced by the operation. Furnish members free from twists, bends, and other deformation.

When assembling, allow enough drifting to bring the parts into position, however, do not allow the drifting to enlarge the holes or distort the metal.

(g) Preassembly of Field Connections.

1. General. As necessary, preassemble field connections of main members of trusses, arches, continuous beams, plate girders, bents, towers and rigid frames before erection to verify the geometry of the completed structure or unit and to verify or prepare field splices.

Submit an appropriate method of preassembly for approval. Provide a method and details of assembly consistent with the erection procedure indicated on the approved erection plans and camber diagrams. At a minimum, provide a preassembly procedure consisting of assembling three contiguous panels accurately adjusted for line and camber.

Provide a procedure for progressive assemblies consisting of at least one section or panel of the previous assembly (repositioned if necessary and adequately pinned to ensure accurate alignment) plus two or more sections or panels added at the advancing end. For structures longer than 150 feet, furnish a procedure for assemblies not less than 150 feet long regardless of the length of individual continuous panels or sections. The Contractor may start the sequence of assembly from any location in the structure and proceed in one or both directions provided that the preceding requirements are satisfied.

Use the Progressive Truss and Girder Assembly unless otherwise specified in the proposal.

2. Bolted Connections. For bolted connections, prepare holes as specified in Section 1105.03(c). Where applicable, assemble major components of compression members with finished-to-bear ends in full bearing, and then ream the sub-sized holes to the specified size.

3. Check Assembly-Numerically Controlled Drilling. When using numerically controlled, CNC drilling, furnish a check assembly for each major structural type of each project unless otherwise indicated or specified in the special provisions. Provide check assemblies consisting of at least three contiguous shop sections or, for a truss, all members in at least three contiguous panels but not less than the number of panels associated with three contiguous chord lengths (i.e., length between field splices). Base check assemblies on the proposed order of erection, joints in bearings, special complex points, and similar considerations. Special complex points include the portals of skewed trusses.

Use the first sections of each major structural type to be fabricated as the check assemblies.

Obtain approval for each CNC drilled check assembly before reaming or dismantling the assembly. If a check assembly fails to demonstrate that the required accuracy is being obtained for camber, alignment, accuracy of holes, and fit of milled joints, the Representative may require additional check assemblies. Additional check assemblies will be at no additional cost to the Department.

4. Field Welded Connections. Preassemble field welded connections as specified in Section 1105.03(g)1 and verify the fit of members, including the proper space between abutting flanges.

(h) Match-Marking. Match-mark connecting parts preassembled in the shop to ensure proper fit in the field. Furnish a diagram showing match-marks to the Representative.

(i) Connections Using Unfinished or Turned Bolts.

1. General. When unfinished bolts are specified, furnish unfinished or turned bolts conforming to ASTM A307, Grade A Bolts. Provide bolts with single self-locking nuts or double nuts unless otherwise indicated or specified in the special provisions. Use beveled washers where bearing faces have a slope of more than 20:1 with respect to a plane normal to the bolt axis.

For bolted connections fabricated with high-strength bolts, assemble connections as specified in Section 1105.03(j).

2. Turned Bolts. Provide turned bolts with an ANSI roughness rating value of 125 for the surface of the body of the bolts. Furnish hexagonal heads and nuts with standard dimensions for bolts of the nominal size specified or the next larger nominal size. Provide thread diameters equal to the body of the bolt or the nominal diameter of the bolt specified. Carefully ream holes for turned bolts with bolts furnished to provide for a light driving fit. Furnish bolts with threads that are entirely outside of the holes. Provide a washer under the nut.

(j) Connections Using High Strength Bolts. Section 1050.3(c)7 and as follows:

1. General. Furnish bolts, nuts, and washers as specified in Section 1105.02(d). Provide bolt holes as specified in Section 1105.03(c). When Turn-of-Nut Tightening Method is used, provide hardened washers as specified in Section 1105.02(d)5, under the element turned in tightening.

2. Bolted Parts. Use steel for all material within the grip of the bolt; do not use compressible material such as gaskets or insulation within the grip. Ensure that bolted steel parts solidly fit together after the bolts are tightened. Bolted steel parts may be coated or uncoated. Do not exceed a slope of 20:1 for the surfaces of parts in contact with the bolt head or nut with respect to a plane normal to the bolt axis.

3. Surface Conditions. At the time of assembly, ensure that all joint surfaces, including surfaces adjacent to the bolt head and nut, are free of scale (except tight mill scale), dirt, or other foreign material. Remove burrs that would prevent solid seating of the connected parts.

Paint is allowed on the faying surface in connections except for slip-critical connections as defined in Article 6.13.2.1.1 of the LRFD Specification. Prepare faying surfaces for slip-critical connections according to the following requirements, as applicable:

3.a Non-coated Joints. Exclude paint, including any inadvertent over spray, from the area within the bolt pattern and areas closer than one bolt diameter, but not less than 1 inch, from the edge of any hole.

3.b Joints with Painted Faying Surfaces. Blast clean joints specified to have painted faying surfaces. Except as specified in Section 1105.03(j)3.c, coat the joints with a Class A or B paint according to Section 6.13.2.8 of the LRFD Specification.

3.c Coatings with Low Slip Coefficient. If allowed and provided that the mean slip coefficient is established (tested according to Section 6.13.2.8 of the LRFD Specification) and the allowable slip load per unit area is achieved, the Contractor may use a coating providing a slip coefficient less than 0.33.

3.d Minimum Coating Curing Time. Do not assemble coated joints before the coating has cured for the minimum time used in the qualifying test.

3.e Galvanized Faying Surfaces. Hot-dip galvanize faying surfaces specified to be galvanized according to AASHTO M 111 (ASTM A123).

3.f Existing Field Surfaces. For connections to existing structures, provide surface conditions as indicated.

(k) Plate Cut Edges.

1. Edge Planning. Plane, mill, grind, or thermal cut to a depth of 1/4 inch the sheared edges of plates more than 5/8 inch thick that carry calculated stress.

2. Thermal Cutting and Other Cutting Methods. Section 1105.03(p).

3. Visual Inspection and Repair of Plate Cut Edges. Perform visual inspection and repair of plate cut edges according to the AASHTO/AWS D1.5M/D 1.5-2015.

(l) Not used.

(m) Welding. All Weld Procedure Specifications must be based upon Weld Procedure Specification (WPS) qualification tests, pre-tests and verification tests. All non-Fracture Critical (FCM) approved PQR's are valid indefinitely unless application of the WPS results in consistently substandard welds. Submit WPS for review and acceptance not more than 60 months in advance of the production welding. WPS qualification welding must be witnessed by a Department representative unless otherwise approved by the Chief Structural Materials Engineer.

For welding aluminum structures, conduct welding, welder qualification, prequalification of weld details and inspection of welds according to AWS D1.2M/D1.2-2014. For the purpose of establishing weld acceptance criteria, define all welded aluminum structures as 'Class II' structures.

For welding sheet steel, conduct welding, welder qualification, prequalification of weld details and inspection of welds according to AWS D1.3M/D1.3-2008.

For welding stainless steel or stainless steel to carbon steel, conduct welding, welder qualification, prequalification of weld details and inspection of welds according to AWS D1.6M/D1.6-2007.

Unless otherwise indicated or specified, for tubular steel structures, conduct welding, welder qualifications, prequalification of weld details, and inspection of welds according to AASHTO/AWS D1.1M/D1.1-2015 subject to the following limitations:

- Use on low-hydrogen electrodes
- Provide a minimum preheat and interpass temperature of at least 50F.

Conduct welding, welder qualifications, prequalification of weld details, and inspection of welds according to the AASHTO/AWS D1.5M/D1.5-2015.

Do not weld or tack brackets, clips, shipping devices or other material not indicated or specified in the special provisions to any member unless shown on the shop drawings and approved.

1. Weld structural steel for highway bridges according to the AASHTO/AWS D1.5M/ D1.5-2015 with the following modifications:

- Section 1.1.3. Revise completely as follows:
All references to acceptance or approval will denote acceptance or approval by the Engineer. The term Engineer refers to the Chief Bridge Engineer or the Chief Bridge Engineer's representative; namely, the Chief Structural Materials Engineer.
- Section 1.3.1. Delete reference to EGW. ESW may be used if approved by the Engineer.
- Section 1.3.3. Delete this section.
- Section 1.3.4 Add: Electrosag Welding (ESW) may be used if preapproved by the Engineer.
- Section 1.3.7. Welding of Ancillary Products. Delete this section.
- Section 2.3.3. Plug and Slot Welds. Delete this section.
- Section 2.9. Details of Plug and Slot Welds. Delete this section.
- Section 2.17.6.1 Revise second sentence as follows:
Design connections or splices made with fillet welds for the average of the calculated stress and the strength of the member, but no less than 75% of the strength of the member.
- Section 3.5.1.6(2). Revise completely as follows:
Use web flatness tolerances for all girders according to the following equation and the Web Flatness Tolerance Table below.

$$0.75t \left(1 + \frac{\frac{D}{t} - 50}{150} \right)$$

Where, D = web depth, in.
t = web thickness, in.

Verify web flatness in all girder panels in the presence of the Department inspector. Flatness variations and locations exceeding the allowable tolerance must be documented. Submit a repair procedure to the Chief Structural Materials Engineer for review and approval before repair.

Web Flatness Tolerance Table																
Web Thickness, in.	Web Depth, in.															
	20	25	30	35	40	45	50	55	60	65	70	75	80	85	90	95
5/16	1/4	5/16	5/16	5/16	3/8	3/8	7/16	7/16	7/16	1/2	1/2	9/16	9/16	9/16	5/8	5/8
3/8	5/16	5/16	5/16	3/8	3/8	7/16	7/16	7/16	1/2	1/2	9/16	9/16	9/16	5/8	5/8	11/16
7/16	5/16	3/8	3/8	3/8	7/16	7/16	1/2	1/2	1/2	9/16	9/16	5/8	5/8	5/8	11/16	11/16
1/2	3/8	3/8	3/8	7/16	7/16	1/2	1/2	1/2	9/16	9/16	5/8	5/8	5/8	11/16	11/16	3/4
9/16	3/8	7/16	7/16	7/16	1/2	1/2	9/16	9/16	9/16	5/8	5/8	11/16	11/16	11/16	3/4	3/4
5/8	7/16	7/16	7/16	1/2	1/2	9/16	9/16	9/16	5/8	5/8	11/16	11/16	11/16	3/4	3/4	13/16
3/4	1/2	1/2	1/2	9/16	9/16	5/8	5/8	5/8	11/16	11/16	3/4	3/4	3/4	13/16	13/16	7/8
7/8	9/16	9/16	9/16	5/8	5/8	11/16	11/16	11/16	3/4	3/4	13/16	13/16	13/16	7/8	7/8	15/16

Note: For actual dimensions not shown, use the next higher value. For values beyond the table dimensions shown, calculate web flatness according to the equation above and round to the next higher 1/16-inch increment.

- Section 3.5.1.9. Revise the first paragraph in this section completely as follows:
Fit bearing stiffeners as specified in Section 1105.03(u). Flatness tolerance of sole plates after welding as specified in Section 1111.03(c), Class B.
- Section 4.1.6. Delete this section.
- Table 4.2. Matching Filler Metal Requirements for WPSs Qualified according to 5.13. Delete all references to electroslag welding.
- Clause 4. Part E, Electro gas Welding (EGW). Delete this part.
- Clause 4. Part G, Plug and Slot Welds. Delete this part.
- Section 5.3. Duration. Add the following. Submit WPS for review and acceptance not more than 60 months in advance of the production welding.
- Section 5.14. Electro gas Welding. Delete this section.
- Table 5.4. Additional PQR Essential Variable Changes Requiring WPS Requalification for Electroslag or Electro gas Welding. Delete this table.
- Section 5.7.7.1. Delete this section in its entirety. FCAW-s is not allowed.
- Section 5.16.4. Delete EGW in Item (2).
- Section 5.19.5.2. Delete reference to EGW Specimens.
- Clause 6, Part B – Radiographic Testing (RT) of Groove Welds in Butt Joints. Digital Radiography is allowed with the approval of the Chief Structural Materials Engineer. If approved, code variations from Clause 6 will be incorporated into a formal procedure and included in the QC Plan.
- Section 6.7.1. Revise completely as follows:
Non-destructively test complete penetration groove welds as specified in Section 1105.03(m)8.
- Section 6.7.1.1. Delete EGW.
- Section 6.7.1.2(2). Revise completely as follows:
Twenty-five percent of each joint subject to compression or shear.
- Section 6.7.1.2(2)(d). Delete this section.
- Section 6.7.2.1. Revise the first sentence as follows:
At least 12 inches will be tested in every 10-foot length and 12 inches of such welds less than 10 feet length of each size of weld and type joint in primary members including the end connections of such members.
- Section 6.7.8 Can be used if approved.
- Section 6.13.2 add “Steel produced with the Thermo-Mechanical Control Process (TMCP) are considered a variation and require submittal of independent procedures with performance mock-ups”.
- Annex K: use of PAUT must be approved by the Chief Structural Materials Engineer.

- Section 12.6. Consumable Requirements – Delete all references to optional supplemental diffusible hydrogen designator H16.
- Section 12.7.4, Period of effectiveness: 36 Months for all FCM WPS's, 60 Months for PQR's and fillet weld soundness test.

1.a Grades HPS 70W and HPS 100W. Conform to Section 1105.03(m)1 and the following additional requirements.

For final welds, only use the submerged arc and shielded metal arc welding processes. Remove all mill scale by grinding or blasting from the weld area of the Grade HPS 70W and Grade HPS 100W steel before welding.

Processes other than shielded metal arc welding (SMAW) may be approved, including GMAW, when the manufacturer's consumable certification shows that the deposited weld metal has a diffusible hydrogen level equivalent of H4 or less.

1.b Filler Metal Requirements.

1.b.1 Use filler metals that conform to AASHTO/AWS D1.5M/D1.5-2015, Table 4.1, Hydrogen control level H8 or less for AASHTO M 270/ASTM A709, Grade 50W, Grade HPS 50W or Grade HPS 70W, as applicable, for the base metal for all fillet welds, unless otherwise required by design or noted on the plans. Use "undermatched" welds for flange-to-web welds of Grades HPS 70W or HPS 100W when welded to Grade 50W or Grades HPS 50W and HPS 70W respectively. Use only electrodes with the designator "HZ" or "R", where "HZ" indicates the diffusible hydrogen level of either H4 or H8 depending on the preheat and where "R" indicates a moisture-resistant coating. The higher preheat and interpass temperatures listed in Table 1 also apply to H8 electrodes.

1.b.2 Make all 5/16 inch and smaller fillet welds in a single pass. Make all fillet welds larger than 5/16 inch with a root pass of sufficient size to prevent cracking.

1.b.3 Conform to the requirements for Grade 50W or Grade HPS 50W base metal, as listed in AASHTO/AWS D1.5M/D1.5-2015, Table 4.1, or those listed in Section 1105.03(m)1.c, at the Fabricator's option, for filler metals in all full penetration groove welds connecting a Grade HPS 70W plate to a Grade 50W or Grade HPS 50W plate.

Similarly, conform to the requirements for Grade HPS 70W base metal, as listed in AASHTO/AWS D1.5M/D1.5-2015, Table 4.1, or those listed in Section 1105.03(m)1.c, at the Fabricator's option, for filler metals in all full penetration groove welds connecting a Grade HPS 100W plate to a Grade HPS 70W plate.

1.c Groove Weld Requirements-Matching Base Metals. Conform to the following requirements for either two Grade HPS 70W plates or two Grade HPS 100W plates.

1.c.1 SAW Consumables. Use SAW consumables meeting the hydrogen control level of H4, as discussed in AASHTO/AWS D1.5M/D1.5-2015, Annex G, Section G6.2.2.1. Follow the minimum preheat and interpass temperature limits and other conditions listed in Table 1. Fabricators with multiple plants under a common umbrella of welding equipment, welding training and supervision, need to perform the Hd testing only once per combination of consumables for each location. Plants audited as a single facility by the AISC as part of their Quality Certification Program are considered one location. Multiple plants not falling under the AISC Single Facility audit definition are considered separate facilities and additional WPS and Hd tests are required.

1.c.1.a Grade HPS 70W SAW Consumables. Use electrodes conforming to Table 4.1 of AASHTO/AWS D1.5M/D1.5-2015.

1.c.1.b Grade HPS 100W SAW Consumables. Use LA100 electrode with Mil800HPNi flux manufactured by Lincoln Electric Company.

1.c.1.c Alternate Grade HPS 100 SAW Consumables. In lieu of the filler metals for SAW in Section 1105.03(m)1.c.1.a and Section 1105.03(m)1.c.1.b, request approval of alternate consumables from the Engineer.

In addition to the requirements for WPS, qualification according to AASHTO/AWS D1.5M/D1.5-2015, when using "alternate" consumables, perform diffusible hydrogen (Hd) tests on the weld metal. Provide the full range of weld tests as required by AASHTO/AWS D1.5M/D1.5-2015 Section 12.6. Use minimum preheat and interpass temperatures with "alternate" consumables according to AASHTO/AWS D1.5M/D1.5-2015, Table 4.4. Provide a diffusible hydrogen level equivalent to 4 mL/100g or less in the deposited weld metal. Prepare Hd test specimens at the fabrication plant. Test specimens according to AWS A4.3. Test results in excess of 4 mL/100g are unacceptable, and a retest is required, with or without revised welding procedures. AASHTO/AWS D1.5M/D1.5-2015, Section 5.7.6, Exemption from Further Testing, is applicable, but WPS or Hd results are not transferable from fabricator-to-fabricator.

1.c.2 SMAW Consumables.

- Grade HPS 70W: E9018M-HZR (H8 or less)
- Grade HPS 100W: E110M-HZR (H4 only)

The designator "R", for moisture-resistant coating, is required for all SMAW electrode used for welding Grade HPS 70W and Grade HPS 100W.

Use SAW consumables and SMAW electrodes producing weld deposits meeting the requirements of AASHTO/AWS D1.5M/D1.5-2015, Table 4.3, except for single pass fillet welds (up to 1/4 inch maximum for SMAW and up to 5/16 inch for SAW), or welds that will be fully incorporated into a finished weld with satisfactory weathering characteristics.

1.d Qualification Testing. Filler Metal Procedure Qualification Test Requirements for groove (matching) welding of Grade HPS 70W are as listed in Table 4.1 of AASHTO/AWS D1.5M/D1.5-2015. For matching (groove) welds using Grade HPS 100W, meet the minimum properties equal to or greater than Base Metal requirements, according to ASTM A709 for Qualification, Pretest and Verification Test Requirements.

Filler metal qualification test requirements for all hybrid designs and undermatched fillet welds are listed in AASHTO/AWS D1.5M/D1.5-2015, Table 4.1, for the lowest strength base metal used in the hybrid design, as applicable.

Individually qualify WPSs for joint welding combinations of different strength Grades such as Grade HPS 70W to Grade 50W or Grade HPS 50W; or Grade HPS 100W to Grade HPS 70W according to AASHTO/AWS D1.5M/D1.5-2015, Clause 5. For example, when welding Grade 50W webs to Grade HPS 70W flanges will require a procedure plate composed of half Grade 50W and half Grade HPS 70W.

In addition to radiographic testing, all Procedure Qualification tests must be ultrasonically tested in conformance with the requirements of AASHTO/AWS D1.5M/D1.5-2015, Clause 6, Part C. Evaluate according to AASHTO/AWS D1.5M/D1.5-2015, Table 6.3 Ultrasonic Acceptance - Rejection Criteria - Tensile Stress. Disregard indications found at the interface of the backing bar regardless of defect rating.

1.e. Preheat and Interpass Temperature:

1.e.1 Matching Strength Welds. Use minimum preheat and interpass temperatures for "matching strength" fillet and groove welding for two Grade HPS 70W steel plates using consumables listed in Sections 1105.03(m)1.b.4.1 and .03(m)1.b.4.2, according to Table 1.

Limit the maximum interpass temperature for welding Grades HPS 70W and HPS 100W steel to 450F and 400F respectively. For hybrids, welds joining both grades, limit the maximum interpass temperature to 400F.

1.e.2 Undermatched Fillet Welds/ Fillet Welds on Hybrid Members. Use preheat/interpass temperature requirements according to Note (b) of Table 1.

1.e.3 Drying Preheat. As an absolute minimum for all permanent welds, apply to the joint a drying preheat sufficient to remove any existing moisture before to welding.

Table 1 Minimum Preheat and Interpass Temperature Thickness of Thickest Part at Point of Welding					
Grade	Welding Process (Base Metal)	To 3/4 in. inclusive	Over 3/4 in. to 1-1/2 in. inclusive	Over 1-1/2 in. to 2-1/2 in. inclusive	Over 2-1/2 in.
HPS 70W; HPS 100W	SAW; SMAW	50	125	175	225
Notes:					
(a) If satisfactory results are not achieved with the above minimum preheat and interpass temperatures during development of the WPS and increased preheat temperatures are used to produce a satisfactory PQR, use the higher preheat temperature during bridge fabrication used for the PQR.					
(b) Where joints are composed of base metals with different minimum preheats, use the highest of the minimum preheat and interpass temperature from above or from Table 4.4 in AASHTO/AWS D1.5M/D1.5-2015.					
(c) For fracture critical members, comply with the above requirements including the additional requirements of AASHTO/AWS D1.5M/D1.5-2015, Chapter 12.					

1.f Heat Input (HI).

1.f.1 SAW. For HPS Grade 70W or hybrid combinations of HPS Grade 70W and HPS Grade 100W, limit heat input to 40 kilojoules per inch, minimum; 90 kilojoules per inch maximum according to AASHTO/AWS D1.5M/D1.5-2015, Section 5.12. Heat inputs about 90 kilojoules per inch for Grade HPS 70W or hybrid Grade HPS 70W to Grade HPS 50W joints where multiple wire SAW applications are used may be approved if qualified according to the provisions listed herein.

For HPS Grade 100W, limit heat input to 40 kilojoules per inch, minimum; 70 kilojoules per inch maximum according to AASHTO/AWS D1.5M/D1.5-2015, Section 5.12.

1.f.2 SMAW. Use welding heat input parameters recommended by the individual consumable manufacturer.

1.g Backing. Whenever possible, use steel backing material for WPS test plates from the same grade as the weld test plates. For Production and Qualification welding of Grade HPS 70W, steel backing material for WPS test plates that is either Grades 50W or HPS 70W may be used. For Production and Qualification welding of Grade HPS 100W, steel backing material for WPS test plates that are either Grades 50W, HPS 70W, or 100W may be used.

For all cases, limit the maximum sulfur content of the backing material to 0.025% maximum.

2. Do not weld to flanges in tension areas unless indicated.

3. Show specification, grade, type, and any supplementary requirements for each steel indicated on the shop drawings.

4. Do not weld temporary fabrication and construction details, such as rails for deck finishing equipment, bar supports, or deck-forming devices, to beams, girders, or other main members, unless permitted. Identify locations of such welds on the shop drawings.

5. Do not use electroslog or electrogas welding.

6. Gas Metal Arc Welding (GMAW) and Flux Cored Arc Welding (FCAW) – Shop Application only.

6.a Primary Load Carrying Bridge Members. Do not use the GMAW or FCAW processes (including tack welding except as otherwise approved herein) for any of the following conditions:

- web-to-web welds⁵;
- web-to-flange welds⁵;
- flange-to-flange welds⁵; and
- welds on truss members and gusset plates⁵.

Note 5: Including rolled shapes

For stiffener and connection plate welds to flanges and webs and for X-frames and diaphragms considered primary members, the fabricator may use the FCAW-G (gas shielded) process and the GMAW process, subject to the following restrictions:

- Use only GMAW spray and constant voltage pulsed spray transfer modes.
- Use only metal cored electrodes for GMAW on fracture critical members.
- Use only GMAW equipment with the following features:
 - A 'lock out' feature to prevent the operator from adjusting the equipment outside the approved WPS parameters.
 - An adaptive mode capable of automatically correcting amperage, etc. due to operator variations (stick-out, etc.) to maintain the desired transfer mode.
- Single-pass GMAW tack welds and root passes are allowed for all joints on all primary members provided the Contractor can demonstrate that such welds are completely re-melted by subsequent SAW passes.
- Other applications may be allowed by the Engineer if prior approval is received.

6.b Secondary Members and Other Welded Structures. Either the GMAW or FCAW-G process may be used for welding bridge drainage material, expansion dams, bearings, bracing, those X-frames and diaphragms not considered main members, soldier piles, sound barrier posts, and other welded structures. Both Globular and Short Circuit GMAW transfer modes are prohibited unless otherwise specifically approved or specified.

7. Do not use plug welds to repair misplaced holes.

8. Non-destructively test all groove welds in primary members according to the AASHTO/AWS D1.5M/D1.5-2015. Unless otherwise indicated or specified, use radiographic testing on butt joints. Use radiographic or ultrasonic testing for corner or "T" joints. Use magnetic particle testing according to AASHTO/AWS D1.5M/D1.5-2015, Section 6.7.2.

8.a Grade HPS 70W and HPS 100W. For non-fracture critical members, radiographically test 100% of all complete penetration groove welds for Grade HPS 70W steel plates, regardless of the type of stress in the plate.

Test fillet welds according to AASHTO/AWS D1.5M/D1.5-2015, Section 6.7.2.1, on Grade HPS 70W and HPS 100W steel by magnetic particle testing. Use the yoke technique as described in AASHTO/AWS D1.5M/D1.5-2015, Section 6.7.6.2, as specified in Section 1105.03(m) 1. The prod technique is not allowed. For non-fracture critical members, perform testing not less than 48 hours after completion of welding. For fracture critical members, comply with the above including any additional requirements of AASHTO/AWS D1.5M/D1.5-2015, Chapter 12.

9. All welding consumables (electrodes and electrode/flux combinations) used for welding of fracture critical members will conform to the diffusible hydrogen requirements of the AWS filler metal specifications optional supplemental designator H4 or H8 only.

10. Perform weld repairs according to specified welding code and Department approved procedure(s). Do not repair individual locations more than three times without written permission of the Engineer. Following the third unsuccessful attempt, submit a proposed repair procedure for review.

11. Do not repair any individual area on welded pole to base or splice plate to chord or gusset plate connections for luminaire supports, traffic signal supports, and sign structure supports more than one time without written permission of the Engineer.

(n) Weld Repairs and Geometric Corrections using Applied Heat. For non-fracture critical members only, refer to Publication 135 for pre-approved base metal repair procedures and heat correction procedures. The fabricator may use the pre-approved procedures after the Department's inspector has verified that the discontinuity to be repaired is covered by the specific procedure. Any repairs performed are subject to inspection by the Department's inspector.

(o) Not used.

(p) Thermal Cutting. Unless otherwise approved, cut steel and weld metal using oxy-fuel gas, air plasma arc, or oxygen plasma arc processes. Conduct cutting for all processes according to the AASHTO/AWS D1.5M/D1.5-2015. Do not submerge base metal in water during any process unless otherwise indicated.

1. Other Cutting Methods. Laser and water jet cutting may be used with approval from the Chief Structural Materials Engineer.

(q) Facing of Bearing Surfaces. Ensure that the surface finishes of bearing and base plates and other bearing surfaces in contact with each other or concrete conform to the ANSI surface roughness requirements defined in ANSI/ASME B46.1 and listed below:

- | | |
|--|----------------|
| • Steel slabs | ANSI 2 mils |
| • Heavy plates in contact with shoes to be welded | ANSI 1 mil |
| • Milled ends of compression members, finished-to-bear (milled or ground) ends of stiffeners and fillers | ANSI 0.5 mil |
| • Bridge rollers and rockers | ANSI 0.25 mil |
| • Pins and pin holes | ANSI 0.13 mil |
| • Sliding bearing | ANSI 0.13 mil |
| • Sliding bearings—Stainless Steel to
Polytetrafluoroethylene (PTFE) | ANSI 0.008 mil |

Fabricate bearing surfaces according to the following additional requirements:

- Machine sliding bearings having a surface roughness of 0.063 mil or rougher so the lay of the cut is parallel to the direction of movement.
- Provide machined surfaces plane and true, conforming to the indicated dimensions.
- For surfaces designed to be flat, machine surfaces to within 0.01 inch of flatness. Determine flatness as specified in Section 1111.03(c).
- Maintain uniform and even contact when assembling adjacent bearing surfaces. Unless a closer tolerance is indicated or specified, do not exceed a gap of 0.040 inch between bearing surfaces. Machine all sliding surfaces of base plates.
- Do not machine any surfaces of fabricated members until all fabrication and welding of the assembly or subassembly is complete. Machine heat-treated components after completion of heat treating.

(r) Abutting Joints. Mill or saw-cut abutting joints in compression members of trusses and columns to obtain a square joint and uniform bearing. Do not allow the opening at other joints not required to be faced to exceed 3/8 inch.

(s) Plates: Direction of Rolling. Fabrication of Members. Unless otherwise indicated, cut and fabricate steel plates for primary members and splice plates for flanges and main tension members (not secondary members) so that the primary direction of rolling is parallel to the direction of the main tensile and compressive stresses. Unless otherwise indicated or specified, fabricate I-shaped beams and girders so that when erected and under their own weight, the webs are within the allowable tolerance of vertical. Provide flanges normal to the web, unless otherwise indicated.

(t) Bent Plates.

1. General. Fabricate bent, unwelded, load-carrying, rolled-steel plates from the stock plates so that the bend lines will be at right angles to the direction of rolling. If allowed, cold-bent ribs for orthotropic-deck bridges may be bent with bend lines in the direction of rolling. When bend lines must be oriented parallel to the direction of the plate, increase the bend radii specified in Section 1105.03(t)2 by an additional factor of 1.5, unless otherwise specified or approved.

Before bending, round the corners of the plate where bending is to occur to a radius of 1/16 inch.

2. Cold Bending. Cold bend such that no cracking of the plate occurs. Unless otherwise approved, provide a minimum bend radii, measured to the concave face of the metal, of 5.0t for all grades and thickness of AASHTO M 270 (ASTM A709) steel, including material substitutions allowed for AASHTO M 270 (ASTM A709), where t is the thickness of the plate in inches. For cross-frames, diaphragm connection plates up to 0.75 inches thick that are not considered main members, the minimum bending radii may be taken as 1.5t. When bend lines are oriented parallel to the final rolling direction, increase the minimum bend radius to not less than 7.5 times the plate thickness. For all other Grades of steel, provide minimum bend radii according to the applicable material specification, where provided or as follows:

Thickness (t) in inches	Up to 1.0	Over 1.0 to 2.5	Over 2.5 to 4.0
Bend radii	2.5t	3.5t	4.0t

Provide allowance for springback of Grade HPS 100W steels of about three times that for Grade 36 steel. For break press forming, provide a lower die span of at least 16 times the plate thickness. Multiple hits are advisable. Cold Bending of fracture critical members is prohibited without the approval of the Chief Structural Materials Engineer.

3. Hot Bending. If a radius shorter than the minimum specified for cold bending is necessary, hot bend bars and plates at a temperature not less than 800F and not greater than 1,200F. Submit the heating and bending procedure to the Chief Structural Materials Engineer for review and approval. Limit hot bending temperatures for Grade HPS 100W steel plates to not greater than 1,100F.

(u) Fit of Stiffeners. Ensure that at least 75% of the bearing area of end bearing stiffeners for girders and stiffeners intended as supports for concentrated loads have full bearing on the flanges that they transmit load to or receive load from. Full bearing is defined as a gap not exceeding 0.005 inch. The maximum gap between the bearing stiffener and the flange on the remaining 25% may not exceed 1/32 inch. Mill or grind the ends of bearing stiffeners to achieve the required bearing on the flanges. For weldable steel in compression areas of flanges, weld stiffeners as indicated or specified.

Provide a tight fit against the compression flange for intermediate stiffeners not intended to support concentrated loads unless otherwise indicated or specified. Tight fit is defined as a gap not exceeding 1/16 inch.

(v) Eyebars. Flame cut pin holes at least 2 inches smaller in diameter than the finished pin diameter. Securely fasten together all eyebars that are to be placed side by side in the structure in the order that they will be placed on the pin and bore both ends while clamped. No welding is allowed on eyebars or to secure adjacent eyebars. Pack and match-mark eyebars for shipment and erection. Stamp all identifying marks on the edge of one head of each member with steel stencils after fabrication is completed so that the marks are visible when the bars are nested in place on the structure. Provide low stress type steel die stamps.

Furnish eyebars straight and free from twists. Accurately locate pin holes on the centerline of the bar. Limit inclination of any bar to the plane of the truss to 1/16 inch to a foot.

Simultaneously cut the edge of eyebars that lie between the transverse centerline of their pin holes with two mechanically operated torches abreast of each other and guided by a substantial template. Prevent distortion of the plates.

(w) Annealing and Stress Relieving. Anneal (full annealing) and normalize structural members indicated according to ASTM A941. Finish machining, boring, and straightening structural members subsequent to heat

treatment. Maintain the temperature uniformly throughout the furnace during heating and cooling so that the temperatures of any two points on the member differ by no more than 100F at any one time.

Do not anneal or normalize members consisting of Grades HPS 70W and HPS 100W steel. Stress relieve these members only if permitted. Do not allow the holding temperatures for stress relieving Grade HPS 100W or Grade HPS 70W steels to exceed 1,100F and 1,050F, respectively.

Furnish a record of each furnace charge identifying the pieces in the charge and showing the temperature and schedule actually used. Provide proper instruments, including recording pyrometers, to determine the temperatures of members in the furnace at any time. Submit the records of the treatment operation for approval.

When indicated or specified, stress relieve members such as bridge shoes, pedestals, or other parts that are built up by welding sections of plate together according to Section 4.4 of the AASHTO/AWS D1.5M/D1.5-2015.

(x) Pins and Rollers. Turn pins and rollers to the dimensions indicated and ensure that they are straight, smooth, and free from flaws. Forge and anneal pins and rollers more than 9 inches in diameter. Either forge and anneal or use cold-finished, carbon-steel shafting for pins and rollers 9 inches or less in diameter.

In pins larger than 9 inches in diameter, bore a hole not less than 2 inches in diameter full length along the axis of the pin after the forging has cooled to a temperature below the critical range and before annealing. Bore the hole under suitable conditions to prevent damage by cooling too rapidly.

(y) Boring Pin Holes. Bore pin holes true to the specified diameter, smooth and straight, at right angles with the axis of the member and parallel with each other unless otherwise indicated or specified. Produce the final surface by a finishing cut.

Do not allow the diameter of the pin hole to exceed that of the pin by more than 1/50 inch for pins 5 inches or less in diameter, or by more than 1/32 inch for pins larger than 5 inches in diameter. Do not allow the distance outside to outside of end holes in tension members and inside to inside of end holes in compression members to vary more than 1/32 inch from that indicated or specified. Bore pin holes in built-up members after the member has been assembled.

(z) Threads for Bolts and Pins. Provide threads for all bolts and pins for structural steel construction conforming to Unified Standard Series UNC ANSI B1.1, Class 2A for external threads and Class 2B for internal threads, except furnish pin ends having a diameter of 1 3/8 inches or threaded more than six threads to 1 inch.

(aa) Full Size Tests. When full size tests of fabricated structural members or eyebars are indicated or specified, provide suitable facilities, material, supervision, and labor necessary for making and recording the required tests.

(bb) Marking and Shipping. Paint or mark each member with an erection mark for identification. Furnish an erection diagram to the Representative indicating the location of the erection marks on each member, so that the marks can be located in the field.

Furnish copies of material orders, shipping statements, and erection diagrams to the Representative. Show the weights of the individual members on the statements. Mark the weights of members with a weight greater than 3 tons on the members. Load structural members on trucks or cars in such a manner that they may be transported and unloaded at their destination without being excessively stressed, deformed, or otherwise damaged.

Pack bolts of one length and diameter and loose nuts or washers of each size separately. Ship pins, small parts and packages of bolts, washers, and nuts in boxes, crates, kegs, or barrels, but do not allow the gross weight of any package to exceed 300 pounds. Plainly display a list and description of contents on the outside of each shipping container.

(cc) Painting. Section 1060.3 and as follows:

Include the manufacturer of the complete self-curing inorganic zinc system consisting of the primer, intermediate tie, and finish coats on the shipping papers.

(dd) Identification of Steel During Fabrication. Use a system of assembly-marking individual pieces and issuing cutting instructions to the shop (generally by cross-referencing the assembly-marks indicated on the shop drawings with the corresponding item covered on the mill purchase order) that maintains the identity of the original piece.

Only furnish steel from stock material that can be identified by heat number and mill test report.

During fabrication, up to the point of assembling members, clearly and legibly show the grade designation on each piece of steel other than Grade 36 steel. Either write the grade designation on the piece or submit an alternate marking procedure to the Chief Structural Materials Engineer for approval.

Use low stress die stamp or firmly attach a substantial tag to identify the grade designation of those pieces of steel, other than Grade 36 steel, that before being assembled into members will be subjected to fabricating operations such as blast cleaning, galvanizing, heating for forming, or painting that might obliterate paint color code markings.

If requested by the Representative, furnish an affidavit certifying that the identification of the steel was maintained according to this specification throughout the fabrication operation.

(ee) Welded Connections. Ensure that surfaces and edges to be welded are smooth, uniform, clean, and free of defects that would adversely affect the quality of the weld. Prepare edges according to the AASHTO/AWS D1.5M/D1.5-2015.

(ff) Numerically-Controlled Drilled Field Connections. Section 1105.03(c)5.

(gg) Facing of Bolted Surfaces. ASTM A6, and as follows:

- Provide surfaces plane and true, within the specified tolerances.
- Variations for surfaces designed to be flat: Conforming to ASTM A6, Tables A1.13, A1.14, and A1.15, unless otherwise indicated or specified.
- Complete all welded attachments to bolted surfaces before machining surfaces to required tolerances.
- Grind only on surfaces less than 2 inches wide, unless otherwise allowed.
- Use milling or other acceptable procedures to correct plate flatness to within the specified tolerances.
- Provide plate thickness as indicated.
- Identify each plate and the methods used to correct plate flatness to the specified tolerances.
- Replace rejected plates at no additional cost to the Department.

(hh) Determination of Surface Flatness.

Furnish surfaces having flatness as determined by the following method:

- Place a precision straightedge that is a minimum of 6 inches longer than the surface to be measured in contact with and as parallel as possible to the surface. The straightedge may be located in any position on the surface being evaluated and not necessarily at 90 degrees to the edge.
- Attempt to insert a feeler gage having the required tolerance under the straightedge.
- Flatness is acceptable if the feeler gage does not pass between the straightedge and the surface.

SECTION 1107—PRE-STRESSED CONCRETE BRIDGE BEAMS

1107.01 GENERAL REQUIREMENTS—

(a) **Description.** This work is the fabrication, storage, and transportation of pre-stressed concrete bridge beams.

(b) **Shop Drawings.** Section 105.02, and as follows:

1. Drawing Details. Include the following details:

- Items such as chairs, hold downs, tie rod tubes, inserts, and steel bearing plates incorporated into the beams. List inserts and steel bearing plates by source, type, and supplier.
- Incidental items such as plain neoprene bearings, tie rods, and anchor bolts.
- Subassemblies.
- Strand patterns.
- Type of strand.
- De-bonding.
- Deviation from tolerances as specified in Section 1107.03(e).
- Anticipated camber based on the contract drawings.
- Vertical Adjustment Device Assemblies, as shown on the Standard Drawings. Include design related calculations with submission.

If draped strands are used, show the following additional information:

- Hold up and hold down forces.
- Other required data.

1.a Deviations from the Contract Drawings. The total force and the center of gravity of the strands may be adjusted to fit the strand type selected. Forming aid strands tensioned to 3,000 lbs. may be added, as indicated on the shop drawings. If fabricating beams with different strand patterns on the same set-up, full-length de-bonding may be permitted.

Alternate strand patterns and the provision of additional strands in the beam for convenience may be used. Submit bridge shop drawings as specified in Section 105.02(d) for review and acceptance showing the alternate pattern and stress computation documenting the change.

1.b De-bonding of Strands. Compute stresses in the beam end zones at each stress change location. Submit computations documenting these stresses. Stress calculations in the beam end zones for I-beams using de-bonding are not required.

Reduce tensile stresses due to initial pre-stress force in the end sections of box beams to a maximum of $3\sqrt{f'_{ci}}$ by selective strand de-bonding. If this cannot be accomplished, provide additional reinforcement bars to carry the full tensile force of the tensile stress block. NOTE: f'_{ci} = Cylinder strength of concrete (pounds per square inch) at initial pre-stress. For box beam end block crack control, do not de-bond more than 25% of the total number of strands for the end 36 inches and 50% of the total number of strands for the end 6 inches.

If de-bonding of I-beams is not specified, the fabricator may de-bond up to 50% of the total number of strands for the end 6 inches. Do not de-bond more than 50% of the strands in any one row.

If de-bonding results in an odd number of strands in a row, the number of de-bonded strands may be rounded up to the next higher number. Strand de-bonding must maintain a symmetric pattern about the vertical centerline of the beam. De-bonding the exterior strands of any row in the bottom flange is not allowed. Show de-bonding on the shop drawings. Deboning in the web region of the beam is prohibited.

2. Other Shop Drawings. Prepare separate shop drawings for pre-stressed beam sub-items or items fabricated separately, such as steel bearings, moment connections, and post-tensioning operations.

Shop drawings are not required for such items as closed cell neoprene sponge, waterproofing, and laminated metal shim neoprene bearing pads.

(c) Definitions of Terms.

1. Pre-tensioning. Pre-stressing, with strands or wires called tendons, to a predetermined force before placing concrete. After the concrete hardens, the tendons are released and the concrete is stressed by bonding.

2. Post-tensioning. Stressing the concrete after it has hardened by tensioning the tendons, which are free to move in sheaths, and anchoring them at each end of the member, introducing the required force.

3. Pre-Post-Tensioning. A combination of pre-tensioning and post-tensioning.

(d) Rejections. The Representative may reject members accepted at the plant if they are found to be defective. Members which do not meet all specification requirements but may be suitable for use may be submitted to the Department for evaluation and final disposition in accordance with Section 106.07(c). Replace rejected members.

1107.02 MATERIAL—Conforming to the following requirements:

(a) Cement. Type I, IP, IS, II, or III—Section 701. Use the same cement source and type for all beams in the structure for each contract.

(b) Supplementary Cementitious Material. Section 724.

(c) Fine Aggregate. Type A—Section 703.1

(d) Coarse Aggregate. Type A, No. 8, or No. 67—Section 703.2

(e) Water. Section 720.1

(f) Admixtures. Section 711.3

(g) Reinforcement Bars. Section 709.1

(h) Steel Dowels. Certify as specified in Section 106.03(b)3.

- Plain bars—ASTM A 615; Grade 40 or 60
- Threaded bars—ASTM A 615; Grade 40 or 60
- Threaded bars—ASTM A 663; Grade 45, 50, 55, or 60
- Threaded bars—ASTM A 675; Grade 45, 50, 55, or 60

(i) Steel Anchor Bolts. Section 1105.02(c)

(j) Corrosion Resistant Fabricated Structural Steel for Bearings. AASHTO M 270 (ASTM A 709), Grade 50 or 50W. Certify as specified in Section 106.03(b)3.

(k) Burlap. Section 711.1(d)

(m) Box Beam Void Forms. Construct using preformed cellular polystyrene, ASTM C 578, Type 1; or another acceptable material. The use of cardboard void forms is prohibited.

Construct box beam void forms to be watertight and resistant to breakage and deformation during concrete placement. Waterproof the outside of forms if not constructed of approved preformed cellular polystyrene or an acceptable hot-melt wax coated, polymer coated, or asphalt-penetrated material.

Test load or subject box beam void forms to a successful member installation, as directed, before acceptance.

Certify as specified in Section 106.03(b)3.

(n) Tendons.

1. General. Include two copies of typical load-elongation curves with each shipment. Give one copy to the inspector. Attach identification tags to each shipment.

At the fabrication plant, a representative of the Department will select samples to be submitted to the LTS.

Do not use strand larger than 0.60-inch diameter.

Certify as specified in Section 106.03(b)3.

2. Samples for Testing Post-Tension Members.

- 5 feet of wire requiring heading.
- Enough wire, not requiring heading, to simulate 5-foot parallel-lay cable.
- 5 feet of strand between fittings.
- 5 feet of bar between threads, one sample per heat, and not less than one sample per 100 bars.
- Two anchorage assemblies of each size and type; each assembly complete with distribution plates.

3. Description.

3.a Pre-stressing Wire, Low-Relaxation. ASTM A 881

3.b 7-Wire, Uncoated, Low-Relaxation Strand. AASHTO M 203 (ASTM A 416), Grade 270. Unless otherwise indicated, use strand conforming to the following requirements:

Nominal Diameter of Strand, (in.)	Minimum Breaking Strength of Strand, (lbf)	Minimum Load at 1% Extension, (lbf)	Minimum Elongation at Breaking Strength, (%)
0.500	41,300	37,170	3.5
0.520	45,000	40,500	3.5
0.600	58,600	52,740	3.5

3.c High Tensile Strength Alloy Bars. Manufacture and process from steel conforming to ASTM A 322, A 29, and A 722. Stress-relieve by heat treatment and cold-stretch (proof stretch) to the minimum yield strength specified below.

Required physical properties after cold-stretching:

- Guaranteed minimum ultimate tensile strength, as certified by the manufacturer— 150,000 pounds per square inch
- Minimum yield strength, measured by the 0.7% extension under load method and 0.2% in the offset method— 85% and 80% of ultimate for Type I and Type II bars, respectively
- Minimum modulus of elasticity— 29,700,000 pounds per square inch
- Minimum elongation length in 20 bar diameters after rupture— 4% and 7% for Type I and Type II bars, respectively.
- Minimum reduction of area after rupture— 20%
- Diameter tolerance— +0.03 inch, -0.01 inch

Calculate physical properties using nominal bar areas.

3.d Special Grade High Tensile Strength Alloy Bars. Required physical properties are identical to those for High Tensile Strength Alloy Bars as specified in Section 1107.02(n)3.c, except a guaranteed minimum ultimate tensile strength of 160,000 pounds per square inch is required. Tag and identify these bars for verification with mill certification.

(p) Neoprene Joint Material. Identify neoprene material according to the type, class, and grade. Print, stencil, or otherwise affix this code to each pad at intervals of not more than 24 inches and in letters and numerals of not less than 1/4-inch height. Additional information such as lot or batch numbers, date, plant and place of manufacture, trademark, or name of manufacturer may also be added.

Certify as specified in Section 106.03(b)3.

1. Closed-Cell Neoprene Sponge. Pads may be manufactured as sponge neoprene or expanded neoprene and may be composed of laminations. Use material conforming to the following:

- ASTM D 1056, Type 2, Class C, Grade 2, including the requirements of suffixes B3 and F1
- ASTM D 1171, Quality Retention Rating of 100% after 6 weeks exposure

1107.03 BEAM CONSTRUCTION—

(a) Plants and Plant Sites.

1. General. Submit plans to the Chief Bridge Engineer for review and acceptance of the design, redesign, or change in the use of accepted beds, anchorage, abutments, and the deflecting facilities for draped strands.

Provide adequate lighting for operations not completed in the daylight. Provide a drainage system for the removal of rainfall and curing water. For member storage, stabilize areas and grade to a level surface.

Furnish necessary facilities for the inspection of material and workmanship. The necessary facilities for inspection include a plant office, as specified in Section 714.5(a), except a four-drawer fire-resistant (D-label) metal file cabinet will be required in place of a two-drawer fire-resistant (D-label) metal file cabinet. Allow the Representative unrestricted access to work in process and stored materials during plant working hours.

2. Plant Chief Engineer. Engage the Chief Engineer who has the overall responsibility for the adequacy of production facilities, QC, testing, and the fabrication of members and who will ensure beams are fabricated as designed. For plants that offer design service, the Chief Engineer is required to be a Professional Engineer, registered in the State.

3. Beds and Forms. Support casting beds on unyielding foundations.

For standard members, use fixed and movable steel forms. For nonstandard members and bulkheads that have limited use, forms may be of lumber, plywood, or other material.

Maintain accurate form alignment during the casting operation. Check alignment and grade for each setting and for proper strand clearance. Verify the pallet is flat and level in the bearing area. Make joints smooth and tight to prevent leakage of mortar. Plug holes and slots in the forms.

For exposed members, use form ties, chairs, and inserts that are recessed in the concrete by at least 1 inch, or use stainless steel accessories.

Do not use continuous soffit forms longer than 120 feet if the forms are rigidly anchored to the bed. If slight differential movements between forms and beds can cause damage to the member, anchor the forms to prevent differential movements, or loosen them so movements can occur without damage to the member or forms.

Clean beds and forms after each use. Prevent accumulation of coatings used for bond breakers.

4. Plant Acceptance.

4.a General. Do not begin fabrication before the Chief Structural Materials Engineer's inspection and acceptance of the plant. Plant expansions are subject to the same inspection and acceptance. All beams are to be produced from a single producer and plant location.

Provide a permanent building for the Department's acceptance. New plants will be required to produce a sample beam and demonstrate an acceptable level of QC and conformance with specifications and product tolerances before receiving approval to begin production.

Currently accepted plants will retain approved status unless the acceptance is rescinded for failure to comply with the plant requirements as specified in Section 1107.03(a), or until ownership changes. Reinstatement will be based on conformance with the plant requirements as specified in Section 1107.03(a).

Material, equipment, testing procedures, methods of fabrication, handling, storage, and transportation are subject to inspection and acceptance.

Plants may be accepted to fabricate one or more of the following beam types:

- Box beams—with straight strands
- I-beams—with straight strands
- PA Bulb-Tee Beams—with straight strands
- Box beams—with straight and draped strands

- I-beams—with straight and draped strands
- PA Bulb-Tee Beams—with straight and draped strands
- Box beams—with straight and de-bonded strands
- I-beams—with straight and de-bonded strands
- PA Bulb-Tee Beams—with straight and de-bonded strands
- Box beams—with pre-post-tensioned tendons
- I-beams—with pre-post-tensioned tendons
- PA Bulb-Tee Beams—with pre-post-tensioned tendons
- Next-Beam
- Nonstandard beam sections

Each beam type will be subject to inspection during manufacturing, storage, and shipment.

Register and certify the plant under the Pre-stress Concrete Institute (PCI) plant certification program and submit a valid certificate to the Chief Structural Materials Engineer, at 81 Lab Lane, Harrisburg, PA, 17110. Submit an annual endorsed copy for continued qualification.

4.b Bed Approval. For each casting bed offered for production, submit a complete set of construction drawings and detailed design calculations sealed and signed by a Professional Engineer, registered in the State to the Chief Bridge Engineer for review. Theoretical analysis and applicable design code review must be based on a test load equal to 1.5 times the maximum working load and include the following:

4.b.1 Non-self-stressing beds

- Overturning safety factor of abutments for beds having vertical uprights embedded into the foundation
- Stress analysis of embedded vertical uprights, including buckling and foundation analysis
- Buckling analysis of bed slab, including the effects of hold down forces for draped strands, if applicable
- Bulkhead design for transferring the strand forces to the uprights
- Computed theoretical shortening of the bed under full test load
- Cumulative deflections of all structural components, including tilting of uprights into the full test load and flexure of the bulkhead beams

4.b.2 Self-stressing beds

- Anchorage of the bed to the foundation, buckling and overturning safety factors, and theoretical bed shortening under the full test load

When the above requirements are satisfied, test load each bed for approval under the supervision of the Department. Each bed will be approved for and limited to a maximum allowable bed moment (force and eccentricity) that may be used during production and equal to the maximum bed moment applied during the bed test divided by 1.5.

(b) QC.

1. General. Establish a level of QC based on uniform production practices. Submit a QC Plan developed in accordance with the guidelines listed in Publication 145, including mix design(s) to the Chief Structural Materials Engineer, Bridge Design and Technology Division, Structural Materials Section (SMS), for review and approval. Include with the QC Plan a plant organizational chart indicating a separate chain of command from the QC Manager to the Owner/Plant Manager independent of the Production Manager. Resubmit the QC Plan, mix design, and organizational chart, if required, due to changes in materials, processes, or personnel.

2. QC Manager. Provide a QC Manager who has overall responsibility for the adequacy of production facilities, QC, sampling and testing, and fabrication of the product, and who will ensure items are fabricated as designed and specified. Assign plant QC managers certified in the PCI Quality Control Personnel Certification Program, Level III with overall responsibility for the Quality Control program. These requirements may be waived by the Chief Structural Materials Engineer if alternative experience or certifications or both are submitted and considered to be equivalent.

3. QC Personnel. Do not proceed with production until qualified personnel are present and approved by the Department. Assign sufficient qualified personnel with pre-stress concrete fabrication experience to be responsible for QC and sampling and testing during the complete fabrication process, storage, and shipment. Technicians responsible for concrete sampling and testing are required to provide written evidence they successfully completed the certification requirements for an ACI Grade I Field Technician or have approval from the Chief Structural Materials Engineer as a technician-in-training. Assign plant QC personnel certified in the PCI Quality Control Personnel Certification Program, Level II during tensioning, de-tensioning and casting operations. These requirements may be waived by the Chief Structural Materials Engineer if alternative experience or certifications or both are submitted and considered to be equivalent.

(c) Pre-stressing. For all methods of tensioning, determine force in the tendons through application of applied force and verified by elongation.. Do not have the jacking stress exceed 80% of the specified minimum ultimate tensile strength of the pre-stressing steel ($0.80 f'_s$). Measure elongations to an accuracy of 0.0625 inches. Verify at the completion of tensioning that the two control measurements, force and elongation, agree algebraically within 5% of the computed theoretical values. Suspend the tensioning operation if discrepancies are in excess of 5% until the source of error is determined and corrected. If the measurements do not agree within 5%, a load cell may be added at the 'dead end.' If force measurements agree within 5% between the gauge at the live end and the load cell, the elongation agreement may be waived.

1. Safety. Provide safety measures to prevent accidents due to breakage of pre-stressing steel or slippage of grips.

2. Methods of Force Measurement. Measure forces using a primary measuring system. Check primary measurements using a secondary measuring system. Acceptable methods of stressing force measurement consist of:

2.a Curves. Elongation, determined from current stress-strain or load-elongation curves furnished by the manufacturer. An average modulus may be used if acceptable, provided the force indicated falls within the specified tolerance limits.

2.b Pressure Gauges. Pressure gauges that measure force by the pressure applied to hydraulic jacks. Furnish digital readouts or dials for these gauges, a minimum of 5 inches in diameter and calibrated with the jacking system.

2.c Dynamometers. Dynamometers connected in tension into the stressing system for the initial force application.

3. Gauging System. Equip tensioning systems with accurately calibrated gauges for measuring the stressing forces. Calibrate hydraulic gauges, dynamometers, load cells, or other devices used to measure the stressing load to an accuracy of reading within 2%. Ensure a qualified testing laboratory calibrates and issues a certified calibration curve with each gauge. Recalibrate at intervals not greater than 1 year and if a gauging system shows indication of erratic results. Gauges for single strand jacks may be calibrated by an acceptable and calibrated load cell. Calibrate gauges for large, multiple strand jacks, acting singly or in parallel, by proving rings or by load cells placed on either side of the movable end carriage.

Provide pressure gauges and dynamometers with a full-pressure or load capacity of approximately twice their normal working ranges. Limit the loads to not less than 25% or more than 75% of the total graduated capacity, unless calibration data establish consistent accuracy over a wider range.

Each gauge is required to indicate loads directly in pounds or be accompanied by a chart with which the dial reading can be converted into pounds. Direct reading gauges are preferred.

Equip tensioning systems employing hydraulic gauges with appropriate by-pass pipes, valves, and fittings so the gauge pointers remain steady until the jacking force is released.

Mount gauges near eye level, within 6 feet of the operator, and position so readings can be obtained without parallax.

4. Control of Jacking Force. Use either manual or automatic pressure cutoff valves for stopping the jacks at the required force. For automatic pressure cutoff valves, use valves capable of adjustment so the jacking force corresponds to the required force. At the beginning of each day's operation and whenever there is reason to suspect improper results the automatic pressure cutoff valve settings shall be verified for accuracy.

5. Wire Failure in Tendons. Locate wire breaks and tie the ends to the strand with wire to preclude the possibility of raveling during concrete vibration.

For seven-wire strands, remove and replace strands with more than one broken wire, or with more than the following number of wire breaks in a strand pattern:

- Less than 20 strands, no wire breaks allowed
- 20 to 39 strands, one wire break allowed
- 40 to 59 strands, two wire breaks allowed
- 60 and more strands, three wire breaks allowed

Failure of wires in parallel-wire, post-tensioned tendons is acceptable, provided the total area of wire failure is not more than 1% of the total area of tendons in any member or no more than one wire fails in any tendon.

6. Pre-tensioning.

6.a General. In systems of pre-tensioning, apply the load in two increments. Apply the initial load to the individual strands to straighten them, to eliminate slack, and to provide a starting or reference point for measuring elongation. Apply the final load for which elongation of tendons is computed and measured.

Without verification of strand tension by load cells, the maximum permissible holding time for tensioned strands before starting concrete placement is 72 hours. If it is anticipated the holding time for tensioned strands will exceed 72 hours, place load cells during initial tensioning on two separate strands selected by the Representative to verify the strand tension remains within 5% of the theoretical value.

Upon limited request, re-pulling of strands may be accepted instead of the use of load cells. Submit requests to the Structural Materials Engineer before tensioning the bed.

The Representative will select 20%, or 2 minimum whichever is more, of the beam strands to be re-pulled for tension verification. Tension must remain within 5% of the theoretical value.

6.b Forms, Bond Breakers, Strand Surfaces. Before stringing strands, inspect the bottom of forms for cleanliness and accuracy of alignment.

Apply bond breaker coating to the contact surface of forms. Use a form coating that dries to a surface hardness and does not contaminate the strands. Make sure the coating is dry before the strands come in contact with it.

6.c Stringing Strands. Furnish strands in either coils, packs without reels, or on reels. String strands individually or in multiples. Relieve the strand rotation if strands are pulled from coils or packs without reels.

Do not reuse strands containing former vise-grip points, unless the points are outside the new strand vise locations. Do not reuse portions of strands that have been in contact with draping mechanisms.

6.d Strand Vises. Use strand vises capable of anchoring stressing loads positively with minimal slippage. Assemble strand chucks with compatible components from the same manufacturer to avoid improper fit and seating on strands. Clean, lubricate, and inspect the vises between each use. Do not use grips that become visibly worn, distorted, or that allow slippage in excess of 1/4-inch.

Clean and inspect a full set of strand vises before starting each stressing operation.

6.e Measurement of Forces. For gauge readings, elongation measurements, and calculations for elongation, include appropriate allowances for operational losses in the tensioning system. Losses include strand slippage, movement of anchorages and abutments, elongation of abutment anchorage rods, strand rotation, temperature variation, friction, bed shortening, and other forces and influences acting on the strands. Make calculations for elongation available for inspection.

After applying initial tensioning, establish reference points for measuring the elongation due to final tensioning.

6.f Operational Losses.

6.f.1 Friction in Jacking System.

6.f.1.a Single Strand Tensioning. If rams used in jacks for single strand tensioning are small, friction losses in the jacking system may usually be ignored. Verify gauge pressure by measured elongation or load cells.

6.f.1.b Multiple Strand Tensioning. In multiple strand tensioning systems, clean and lubricate the sliding surfaces to minimize friction. Determine and establish a force override (compensatory operational loss correction) for strand patterns if the primary and secondary force measurement systems exceed the allowable 5% variation.

6.f.2 Thermal Effect. For anchored abutment (non-self-stressing) beds, make thermal adjustments to compensate for the loss in stress due to the change in temperature if the pre-stressing steel is tensioned at a temperature more than 25F lower than the estimated temperature of the concrete and the pre-stressing steel at the time of initial set of the concrete. Increase the calculated elongation 0.5% for each 5F of temperature variation. Pre-stress strands only if the ambient temperature is above 40F. After the strands are tensioned, maintain the temperature of the air surrounding the strand at 40F or more.

6.g Initial Tensioning. For 0.500 inch and 0.520 inch diameter strand, do not exceed 15% of the specified final tensioning force, or 3,000 pounds, whichever is greater. If 0.600 inch diameter strands are approved for use, do not exceed 4,000 pounds.

Measure the initial load within a tolerance of ± 100 pounds. Do not use elongation measurement as an initial force measure.

In single strand tensioning, the initial and final loads may be applied in immediate succession on each strand. Acceptable methods of applying initial stress are:

6.g.1 Pressure Jacks. Use the same jack for single strand tensioning as for initial tensioning, provided the jack is equipped with a proper gauging system for measuring the initial force.

6.g.2 Fence Stretchers. Apply load using fence stretchers and measure with a dynamometer. Refer to Section 1107.03(c)3 for capacity.

6.g.3 Other Methods. Acceptable methods that provide a definite and uniform load.

6.h Final Tensioning. Use paint or other acceptable method to permanently mark the reference point on strands to be used to check slippage.

6.h.1 Tensioning Straight Strands.

6.h.1.a Single Strand Tensioning. Use jack-mounted pressure gauges for the primary system of force measurement. Check elongation against pressure gauge readings on the first and last strands tensioned and at least 10% of the remaining strands, but on not less than six strands. Check slippage at strand vises.

The computed elongation, including operational losses and equivalent elongation for initial tensioning converted into force, is required to be within 5% of the pressure gauge reading.

At least every 90 calendar days, or as directed, use load cells as a check of the gauging or tensioning system.

6.h.1.a.1. Form Shortening. For self-stressing beds, if the loss in tension from form shortening is expected to exceed 5%, adjust the strand tension of the previously tensioned strands. Re-tension strands with losses exceeding 5%. Do not exceed a strand stress after seating of 80% of the specified minimum ultimate tensile strength.

6.h.1.b Multiple Strand Tensioning. Use jack-mounted pressure gauges for the primary system of force measurement. For uniform application of load to strand, the face of the anchorage at final load is required to be in a plane parallel to its position under initial load. Verify parallel movement by equal measurements of movement on opposite anchorage sides and check the plumb position of the anchorage before and after final load application. Check slippage at strand vises.

At least every 90 calendar days, or when directed, use load cells as a check of the gauging or tensioning system.

6.h.2 Tensioning Draped Strands. Tension draped, pretensioned strands, initially and finally, by one of the following methods:

- Tensioned in the final design position.
- Tensioned first, and then deflected to the final design position.

Use primary and secondary force measuring systems approved by the Department.

6.h.2.a Tensioning Strand in the Final Design Position.

6.h.2.a.1 Single Strand Tensioning. Stress the strands to their final value in their design position for the full-length of the bed. Pass the strands over saddles, roller fixtures, or pins with a minimum 3/4-inch diameter to minimize friction at deflection points and to prevent strand damage.

Design hold-up and hold-down devices with an adequate factor of safety, but not exceeding 75% of the yield strength of the material used. Maintain strand positions within required tolerances under the induced loads. Design hold-down devices that are free to move and are able to bisect the drape angle. If devices are not free to move, use safety procedures to eliminate strand bonding or restrain at hold-up or hold-down.

Measure strand force and elongation, as specified in Section 1107.03(c)2.

If final tensioning is done by jacking strands from one end of the bed, place two load cells at the dead anchor end of two different strands selected by the Representative. The force indicated by these load cells is required to be not less than 95% of the specified design value.

If the computed elongation has not been attained at the jacking end when the load value shown by the pressure gauge or load cells is exceeded by 5%, jack the strand from the other end to the balance of the computed elongation. If achieving the computed elongation results in an overstress in excess of 5%, as shown on the gauge, reduce the number of deflection points and, consequently, the number of members on the bed until the elongation can be attained with not more than 5% overload.

6.h.2.a.2 Multiple Strand Tensioning. For draped strands, control the specified tension in strands without exceeding the force tolerance limits specified in Section 1107.03(c)6.h.2.a.1.

6.h.2.b Tensioning of Strand in Straight Condition and Subsequent Deflection. Arrange beams symmetrically to mid-bed. Position deflection devices in longitudinal and vertical directions to fit the anchor system. Measure the intermediate force value by pressure gauge and elongation as specified in Section 1107.03(c)2.

Place two load cells on two separate strands selected by the Representative to verify the design load. At the discretion of the Representative, the application of these load cells may be required only at each third line of beams on the same bed for the same bed layout.

Provide for simultaneous lifting or depressing at all bed points in order to distribute friction and restraint at deflection devices. However, if acceptable, depressing may be done on at least 50% of the deflection points simultaneously and alternately symmetrical to the bed center.

Load cell readings are required to be within 3% of each other and each within 5% of the gauge reading.

6.h.3 De-bonded Strand at Ends of Member. De-bond as shown on the shop drawings. Use acceptable sleeves or taping.

6.h.4 Strand Splices. Only one splice per strand is allowed unless force measurement is by load cell.

For single strand tensioning, the number of strands that may be spliced in each bed is not restricted.

For multiple strand tensioning, either splice all strands and adjust the elongation for average slippage, or splice no more than 10% of the strands in which case no slippage allowance is required

Place strands in the same lay or direction of twist. Cut the ends using shears or abrasive cutting wheels.

Do not splice strand within the form where other strands are under applied force.

6.h.5 Strand Position. Position strands as indicated. Use chairs to eliminate sagging of strands in the bottom rows.

6.i De-tensioning.

6.i.1 General. Transfer force to members after the concrete strength, determined by cylinder tests, has reached the specified transfer strength. Transfer force immediately following the curing period while the concrete is still warm and moist.

Remove or loosen forms, ties, inserts, hold-downs, or other devices that restrict the member's longitudinal movement along the bed or perform alternate de-tensioning by a method and sequence to minimize longitudinal movement.

Keep the pre-stressing forces nearly symmetrical around the member's vertical axis and release the tension using a method to minimize sudden or shock loading. Limit eccentricity around the vertical axis to one strand.

6.i.2 De-tensioning of Draped Strands. De-tension using a procedure provided by the fabricator's Representative for the type of system used.

6.i.3 Multiple Strand De-tensioning for Straight Strands or Draped Strands. Provide a length of 6 inches or more between bulkheads.

6.i.4 Strand De-tensioning by Cutting. In single strand de-tensioning, release the strands by heat-cutting according to a pattern and cutting chart that is available at each cutting location along the bed. The fabricator's Engineer will provide a pattern and cutting chart for each plant and bed.

6.i.5. Coating of Strand Ends. As an option to a grouted recess as shown in BC-775M, and if the ends of the beams are to be incorporated into a continuity diaphragm, cut pre-stressing strands off flush with the end of the member, clean the exposed strand and the end of the beam within 1 inch of all exposed strands by wire brushing or abrasive blast cleaning to remove all dirt and residue that is not firmly bonded to the metal or concrete surfaces, and apply zinc-rich paint to the exposed strand conforming to the requirements of ASTM A 780 to achieve an average dry film thickness over the cut ends of not less than 3.1 mil.

7. Post-Tensioning. Fabricate members as indicated and as specified in Section 1108. Perform post-tensioning at the plant unless otherwise designated or specified.

8. Pre-Post-Tensioning. Fabricate members as indicated.

(d) Fabrication.

1. Protection of Pre-stressing Steel. Store pre-stressing steel under shelter and keep free of deleterious material such as grease, oil, wax, dirt, paint, loose rust, or other similar contaminants that reduce the bond between steel and concrete.

Do not use steel showing corrosion, etching, pitting, or scaling of the surfaces. A light coating of surface rust is acceptable if it can be removed completely from the steel by wiping with a cloth.

Do not store pre-stressing steel on a surface that contributes to galvanic or battery action. Do not use as a ground for electric welding. Protect from electric welding sparks.

2. Bars, Mesh Reinforcement, Inserts, and Chairs. Fabricate and place bar and mesh reinforcement as indicated and within specified tolerances. Secure reinforcing to beds and forms using chairs, blocking, or ties to tendons, so the reinforcing maintains its position during placement and vibration of concrete. Bars may be fabricated into cages by tying and tack welding using low-hydrogen electrodes. Use only qualified tack welders to perform tack welding. Inspect welds for soundness and for freedom from undercutting. Do not weld immediately adjacent to a cold bend. To provide maximum cover, bend tie wire- ends into the member. Do not support cages on tensioned strands.

Place inserts as shown on the shop drawings. Recess scaffolding inserts in the concrete at least 1/2-inch or as indicated. Recessing is not required for structural inserts intended to anchor threaded reinforcing bars for diaphragms or utility supports. Fabricate inserts for utility supports from corrosion resistant material, galvanize, or apply another acceptable equal coating. Install self-drilling inserts only at the fabrication plant, and test for soundness.

Use chairs that support and space the strands and mild reinforcing within the tolerances specified in Section 1107.03(e). Use stainless steel or plastic-coated legs for chairs set on the bottom pallet or set against a form side. Concrete block supports may be used on box-beam void form tops.

If indicated, place epoxy coated- reinforcement as specified in Section 1002 in the top slab of adjacent box beams.

3. Bearing Areas.

3.a Embedded Steel Bearing Plates. Set embedded plates level, align parallel to each other, and anchor in the exact location indicated.

3.b Concrete Bearing Areas. Finish concrete bearing areas that receive neoprene bearing pads to true, flat planes to ensure uniform bearing on the entire area. Use smooth and unyielding pallet forms.

4. Forms for Internal Voids. Use the type shown on the accepted shop drawings. During placement and vibration of concrete, maintain form positions within the limits of dimensional tolerances with respect to the horizontal and vertical axis of the member. Do not strap void forms to pre-stressed strands.

During vibration of the concrete, restrain the tendency of void forms to float.

Check void positions during casting at least every 10 feet.

Seal ends and splices by taping or by other acceptable means. Unless required, void forms manufactured to provide very tight seams need not be sealed.

Vent and drain rectangular void forms for each spliced sub-unit and for the full void compartment length.

Puncture box beam void forms at vent and drainage holes after removing the beam from the casting bed.

5. Concrete.

5.a Testing. Verify the concrete attains both the required de-tensioning and 28-day minimum strengths shown on the accepted shop drawings. If the test results of the acceptance cylinders fail to meet the required 28-day minimum concrete strength, the disposition of the concrete beams will be resolved as specified in Section 110.11.

5.b Air Content. Provide an air content of $6\% \pm 1.5\%$ for traditional mixes and $7\% \pm 2\%$ for self-consolidating (SCC) mixes. The air content requirement may be waived if the mix meets the following additional qualification tests before production:

- Rapid Chloride Permeability, AASHTO T 277: 1500 coulombs at 56-days
- Freeze Thaw Resistance, ASTM C 666, Procedure A or B: Minimum durability factor of 90 at 300 cycles.

5.c Mixture. Provide concrete conforming to Section 704, ACI 211, and meeting the specified compressive strength or other requirements shown on the accepted shop drawings. The use of Aggregate Mineral Filler (AMF) is permitted for beams. Use AMF replacements for fine aggregate as specified in Section 714.7(b)1.

Use enough water to obtain workability, but do not exceed a water cement ratio of 0.40. Use a maximum of 850 pounds of cement per cubic yard.

Make trial mixtures according to ACI 211. Mold, cure, and test cylinders using the procedures specified for the beam concrete.

Unless otherwise approved, produce all beams on a bridge from a single concrete mix design.

Fully automated batch systems utilizing in mixer moisture probes may be utilized, at the Fabricator's request and approval by the Chief Structural Materials Engineer. Fully automated batch systems must be operated according to Publication 145.

5.c.1 Traditional, Non-Self-Consolidating Mixtures. Select an appropriate slump value that will provide a workable mix for the pre-stressed beams. At no time is the slump upper limit to exceed 8 inches for mixes with high range water-reducing admixtures (superplasticizers). Reject the concrete if the upper limit is exceeded on any slump test. Maintain the cement concrete consistency with 1 1/2 inches on either side of the selected value.

5.c.2 Self-Consolidating Concrete Mixtures (SCC). Perform slump flow testing according to ASTM C 1611. Evaluate the Visual Stability Index (VSI) of the mixture when the slump flow is measured during testing. Reject mixtures with a $VSI > 1$. Conduct J-Ring testing according to ASTM C 1621 whenever the slump flow test is performed. Establish a slump flow target for production of not less than 20 inches nor more than 30 inches and maintain the slump flow within a range of ± 3 inches of the target. Reject the concrete if the upper specification limit is exceeded. If the slump flow test result is less than the lower production range limit or the difference between the slump flow and J-Ring results is greater than 2.0 inches reject the concrete mixture unless the mixture has been approved for vibration and is subsequently vibrated. Take immediate corrective action whenever the slump flow limits or action points are exceeded and test succeeding batches until material control has been reestablished.

Perform the following additional qualification tests for SCC mixtures before production:

- Column Segregation Test, ASTM C 1610: 12% maximum
- Rapid Chloride Permeability, AASHTO T 277: 2000 coulombs at 56-days
- Freeze Thaw Resistance, ASTM C 666, Procedure A or B: Minimum durability factor of 80
- Strand Bond Qualification, PTM No. 630

5.d Mixing and Placing Conditions. Mix and deliver the concrete as specified in Section 704. Fully automated batch systems utilizing in mixer moisture probes may be utilized, at the Fabricator's request and approval by the Chief Structural Materials Engineer. Fully automated batch systems must be operated according to Publication 145.

Discard concrete that develops initial hardening or has become unsatisfactory for any reason. Do not remix or add water. Do not use materials containing frost, lumps, or crusts of hardened material.

Do not place concrete in forms, on casting beds, around reinforcement, on pre-stressing steel, or on other fixtures if the ambient temperature is below 40F or above 100F. Place only concrete having a temperature of 70F \pm 20F.

5.d.1 During Cool Weather. If the air temperature is below 50F, but not lower than 40F, heat the mixing water to not less than 50F, or more than 150F. Ensure the aggregate is free of frozen lumps and maintains a temperature not less than 40F, or more than 100F at the time the aggregate is charged into the mixer. Do not use water hotter than 90F until the cement has been mixed with the aggregate.

5.e Placing Concrete. Place concrete without segregation using an acceptable method. Deposit the concrete in its final position in each part of the form. Do not work or flow the concrete along the forms from the point of deposit. Work the concrete under and around the pre-stressing steel and reinforcement. Once concrete placement has begun, continue for all beams on the bed.

If the concreting operation is stopped for an extended period of time due to mechanical failure, inclement weather, or other causes, begin curing completed beams. Remove the concrete from unfinished beams. Strands may be reused if not damaged during concrete removal and with approval from the Chief Structural Materials Engineer.

Place concrete in lifts as shown on the shop drawings or as otherwise directed.

Do not consolidate SSC mixtures without approval and unless the mixture was qualified within 2 inches of the upper production slump flow limit during the trial batching and evaluation phase. For traditional mixtures, consolidate the plastic concrete by internal vibration. Use vibrators with 1-inch to 1 3/8-inch heads for penetrating the strand pattern. Use vibrators only to consolidate the concrete after it has been properly placed. Operate vibrators vertically, pushing into and pulling out of the concrete slowly. Do not hold the vibrators in one spot long enough to cause segregation.

External vibrators may be used to reduce surface blemishes.

5.e.1 Test Cylinders. Mold a minimum of four concrete acceptance cylinders for each beam cast under the supervision of a Department representative. Mold the cylinders according to PTM No. 631 with the concrete being placed into each beam. Handle and cure the cylinders in the same manner as the beam.

Remove test cylinders from the bed a minimum of 1 hour before the scheduled time for de-tensioning. Cool cylinders from heat-cured beds for approximately 1/2-hour if bonded capping methods are used according to PTM No. 631. Cure the capped cylinders for 1/2-hour before testing.

Test the cylinders according to PTM No. 604 to verify minimum concrete transfer strength and 28-day minimum concrete strength. Test cylinders under the supervision of a Department representative. Match and mark test cylinders with the beams they represent and record test results so the beams can be readily identified. Submit the test results to the Department representative at the plant.

If acceptance test cylinders fail to meet the 28-day minimum strength requirement, evaluation and disposition the beam(s) as specified in Section 110.11.

5.e.2 Finishing. Make concrete surfaces true and even, free from rough, open, or honeycombed areas, depressions, or projections. Do not use brush or bag finishing. Do not paint with grout or neat cement. Do not add water to the concrete to facilitate finishing.

After the concrete has been placed as specified in Section 1107.03(d)5.e, use a template to strike-off the top of beams level. Before the concrete has initially set, finish the top surface with a stiff wire bristle broom, flat tine wire

broom or template. Run the broom or template from edge to edge of the beam in a transverse direction to produce not less than 4 scores per inch, to achieve a final texture from 1/16 inch to 3/16 inch in depth. Do not penetrate the concrete to depths where the brooming or tining operation pulls coarse aggregate to the surface.

Finish the top of the beam with the type of finish shown on the shop drawings.

5.f Repairs and Patching. Do not repair damaged areas unless pre-approved procedures according to Publication 145 are used or otherwise approved by the Chief Structural Materials Engineer. Ensure uniform appearance and color. The Department's representative will inspect repairs.

Maintain a minimum 50F environment until the repaired areas have cured. If at any time during the curing period the curing temperature falls below 50F, the Department's representative will consider the work deficient and will reject the work.

Before patching, clean holes left by tie rods, strand hold-down devices, recessed strand pockets, or other temporary inserts. Use a hammer to pack the holes with stiff dry mortar of the same material used in the concrete. Fill surface blemishes on the outside fascia beam surfaces with mortar as specified in Section 1001.2(d).

5.g Curing Concrete. Cure and protect concrete until pre-stress transfer has been accomplished. Construct and maintain a suitable curing enclosure to retain heat and moisture around the beams. Do not use membrane curing. The full concrete curing cycle consists of the initial curing phase, the intermediate curing phase, and the final curing phase.

5.g.1 Initial Curing Phase. The initial curing phase begins when each beam is completely covered with saturated covering.

After each beam has been cast and immediately after the concrete has initially set, cover exposed surfaces using a double thickness of saturated burlap or cotton or jute mats. Place covering carefully to avoid damaging the concrete. During the initial curing phase, which extends over a period of not less than 2 hours or more than the time required to achieve initial set, apply artificial heat, if necessary, to maintain the temperature at approximately 70F within the enclosure.

5.g.2 Intermediate Curing Phase. Cure beams using either steam curing or saturated cover curing. Maintain curing for 12 hours or until at least one hour after the required transfer strength is attained, whichever is greater. An additional hour of curing is not required if the transfer strength is attained after 20 hours.

5.g.2.a Steam Curing. Raise the temperature within the enclosure to between 100F and 160F, at a rate not exceeding 40F per hour. Use steam of 100% relative humidity. Ensure full circulation between the beams and the enclosure. Do not direct steam jets onto forms or beams.

5.g.2.b Saturated Cover Curing. Raise the temperature within the enclosure and the temperature of the covering material to between 120F and 160F, at a rate not exceeding 40F per hour. Keep the covering thoroughly saturated throughout the curing process. Use water with a temperature no more than 10F from the enclosure temperature. Control the temperature of the water to maintain a uniform enclosure temperature at the beam surface. Forms may be removed after 5 hours; provided saturated cover curing is continued on all beam surfaces up to the time of transfer.

5.g.2.c Record of Curing Temperatures. Record curing temperatures for the full curing cycle, up to removal of beams from the bed. Provide one continuous record chart of curing temperatures for every 100 feet of casting bed.

Use accurate, automatic recording devices with temperature pickup devices properly placed either within the curing enclosure or embedded in the beam. Locate the temperature pickup devices away from direct contact with steam or water jets. If enclosures are removed to facilitate form removal, place any non-embedded pickup devices on top of a 3/4-inch board directly on the saturated covering and overlay three additional layers of saturated covering. If embedded probes must be temporarily disconnected from the beam during this process, reattach immediately. Mark the curing chart to indicate the point at which this change of pickup location is made.

Use recording charts covering a minimum of 24 hours and a maximum of 72 hours per one full revolution, or as otherwise permitted. Record beam number, shop drawing number, date, start time and time concrete placement was completed, and time of pre-stress transfer on the chart.

Every year, certify the accuracy of the recording device. Display the certificate with the recorder. Place the recorder so the chart may be observed at all times during the curing cycle.

After completion of curing, submit the charts to the Representative.

5.g.3 Final Curing Phase. This phase consists of pre-stress transfer and beam storage.

Following pre-stress transfer, lower the enclosure temperature to 100F at a rate not exceeding 40F per hour until ambient temperature is reached. Conduct transfer of pre-stress as specified in Section 1107.03(d)5.h. Store beams as specified in Section 1107.03(f) for a minimum of 48 hours.

5.h Transfer of Pre-stress. Do not transfer pre-stress before the specified concrete strength has been attained. Retain the saturated covering on the top and sides of the beams and continue curing until final pre-stress transfer is complete. Transfer pre-stress as specified in Section 1107.03(c)6.i.

Transfer pre-stress not later than 5 days after casting, provided the minimum specified concrete strength at transfer has been reached. If this strength has not been reached, the Representative will declare the concrete, “deficient in strength” and may reject the deficient member.

(e) Tolerances.

1. Pre-stressed Concrete Members. Fabricate members to plan dimensions within the following tolerances (tolerances are not cumulative). The Representative will not accept members that deviate from tolerances unless they are accepted in accordance with Section 106.07 (c) .

1.a Pre-stressed Concrete I-Beams/PA Bulb-Tee Beams.

- Depth (flanges, web, and fillets) $\pm 1/4$ inch
- Depth (overall) $+1/2$ inch
 $-1/4$ inch
- Width (flanges and fillets) $+3/8$ inch
 $-1/4$ inch
- Width (web) $+3/8$ inch
 $-1/4$ inch
- Length of beam (longitudinal
 tolerances based on design length,
 as indicated at centerline) $+1/2$ inch
 -1 inch
- Center-to-center of bearings $+1/2$ inch
 -1 inch
- Web Perpendicularity Greater of $1/4$ inch or $1/8$
 inch/vertical foot

Measurement: While the beam is on the fabrication bed, verify web perpendicularity at beam ends, midspan, and quarter points using a bubble level.

If the level indicates the web is not truly vertical, verify and record measurements establishing offset from center of top flange to center of bottom flange using a plumb bob, square, or other method acceptable to the Chief Structural Materials Engineer at beam ends, midspan, and

- quarter points along the length of the beam.
- Centerline of bearing to beam end $\pm 3/4$ inch
 - Exposed beam ends (deviation from square or designated skew): horizontal $\pm 1/4$ -inch; vertical, $\pm 1/8$ inch per inch of beam height, but not more than $1/2$ inch for beams up to 63 inches in depth and $3/4$ inch for beams over 63 inches in depth.
 - Threaded inserts (spacing between the center of inserts and from center of inserts to ends of beams) $\pm 1/2$ inch
 - Concrete bearing area (deviation from plane at bottom of beam) $\pm 1/16$ inch
 - Dap depths, (deviation from the specified dap depth dimensions) as measured from a straight-edge, parallel to the centerline of the beam. $\pm 1/8$ inch
 - Out of plane deviation from one beam end relative to the other beam end, measured on the bottom of the beam with a level at a right angle to the beam length.⁽¹⁾ $\pm 1/4$ inch
 - Stirrup bars (projection above top of beam) $\pm 3/4$ inch
 - Stirrup bars (longitudinal spacing): -2 inches, +1 inch for 12 inches or greater spacing and $\pm 1/2$ -inch for spacing less than 12 inches
 - Horizontal alignment (deviation from a straight line parallel to the beam centerline)⁽¹⁾ $\pm 1/8$ inch per 10 feet
 - Horizontal misalignment of adjacent form sections $3/16$ -inch max.
 - Location of each strand $\pm 1/4$ inch
 - Location of each deflected strand at the beam end $\pm 1/2$ inch
 - Position of post-tensioning duct $\pm 1/4$ inch
 - Longitudinal position of hold-down points for deflected strands ± 10 inches

- Longitudinal position of handling devices ± 6 inches
- Camber differential between adjacent beams⁽¹⁾: $1/8$ inch per 10 feet of span up to a maximum of $1\ 1/4$ inches for beams up to 100 feet in length and $1\ 1/2$ inches for beams over 100 feet in length.
- Camber deviation from plan camber, as measured at release or at beginning of beam storage at the fabricating plant:
 - Plan camber 1 inch or greater $\pm 50\%$
 - Plan camber less than 1 inch $\pm 1/2$ inch
- Position of positive moment connection reinforcement bars (beams made continuous):
 - Horizontal position of the bar at end face of beam and end of projection, measured perpendicular to the end face of beam $3/8$ inch

Projection from end face of beam $1/2$ inch

Note (1) - Verify tolerance approximately 2 weeks before shipping.

1.b Pre-stressed Concrete Box Beams.

- Depth (overall) $+1/2$ inch
 $-1/4$ inch
 - Width (overall) $\pm 1/4$ inch
 - Beam length at centerline (longitudinal tolerances based on design length indicated) $+1/2$ inch
 -1 inch
 - Wall thickness (web) $+3/8$ inch
 $-1/8$ inch
 - Depth (top slab) $\pm 1/2$ inch spread box;
 $+1/2$ inch,
 $-1/8$ inch adjacent box
 - Depth (bottom slab) $+1/2$ inch
 $-1/8$ inch
 - Web Perpendicularity Greater of $1/4$ inch or $1/8$ inch/vertical foot
- Measurement: While the beam is on the fabrication bed, verify web perpendicularity at

beam ends, midspan, and quarter points using a bubble level.

If the level indicates the web is not truly vertical, verify and record measurements establishing offset from center of top flange to center of bottom flange using a plumb bob, square, or other method acceptable to the Chief Structural Materials Engineer at beam ends, midspan, and quarter points along the length of the beam.

- Horizontal alignment (deviation from a straight line parallel to the beam centerline)⁽¹⁾:

Up to 40-foot lengths	1/4 inch
40-foot to 60-foot lengths	3/8 inch
Greater than 60-foot lengths	1/2 inch
- Horizontal misalignment of adjacent form sections 3/16-inch max.
- Camber deviation from plan camber, as measured at release or at beginning of beam storage at the fabrication plant:

Plan camber 1 inch or greater	±50%
Plan camber less than 1 inch	±1/2 inch
- Camber differential between adjacent beams⁽¹⁾: 1/4 inch per 10 feet, but not greater than 3/4-inch for beams up to 90 feet in length and 1 1/4 inches for beams over 90 feet up to 160 feet in length.
- Camber differential between minimum and maximum camber in one span⁽¹⁾ 2 inches max.
- Location of each strand ±1/4 inch
- Stirrup bars (projection above top of beam) ±3/4 inch spread box; ±1/4 inch adjacent box
- Stirrup bars (longitudinal spacing): -2 inches, +1 inch for 12 inches or greater spacing and ±1/2-inch for spacing less than 12 inches
- Longitudinal position of hold-down points for deflected strands ±10 inches
- Bridge barrier bars (projection above top of beam) +1-inch
-0-inch*
*-1/2" if shop drawings position bar above minimum shown on contract

plans. Additional projection must be noted on accepted shop drawings.

- Longitudinal position of handling devices ± 6 inches
- Concrete bearing area (variation from plane surface, when tested with a straightedge through middle half of member) $\pm 1/8$ -inch
- Dap depths, (deviation from the specified dap depth dimensions) as measured from a straightedge, parallel to the centerline of the beam. $\pm 1/8$ -inch
- Out of plane deviation from one beam end relative to the other beam end, measured on the bottom of the beam with a level at a right angle to the beam length.⁽¹⁾ $\pm 1/4$ inch
- Dowel tubes (spacing between the tube centers and from the tube centers to the member ends) $\pm 1/2$ -inch
- Tie rod tubes (spacing between the tube centers and from the tube centers to the member ends) $\pm 1/2$ -inch
- Tie rod tubes (spacing from tube centers to the beam bottom) $\pm 3/8$ -inch
- Threaded inserts (spacing between the center of inserts and from center of inserts to ends of beams) $\pm 1/2$ -inch
- Square ends (deviation from square) $\pm 1/2$ -inch
- Skew ends (deviation from designated skew) $\pm 1/2$ inch
- Vertical and slanted ends (deviation from plan dimension) $\pm 3/8$ -inch for beams up to 48 inches in depth and $\pm 5/8$ -inch for beams over 48 inches in depth.
- Slab void position $\pm 1/2$ -inch from end of void to center of post-tensioning hole
- Position of post-tensioning duct $\pm 1/4$ inch
- Position of positive moment connection reinforcement bars (beams made continuous):
 - Horizontal position of the bar at end face of beam and end of projection, measured $3/8$ inch

perpendicular to the end face of
beam

Projection from end face of beam 1/2 inch

Note (1) - Verify tolerance approximately 2 weeks before shipping.

1.c Pre-stressed Concrete Next Beams.

- Depth (stem and fillets) $\pm 1/4$ inch
- Thickness (top flange) $+1/4$ inch
 $-1/8$ inch
- Depth (overall) $\pm 1/4$ inch
- Width (flanges) $\pm 1/4$ inch
- Width (stem) $\pm 1/8$ inch
- Length of beam (longitudinal
tolerances based on design length, as
indicated at centerline) $+1/2$ inch
 -1 inch
- Center-to-center of bearings $+1/2$ inch
- Centerline of bearing to beam end $\pm 3/4$ inch
- Stem Perpendicularity 1/8 inch/vertical foot
- Measurement: While the beam is on the fabrication
 bed, verify stem perpendicularity at
 beam ends using a special
 constructed jig.
- Distance between stems $\pm 1/4$ inch
- Exposed beam ends (deviation from
square or designated skew) horizontal $\pm 1/4$ -inch; vertical,
 $\pm 1/8$ inch per foot of beam height,
 but no more than 1/2 inch
- Deviations of ends (vertical batter) $\pm 3/8$ inch
- Threaded inserts (spacing between the
center of inserts and from center of
inserts to ends of beams) $\pm 1/2$ inch
- Concrete bearing area (deviation from
plane at bottom of beam) $\pm 1/16$ inch
- Blockout/Dap depths, (deviation from
the specified dap depth dimensions) as
measured from a straight-edge, parallel
to the centerline of the beam $\pm 1/8$ inch

- Stirrup bars (projection above top of beam) $\pm 3/4$ inch
- Stirrup bars (longitudinal spacing): -2 inches, +1 inch for 12 inches or greater spacing and $\pm 1/2$ -inch for spacing less than 12 inches
- Horizontal alignment (deviation from a straight line parallel to the beam centerline)⁽¹⁾ $\pm 1/8$ inch per 10 feet
- Horizontal misalignment of adjacent form sections $3/16$ -inch max.
- Location of each strand $\pm 1/4$ inch
- Position of post-tensioning duct $\pm 1/4$ inch
- Longitudinal position of handling devices ± 6 inches
- Camber differential between adjacent beams⁽¹⁾ $1/4$ inch per 10 feet of span up to a maximum of $3/4$ inch.
- Position of positive moment connection reinforcement bars (beams made continuous):
 - Horizontal position of the bar at end face of beam and end of projection, measured perpendicular to the end face of beam $3/8$ inch
 - Projection from end face of beam $1/2$ inch

Note (1) - Verify tolerance approximately 2 weeks before shipping.

2. Void Forms, Outside Dimensions.

- Length $\pm 1/2$ inch
- Height and Width -1 inch
+1/8 inch

3. Closed-Cell Neoprene Sponge. Do not exceed $\pm 1/8$ inch for laminate unevenness at the edge of finished, laminated, closed-cell neoprene sponge pads.

4. Maximum Width of Deck. (out-to-out of beams) Specified width plus $1/2$ inch per joint for adjacent boxes.

5. Steel Bearings. Section 1105.03(q)

(f) Handling and Storage. Members may be handled immediately after completion of stressing. If stressing is not done in a continuous operation, do not handle members before they are sufficiently stressed to sustain the forces and bending moments due to handling. For handling, lift beams from the locations shown on the shop drawings using accepted devices.

If the air temperature is below 40F, do not remove beams from the beds until they are surface-dry. If the air temperature is below 32F, do not place beams outside the beds unless the differential between the beam temperature and the air temperature is less than 50F.

Store beams to maintain the same direction of reactions as in the final position in the bridge deck. Support stored beams as shown on the accepted shop drawings. Store the beams in areas that are suitable and accessible for inspection until the 28-day compressive strength is attained. Maintain beams in horizontal and upright positions at all times.

Separate stacked members and support them by battens placed across the full width of each bearing point or as detailed on the accepted shop drawings. Stack members so lifting devices are accessible and undamaged. Do not use the upper members of a stacked tier as storage areas for shorter members or for heavy equipment.

Before shipment, provide a rough texture to the entire keyway on adjacent box beams and completely remove oil, grease, dirt, or other material that would prevent bonding by sandblasting or other methods approved by the Chief Structural Materials Engineer.

Before shipment, mark each beam with an individual and consecutive identification mark at a permanently exposed beam location. Use the identification mark shown on the accepted shop drawings and erect beams according to the framing plan.

Do not ship beams until the Inspector places a stamp of acceptance on each beam.

(g) Transportation. Unless authorized by the Representative, do not ship beams until they have attained the minimum 28-day compressive strength shown on the shop drawings, or until 48 hours total storage time has elapsed following pre-stress transfer, whichever is greater.

Support the members as shown on the accepted shop drawings using adequate bracing to maintain the vertical position. Ensure supports, bracing, and shipment methods dampen vibrations. Provide adequate padding material between tie chains or cables to prevent concrete chipping.

For medium length members, pole-type trailers are satisfactory, with the member serving as the connection between truck and trailer. Trucks with double bolsters are generally satisfactory, provided:

- Fabricator provides stability calculations according to AASHTO LRFD Bridge Design Specifications. Calculations must be prepared and sealed by a Professional Engineer, registered in the State.

Observe hauling restrictions as specified in Section 107.23.

SECTION 1108—POST-TENSIONING OPERATIONS

1108.01 GENERAL REQUIREMENTS—

(a) Description. This work is pre-stressing, grouting, and other work related to post-tensioning operations.

(b) General. Perform post-tensioning operations in the presence of an authorized representative of the Department, either in a pre-stressing plant or on the project site.

Retain a Professional Engineer, registered in the State and experienced in post-tensioning operations, to be present and in charge of tensioning and grouting operations. Submit, in writing, the Engineer's name and the date and place of post-tensioning to the Structure Control Engineer 3 weeks before the start of the post-tensioning operations. A Professional Engineer, registered in the state is not necessary for post-tensioning box culverts or transversely post-tensioning adjacent box beam bridges.

At the approval of the District Structure Control Engineer, post-tensioning operations may be done under the direct supervision of a qualified supervisor maintaining an active Post-Tensioning Institute (PTI) Bonded Post-Tensioning Level 2 certification with a minimum of 3 years of related experience instead of the use of a Registered Professional Engineer. At the approval of the District Structure Control Engineer, grouting operations may be done under the direct supervision of a qualified supervisor maintaining an active American Segmental Bridge Institute (ASBI) Grouting Certification with a minimum of 3 years of related experience in lieu of a Registered Professional Engineer.

Submit, in writing to the Structure Control Engineer, the grouting crew's verifiable experience three weeks before grouting operations. At a minimum two of the grouting crew members and the grout pump operator must have current ASBI certifications.

(c) Shop Drawings. Section 105.02 and as follows:

Show the proposed method, material, and equipment including all changes to reinforcing steel. Shop drawings must show the following:

- method and sequence of stressing including complete specifications
- details of the pre-stressing steel
- details of the anchoring devices, bearing devices, location of splices or couplings,
- details of the working stresses, anchoring stresses,
- type of ducts,
- steel corrosion protection,
- proposed arrangement of the pre-stressing steel in the members,
- pressure grouting- material and equipment, and
- vent details including size, type, spacing, and location and direction of grouting.

Provide a detailed stressing force diagram showing the following:

- deviations from design forces;
- sequence of loading stages;
- friction coefficients for the duct and tendon combinations;
- friction and jacking forces;
- jacking techniques, e.g., overjacking;
- friction loss diagram, superimposed on the force diagram; and
- elongation computations.

Provide shop drawings that are signed, dated, and sealed by a Professional Engineer, registered in the State.

Unless indicated or specified, do not use a working stress greater than $0.6 f_u$, a temporary stress greater than $0.75 f_u$, or an anchoring stress greater than $0.7 f_u$ (f_u = specified minimum ultimate tensile strength of pre-stressing steel).

Working force and working stress are the force and stress remaining in the pre-stressing steel after losses including concrete creep and shrinkage, elastic concrete compression, steel losses due to stressing sequence, steel relaxation, friction and take up at anchorages, and other losses peculiar to the pre-stressing system.

1108.02 MATERIAL—

(a) Pre-stressing Steel. Use wire, strand, or bar conforming to the requirements specified in Section 1107.02(n).

(b) Corrosion Inhibitor. For use with Special Design Grout, Class D. Obtain from a manufacturer listed in Bulletin 15. Submit the grout mixture to the DME/DMM for review and approval before use.

Certify as specified in Section 106.03(b)3.

(c) Anchorages, Bearing Devices, Fittings, and Couplings. Design anchorages to develop $0.95 f_u$. Design couplings to develop $1.0 f_u$. Use bearing devices designed to transmit the anchor force to the concrete at bearing stress no greater than 3,000 pounds per square inch. Limit bearing device stress to 80% of its yield strength if the pre-stressing steel is stressed to $0.95 f_u$.

Certify as specified in Section 106.03(b)3.

(d) Duct Sheathing. Unless otherwise indicated, use corrugated, rigid or semi-rigid type, galvanized steel sheathing. PVC plastic ducts, corrugated seamless polypropylene plastic duct, or smooth HDPE ducts may be used only if sufficiently secured to prevent internal bowing or sway.

Certify as specified in Section 106.03(b)3.

Minimum duct thickness for metal ducts shall be as follows:

- Strand tendons—26-gauge diameter for ducts less than or equal to 2.625 inches in diameter and 24-gauge diameter for ducts greater than 2.625 inches in diameter
- Bar tendons—31-gauge diameter

(e) Epoxy Resin. Section 1019.2(b)

(f) Water. Section 720.1

(g) Unbonded Pre-stressing Steel for Precast Box Culverts and Adjacent Box Beams. Encased, corrosion protected, pre-stressing strand for unbonded post-tensioning comprised of the following components:

1. Special Grade, 7-Wire, Uncoated, Low-Relaxation Strand. Section 1107.02(n)3.b

2. Polymer Sheathing.

2.a Material. Polypropylene, cell classification PP 210 B55542, conforming to ASTM D 4101, or polyethylene, High Density Type II, conforming to ASTM D 3350 and ASTM D 1248.

2.b Thickness and Diameter. Provide a minimum sheathing wall thickness of 0.05 inch and an inside diameter of 0.03 inch greater than the maximum diameter of the strand.

2.c Application. Apply around pre-stressing strand in a seamless hot-melt extrusion process. Provide a smooth, circular outside with no visible reveal of the lay of the strand.

3. Corrosion Inhibitor Compound.

3.a Material Properties. Provides corrosion protection to the strand; lubrication between the strand and sheathing; continuous non-brittle coating if exposed to a temperature of -10F; resists flow within temperature range of -10F to 110F; and chemically stable and nonreactive with pre-stressing strand, reinforcing steel, sheathing material, and concrete.

3.b Quantity. Not less than 2.5 pounds per 100 feet for 0.5-inch diameter strand and 3.0 pounds per 100 feet for 0.6-inch diameter strand. Completely fill the annular space between the strand and sheathing along the entire length of strand.

3.c Performance Criteria. Table A.

TABLE A
Performance Specification for Corrosion Inhibitor Compound

Test Description	Test Method	Acceptance Criteria
Dropping Point	ASTM D 566 or ASTM D 2265	Minimum 300F
Oil Separation at 160F	FTMS (Federal Test Method Standard) 791B Method 321.2	0.5% max by weight
Water Content	ASTM D 95	0.1% maximum
Flash Point (refers to oil content)	ASTM D 92	Minimum 300F
Corrosion test (5% salt fog at 100F 5 mils)	ASTM B 117	Rest Grade 7 or better after 1000 hours of exposure according to ASTM D 610
Water-soluble ions * a. Chlorides b. Nitrates c. Sulfides	ASTM D 512 ASTM D 3867 APHA (American Public Health Association) 4500-S ² E	10 ppm maximum 10 ppm maximum 10 ppm maximum
Soak test (5% salt fog at 100F 5 mils coating, Q Panel Type S. Immerse panels 50% in a 5% salt solution and expose to salt fog)	ASTM B 117 (modified)	No emulsification of the coating after 720 hours of exposure.
Compatibility with sheathing a. Hardness and volume after exposure of polymer to grease, 40 days at 150F b. Tensile strength change of polymer after exposure to grease, 40 days at 150F	ASTM D 4289 (ASTM D 792 for density) ASTM D 638	Permissible change in hardness 15%, volume 10%. Permissible change in tensile strength 30%.

* Procedure: The inside (bottom and sides) of a 1 L calibrated, graduated beaker (approximate outside diameter 105 mm, 145 mm height) is thoroughly coated with 100 ± 10 g of corrosion inhibitor compound. The coated beaker is filled with approximately 900 cc of distilled water and heated in an oven at a controlled temperature of $38^{\circ}\text{C} \pm 1^{\circ}$ for 4 hours. The water extraction is tested by the noted test procedures for the appropriate water-soluble ions. Results are reported as ppm in the extracted water.

1108.03 CONSTRUCTION—

(a) Post-Tensioning Systems. Include anchorages, fittings, sheathing, tendons, and grout.

(b) Corrosion Protection. Protect pre-stressing steel against physical damage, rust, and corrosion. Do not use pre-stressing steel with sustained physical damage, pitting, or rust that cannot be removed by wiping with a dry cloth. Do not retain pre-stressing steel in an ungrouted duct for more than 14 days without special acceptable corrosion protection. Pack pre-stressing steel in containers or other shipping forms for protection against physical damage and corrosion during shipping and storage. Place a corrosion inhibitor that prevents rust or other corrosion in the package or form or, if allowed, apply it directly to the steel or tendon.

Mark on the shipping package or form that the package contains high-strength, pre-stressing steel and the care to be used in handling. State the type, kind, and amount of corrosion inhibitor used, including placement date, safety orders, and instructions for use. When stressing and grouting are completed within 10 calendar days after the pre-

stressing steel installation, rust that may form will not be cause for rejection. In this case, use of a corrosion inhibitor is not necessary.

Before use, submit the coating system for tendon corrosion protection in a bonded system for approval.

Protect bar tendons from corrosion at the job site by spraying with a rust preventative and by use of an approved protective covering over the bars.

(c) Anchorages and Bearing Devices. Use permanent-type anchorages to secure pre-stressing steel at the ends. Steel distribution plates or assemblies may be omitted if large enough anchorages are used in conjunction with a steel grill embedded in the concrete to effectively distribute the compressive stresses to the concrete.

For all systems of post-tensioning, set each anchorage device in all directions perpendicular to the pre-stressing steel axis. At both tendon ends, make accurate measurements of anchorage loss due to slippage or other causes. Compare these losses with the assumed losses shown in the post-tensioning schedule on the shop drawings. If necessary, make adjustments or corrections in the operation to reduce loss or slippage.

For special anchorage devices, test according to AASHTO LRFD Bridge Construction Specifications, Section 10.3.2.3.

(d) Installation of Sheathing Ducts. Form and place sheathing and secure it to prevent movement when concrete is placed. Make splices grout-tight.

After installation, blow the ducts clear using oil-free, compressed air for at least 5 seconds each. Plug the duct ends to prevent the entry of water or debris.

Make all splices, joints, couplings and connections to the duct and anchorages with devices or methods (mechanical couplers, plastic sleeves, heat-shrink sleeve) producing a smooth interior alignment with no lips or kinks. Use plastic welded connections on plastic sleeves and splices or use heat-shrink sleeves at the connections to seal seams. Connections must be sealed to prevent leakage.

Provide ducts or anchorage assemblies with pipes or connections for grout injection. Install 1/2 inch or larger in size pipe vents near the high points of each duct. Make vents grout-tight and provide means for grout injection, and heat-shrink wrap as necessary. Remove vent ends 1 inch below the member surface, after grouting has been completed.

For tendons made up of single pre-stressing bar or strand, make the inside diameter at least 1/4 inch greater than the diameter of the pre-stressing bar or strand. For tendons consisting of several pre-stressing strands, make the duct's cross-sectional area at least 2.5 times the net area of pre-stressing steel.

Locate ducts within the specified tolerances. For curved members, place the ducts on, or symmetrically about, the member axis parallel to the curvature direction.

Provide concrete cover a minimum of 1 1/2 inches for sheathing up to 2 inches O.D., and a minimum of 2 inches of cover for larger sheathing. Provide a minimum of 1 1/2-inch clear spacing between the sheathing at the beam ends, or provide 1 1/2 times the maximum aggregate size, whichever is greater.

After the pre-stressing steel has been installed, do not weld or use as a ground for welding equipment on steel in the member. Do not flame cut, unless the ducts and tendons are effectively shielded.

(e) Pre-stressing. Tension pre-stressing steel using hydraulic jacks, so the force in the pre-stressing steel is not less than the value indicated on the accepted shop drawings with appropriate allowance for all losses.

Within 20 days before stressing, calibrate all jacks and pressure gauge system and furnish certified copies of the load calibration curves to the Engineer except jack calibration for post-tensioning of box culverts and adjacent box beams. For post-tensioning of box culverts and adjacent box beams, accompany jack gauges with a current, certified calibration chart not older than 6 months. Equip each jack with a pressure gauge having an accurate reading dial at least 6 inches in diameter. Calibrate each jack and its gauge as a unit with the cylinder extension in four separate locations based on the final jacking force. Calibrate the jack and its gauge in the approximate 1/4 stroke, 1/2 stroke, 3/4 stroke, and final stroke position. Recalibrate stressing equipment at 6-month intervals, after mechanical failure, and if the accuracy of the stressing equipment is called into question by the Representative. Do not interchange jacks and gauges without recalibration. Check the certified calibration chart for hydraulic jacks and pressure gauges used for tensioning pre-stressing steel, both before and during tensioning operations.

Do not stress tendons until the concrete has attained its 28-day strength, unless partial stressing is allowed at a lower strength.

Apply an initial load of 10% of the full load to the tendon to take up slack and to provide a starting point for measurement of elongations. Apply the final load, including any overload. Apply the load at a rate consistent with procedures recommended by the manufacturer of the system.

Unless otherwise indicated, in simple span members, stress by jacking from one end only, with one-half of the prestressing steel in each member tensioned from one end and the other one-half tensioned from the opposite end.

If the same tendons are jacked from two ends, both jacking operations may be done simultaneously, provided uniform tensioning forces are applied at each end. The stressing forces, measured by jacking pressures and elongation, are required to agree within 5%. If the measurements cannot be reconciled within this range, halt the stressing, examine the procedure, and determine the sources of error so the measured force can be verified within this limit. If sources of error cannot be determined or verified by the Professional Engineer in charge of post-tensioning operations, to the satisfaction of the Engineer, the post-tensioning of the member will be stopped and the member rejected.

In continuous members, tension by jacking at each tendon end, unless otherwise indicated. Jacking of both ends need not be done simultaneously, unless otherwise indicated.

(f) Bonding and Grouting. Start grouting promptly after tensioning.

1. Grout. Use grout consisting of Portland cement, water, and admixtures. Use a Class C, prepackaged grout. Alternate grouts consisting of Type I, II, or III Portland cement may be used if an approved Special Design Grout, Class D is provided by the Design Engineer and conforms to the requirements of the Post-Tensioning Institute (PTI) M55.1 Section 3.4. Class D grouts must use non-shrink admixture and anti-bleed admixture of the type recommended by the manufacturer of an accepted tendon. Do not use admixtures containing chlorides or nitrates, or that release free hydrogen.

Use enough grout plastic to pump and completely fill the ducts. No grout shrinkage is allowed while in the plastic state. Before post-tensioning, submit the Manufacturer's data sheet of the grout to be used, to the Structure Control Engineer. If using a Class D, Special Design Grout, submit the mix design to the DME/DMM a minimum of two weeks before grouting. Design the mix and verify it has a minimum compressive strength of 2,500 pounds per square inch at 7 days and has 4% to 10% expansion. Verify strength by testing according to ASTM C 109. Limit the water content of the grout to the minimum volume necessary to produce a mix that can be pumped, with a maximum of 5 gallons per bag of cement or grout according to manufacturer's recommendations, whichever is less.

Prepare test cylinders from each day's grouting.

Visually determine the grout's ability to be pumped.

Strength testing of grout for precast box culverts is not required.

1.a Quality Control Testing – perform the following tests for each pump used for each shift or if a change in pump operator occurs. Testing must re-occur if visual or apparent changes in the characteristics of the grout occurs.

- Fluidity Test – ASTM C 939, Modified – Once every 2 hours, at the inlet. Results must be within 5 seconds of values established for grout qualification.
- Schupack Pressure Bleed Test – ASTM C 1741 – Once per day, per shift at the inlet.
- API Mud Balance Test – Two (2) per day, at both the inlet and outlet. Result shall be between the values for minimum and maximum water dosage
- Change in Volume Tests (if expansive agent is used) – ASTM C 1090 – Once per day. 0.0% +/- 0.1% change in 24 hours max, +0.20% change at 28 days.
- Grout Strength – ASTM C 942 – Once per day, per shift at the inlet.

2. Grouting Equipment. Use equipment capable of grouting at a pressure of at least 100 pounds per square inch. Furnish equipment with a pressure gauge that has a full-scale reading of not more than 300 pounds per square inch. Provide standby flushing equipment and compressed air equipment capable of developing a pumping pressure at 250 pounds per square inch and large enough to flush out partially grouted ducts. Provide working pressure meters that show the grout pressure at the injector nozzle discharge end on the group pumps.

3. Grouting. Clear ducts of deleterious materials that would impair grout bonding or interfere with grouting procedures.

After curing, blow ducts free of water and keep them dry until grouting. Immediately before grouting, blow the ducts out with oil-free compressed air.

Mix the grout using a high-shear colloidal mixer that produces uniform and thoroughly mixed grout. Do not retemper grout. Agitate the grout continuously until it is pumped. Before entry into the pump, screen grout through 0.07-inch maximum, clear opening screen.

Grout the ducts after completion of the tensioning operation for each unit as specified in Section 1108.03(b), unless otherwise directed.

Equip grout injection pipes with positive, mechanical shutoff valves. Fit vents and ejection pipes with valves, caps, or other devices capable of withstanding the pumping pressures. Do not remove or open valves and caps until directed, generally after the grout has set.

Apply grout by pumping toward open vents. Pump continuously, approximately 15-50 ft per minute, using moderate pressure, not to exceed 145 pounds per square inch for plastic ducts or 245 pounds per square inch for steel ducts, at the entry point in the duct, until entrapped air is forced out the open vent or vents and until visible slugs of water or air are ejected. Close the outlet pipe only after sufficient grout, equivalent to the grout being injected at the inlet, is ejected from the outlet. With the entire duct filled and discharge vents closed, raise the pressure to a minimum of 50 pounds per square inch and hold for a minimum of 1 minute, and then plug the injection point to prevent grout loss. Close the valve at the inlet while maintaining this pressure.

3.a For box culverts:

3.a.1. Close discharge vents while applying constant grouting pressure from the injection point.

3.a.2. Once all discharge vents are closed, close the valve at the injection point and disengage the pump. Do not apply an increase in pressure after all discharge vents are closed.

Using an abrasive, blast clean the concrete surfaces at anchorage assemblies, until clean aggregate is exposed, to ensure concrete bonding or grout encasement of assemblies.

Where the end of a post-tensioned assembly is not embedded in concrete, recess the anchorages so the prestressing steel ends and parts of the anchorages will be at least 2 inches inside of the member end surface, unless a greater embedment is indicated. Following post-tensioning, clean the recesses, fill with non-shrink mortar, and finish flush. After curing, paint surfaces with two coats of epoxy resin.

SECTION 1109—GUIDE RAIL AND METAL MEDIAN BARRIER

1109.01 RAILS—As shown on the Standard Drawings and as follows:

- (a) **Rail Elements.** AASHTO M 180, Class A, Type II; mark to show the approximate radius of curved rails.
- (b) **Rubbing Rails.** Fabricate from steel, ASTM A1011, with mechanical properties conforming to ASTM A709, Grade 36.
Galvanize as specified in Section 1105.02(s) (AASHTO M 111).
Shop form, when required, on curves having a radius of less than 150 feet, as follows:
 - Notch flanges to form a curve with a series of chords of equal lengths not exceeding 18 inches (for radii from 0 to 20 feet), 3 feet for radii from 20 feet to 100 feet, and 6 1/4 feet for radii from 100 feet to 150 feet; cut notches to the proper angle and weld.
 - Form so the midpoint of the chord is tangent to the curve.
 - Mark to show the approximate radius of curvature.

1109.02 TERMINAL SECTIONS—As shown on the Standard Drawings and as follows:

- (a) **Alternate Terminal Sections.** AASHTO M 180, Class A, Type II.
- (b) **Terminal Connector.** AASHTO M 180, Class B, Type II.
- (c) **Flared Terminal Section.** AASHTO M 180, Class A, Type II.

1109.03 POSTS—As shown on the Standard Drawings and as follows:

- (a) **Steel I-Beam Posts.** ASTM A709, Grade 36/50/50S, ASTM A36, or ASTM A992.
Galvanize as specified in Section 1105.02(s) (AASHTO M 111).
- (b) **Steel C-Posts and Channel Posts.** Fabricate from steel, ASTM A1011, with mechanical properties conforming to ASTM A709, Grade 36.
Galvanize as specified in Section 1105.02(s) (AASHTO M 111).
- (c) **Wood Guide Rail Posts.** AASHTO M 168. As shown on the Standard Drawings and as follows:
Label each wood item with lot or batch number, plant, place, and date of manufacture.
Manufacture from timber having a minimum grade of 1,200 pounds per square inch according to the current standard grading and dressing rules of the West Coast Lumber Inspection Bureau, the Southern Pine Inspection Bureau or other acceptable timber associations. Timber to be either rough sawn (unplanned) or surfaced four sides (s4s) to the dimensions indicated. Size in the direction parallel to the axis of bolt holes to be within a tolerance of $\pm 1/4$ inch. Use one type of surface finish for posts and offset blocks in a continuous run of guide rail.
Treat timber with a preservative according to AASHTO M 133, after end cuts are made and holes are drilled. Certify as specified in Section 106.03(b)3.
- (d) **Breakaway Terminal Wood Posts.** Section 1109.03(c)
- (e) **Breakaway Terminal Foundation Wood Posts.** Section 1109.03(c)

1109.04 OFFSET BRACKETS—

(a) General Requirements. Provide offset brackets from a manufacturer listed in Bulletin 15. Certify as specified in Section 106.03(b)3.

(b) Wood Offset Brackets. As shown on the Standard Drawings and/or the approved Shop Drawings manufactured from timber having a minimum grade of 1,200 pounds per square inch according to the standard grading and dressing rules of the West Coast Lumber Inspection Bureau, the Southern Pine Inspection Bureau, or other acceptable timber associations. Treat timber with a preservative according to AASHTO M 133, after cutting ends, drilling bolt holes and, if applicable, routing. Provide brackets with a $\pm 1/4$ -inch dimension tolerance in the direction of the bolt hole.

1. Non-Routed. Use with wood posts.

2. Routed. Use with steel posts.

(c) Composite Offset Brackets. As shown on the Standard Drawings and/or the approved Shop Drawings and manufactured from a combination of either virgin or recycled wood, plastic, rubber, or other materials. Provide brackets with a $\pm 1/4$ -inch dimension tolerance in the direction of the bolt hole.

1. Non-Routed. Use with wood posts.

2. Routed. Use with steel posts.

1109.05 MISCELLANEOUS MATERIAL—As shown on the Standard Drawings and as follows:

(a) Nuts, Bolts, and Washers. Section 1105.02(c)1.

Galvanize as specified in Section 1105.02(s) (ASTM A153, or ASTM B695 and B696).

(b) Base Plates, Post Plates, End Post Support Angles, and Hardware. ASTM A709, Grade 36.

Galvanize base plates and hardware after fabrication, as specified in Section 1105.02(s) (AASHTO M 111). Do not punch, drill, grind, cut, or weld after galvanizing. Repair minor abrasions of galvanized surfaces with two coats of galvanizing paint.

(c) Rotating Bracket. Fabricate from malleable cast iron, ASTM A47 or structural steel, ASTM A709, Grade 36. Galvanize as specified in Section 1105.02(s) (AASHTO M 111).

1109.06 GALVANIZING—Galvanize metal parts as specified in Section 1105.02(s) (ASTM A153 unless otherwise specified) and conform to the requirements of AASHTO M 180, Section 9.

1109.07 GALVANIZING PAINT—ASTM A780 Section 4.2.2

1109.08 WELDING MATERIAL—Section 1105.02(t)

1109.09 CERTIFICATION—Section 106.03(b)3

SECTION 1110—RIGHT-OF-WAY FENCE

1110.01 WIRE FABRIC AND COMPONENTS—As shown on the Standard Drawings and as follows:

(a) Type 1 Right-of-Way Fence.

1. Fabric. AASHTO M 181, Type I, II, or IV, 0.148-inch (No. 9 gage) coated wire size with the same type of coating throughout the project. Galvanize Type I fabric with a Class D coating.

2. Fasteners.

- For attaching the fabric to line posts: 0.192-inch (No. 6 gage) aluminum wire or 0.148-inch (No. 9 gage) galvanized preformed clips.
- For attaching the fabric to tension wires: 0.135-inch (No. 10 gage) galvanized steel wire or aluminum hog rings of comparable size.

Galvanize at a minimum of 1.6 ounces per square foot of actual surface area.

3. Tension Wire. AASHTO M 181

(b) Type 2 and Type 5 Right-of-Way Fence.

1. Fabric. Galvanized, 0.148-inch (No. 9 gage) steel wire, 0.120-inch (No. 11 gage) aluminum coated steel wire conforming to ASTM A491, or galvanized 0.148-inch (No. 9 gage) steel wire top and bottom with galvanized 0.120-inch (No. 11 gage) steel intermediate wires.

Join vertical stays at each horizontal wire by electric arc welding or by a hinge-type method, consisting of not less than 1 1/4 tightly wrapped twists.

Galvanize at a minimum of 0.6 ounce per square foot of actual surface area, as specified in Section 1110.04.

2. Fasteners. For attaching the fabric to posts; aluminum or galvanized steel bands or clamps, galvanized staples set in the post flanges, or another acceptable method.

1110.02 END POSTS, CORNER AND PULL POSTS, LINE POSTS, BRACES, STRETCHER BARS, TRUSS RODS, FITTINGS, AND HARDWARE—As shown on the Standard Drawings and as follows:

- Straight posts true to section.
- Braces, fittings, and hardware of commercial-quality steel or malleable iron.
- Posts of commercial quality steel or malleable iron, or Aluminum Alloys 6063-T6, 6005-T5, or 6061-T6, according to ASTM B221; tubular and open type sections.
- Moisture-excluding caps, firmly and rigidly secured to the post top.

Galvanize or coat both the inside and outside of tubular and open-type sections, according to AASHTO M 111. Either of two alternate coating systems may be used, as follows:

- **Outside.** Hot-dipped zinc coating, according to ASTM B6, at a minimum of 1.0 ± 0.1 ounce per square foot of actual surface area; chromate conversion coating at 30 micrograms per square inch \pm 15 micrograms per square inch of actual surface area; thermoplastic electrostatically applied acrylic coating, 0.5 mil \pm 0.2 mil in thickness.

and

- **Inside.** Zinc base coating, 0.5 mil \pm 0.2 mil thickness (0.3 ounce per square foot \pm 0.05 ounce per square foot) with a minimum of 80% zinc powder by weight.

or

- **Outside and Inside.** Hot-dipped, pure, aluminum coating, commonly identified as Type 2, with a minimum weight of coating of 0.75 ounce per square foot of actual surface area, triple spot test, and 0.70 ounce per square foot of actual surface area, single spot test, as measured according to AASHTO T 213; a chromate conversion coating; and a thin acrylic resin film.

(a) Type 1 Right-of-Way Fence.

1. End Posts. Round, rectangular, or square tubular sections, conforming to the requirements of Table A; if acceptable, other posts sections, conforming to the requirements of Table A.

Table A Minimum Bending Moment (in-lb)^A				
Fence Height (ft)	End, Corner, and Pull Post		Line Post*	
	Major Axis	Minor Axis	Major Axis	Test Load (lbs)^B
4	13,700	5,000	12,000	1,600
5	17,000	7,700	15,000	2,000
6	20,600	11,100	18,000	2,400
7	24,000	15,100	21,000	2,800
8	27,400	19,800	24,000	3,200

A. Bending Moment (in-lb) = Yield Strength (psi) x Section Modulus (in³)

B. Test a 36-inch section of line post for bending capacity about the major axis of its cross section. Apply the Test Load concentrated at span center with supports spaced at 24 inches. Ensure that the test section achieves the Test Load as indicated in Table A, within the elastic limit of the material.

2. Corner and Pull Posts. Section 1110.02(a)1., except finish brace clamps or attaching devices, adjustable to various horizontal and vertical angles.

3. Line Posts. Tubular, H-column, or I-beam sections, conforming to the requirements of Table A; if acceptable, other post sections, conforming to the requirements of Table A.

4. Braces, Stretcher Bars, and Truss Rods.

- Braces: 1.66-inch O.D. tubular steel section with a minimum Bending Moment of 7050 inch-pounds; 1 5/8 inches by 1 1/4 inches roll formed U-shaped steel section at nominal 1.35 pounds per linear foot or equal.
- Stretcher Bars (for attaching the fabric), at least 3/16-inch by 3/4-inch flat steel, or equal.
- Truss Rods, 3/8-inch nominal diameter, good quality steel, or equal, with a turnbuckle or other provision for adjustment.

(b) Type 2 and Type 5 Right-of-Way Fence.

1. End, Corner, and Pull Posts. Tubular, angle, or other acceptable section, conforming to the requirements of Table A.

2. Line Posts. Tubular, ribbed tee, U-shaped, angle, or other acceptable section, conforming to the requirements of Table A.

Attach an acceptable plate or other device to the posts to hold plumb and to keep properly aligned. Fasten the plate or device by welding or riveting (not less than two rivets), or by another acceptable method.

3. Braces. 1.66-inch O.D. tubular steel section with a minimum Bending Moment of 7050 inch-pounds; 2-inch by 2-inch by 1/4-inch angle or equal.

1110.03 GATES—As shown on the Standard Drawings and as follows:

- Swing-type gates, with latches, stops, keepers, hinges, and locks.
- Steel wire fabric of same type material as the fence.
- Hinges of adequate strength to support the gate, and that do not twist or turn under the gate's action.
- Plungebar-type latches that can be locked, full gate height, and located in a manner that engages the gate stop.

Forked latches may be allowed, for single gates less than 10 feet wide.

- Stops are to consist of a flush plate, anchored in concrete, to engage the plungebar of the latch.
- Other types of stops may be allowed, for single gates less than 10 feet wide.
- Substantial devices are necessary for securing and supporting the free end of the gate in an open position.

1110.04 GALVANIZING—Galvanize fabric, posts, post caps, braces, fittings, and hardware, by electrolytic, hot-dip, mechanical, or other acceptable methods as specified in Section 1105.02(s) and as follows:

For electrolytic method: ASTM B633

For hot-dip method:

- Posts, braces, and fittings—ASTM A123 or ASTM A53
- Fabric—ASTM A392
- Hardware—ASTM A153

For mechanical method (hardware only): ASTM B695

Test galvanizing by weight, according to ASTM A90.

1110.05 INSPECTION—Material will be inspected, if considered necessary, at the place of manufacture, before shipment. Provide facilities for the Department inspector to determine that the material is being furnished as indicated.

1110.06 CERTIFICATION—Section 106.03(b)3

1110.07 DRIVE ANCHOR—Anchors from a manufacturer listed in Bulletin 15.

SECTION 1111—HIGH LOAD MULTI-ROTATIONAL BEARINGS

1111.01 DESCRIPTION—This work is the fabrication of high load multi-rotational bearings, as indicated.

1111.02 MATERIAL—Use new material at all times, with no reclaimed material incorporated in the finished bearing.

(a) **Steel.** Conform to AASHTO M 270 (ASTM A709), Grade 36, 50, or 50W, except for steel for guide bars and shear restriction pins and sleeves. Furnish guide bars and shear restriction mechanisms as specified by the manufacturer and that are approved.

(b) **Elastomeric Disc.**

1. Pot Bearings. Provide Shore A 50 Durometer and conform to the following requirements:

Furnish only virgin, crystallization-resistant polychloroprene (neoprene) or virgin, natural polyisoprene (natural rubber) as the raw polymer for the elastomeric rotational element used in the construction of pot bearings. Use individually molded and one-piece elastomers. Provide neoprene and natural rubber used in these bearings with physical properties, which conform to the following ASTM or AASHTO requirements, with the modification noted:

Compound	ASTM Requirement	AASHTO Requirement
Neoprene	ASTM D2000, Line Call Out M2BC520A14B14	AASHTO M 251
Natural Rubber	ASTM D2000, Line Call Out M4AA520A13B33	AASHTO M 251

Modification: 1) Samples for compression set tests shall be prepared using a type 2 die.
2) Shore A durometer hardness = 50 ± 10 Points

2. Disc Bearings. Provide polyether urethane conforming to the following requirements:

Physical Property	ASTM Test Method	Requirements			
		Compound A		Compound B	
		Min.	Max.	Min.	Max.
Hardness, Type D Durometer	D2240	46	50	60	64
Tensile Stress, psi	D412				
At 100% elongation		1,500	—	2,000	—
At 200% elongation		2,800	—	3,700	—
Tensile Strength, psi	D412	4,000	—	5,000	—
Ultimate Elongation, %	D412	350	—	220	—
Compression Set, 22 h @ 158F, %	D395 Method B	—	40	—	40

(c) **Sliding Surfaces.**

1. General. Provide polytetrafluoroethylene (PTFE) resin sheets, PTFE fabric, interlocked bronze and PTFE structures, PTFE-perforated metal composite, back-up materials and all other parts of fixed or expansion bearings containing PTFE materials having the friction, mechanical, physical, and weathering properties specified in 1111.02(c) or indicated.

2. PTFE Resin. Furnish virgin PTFE resin (not reprocessed) conforming to the requirements of ASTM D4894. Provide resin with specific gravity of 2.13 to 2.19 and Second Melting Peak Temperature of 621F \pm 18F.

3. Filler Material. When filler material is used, furnish milled glass fibers (15% maximum filler percent by weight), carbon (25% maximum filler percent by weight) or fabric containing PTFE fibers, or other approved inert

filler materials.

4. Adhesive Material. Use heat cured, high temperature epoxy capable of withstanding temperatures of 385F to 500F when bonding the PTFE to its steel substrate. Provide adhesive material in epoxy resin conforming to the requirements of Federal Specification MMM-A-134 FEP film or approved equal.

5. Unfilled PTFE Sheet. Make finished unfilled PTFE sheet from virgin PTFE resin.

Ensure that finished unfilled PTFE sheet conforms to the following requirements:

Tensile Strength (minimum)	ASTM D638	2,800 psi
Elongation (minimum)	ASTM D638	200%

6. Filled PTFE Sheet. Make filled PTFE sheet from virgin PTFE resin uniformly blended with inert material. Ensure that finished filled PTFE sheets containing glass fiber or carbon conform to the following requirements:

Requirement	ASTM Method	15% Glass Fibers	25% Carbon
Mechanical			
Tensile Strength (minimum)	D638	2,000 psi	1,300 psi
Elongation (minimum)	D638	150%	75%
Physical			
Specific Gravity	D792	2.20 ± 0.03	2.10 ± 0.03
Melting Point	D4894, D4895	621F ± 18F	621F ± 18F

7. Fabric Containing PTFE Fibers. Use manufactured fabric produced from oriented, multifilament, PTFE, fluorocarbon fibers and other fibers as required by proprietary designs. Use PTFE fibers with the following typical physical properties:

Physical Requirement	ASTM Method	PTFE Fibers
Tensile Strength (minimum)	D2256	2,400 psi
Elongation (minimum)	D2256	35%

8. Interlocked Bronze and Filled PTFE Structures. Supply interlocking bronze and filled PTFE structures consisting of a phosphor bronze plate with a 0.010-inch thick porous bronze surface layer into which is impregnated a lead/PTFE compound. Provide an overlay of compounded PTFE not less than 0.001 inch thick. Ensure that the phosphor bronze back plate conforms to ASTM B100 and the porous bronze layer conforms to ASTM B103/B103M.

9. PTFE Metal Composite. Supply PTFE metal composite consisting of virgin PTFE molded on each side and completely through a 1.32-inch perforated stainless steel ASTM A240, Type 304 sheet.

10. Surface Treatment. Where PTFE sheets are to be epoxy bonded, have an approved manufacturer factory treat one side of the PTFE sheet using the sodium naphthalene or sodium ammonia process.

11. Stainless Steel Mating Surface. Furnish stainless steel sliding surfaces conforming to ASTM A240, Type 304 with an ANSI 0.02 mil surface finish or less. Attach a stainless steel sheet by an approved welding procedure, which keeps the sheet in contact with the substrate, or weld a stainless steel overlay using Type 309L electrodes. Use 0.05-inch minimum thickness stainless steel.

12. Manufacturing Requirements. Manufacture the expansion bearing to the dimensions of and to conform to the requirements of the method of fastening to the structure as indicated.

12.a Attachment of PTFE Material. Factory-bond, mechanically connect, or recess into the back-up material PTFE material as indicated.

12.a.1 Bonding. Perform the bonding at the factory of the manufacturer of the fixed or expansion bearings under controlled conditions and according to the written instructions of the manufacturer of the approved adhesive system. Ensure that after completion of the bonding operation, the PTFE surface is smooth and free from bubbles.

Then polish filled PTFE surfaces.

12.a.2 Mechanically Fastened. If mechanically fastened, fasten PTFE sheet as indicated with the size, type, and number of fasteners required, taking care to have full bearing of the fastener used in the PTFE sheet and back-up material.

12.a.3 Fabric Containing PTFE Fibers. Bond or mechanically attach the fabric to a rigid substrate. Supply fabric capable of carrying unit loads of 10,000 pounds per square inch without cold flow. Provide a fabric-substrate bond capable of withstanding a shear force equal to 10% of the perpendicular or normal application loading without delamination in addition to the shear force developed as a result of the natural bearing friction shear force.

(d) Sealing Rings.

1. Rings with Rectangular Cross Sections. Furnish brass sealing rings conforming to ASTM B36/B36M.

2. Rings with Circular Cross Sections. Furnish round cross section metal sealing rings conforming to ASTM B16, Temper H02, half hard.

(e) Bronze Elements. Ensure that bronze bearing and expansion plates conform to the specification for Bronze Castings for Bridges and Turntables, ASTM B22. Furnish alloy C91100 unless otherwise specified.

Cast bronze plates according to the indicated details. Plane sliding surfaces parallel to the movement of the spans and polish them unless otherwise indicated.

(f) Lubricant. Furnish solid lubricant consisting of a combination of solids having non-deteriorating characteristics as well as lubricating qualities and capable of withstanding long term atmospheric exposure, de-icing materials, and water. Do not use molybdenum disulfide and other ingredients, which promote electrolytic or chemical action between the bearing elements. Do not use shellac, tars and asphalts, or petroleum solvents as binders.

1111.03 FABRICATION—

(a) Rotational Elements. Furnish elements conforming to the following requirements:

1. Pot and Disc Bearings. Manufacture from a solid plate by machining or fabricate by welding a flame-cut shape to a plate. Test all welded areas by the magnetic particle method meeting AWS D1.5/D1.5M, Clause 6 requirements. Welding is as specified in Section 1105.03(m).

Machine inside diameter (ID) of pots to a tolerance of ± 0.005 inch up to 20 inches ID and ± 0.007 inch over 20 inches ID.

Pots machined parallel to the inside to Class “A” tolerance.

Machined surfaces to an ANSI 125 micro-inch rms finish or better.

Elastomeric discs with tolerances as follows:

- Diameters up to 20 inches, $\pm 1/16$ inch
- Diameters greater than 20 inches, $\pm 3/32$ inch
- Total thickness of all pieces, -0 inch, $+1/8$ inch
- Mold discs in one piece, do not layer elastomer.

Pistons with tolerances as follows:

- Diameters up to 20 inches, ± 0.005 inch.
- Diameters greater than 20 inches, ± 0.007 inch.

- Upper side, Class “A” tolerance. Lower side, Class “B” tolerance.

2. Disc Bearings. Provide discs with tolerances as follows:

- Diameters up to 20 inches, $\pm 1/16$ inch.
- Diameters greater than 20 inches, $\pm 3/32$ inch.
- Thickness, -0 inch, $+1/8$ inch.
- Mold discs in one piece, do not layer elastomer.

Furnish bearing plates for discs with tolerances as follows:

- Diameters up to 20 inches, ± 0.005 inch.
- Diameters greater than 20 inches, ± 0.007 inch.
- Inside surfaces facing disc Class “A” tolerance and minimum ANSI 125 micro-inch rms finish.
- Outside surfaces, Class “A” tolerance and minimum ANSI 125 micro-inch rms finish.

3. Spherical Bearings. Provide spherical bearings with tolerances as follows:

- Machined diameters, ± 0.015 inch.
- Convex radius dimensions, $+0.000$ inch, -0.010 inch.
- Concave radius dimensions, $+0.010$ inch, -0.000 inch.
- Mating surfaces to be as indicated, external edges may be “as cast” or flame-cut.
- Lower surface of convex element Class “C” tolerance.

(b) Non-Rotational Elements (All Bearings). Furnish elements conforming to the following requirements:

Furnish masonry and distribution plates with tolerances as follows:

- Plan dimensions up to 30 inches, -0 inch, $+3/16$ inch
- Plan dimensions over 30 inches, -0 inch, $+1/4$ inch
- Thickness tolerance, -0.030 inch, $+0.060$ inch
- Masonry plates used with pot, disc, or spherical bearings, Class “C” tolerance for the underside and Class “A” tolerance for the upper side.

Provide PTFE sliding surfaces with tolerances as follows:

- Plan dimensions “total design area,” $+5\%$, -0%
- Substrate flatness: Class “A” tolerance for pot and disc bearings, Class “B” tolerance for spherical bearings.
- Thickness, -0 inch, $+0.063$ inch per AASHTO LRFD Construction Specifications Table 18.1.4.2-1

Seal weld the stainless steel sheet around the entire perimeter using techniques, which ensure it will remain in

contact with the backing plate.

Provide an ANSI 20 micro-inch rms finish or better. Flatness to Class “A” tolerance. Furnish sole plates with tolerances as follows:

- Plan dimensions up to 30 inches, -0 inch, +3/16 inch
- Plan dimensions over 30 inches, -0 inch, +1/4 inch
- Center line thickness, -1/32 inch, +1/8 inch
- Flatness of surface in contact with steel beams, Class “B” tolerance; in contact with fresh concrete, none; in contact with stainless steel sliding surface, Class “A” tolerance; in contact with another steel plate, Class “B” tolerance.
- Minimum edge thickness, 3/4 inch
- Machined bevels to an angular tolerance of ± 0.002 radians (0.115 degrees)
- Flatness of beveled surfaces, Class “A” tolerance

Provide guide bar with tolerances as follows:

- Length, unless integral with plate, $\pm 1/8$ inch
- Section dimensions, $\pm 1/16$ inch
- Flatness where it bears on another plate, Class “A” tolerance
- Bar-to-bar, nominal dimension $\pm 1/32$ inch
- Not more than 1/32 inch out of parallel

Overall bearing height not more than 1/8 inch or less than 0 inch from nominal dimension. Chamfer all edges.

(c) Determination of Flatness and Tolerances. Furnish bearings with flatness determined by the following method:

Place a precision straightedge, longer than the nominal dimension to be measured, in contact with the surface to be measured or as parallel to it as possible.

Select a feeler gage having a tolerance of ± 0.001 inch and attempt to insert it under the straightedge using the least number of blades.

Flatness is acceptable if the feeler gage does not pass under the straightedge.

Flatness tolerances are arranged in the following classes:

Class “A” = $0.0005 \text{ inch} \times \text{“Nominal Dimension”}$

Class “B” = $0.001 \text{ inch} \times \text{“Nominal Dimension”}$

Class “C” = $0.002 \text{ inch} \times \text{“Nominal Dimension”}$

“Nominal Dimension” is defined as the actual dimension of the plate, in inches, under the straightedge.

In determining flatness, the straightedge may be located in any position on the surface being evaluated and not necessarily at 90 degrees to the edges.

Ignore a 1-inch wide border around the plate in determining flatness.

(d) Painting. Do not paint before completion of welding.

If the time of exposure before welding is to exceed 90 calendar days, provide metal surfaces with a protective coating of clear lacquer or other approved coating.

Paint all steel surfaces as indicated and according to recommendations of the coating manufacturer.

(e) Testing. Conduct the following tests before installation of the bearings, and in the presence of the Representative.

1. Sampling. Select one sample, for testing purposes, at random from each “lot” of completed bearings at the manufacturer's plant.

A “lot” consists of one of the following:

- No more than 25 fixed bearings of one “load category”
- No more than 25 expansion bearings of one “load category”

One “load category” may consist of bearings of differing vertical force capacity but the bearings may not exceed a range of capacity differing by more than 300 kips.

2. Friction Test. Test only those bearings actually fabricated for the project.

Test a sample from each lot of expansion bearings. For all guided and nonguided expansion type bearings, measure the sliding coefficient of friction at the bearing's design capacity as specified in Section 1111.03(e)2.a, and on the fifth and fiftieth cycles, at a sliding speed of 1 inch per minute.

Calculate the sliding coefficient of friction as the horizontal force necessary to maintain continuous sliding of one bearing, divided by the bearing's vertical design capacity.

The test results will be evaluated as follows:

- Measured sliding coefficients of friction not to exceed 3%.
- Visually examine the bearing both during and after the test. Any resultant visual defects, such as bond failure, physical destruction, cold flow of TFE to the point of debonding, or damaged components will cause rejection of the lot.

2.a Test Method. Obtain approval of the test method and equipment and comply with the following requirements:

- Arrange the test so that the coefficient of friction on the first movement of the manufactured bearing can be determined.
- Clean the bearing surface before testing.
- Conduct the test at maximum working stress for the TFE surface with the test load applied continuously for 12 hours before measuring friction.
- Determine the first movement static and dynamic coefficient of friction of the test bearing at a sliding speed of less than 1 inch per minute, which is not to exceed the coefficient of friction for design in Article 14.7.25 of the LRFD specification.
- Subject the bearing specimen to 100 movements of at least 1 inch of relative movement and, if the test facility allows, the full design movement at a speed of less than 1 foot per minute. Following this test, determine the static and kinetic coefficient of friction again, which is not to exceed the values specified in Section 1111.03(e)2.a, fourth bullet. Verify that the bearing or specimen shows no appreciable sign of bond failure or other defects.

Bearings represented by test specimens passing the above requirements will be approved for use in the structure subject to on-site inspection for visible defects.

Bearings not damaged during the testing of performance characteristics may be used in the work.

3. Proof Load Test. Test one bearing from each production “lot” of fixed and expansion bearings. Load a test bearing to 150% of the bearing's rated design capacity and simultaneously subject it to a rotational range of 0.02

radians (1.146 degrees) or design rotation, whichever is greater, for a period of 1 hour.

Visually examine the bearing both during the test and upon disassembly after the test. Any resultant visual defects, such as extruded or deformed elastomer, polyether urethane or TFE, damaged seals or limited or cracked steel, will cause rejection of the lot.

During the test, for pot bearings maintain continuous and uniform contact between the steel bearing plate and steel piston for the duration of the test. For disc bearings maintain continuous and uniform contact between the polyether urethane element and the bearing plates and between the sliding steel top plate and the upper bearing plate for the duration of the test. Any observed lift-off will cause rejection of the lot.

4. Material Tests. Submit one sample of elastomer and one sample of PTFE from each “lot of material” to LTS for material testing to ensure compliance with appropriate material specifications.

(f) Packing and Shipping.

1. Packaging and Handling. Ensure that the bearings are securely banded together as units by fabricator, shipped to the job site, and stored without relative movement of the bearing parts or disassembly at any time. Wrap bearings in moisture resistant and dust resistant material to protect against shipping and job site conditions. Match mark the bearings to indicate normal position of each bearing.

Take care to ensure that bearings are stored at the job site in a dry sheltered area free from dirt or dust until installation.

Inspect bearings within one week after arriving on the project. Do not disassemble unless the fabricator's representative is present. Following inspection, rewrap the bearings to keep them clean until installation. Do not remove the sole and top plates of bearings for separate attachment to the structure except under the direct supervision of the fabricator.

Do not remove the sole and top plates of bearings for separate attachment to the structure except under the direct supervision of the fabricator.

With each shipment, enclose a copy of the materials, fabrication, and testing compliance certifications.

(g) Shop Drawings. Submit as specified in Section 105.02(d) and include the following information:

- The total quantity of each kind of bearing required (fixed, guided-expansion, or non-guided expansion), grouped first according to type (load range) and then by actual design capacity.
- Plan view and section elevation including all relative dimensions.
- Details of all components and sections showing all materials incorporated into the bearing.
- All ASTM, AASHTO, and other material designations.
- The maximum design coefficient of friction as indicated.
- Clearly describe and detail any welding process used in the bearing manufacture that does not conform to the approved processes of the AWS code.
- Vertical, horizontal, rotation, movement, and load capacity.
- A schedule of all bearing offsets, if required by the project.
- Alignment plans.
- Paint or coating requirements.
- Installation scheme.
- Complete design calculations verifying conformance with the provisions of this specification. Stress analysis and the mechanics of standard bearing details are not required.

- Anchorage details.
- Bearing pre-set details.
- Location of the fabrication plant.
- The manufacturer's name and the name of its representative responsible for coordinating production, sampling, and testing.

(h) Certification. Ensure that the fabricator provides a certification package as specified in Section 106.03(b)3 and containing the following:

- Material test reports for all steels used except AISI C1018 and C1020 for which a mill conformance certificate is acceptable.
- Certificate of Compliance for all non-ferrous metals.
- Material test reports for any elastomeric components.
- Certificate of Compliance for PTFE and any adhesive used.
- A Certificate of Compliance for the bearings, executed by an officer of the manufacturing company.
- Certificate of Compliance for any dowels or bolts supplied.
- Test reports for the performance tests.

SECTION 1112—GLUED LAMINATED HARDWOOD TIMBER MEMBERS

1112.01 GENERAL REQUIREMENTS—

(a) **Description.** This work is the fabrication, treatment, delivery, and storage of hardwood glued laminated timber for structural members.

(b) **Definitions.**

1. Glued Laminated Hardwood Timber. An engineered, stress-rated product of a timber laminating plant, comprising assemblies of suitably selected and prepared laminations bonded together with adhesives.

2. Lamination. The separate lamination thickness shall not exceed 2 inches or be less than 3/4 inch. They may be comprised of pieces jointed to form any specific lamination length.

Laminations formed in combination using narrower pieces are not acceptable for bridge stringers.

Laminations bent and glued to curve form are accepted for use.

3. Exterior Use Adhesives. Use adhesives that perform satisfactorily for all moisture conditions, including exposure to weather, marine use, and where approved preservative pressure treatments are used after gluing. Accepted exterior use adhesives conform to current ANSI/AITC A190.1 requirements.

(c) **Prequalification.** Unless otherwise specified, timber fabricators will be required to prequalify to perform work for the Department by establishing proof of their competency in fabricating members conforming to the current ANSI/AITC A190.1.

Certification of the plant/shop will be performed by the LTS, and submission of a valid certificate to the Structural Materials Engineer, at 81 Lab Lane, Harrisburg, PA 17110, is required by the Department. An annual endorsed copy is required for continued qualification.

(d) **Shop Drawings.** Section 105.02 and as follows:

Design bridge members in lengths, depths, and widths that can be transported from fabrication source to the project.

Provide design computations prepared by a Professional Engineer registered in the State for Department approval.

It is the Department's prerogative to accept or reject the changes by the Contractor.

(e) **Inspection.**

1. General. The LTS will supervise fabrication and treatment inspection. Provide at least 14 calendar days notice of the beginning of work to the Department so that arrangements can be made for inspection.

The Department may waive fabrication or treatment shop inspection and make a complete inspection at a later stage of the construction sequence.

Provide material certification, in duplicate, ensuring that the components used in fabrication were in conformance with material specifications.

2. Facilities for Inspection. Furnish necessary supplies for the inspection of materials and workmanship. Allow Inspectors unrestricted access to the premises during plant working hours. Necessary facilities for inspection include a Type C field office as specified in Section 609.

3. Plant Inspector's Authority. Plant inspectors have the authority to reject any material or work that does not conform to the requirements of these Specifications.

In case of dispute, the Contractor may appeal to the Representative, whose decision will be final.

4. Rejections. Material, workmanship, or finished members accepted by the inspector at the fabricator's plant and treatment plant may be rejected later if they do not conform to the specifications.

5. Testing. Perform all certification tests when required according to the provisions of the current AITC 200 Inspection Manual or another trade association that certifies glued laminated timber under ANSI/AITC A190.1. Perform all preservative testing according to AWWA Standards.

6. Mill Orders and Shipping Statements. Furnish copies of mill orders and shipping statements, as directed. Ensure that the fabricator presents a copy of the shipping invoice to be stamped for verification of inspection and approval of timber items before shipment to the Department's shop inspector. Forward the stamped copy with the shipment for the project file.

(f) Storage of Materials. Section 106.05 and as follows:

Store fabricated glued laminated materials above ground upon suitable platforms, skids, or other supports.

Keep material free from dirt or other foreign materials and properly protected from moisture. Store glued laminated materials to avoid water or high humidity exposure.

1112.02 MATERIAL—

(a) Lumber.

1. General. Ensure that lumber conforms to the manufacturer's requirements under the American Softwood Lumber Standard PS 20-70. Use only Red Maple, Northern Red Oak, or Yellow Poplar.

2. Grading. Grade the lumber according to appropriate grading agency or inspection bureau rules. Grade red maple and northern red oak according to Northeast Lumber Manufacturer's Association (NELMA) rules. Grade yellow poplar according to Northern Softwood Lumber Bureau (NSLB) rules. Certify as specified in Section 106.03(b)3.

3. Moisture Content. Maintain average moisture content of hardwood lumber at 12% to 15%. Any deviations from these lumber moisture content conditions must be approved.

(b) Adhesives.

1. General. Use any fully exterior adhesive for face joint bonding of laminations provided that adhesives have been qualified under appropriate sections of ANSI/AITC A190.1.

Acceptable face bonding includes either a 100% resorcinolic adhesive or in formulation with phenolic base adhesives.

End-joint connections must be bonded with a similar fully exterior adhesive or a 100% melamine base adhesive.

2. Exterior Adhesives. Examples of adhesive formulations shown acceptable for face lamination are:

Cascophen RS-254 (Resorcinol Adhesive)
 Penacolite G1131 (Resorcinol Adhesive)
 Cascophen LT-75 (Phenol with Resorcinol Adhesive)
 Cascophen LT-5210 (Phenol with Resorcinol Adhesive)
 Penacolite G1260 (Phenol with Resorcinol Adhesive)

Acceptable performance with use of these exterior adhesives is species dependent and is maintained through strict lamination procedures to achieve optimum bond development.

(c) Marking.

1. Mark all glued laminated hardwood timber bending members for orientation of end-use application. Mark straight or slightly cambered members with identification to denote proper top versus bottom beam orientation.

2. Include the word "TOP" by permanently labelling with routed letters approximately (2 inches high with identifications.

Members intended for axial load application or of symmetric construction suited for either up or down installation need not be labelled.

Appropriately stamp members with a quality mark or other documentation indicating conformance with ANSI/AITC A190.1. Certify as specified in Section 106.03(b)3.

(d) Treatment Chemicals. Treat northern Red Oak, Red Maple, and Yellow Poplar glued laminated members with an AWPAs accepted oil base preservative. For creosote or creosote solution treat to a minimum 11.5 pounds per cubic foot assay retention. Other oil base treatments must meet minimum retentions conforming to AWPAs C14.

Conduct retention and penetration assay according to AWPAs C28.

Sample Northern Red Oak and Red Maple for soil contact as required for Southern Pine (refer to AWPAs C28, Table 1).

Sample Yellow Poplar for soil contact as required for Pacific Coast Douglas-Fir (refer to AWPAs C28, Table 1).

1112.03 FABRICATION—

(a) Required Standards. Fabricate structural glued laminated hardwood timber according to the requirements put forth in the current ANSI/AITC A190.1 and AITC 119.

Treat all structural glued laminated bridge members to minimum retention and penetration requirements.

(b) Lumber Preparation.

1. Moisture Content. Maintain moisture content for lumber received, at the Laminator's shop/plant, between 12% and 15%.

2. Surfacing Tolerances. Current ANSI/AITC A190.1.

3. End Joints. Current ANSI/AITC A190.1.

(c) Laminating Requirements. Current ANSI/AITC A190.1. Conduct red maple and yellow poplar lamination fabrication according to the general requirements for a 24F-E4 or 24F-E1 southern pine glued laminated timber (refer to AITC 117, Table 1) with special lumber stiffness and edge knot restrictions as follows:

Outer Tension Zone	10% 2.0-1/6 E-rated
Inner Tension Zone	15% 1.8-1/3 E-rated
Core	50% No. 2 VSR (NELMA, NSLB)
Inner Compression Zone	15% 1.8-1/3 E-rated
Outer Compression Zone	10% 2.0-1/3 E-rated

Conduct Northern Red Oak lamination according to the AITC 119 for the fabrication of Combination A glued-laminated timbers.

For applications other than girders no special laminating requirements apply other than minimum No. 2 lumber grade.

Provide hardwood glued laminated timbers at the treatment facility conforming to these requirements with a minimum 12% and maximum 19% moisture content.

Accept only hardwood glued laminated timbers that conform to these requirements. Certify as specified in Section 106.03(b)3.

(d) Surfacing of Laminated Members. Surface according to AITC 110. Provide industrial appearance hardwood glued-laminated members.

(e) Holes and Countersinks for Bolts, Dowels, Rods, Nails, and Screws.

1. Preservative Treatment. Section 1031.3(b)1

2. Location Tolerances. Section 1031.3(b)1 and 1031.3(b)2

3. Temporary Attachments. Section 1031.3(e)

4. Diameter. Size holes for driftpins, machine bolts, rods, and lag screws to allow in-service shrinkage and swelling of the wood. For dowels, drifts, pins and rods, match the hole diameter with the connection shank. For lag screws, refer to National Design Specifications (NDS), NDS Section 9.1.2. For machine bolts, refer to NDS Section 8.1.2 for size.

(f) Shop Assembly. Ensure that all fabricated members assemble together according to the shop and design drawings before shipping components to the job site.

1112.04 TREATMENT—

(a) General. Treat all glued laminated hardwood timber surfaces with an approved oil-borne preservative conforming to AWPAC1.

(b) Treatment Facilities. All treatment facilities must be prequalified by the Department by establishing proof of their competency and efficacy of their treating operation with the LTS.

(c) Creosote Treating Cycle. An empty cell cycle shall be used for creosote treatment of northern red oak, red maple and yellow poplar glued laminated timber bridge members. Provide initial air pressure between 140 kPa and 20 pounds per square inch and 30 pounds per square inch. Creosote solutions shall be introduced into the chamber and pressurized to 150 pounds per square inch to 200 pounds per square inch. The actual pressure will depend upon hardwood species being treated. Treatment temperature shall be between 190F and 210F. Continue treatment pressure and temperature until 12 pounds per cubic foot gauge retention is achieved. Gauge retention is confirmed by assay measurement to ensure a minimum 11.5 pounds per cubic foot creosote retention.

Following the pressure cycle, the pressure shall be released in a slow step down manner over a 1-hour period. An expansion bath during the “slow pressure release” shall be used with an increase in temperature in the treating chamber of 43F following the pressure release. The creosote solution is removed from the cylinder and a minimum vacuum of 11 pounds per square inch shall be applied for 2 hours. At this time the vacuum is released to atmospheric pressure and, if possible, the surface is steamed for 1 hour. A final minimum vacuum of 11 pounds per square inch is applied to the treated members for 2 hours.

This treating cycle will ensure a minimum amount of exudate during the service life of the member. It is the Department's prerogative to accept or reject treated hardwood glued laminated members, after pressure treatment that do not minimize exudate.

(d) Field Treatment. Field treat any preservative treated hardwood according to AWPAC M4.

(e) Finish. Oil-borne preservative treated hardwood glued laminated members do not require a finish or sealer treatment. Do not use treated hardwood glued laminated railings where prolonged exposure to direct human contact is likely without application of a finish sealer.

Provide a two-coat sealer application for finish treatment for treated railings where prolonged exposure is likely. Acceptable sealers include latex epoxy, urethane, shellac, or other finishes that are effective coating agents that adhere to treated rails.

(f) Shipping, Field Storage, and Field Handling.

1. Storage and Handling. Section 1031.3(a)

2. Cuts and Abrasions. Section 1031.3(e)

3. Temporary Attachments. Section 1031.3(e)

SECTION 1113—PLAIN AND LAMINATED NEOPRENE BEARING PADS

1113.01 GENERAL REQUIREMENTS—

(a) **Description.** This work is the fabrication, furnishing, transportation, and delivery of plain and laminated neoprene bearing pads.

(b) **General Requirements.** Furnish bearing pads with the dimensions, material properties, elastomer grades, and laminate types indicated.

(c) **Definition of Terms.**

1. **Unreinforced Bearing Pads.** Elastomeric bearing pads consisting of elastomer only.

2. **Reinforced Bearing Pads.** Elastomeric bearing pads reinforced with steel or fabric laminates.

1113.02 MATERIAL—

(a) **Elastomer.** Furnish virgin Neoprene (polychloroprene) elastomer. Provide low temperature grade 0, 2, 3, 4, or 5 elastomer compound. Elastomer compound grades are defined by the testing requirements in Table A. Substitution of a higher grade of elastomer for a lower one is permissible.

Provide elastomer compound conforming to Table A unless otherwise directed. Interpolate test requirements for any intermediate specified hardness. If the material is specified by its shear modulus, furnish material with a measured shear modulus that is within 15% of the specified value. For the purpose of defining limits for the tests in Table A, supply material with a consistent value of hardness. If the material is specified by its hardness, furnish material with a measured shear modulus that conforms to Table 14.7.5.2-1 of the LRFD Specification. When test specimens are cut from the finished product, the physical properties are allowed to vary from those specified in Table A by 10%. Conduct all material tests at $73\text{F} \pm 4\text{F}$ unless otherwise noted. Conduct shear modulus tests according to Annex A of ASTM D4014.

(b) **Steel Laminates.** Fabricate steel laminates used for reinforcement from rolled mild steel conforming to A 36/A36M, ASTM A1011, or equivalent, unless otherwise directed. Furnish laminates with a minimum nominal thickness of 16 gage. Do not make holes in plates for manufacturing purposes unless indicated.

(c) **Fabric Reinforcement.** Weave fabric reinforcement from 100% glass fibers of “E” type yarn with continuous fibers. Provide a minimum thread count in either direction of ten threads per 25 threads per inch. Furnish fabric having either a crowfoot or an 8 Hardness Satin weave. Ensure each ply of fabric has a minimum breaking strength of 800 pounds per inch in each thread direction. Holes in the fabric are not allowed.

(d) **Bond.** Provide a vulcanized bond between the fabric reinforcement and elastomer with a minimum peel strength of 30 pounds per inch. Supply steel laminated bearing pads that develop a minimum peel strength of 40 pounds per inch. Perform peel strength tests according to ASTM D429, Method B.

1113.03 FABRICATION—

(a) **General.** Ensure that the bearing pads conform to the requirements for flash tolerance, finish, and appearance included in the latest edition of The ARPM Rubber Handbook for Molded, Extruded, Lathe Cut and Cellular Products, MO-1, published by the Association for Rubber Products Manufacturers; RMA F3 AND T.063 for molded bearing pads and RMA F2 for extruded bearing pads.

(b) **Laminated Bearing Pads with Steel Reinforcement.** Cast laminated bearing pads with steel reinforcement as a unit in a mold. Bond and vulcanize bearing pads under heat and pressure. Ensure that the mold finish conforms to standard shop practice. Sand blast and clean the internal steel laminates to remove all surface coatings, rust, mill scale, and dirt before bonding, and ensure that the internal steel laminates are free of sharp edges and burrs. For bearing

pads that are designed to act as a single unit with a given shape factor, manufacture the bearing pads as single units. Repair all cavities left in the edges of the bearing pad from the manufacturing process by in-plant vulcanizing with neoprene material from the same lot as the bearing pad.

(c) Laminated Bearing Pads with Fabric Reinforcement. Vulcanize fabric-reinforced bearing pads in large sheets and cut to size. Perform cutting in such a way to avoid heating the materials and to produce a smooth finish with no separation of the fabric from the elastomer. Furnish at least single ply fabric reinforcement for the top and bottom reinforcement layers and double ply for internal reinforcement layers. Place fabric parallel to the top and bottom surfaces. Ensure that the fabric is free of folds and ripples.

(d) Plain Bearing Pads. Mold, extrude, or vulcanize plain bearing pads in large sheets and cut to size. Ensure that cutting does not heat the material, but produces a smooth finish.

(e) Marking and Certification. Provide the manufacturer's certification that each bearing pad satisfies the requirements of the plans and these Specifications. Provide a certified copy of the material test results. Mark each bearing pad (both reinforced and plain) in indelible ink or flexible paint. Include the orientation, the order number, lot number, bearing identification number, and elastomer type and grade number in the marking. Unless otherwise specified in the contract documents, place the markings on the face that is visible after erection of the bridge.

(f) Testing. Sample the completed bearing pads according to PTM No. 312.

1. Scope. Test materials for elastomeric bearing pads and finished bearing pads according to Table A and as specified below.

TABLE A
Neoprene Quality Control Tests

Property		Test Method	Minimum Requirements		
			Type 50	Type 60	Type 70
Physical Properties	• Hardness (Shore A Durometer)	ASTM D2240	50 ± 5	60 ± 5	70 ± 5
	• Tensile Strength, Min. psi	ASTM D412	2,250	2,250	2,250
	• Ultimate Elongation, min. %		400	350	300
Heat Resistance	• Change in Durometer Hardness, max. points	ASTM D573 70 h @ 212F	15	15	15
	• Change in Tensile Strength, max. %		-15	-15	-15
	• Change in Ultimate Elongation, max. %		-40	-40	-40
Compression Set	• 22 h @ 212 F, max. %	ASTM D395 Method B	35	35	35
Ozone	• 100 pphm Ozone in Air by Volume, 20% Strain 100F ± 2F 100 h	ASTM D1149 Method B, Procedure B1	No Cracks	No Cracks	No Cracks
Low Temperature Brittleness	• Grades 0 & 2	No test required			
	• Grade 3 Tested @ -40F	ASTM D746 Procedure B	No Failure	No Failure	No Failure
	• Grade 4 Tested @ -55F		No Failure	No Failure	No Failure
	• Grade 5 Tested @ -70F		No Failure	No Failure	No Failure
Instantaneous Thermal Stiffening	• Grades 0 & 2 @ -25F • Grade 3 Tested @ -40F • Grade 4 Tested @ -50F • Grade 5 Tested @ -65F	ASTM D1043	Stiffness ⁽¹⁾ at test temperature not to exceed 4 times the stiffness measured at 73F.		
Low Temperature Crystallation	• Grade 0	No test required			
	• Grade 2, 7 days @ 0F				

	<ul style="list-style-type: none"> • Grade 3, 14 days @ -15F • Grade 4, 21 days @ -35F • Grade 5, 28 days @ -35F 	Quad Shear Test as described ⁽²⁾	Stiffness ⁽¹⁾ at test time and temperature not to exceed 4 times the stiffness at 73F with no time delay.
--	---	---	--

(1) Note in Table A that ASTM D1043 refers to “modulus of rigidity”, while ASTM D4014, referenced in the text, refers to “shear modulus stiffness”. The word “stiffness” is used in Table A to cover both terms.

(2) Measure the stiffness with a quad shear rig in an enclosed freezer unit. Take test specimens from a randomly selected bearing pad. Use a 25% strain cycle and apply a complete cycle of strain with a period of 100 seconds. Discard the first 3/4 cycle of strain and determine the stiffness by the slope of the force deflection curve for the next 1/2 cycle of loading.

2. Frequency of Testing. Conduct ambient temperature tests as specified in Section 1113.03(f)3 for each lot of bearing pads. Provide test certificates from the supplier for each lot of steel or fabric reinforcement.

Conduct low temperature tests as specified in Section 1113.03(f)4 for each lot of bearing pads.

Visually inspect every finished bearing pad as specified in Section 1113.03(f)5.

Conduct short-duration compression tests as specified in Section 1113.03(f)6 on every steel reinforced bearing pad.

If required, conduct shear stiffness tests on material from a random sample of the finished bearings as specified in Section 1113.03(f)8.

3. Ambient Temperature Tests on the Elastomer. Use elastomer conforming to Table A for durometer hardness, tensile strength, ultimate elongation, heat resistance, compression set, and ozone resistance. Ensure that the bond to the reinforcement conforms to the requirements specified in Section 1113.02(d).

Test the shear modulus of the material at 73F according to Annex A of ASTM D4014. Ensure that the measured shear modulus is within 15% of the specified value. If no shear modulus is specified, ensure that the hardness falls within the range given in Article 14.7.5.2 and Article 14.7.6.2 of the LRFD Specification. Instead of performing a shear modulus test for each batch of material, the manufacturer may, if permitted, provide certificates from tests performed on identical formulations within the preceding year.

4. Low Temperature Tests on the Elastomer. Conduct low temperature brittleness tests (ASTM D746), instantaneous low temperature stiffness tests (ASTM D1043), and low temperature crystallization tests (ASTM D4014) on grades 3, 4, and 5 elastomers. For grade 3 elastomers, instead of conducting low temperature crystallization tests, the manufacturer may provide certificates from low temperature crystallization tests performed on identical material within the last year, unless the tests are required.

Conduct instantaneous low temperature stiffness tests (ASTM D1043) on grades 0 and 2 elastomers. If required, conduct low temperature brittleness tests (ASTM D746) and low temperature crystallization tests (ASTM D4014) on grades 0 and 2 elastomers.

Perform all tests according to Table A and ensure the compound satisfies all limits for its grade.

5. Visual Inspection of the Finished Bearing Pad. Inspect every finished bearing pad for compliance with dimensional tolerances and for overall quality of manufacture. In steel reinforced bearing pads, protect the edges of the steel everywhere from corrosion.

6. Short-Duration Compression Tests on Bearing Pads. Load the bearing pad in compression to 1.5 times its maximum design load. Hold the load constant for 5 minutes, remove, and reapply for another 5 minutes. Visually examine the bearing pad while under the second loading. If the bulging pattern suggests laminate parallelism or a layer thickness that is outside the specified tolerances, or poor laminate bond, reject the bearing pad. If there are three or more separate surface cracks that are greater than 0.08 inch wide and 0.08 inch deep, reject the bearing pad.

7. Long-Duration Compression Tests on Bearing Pads. Load the bearing pad in compression to 1.5 times its maximum design load for a minimum period of 15 hours. If during the test the load falls below 1.3 times the maximum design load, increase the test duration by the period of time for which the load is below this limit. Visually examine the bearing pad at the end of the test while it is still under load. If the bulging pattern suggests laminate parallelism or a layer thickness that is outside the specified tolerances, or poor laminate bond, reject the bearing pad. If there are three or more separate surface cracks that are greater than 0.08 inch wide and 0.08 inch deep, reject the bearing pad.

8. Shear Modulus Tests on Material from Bearing Pads. Cut a specimen from the finished bearing and test the shear modulus of the material according to Annex A of ASTM D4014, or, if acceptable, conduct a comparable nondestructive stiffness test on a pair of finished bearing pads. Ensure that the measured shear modulus is within 15% of the specified value. If no shear modulus is specified, ensure that the hardness falls within the range given in Article 14.7.5.2 and Article 14.7.6.2 of the LRFD Specification. If the test is conducted on finished bearing pads, compute the material shear modulus from the measured shear stiffness of the bearing pad, taking due account of the influence on shear stiffness of bearing pad geometry and compressive load.

(g) Tolerances. Measure Overall Height and Overall Horizontal Dimensions of bearing pads according to ASTM D3767, modified as follows: Measure dimensions 4 inches or less according to ASTM D3767 Procedure B. Measure dimensions greater than 4 inches according to ASTM D3767 Procedure C. Provide finished bearing pads within the following tolerances:

- Overall Height

Design Thickness 1 1/4 inches or less	+1/8 inch
Design Thickness over 1 1/4 inches	+1/4 inch
- Overall Horizontal Dimensions

3 feet or less	+1/4 inch
Over 3 feet	+1/2 inch
- Thickness of Individual Layers of Elastomer
(Laminated Bearing Pads Only)

At any point within the bearing pads	±20% of design value but no more than ±1/8 inch
--------------------------------------	---
- Parallelism with Opposite Face

Top and bottom	0.005 rad
Sides	0.02 rad
- Position of Exposed Connection Members

Hole, slots or inserts	±1/8 inch
------------------------	-----------
- Edge Cover

Embedded laminates or connection members	+1/8 inch
--	-----------
- Thickness

Top and bottom cover layer (if required)	-0, the smaller of 1/16 inch and +20% of the nominal cover layer thickness
--	--
- Size

Holes, slots, or inserts	±1/8 inch
--------------------------	-----------

(h) Bedding Material for Bridge Shoes. Manufacture material from elastomeric material reinforced with organic fiber as filler material. The fiber may be oriented or random (Type I), or in the form of fabric (single or multiple laminations, Type II). Certify as specified in Section 106.03(b)3. Furnish finished bedding material conforming to the following requirements:

	Type I	Type II
1. Tensile Strength. ASTM D378, Die A, min.	500 psi	1,500 psi
2. Oven Aging. 7 days at 158F, change in actual tensile strength not to exceed	±40%	±40%

- | | | | |
|--|------|-----------|-----------|
| 3. Compressibility. ASTM F36, Procedure H., without high temperature preconditioning | min. | 10% | 0% |
| | max. | 20% | 20% |
| 4. Compressive Strength. 4-inch by 4-inch specimen, compressed to rupture between flat plates | | 5,000 psi | 8,000 psi |
| 5. Water Absorption. 24-hour immersion | max. | 3.5% | 0% |

SECTION 1119—THREE BEAM GUIDE RAIL

1119.01 RAILS—As shown on the Standard Drawings and as follows:

- (a) **Rail Elements.** AASHTO M 180, Class A, Type II; mark to show the approximate radius of curved rails.
- (b) **Transition Section.** AASHTO M 180, Class B, Type II; mark to show the approximate radius of curved rails.

1119.02 TERMINAL SECTIONS—As shown on the Standard Drawings and as follows:

- (a) **Terminal Connector.** AASHTO M 180, Class B, Type II

1119.03 POSTS—As shown on the Standard Drawings and as follows:

- (a) **Steel I-Beam Posts.** ASTM A709, Grade 36/50/50S, ASTM A36, or ASTM A992.
- (b) Galvanize as specified in Section 1105.02(s) (AASHTO M 111).

1119.04 OFFSET BRACKETS—Section 1109.04

1119.05 MISCELLANEOUS MATERIAL—As shown on the Standard Drawings and as follows:

(a) **Nuts, Bolts, and Washers.** Section 1105.02(c)1. Galvanize as specified in Section 1105.02(s) (ASTM A153 or ASTM B695 and B696).

(b) **Miscellaneous Hardware.** ASTM A709, Grade 36.

Galvanize hardware after fabrication, as specified in Section 1105.02(s) (AASHTO M 111). Do not punch, drill, grind, cut, or weld after galvanizing. Repair minor abrasions of galvanized surfaces with two coats of galvanizing paint.

1119.06 GALVANIZING—Galvanize metal parts as specified in Section 1105.02(s) (ASTM A153 unless otherwise specified) and conform to the requirements of AASHTO M 180, Section 9.

1119.07 GALVANIZING PAINT—ASTM A780 Section 4.2.2

1119.08 WELDING MATERIAL—Section 1105.02(t)

1119.09 CERTIFICATION—Section 106.03(b)3

SECTION 1200 INTELLIGENT TRANSPORTATION SYSTEM (ITS) DEVICES

SECTION 1201—ITS DEVICES - GENERAL

1201.1 DESCRIPTION—This work is the furnishing and installing fully functional and operational Intelligent Transportation System (ITS) devices. Provide furnished items to be new and utilize the most current technology. Provide subsystems that minimize the possibility that failure of any one component or module causes total subsystem failure. Failure of one component or module must not damage any other component or module. Provide device subsystems that proceed automatically to full-functional mode at the device location and at the TMC/RTMC or remote control location, without the need for human intervention, if related electrical power supply is turned on or restored.

Comply with the following standards and codes as indicated and where applicable: NEMA, NTCIP, ASTM, IEC, UL, EIA, NEC, and AASHTO. Furnish ITS devices conforming to and compatible with structures contained in Publication 647 and the Standard Drawings.

1201.2 MATERIAL—

(a) Materials Acceptance. Section 106 and as follows.

For all ITS devices submit for approval, at no additional cost to the Department, catalog cuts, drawings, sources of supply, and additional submissions as follows before purchasing equipment.

1. ITS Enclosure. For enclosure heating and cooling subsystems, submit heat-load calculation sheets, accompanied by related manufacturer's data sheets, as support materials for justifying the heating/cooling sizing choices. Use worst-case heat-load data of the energized devices for the calculations. Submit power usage calculations to support power distribution type and size.

2. Uninterrupted Power Supply (UPS). Submit calculation sheets, accompanied by manufacturer's data sheet listing the power requirement of critical components, as support materials for justifying the UPS sizing choices. Use worst-case power-load data for the calculations.

(b) ITS Enclosure. Utilize enclosure for ground-mounted, pole-mounted, or other structurally mounted enclosure installations as shown on the Standard Drawings and as indicated.

House all ITS device electronics in the ITS enclosures according to Publication 647 and as indicated in the contract documents. For pole-mounted and ground-mounted enclosures, provide all material, including mounting equipment, and a concrete pad or elevated pedestal, to meet the requirements contained in Publication 647.

1. NEMA 3R Enclosure. House device electronics in a locking, weather resistant NEMA 3R, UL50E listed aluminum enclosure. Furnish enclosure to provide protection from rain, sleet, snow, dripping water and corrosion. Construct complete enclosure from 0.125 inch thick aluminum alloy type 5052-H32 to provide strong and rigid construction. Provide enclosure with minimal dimensions of height, depth, and width necessary to accommodate all electrical equipment and wiring, plus a minimum additional 20% of excess empty space for future equipment and maintenance access. Adhere to the minimum requirements on clearances around all components and bending radii for all cables as specified by the manufacturers. Utilize weld nuts for mounting all enclosure inner panels.

Provide enclosure seams that are continuous and ground smooth, solid welds made by the Heliarc or stitch welding method. Provide enclosure welds that are neatly formed and free from cracks, blowholes, and other irregularities. Where enclosures are not ground-mounted, provide welded brackets or brackets bolted to the back of the enclosure for enclosure mounting. Where bolted bracket is used, bolt the bracket to an interior reinforcing plate fabricated of the same material as the enclosure. Fabricate mounting plates of a minimum 0.125 inch thick aluminum. Add body stiffeners where required to prevent the enclosures from sagging or bowing.

Equip enclosure with means for locking with pad lock. Furnish door handles which provide for positive latching of the door at three points as viewed if facing the door - top, bottom, and left side. Provide a pin tumbler type lock which serves to secure the door handles, thereby locking the cabinet doors. Provide two door keys with the cabinet.

Coordinate key type with the Representative.

Furnish door hinges and pins of 304 stainless steel conforming to ASTM A276. Provide continuous hinge mechanism along the entire side. Equip door with an adjustable doorstop to hold the door open at the angles of 90 degrees, 135 degrees, and 180 degrees with the front of the enclosure. Provide gasketing on all door openings that is permanently bonded to the metal. Cover mating surface of the gasketing with a silicone lubricant to prevent sticking to the mating surface. Provide bonding on the door and a grounding stud in the enclosure.

Provide shut-offs and panels with identification labels and appropriate warning labels. Place identification nameplate on the outside of the enclosure. Provide nameplate that does not deteriorate over time due to weather. Indelibly identify all devices, components, cables and wires on permanently attached labels for use in the intended environment using labels approved by the Representative, and inscribed according to the approved schematic shop drawing showing the component layout. Label all internal connectors and wire terminations with sufficient information to locate its connection point. Insert a block diagram of all components illustrating all connectors and connections used to interconnect the components, wiring diagrams and schematic drawings of all circuits in a resealable weather-resistant pocket that is permanently mounted on the inside of an accessible door in the controller enclosure. Inscribe the component name and model number using a permanent label or laminated name plate in a position adjacent to the location of each major or replaceable component on the inside of the enclosure.

Provide racks and shelves to mount equipment as needed, including communications, power and UPS equipment. Do not stack equipment on top of other equipment. Equipment may be set on shelves, installed on 19 inch rack rails, or attached to panels mounted to the rear or side walls of the enclosure. Provide a laptop shelf within the enclosure to accommodate for laptops/other devices during commission, testing, and maintenance. For all enclosures utilizing leased-line communications connections, provide for each lease-line connection mounting space for an additional 8 inches wide by 12 inches high by 2 inches thick Channel Service Unit (CSU) or other communication module (supplied by the telephone/cable company). Provide an additional fused or breaker protected, UPS-powered receptacle for related power requirement.

Furnish fluorescent lighting fixture complete with lens or shield and Type T-4 16 Watt fluorescent lamp with rapid start. Provide lighting fixture that activates upon opening enclosure door, and deactivates upon closing enclosure door. Position lamp assembly to provide light to all of the equipment within the enclosure. Shield lamp assembly to prevent light from shining directly in the eyes of servicing personnel.

Provide sufficient shelf space within the enclosures for shelf-mounted equipment. If plans indicate, provide an enclosure with a transparent anti-graffiti coating over the entire outer surface of the enclosure.

Provide the Statewide Device Identification Number on the enclosure so it is visible to maintenance and Department personnel approaching the device. Provide fabricated plaques of aluminum, plastic, or fiberglass of sufficient thickness to provide the necessary stiffness and to resist vandalism, or stencil directly onto the enclosure with weather-resistant paint. Indicate the complete Statewide Device Identification Number with 3 inch high letters with a contrasting color background. Caulking and weather proofing is required if attached by hardware that will penetrate the enclosure.

2. Power Distribution Subsystem. Provide full power distribution subsystem to all electronic components within the enclosure and the related ITS device. Furnish power distribution panel to distribute power to all equipment within the enclosure and ITS devices served by the enclosure. Provide circuit breakers sized to meet or exceed the NEC requirements for the loads supported, with a minimum of 10 A trips. Size the circuit breaker based on the loads of the ITS device(s) utilizing the enclosure. Provide circuit breakers on an electrical panel in a NEMA 1 enclosure, or DIN rail mounted with appropriately rated junction blocks and buses. Provide a power distribution panel that is fed directly by the main circuit breaker at the electrical point of service, or solar installation, where applicable. Provide interface and connection to UPS. Provide connection to grounding system.

If DIN rail components are utilized, provide black, white, and green DIN rail terminal blocks for 120VAC Hot, Neutral, and Ground, respectively. Provide differently colored terminal blocks for low voltage power and signals. Provide end stops, dividers, and appurtenances as required.

Provide a neutral bus of solid metallic strip rigidly mounted on the power panel which is isolated from enclosure ground. Provide all neutral conductors terminated on the neutral bus. Bond the control enclosure, the main disconnect, the power distribution panel, the service ground wire and the branch circuit ground wires to the ground bus. Bond the ground bus to the enclosure grounding system with AWG No. 4 Ground Wire.

3. Wiring and Cabling. Section 1101.08. Provide layout to minimize the flexure of cabling. Where wire is required to flex often, use high strand wire.

4. Heating and Ventilation Subsystem. Provide insulation, thermostat-controlled heating, heat dispersion and

ventilation to maintain internal temperature between 32F and 104F, with all installed components operating continuously at full capacity. Provide for other measures to allow the enclosure and internal component, as a single entity, to operate reliably in the ambient temperature between -40F and 140F, relative humidity between 20% to 95%, non-condensing. Where ventilation fan is used, provide thermostatically controlled enclosure ventilation fan that supplies a minimum airflow of 100 cubic feet per minute. Utilize enclosure openings to ensure continuous air circulation. Position the openings so short circuiting of air circulation is avoided, and the effect of removal of heat from inside the enclosure is maximized. Utilize louvers or other means to limit openings to 1/4 inches or smaller. Screen the fan to prevent the entrance of dust, small animals, and foreign matter. Screen all enclosure openings and vents besides the door opening with a filter that prevents small foreign objects from entering through these openings.

5. Duplex Outlet. Provide one duplex NEMA 5-15R, ground-fault circuit interrupting, GFCI receptacle, with 120 VAC power, for use as a convenience outlet inside the enclosure. Provide two duplex, NEMA 5-15R, receptacles, with 120 VAC power, marked for "Equipment Use Only" inside the enclosure. Ground the outlets through the enclosure grounding system. Furnish UL-listed receptacles.

6. Transient Voltage Surge Suppression (TVSS). Provide transient voltage surge suppressor (TVSS) for each copper cable entering/leaving the cabinet. The AC powerline TVSS is to be UL 1449 Third Edition listed as Type 1 or Type 2. Low voltage and signal circuit TVSS are to be UL 749 listed. TVSS protection is not required for fiber optic cables.

7. Ground Rod. Section 1101.11(j) and as follows:

If the enclosure and a device are mounted on the same support structure, provide a common grounding electrode system for both.

8. Enclosure Foundation. For ground-mounted enclosures.

- Class A Cement Concrete. Section 704
- Caulking Compound. Section 705.8(b)

9. Maintainer Pad. For pole or structure-mounted enclosures.

- Class A Cement Concrete. Section 704.
- Reinforcement Bars. Galvanized or epoxy coated steel wire fabric Section 709.3.
- No. 57 Coarse Aggregate. Section 703.2.

(c) Managed Network Switch. Provide an environmentally hardened managed network switch with a minimum of four (4), RJ45 ports for local connections, in addition to two (2) SFP gigabit transceivers to accept the communication media to the enclosure used for wide area network connection as indicated on the project plans. Configure it to limit the access for viewing, issuing instruction, and performing configuration to authorized users only. Provide cabling and connectors to connect network switch to all electronic devices in the enclosure which require LAN connectivity. Provide a managed network switch that meets the following requirements:

1. Physical Ports:

- 4 Gbps Ports: 4 × 10/100/1000Base-TX, 2 SFP Combo Ports: 2 × 10/100/1000Base-TX/100/1000Base-FX. Serial Console Port: RS-232 in RJ-45 with DB adaptor or console cable.

2. Security Features:

- Enable/disable ports, MAC based port security.
- Port based network access control (802.1x).
- VLAN (802.1Q) to segregate and secure network traffic.
- Radius centralized password management.
- SNMP v1/v2c/v3 encrypted authentication and access security.

3. Ethernet Standards:

- IEEE 802.3 for 10Base-T
- IEEE 802.3u for 100Base-TX and 100Base-FX
- IEEE 802.3z for 1000Base-X
- IEEE 802.3ab for 1000Base-T(X)
- IEEE 802.3x for Flow control
- IEEE 802.3ad for LACP (Link Aggregation Control Protocol)
- IEEE 802.1D for STP (Spanning Tree Protocol)
- IEEE 802.1p for COS (Class of Service)
- IEEE 802.1Q for VLAN Tagging
- IEEE 802.1w for RSTP (Rapid Spanning Tree Protocol)
- IEEE 802.1s for MSTP (Multiple Spanning Tree Protocol)
- IEEE 802.1x for Authentication
- IEEE 802.1AB for LLDP (Link Layer Discovery Protocol)

4. Regulatory Compliance:

- EMI: FCC Part 15, CISPR (EN55022) class A, EN50155 (EN50121-3-2, EN55011, EN50121-4)
- EMS: EN61000-4-2 (ESD), EN61000-4-3 (RS), EN61000-4-4 (EFT), EN61000-4-5 (Surge), EN61000-4-6 (CS), EN61000-4-8, EN61000-4-9, EN61000-4-11
- Shock: IEC60068-2-27, EN61373
- Free Fall: IEC60068-2-32
- Vibration: IEC60068-2-6, EN61373
- Safety: EN60950-1

5. Power:

- Input Power: Redundant +/-12~48VDC on terminal block, one 12 ~ 45VDC on power jack
- Power Consumption 10 Watts (Typ.)
- Overload Current Protection
- Reverse Polarity Protection

6. Mechanical:

- Size: (W × D × H) No larger than 3.00 × 5.00 × 6.00 in.
- Weight: <2.0 lbs.
- Installation DIN Rail and Wall Mount Design

7. Environmental:

- Storage Temperature -40 to 185°F
- Operating Temperature -40 to 167°F
- Operating Humidity 5% to 95% Non-condensing

(d) Power Supply 24 VDC. Provide an industrial grade, field-hardened 24 VDC output power supply to power ITS communications, network management and PSE devices(s). The power supply shall be DIN rail mounted and operate from an input voltage range of 100 VAC -240 VAC with an operating temperature no less than -30F to +167F. The power supply shall be sized to satisfy the amperage requirements for all ITS devices identified in the project plan documents with 20% spare capacity. The power supply shall be individually circuit protected at the Power Distribution Subsystem.

(e) UPS Subsystems. Furnish UPS subsystem inside the enclosure. Provide UPS subsystem that maintains a continuous supply of electric power to connected equipment by supplying power from a battery-backed power source when electric power from the regular source is not available. Furnish UPS of the double-conversion type, where the output to the connected load is only generated from the back-up battery (battery set), and the power from external source is only used to charge the backup battery (battery set). Furnish the battery subsystem to provide backup power

to all critical enclosure equipment, all operating at 100% capacity for minimum 1/2 hour duration. Critical enclosure components, by default, include power modules/subsystems required for operating all communication devices, controllers, low-power radio broadcast of 10 W transmission power or lower, all sensing ITS devices (cameras, vehicle detectors, environmental detectors, etc.).

Provide a true, separately derived power source as defined by NEC Article 250-5d with output neutral bonded to ground. Do not provide direct connection between input and output and less than 2 pF of effective input to output capacitance. Regulate UPS output to within the CBEMA and ANSI C84.1 point of utilization range of 104 to 127 VAC over the full dynamic range from no load to full load, low line VAC to high line VAC, and low battery voltage to high battery voltage.

Provide continuous, no break power during a power outage or momentary interruption. Standby power subsystems which have any measurable transfer time and interruption of the output wave form are unacceptable. Provide computer-grade sine-wave power with 5 percent or less total harmonic distortion capability. Meet or exceed CSA standard 22 Part 2-107 for harmonic distortion. Provide UPS that passes lightning testing standard as per ANSI/IEEE C62.41 category A test (6000 V spike and 3000 A) and C62.45 test procedures. Reduce the input spike to no less than 3 V on the output, for 2000 to 1 spike attenuation. Provide capacity in volt amperes (VA) while loaded with typical computer-grade switch-mode power supplies having a power factor of 0.5 to 0.7 and crest factor of 2.7 to 3.5. Install UPS batteries, or UPS with integral battery at construction.

Provide a UPS with secure monitoring and control via web browser, command line interface or SNMP. Configure the monitoring to notify the TMC/RTMC through the existing ATMS when the UPS is operating on battery power.

(f) IP Controlled Remote Power Switch. Provide a Remote Power Switch that allows the operator to securely monitor, identify abnormal conditions and reboot critical ITS devices. Provide an ethernet controlled remote power switch capable of individually controlling up to eight (8) circuits that meets the following requirements:

- Input Power: 89-135 VAC, 60± 3Hz.
- Rated Current: 12A.
- Overload Current Protection: 15A.
- Outlet Switching: minimum of six (6) switched circuits on individual 5-15R receptacles.
- Internal Surge Protection.
- Operating Temperature: -30° to 170°F.
- Ethernet Interface: RJ-45 10/100 Base-T.
- Software Controls: Individual outlets on/off, all on/off, network settings, Web UI
- Panel mount or rack mount options
- Compliance: UL/CSA/FCC

(g) High PoE (Power over Ethernet) Midspan Injector. Provide a High PoE, midspan injector for each camera in the CCTV, DMS or Wireless Radio ITS enclosure, or as indicated on the design drawings. The midspan injector shall be industrial grade, field-hardened for long-term freeway deployment meeting the following requirements:

- Basic Function: PSE (Power Sourcing Equipment) Midspan, compliant with IEEE 802.3af, 802.3at
- Extended supply voltage range of 18 VDC to 57 VDC or 100-240 VAC.
- Output Nominal Voltage: 54 VDC (PoE).
- Output Power: Sized as required by the powered device (PD), 60W-90W typical.
- Serial Transmission Speed: 10/100/1000 Mbps.
- Pin Assignment: 1:1.
- Transmission Length: 100 m.
- Input Interface: Ethernet, RJ45.
- Output Interface: Ethernet, RJ45.
- Connection Method: CAT5e
- Circuit Protection: Reverse Polarity Protection
- Operating temperature range no less than -30F to +167F.
- DIN rail mounted

(h) Electrical Service. Furnish all conduit, elbows and expansion fittings, wire, connections, wooden poles, service disconnects, and related equipment to establish electrical service at the ITS device location according to Publication

647. Include all materials necessary to establish electrical connection between the device location, the device enclosure, and the electrical point of service.

1. Electrical Cable. Section 1101.08

2. Conduit. Section 1101.09

3. Junction Boxes. Section 1101.10

4. Power Supply. Section 1101.11

(i) Documentation. Provide documentation pertaining to each ITS device subsystem. At a minimum provide one hard copy and one electronic copy of the operations manuals for each device and all its subsystems to the TMC/RTMC Representative. Submit an electronic and a hard copy of the wiring diagrams that display the connections between each of the subsystems. Coordinate with the Representative for relevant existing system information and desired formatting for the diagrams. At a minimum, provide the following diagrams:

- **Communications Subsystem.** Provide a comprehensive network architecture drawing documenting all subsystems and components, including port assignments and IP addresses, device model numbers and serial numbers, and network path to the TMC details. Provide detailed fiber optic cable documentation requirements, such as strand assignments, spare strands, splicing details, ODTR results, etc.
- **TMC/RTMC.** Including connections to and from the TMC/RTMC, ITS devices, network servers, and other related communications equipment. Include all new physical connections established within the TMC, including to and from existing or new work stations.
- **ITS Enclosure.** Provide three copies of the enclosure wiring diagram for each ITS enclosure assembly. Place a clear protective envelope in the controller assembly cabinet that contains one copy of the manufacturer's instruction manual for each component contained in the enclosure.
- **As-Built Drawings and Details.** Prepare As-Built drawings according to Publication 10, Design Manual, Parts 1 and 1A. Submit As-built Plans at the completion of the 60-Day Test. The 60-Day Test will not end until the As-Built drawings have been submitted and approved. Submit As-Built drawings for all device locations, electrical, communications details and structures. Provide As-Built plans and details formatted for 22" x 34" paper size in PDF format. Include all As-Built plans, wiring diagrams, installation plans, cabinet diagrams. As-built documentation is also required to include GPS coordinates for all ITS and communications equipment locations. Provide one complete set of As-Built drawings on 11" x 17" paper. Provide one set of As-Built drawings on 11" x 17" paper inside each ITS enclosure.

(j) Certification. Section 106.03(b)3 and as follows: Certify all structural attachments satisfy the Department's criteria and are adequate to support the loads indicated. As required by the Representative, this certification may include the signature and seal of a Professional Engineer registered in Pennsylvania. Certify the structural adequacy of all sign and device mounting brackets.

1201.3 CONSTRUCTION—As shown on the Standard Drawings, as indicated, and as follows:

(a) ITS Enclosure. Install an ITS enclosure to house ITS device communication, power and other related equipment necessary for the operation of field ITS devices. Provide enclosure at each device location, and as directed in the contract documents. Determine ITS enclosure mounting location and type per recommendations provided in Publication 646.

1. Component Mounting. Fasten all internal components securely to the enclosure using explicit mechanical means such as clamps, bolt/nut sets and screws.

2. Enclosure Height. According to Publication 647 and as follows: For mounting on vertical support structure, unless otherwise specified, where practical, install the enclosure with related center line at a nominal height of 42

inches above adjacent finished grade/floor. For ground-mounted enclosure installation, apply Ultraviolet (UV)-resistant caulking material along the joints with the enclosure. For mounting under a camera lowering system, position the enclosure away from the space directly below the camera.

3. Enclosure Openings. Include sealing lock nuts on each side of the enclosure wall on all penetration arrangements through the enclosure walls to prevent ingress of water. Use a bushing on the end of the conduit inside the enclosures to prevent chaffing of the cables. Seal all penetrations to the enclosure with rubber silicone sealant to impede entry of water.

After installing all related cables, seal all conduits connected to the enclosure, including all spare conduits, with self-expanding insulation foam, electrical putty or an approved sealant as recommended by the cable manufacturer, and in a manner that does not damage the cable, to a depth of minimum 4 inches. Provide measures to protect cables from all sharp edges at the end of the conduits. Insert steel wool before the sealant, to prevent rodent infestation.

4. Wiring. Neatly bundle and label all wires/cables within the enclosure.

Terminate ground wire from all electric devices, including surge suppressors, directly to the dedicated grounding terminal in the enclosure. Provide a maximum separation possible between signal wiring and power wiring or control wiring, to avoid inductive pickup. The minimum separation between the signal wiring and power wiring or control wiring is 12 inches. If power wiring has to cross the signal wiring, orient crossing as close to a right angle as possible.

5. Grounding. Section 910.3(q) and according to Publication 647.

6. TVSS. Segregate TVSS devices by type and position the TVSS devices as close as practical to the main termination point for grounding.

7. Enclosure Foundation. For pad mounted enclosures, construct the foundation according to Publication 647 and as specified in Sections 951.3(a) and (b).

8. Maintainer Pad. Provide a ground-level, concrete maintainer pad in front of each enclosure door and in front of the hand hole that provides a solid, leveled standing platform in front of the enclosure opening. Furnish a pad with sufficient space for maintenance personnel to stand and perform maintenance at the enclosure. Provide pad according to Publication 647. The size of the maintainer pad may be reduced in tight geometric areas and on steep slopes as determined by the Department.

9. UPS Subsystem. Install UPS and all required batteries into the ITS Enclosure or separate UPS cabinet as specified in contract documents. Ensure all electrical connections are terminated according to the manufacturers specifications.

(b) ITS Device Testing. Complete all testing for the following ITS devices: CCTV, HAR Subsystem, DMS, and Vehicle Detector Subsystem. Testing of the related ITS subsystems may involve additional ITS-related items, including, but not limited to, ITS Communications, Portable DMS, and ITS Enclosure.

Testing procedures described in this Section are intended to test each subsystem element to make certain that the elements are properly integrated to achieve a fully functioning subsystem. Make provisions for up to two Department personnel or their representatives to attend all tests and demonstrations. Conduct the following tests, in the order indicated, on each ITS device and device subsystem:

- Factory Demonstration Tests (documented factory testing may be used instead of having personnel on site for this at the discretion of the Representative)
- On-Site Standalone Tests
- System Tests
- 60-Day Testing
- 180-Day Operational Support Period
- Warranty Period (the length of the manufacturer's standard warranty at the end of the 60-Day Test)

The acceptance of each stage of testing does not imply testing is complete at that stage. If problems are found at a later date or stage of testing, it may be necessary to return to an earlier stage of testing after repairs have been made to the system. If at a later stage of testing, a piece of equipment is replaced, repaired, or significantly modified, retest to the level necessary to isolate any problem and establish a course of action to remedy the situation.

Provide test documentation, including at a minimum, test procedures, checklist, test forms, and data summary sheets for each item. Tailor test documentation for each item being tested. Submit testing documentation before testing for the Representative's acceptance. After test documentation is approved, provide the Representative with advance notice, as specified for each test, so the Representative can observe each test.

Failure to conform to the indicated requirements of all tests will be considered defective and equipment will be subject to rejection by the Representative. In the event a defect is determined, identify whether it is limited to a specific unit or could be potential problems in all such units. Equipment rejected because of problems limited to the specific unit may be offered again for retest provided all issues of non-compliance have been corrected and re-tested, and evidence is submitted to the Representative.

In the event equipment malfunctions during the test period, the Representative may declare a subsystem defect and require replacement of all equipment at no additional cost to the Department. If a subsystem defect is declared, restart the test for that specific subsystem. Begin the test period when all similar equipment is replaced and retest has been successfully completed.

If a unit has been modified as a result of the equipment replacement, prepare a report and deliver it to the Representative for acceptance. Describe in the report the nature of the failure and the corrective action taken. If a failure pattern, as defined by the Representative, develops, the Representative may direct design and construction modifications be made to all similar units without additional cost to the Department. In the case of problems common to many units, modify all units without additional cost to the Department.

1. General. Test the equipment according to approved test procedures only. Record test results on data summary sheets for each piece of equipment tested. Provide certification of test results by a qualified Representative. Submit all test records, including photocopied duplicates, as required, to the Representative, within one day of the test.

Complete testing for each equipment unit in as few consecutive days as possible as determined by the Representative. Schedule testing with additional time allotted for the Representative to request certain portions of a test be repeated. The Representative has the right to witness or assign their designee to witness all tests.

At a minimum, all testing procedures must be signed by the following: The Representative, or the Representative's designee, and the Contractor's designee. The acceptance of test procedures and witness of such tests does not relieve the responsibility to provide a completely acceptable and operating subsystem that meets the indicated requirements.

2. Factory Demonstration Test. Conduct factory demonstration tests at manufacturer's facility or a remote site location, identified in the project documents, before shipping the equipment, to verify each subsystem meets the contract requirements. If required by the Representative, provide personnel to observe the factory demonstration test in person before shipping the equipment. Include NTCIP testing as part of factory demonstration test. Utilize testing procedures to validate the latest version of NTCIP requirements. Prepare factory demonstration test documentation. Conduct factory demonstration tests at the manufacturer's facility for every ITS device provided for this project.

3. On-Site Standalone Tests. Conduct on-site standalone tests at each field location to verify each individual field device satisfies the indicated requirements. Conduct these tests before interconnection to the TMC/RTMC.

Following the installation of equipment in the field, conduct field tests on each piece of equipment, at each installation site to verify components, modules or subsystem of equipment operate properly in their intended application to the extent possible before connection to the TMC/RTMC and to other devices. Provide the required testing equipment, including a portable computer, and test software to perform local subsystem operations and diagnostic test procedures.

Submit test procedures, checklist, and summary sheets for the Representative's acceptance before performing tests. Provide Representative with a testing schedule indicating the date, time, and location of each test. Provide at least 5 working days' notice before all tests so the Representative can observe each test. At a minimum submit the following testing data:

3.a Telecommunication Utility Coordination: Coordinate with the Utility provider(s) and the Department IT staff to setup new communication services at each proposed ITS site. Communications include Private IP (PIP) network and Frame Relay (MPLS). All communications are to be IP addressable and compliant with all applicable NTCIP standards. Configuration will allow the Department IT personnel to monitor the ITS sites simultaneously.

- T1 Line, Multiprotocol Label Switching (MPLS) Connections: Connections from the District facilities to the PIP network will be procured by the District IT staff. The contractor must supply GPS coordinates and a 911 address for each location.

Install, connect and configure equipment in ITS enclosures or node cabinets if applicable, and the RTMC as indicated on the Intelligent Transportation System Plans. Install MPLS equipment according to the manufacturer's recommendations. Coordinate with PennDOT IT Department and follow the Department's policies concerning but not limited to; IP addressing schemes, management and security policies, etc.

Depending upon project specific requirements Telecommunication Utility Coordination and testing may include:

- Cellular: Verizon Wireless Cellular activations will be done by the District IT staff. Supply GPS coordinates and a 911 address for each location.

Coordinate with the Department for installation of the existing SIM card and existing cellular provider to provide service to the proposed Cellular modem. Orient antenna to achieve the best signal possible. This may require multiple attempts. Once connectivity has been established coordinate with the Department IT staff for the integration of the ITS Communications subsystem into the existing RTMC and test accordingly.

3.b ITS Communications Device Testing: test all telemetry equipment under normal operating conditions. The intent of this test is to demonstrate and certify the operational interaction of the ITS WAN/LAN via/through the wired and wireless telemetry equipment. Testing shall include, but not be limited to:

Installation Tests:

- Verify new Radio Telemetry Equipment is located and installed according to the design drawings.
- Verify new Radio Antenna Equipment is located and installed according to the design drawings.

Electrical Tests:

- Verify the Telemetry Equipment is provided with adequate and stable power and is functional according to the design drawings.
- Verify all the wiring connections to the Telemetry Equipment are secure (including power, data and if applicable, RF).

Functionality Tests:

- Verify there is a clear transmission path between the Master and each Remote Telemetry Equipment.
- Verify the Telemetry Equipment has been programmed properly (including the correct IP addresses).
- Verify all remote radios have a Received Signal Strength Indication (RSSI) of -80 dBm or better (less negative).
- Verify all telemetry antennas operate with a Standing Wave Ratio (SWR) of less than 2:1.

If a device fails to meet the requirements specified, rectify the device as required and repeat the tests until successful at no additional cost to the Department. If a subsystem component has been modified as a result of the test failure, prepare a detailed report on the modifications to subsystem or software and submit it to the Representative. Describe in the report the nature of the failure and corrective action(s) taken.

4. System Tests. Conduct system tests from the TMC/RTMC and field locations, as required, to verify the overall subsystem meets the indicated requirements. Conduct system tests following completion and acceptance of all on-site standalone tests.

Provide at least 10 working days' notice before all tests so the Representative can observe each test. Where central control software, hardware and network switches exist, utilize the existing equipment and control software to manage and control the ITS devices. Exercise all functions for the device subsystems to test control and monitoring functions of the devices remotely. Where new software, switching systems, or hardware are installed in the project, utilize this new equipment to test control and monitoring functions of the devices remotely.

Demonstrate the communications subsystem is fully functional. In the event of test failure, perform a partial or total re-test to demonstrate the subsystem is functioning as a whole.

Conduct system tests on all subsystems and components that are being furnished under this contract. Conduct tests from the TMC/RTMC as indicated, exercising functional and interface requirements as required.

5. 60-Day Test. Conduct a continuous, 24 hour operating test for no less than 60 consecutive calendar days, beginning the day after the subsystem completes the system tests and is accepted. Conduct the 60-day test simultaneously for each subsystem installed in this project (for example, CCTV, DMS, and HAR subsystems). Provide operational and maintenance support for all installed equipment including troubleshooting and diagnostics in the event a malfunction occurs.

In the case where equipment malfunctions during the 60-day test period, the Representative may declare a subsystem defect. Correct failures during the test period by repairing or replacing malfunctioning parts or equipment or faulty work, regardless of the cause, in less than 24 hours. Restart at day 1 of the 60-day test for that specific subsystem. The 60-day test period is to begin when all similar equipment is replaced and a system retest has been successfully completed.

If over 10% of subsystems fail their 60-day test period, that is considered a large failure of the system, and the 60-day test will be restarted for all subsystems following replacement of the malfunctioning parts or equipment or faulty work. If less than 10% of the subsystems fail their 60-day test period, that is considered a small failure, and only the subsystem test needs to be restarted.

Make available a systems technician who is fully knowledgeable and capable of operating all functions of the specified subsystem for technical support during the 60-day test period. Provide this systems technician on-site from 8:00 A.M. to 5:00 P.M. on the first day of the 60-day test and on-call basis thereafter. The systems technician must specialize in communications. Provide technician having a minimum of 5 years' experience in the installation, testing, troubleshooting, and fine tuning of communication subsystems. Submit the systems technician qualifications for acceptance at least 20 working days before the start of the 60-day test.

Notification of a malfunction will be provided by the Department personnel immediately following the occurrence of the equipment malfunction. Receipt of notification is defined as when the systems technician or the answering service receives the call. Maintain records of stoppages and resumptions of the 60-day test. Verify against the records maintained by the Representative for accuracy. Submit documentation for all activities performed during this support period.

Provide complete operations support as required during the 60-day test period to the Department personnel, who will be using the subsystem and performing operational tests on the complete subsystem on a day-to-day basis. The means of communications during this test period will be through a local telephone number or an answering service. Provide at least one local telephone number at which the contractor can be reached. Provide a response to each call within an hour of the call being placed. Provide a turnaround time of 8 hours for each call.

If one of the subsystems fails during the 60-day test, the completion of the test for the other subsystems will not be delayed. During the testing period, provide Department personnel training, in order to operate all normal functions of the subsystem.

After the completion of 60-day test, conduct complete subsystem diagnostics for field and TMC/RTMC equipment as follows: Equipment testing and adjustment of settings and parameters; Check component operations with respect to these specifications.

Following the completion of 60-day test, clear the inside of all ITS enclosures using brushes and vacuums, as appropriate, perform component cleaning and filter replacements at all enclosures installed in the project. During the 60-day test, power and communication costs associated with maintaining the operation of the ITS devices will be the responsibility of the Contractor. Ownership of the subsystem will be transferred to the Department upon successful completion of the 60-day test.

6. 90-Day Operational Support Period. Conduct a 90-day operational support period. Furnish a detailed operational support plan covering preventive and remedial maintenance of all equipment. Furnish all necessary labor,

materials, equipment, tools, transportation, supplies, maintenance and protection of traffic, and incidental items. The plan must include qualifications of the personnel assigned by the Contractor for each activity included. The plan must be approved by the Representative before the completion of the 60-day test. The Representative's review period will not exceed 21 calendar days from receipt of the operational plan.

Provide operational support for a period of 90 days. The operational support period will start on the calendar day after the 60-day test is completed. The Department will operate and own the subsystem during this period.

If adjustments are made to software, wiring, or equipment settings during the operational support period, provide this upgraded software at no additional cost to the Department. If adjustments are made to wiring or equipment settings during the operational support period, reflect the adjustments in the documentation.

Coordinate with the Department's Traffic and Maintenance Units for all field activities. Except for emergency service requested by the Department or if responding to a malfunction repair request by PennDOT, notify the Department 7 calendar days before scheduling activities. Furnish maintenance and protection of traffic plans as required by the Representative.

Conduct preventative and remedial maintenance activities during the 90-day operational support period.

6.a Preventive Maintenance. As specified in Section 1206.3(a), Section 1216.3(a), Section 1217.3(a), Section 1226.3(a), Section 1236.3(a), Section 1237.3(a), and Section 1246.3(a).

6.b On-call Maintenance. As specified in Section 1206.3(b), Section 1216.3(b), Section 1217.3(b), Section 1226.3(b), Section 1236.3(b), Section 1237.3(b), and Section 1246.3(b).

7. Warranty Period. Provide a manufacturer's warranty for each ITS device, component, subsystem, hardware, software and piece of equipment furnished in the project. Provide manufacturer warranties of durations equivalent to industry standards. Provide warranties of a one-year minimum duration. Manufacturer warranties in excess of one year will remain in full force and effect throughout the entire manufacturer's warranty period. The warranty period for all individual devices will begin upon conclusion and acceptance of the 60-day operational test.

Provide a warranty that will enable the full replacement of a piece of equipment in the event of equipment failure, at no additional cost to the Department.

8. ITS Grounding Testing. Section 910.3(q).

9. Camera Lowering Device (CLD) Testing. Standalone testing is required for all CLD systems. At a minimum, the CLD must meet the following criteria:

- Raise or lower the camera within 2 minutes if utilizing the motorized drill component of the lowering device.
- Lock and unlock the camera into position at the top of the structure at least 2 times to demonstrate functionality of the locking mechanism. Verify the camera fully re-starts without manual initiation.

(c) ITS Device Integration. Integrate ITS equipment into the existing ITS system at the related TMC/RTMC or remote control location as indicated or directed by the Representative. Provide ATMS integration as specified in Section 1202. Provide all connectors, cables, software configuration and labor necessary to furnish a fully functional ITS device subsystem. This includes all work, cable, data connections, and installation that allows for data transmission and control from the TMC/RTMC. Coordinate with the Representative to obtain all relevant network information to configure the devices to successfully operate. Work scheduled for the RTMC will only be scheduled during normal working hours, subject to approval by the TMC/RTMC manager or designee. Normal working hours for the RTMC are Monday through Friday, 7:30AM to 3:30PM.

Integrate to ensure additional device capabilities as follows:

Install all cables and connections to enable bi-directional pan-tilt-zoom control to the TMC/RTMC and other locations as specified in contract documents. Perform all coordination and work with PennDOT's IT Bureau of Infrastructure and Operations (BIO) to enable the CCTV feeds to be available through PennDOT's 511 System, existing video management system software and any other systems deemed appropriate by the Department. Provide the necessary device information and coordinate with District and District IT staff in contacting BIO for system testing and integration into PennDOT's 511 System and other systems.

1. Vehicle Detector. Integrate the detector subsystems into the existing Transportation Sensor System (TSS) in the TMC/RTMC ATMS software using the related Field-to-Center (F2C) communications subsystem as indicated.

(d) ITS Device Training. Provide device training to Department personnel as identified by the Representative. Submit training plan for approval. At a minimum, provide training for the maintenance of the installed devices. If a standard device is integrated into ATMS or a currently used make/model device is provided, operational training is not required. Train personnel to use all major functionalities of the subsystem, including device maintenance procedures, before the beginning of the 60-day test. Provide training manuals and handouts for future reference. Training includes a minimum of 1 personnel present at the TMC/RTMC or control facility for a minimum of 8 hours per subsystem, unless otherwise specified.

(e) Electrical Service. Section 910.3 and as follows: Install all conduit, service poles, conduit, junction boxes and related equipment to establish electrical service for the ITS device. Where electrical and communications service are collocated at the electrical point of service, install complete, separate communications connection between the communications point of service, the device enclosure and the ITS device. Establish connection independent of power connection. Utilize separate conduit and junction boxes for all underground connections.

- 1. Trench and Backfill.** Section 910.3(c)
- 2. RGS and PVC Conduit.** Section 910.3(g)
- 3. Cable Installation.** Section 910.3(h)
- 4. Power Supply System.** Section 910.3(s)
- 5. Power Supply Service Pole.** Section 910.3(k)
- 6. Junction Box (power and communications).** Section 910.3(p)

1201.4 MEASUREMENT AND PAYMENT—

(a) ITS Enclosure. Each

Includes all cables, connectors, mounting, mounting hardware, heating ventilation subsystem, TVSS, managed network switch, UPS, equipment, racks, maintainer pad, grounding rod and conductor, installation, documentation, and configuration.

(b) ITS Testing. Lump Sum

- **Factory Demonstration Test.**
- **On-Site Standalone Test.**
- **System Test.**
- **60-Day Test.**
- **180 Day Support Period.**
Includes all maintenance, repairs, on-call responses, and documentation.
- **Warranty Period.**

(c) UPS Subsystem. Each

Includes UPS Controller, all necessary batteries, and enclosure (if specified) as well as all cabling to ensure a fully functional Supply.

(d) **Electrical Service.** As follows:

- **Trench and Backfill.** Section 910.4(n)
- **Rigid Galvanized Steel (RGS) and PVC Conduit.** Section 910.4(k)
- **Cable Installation.** Section 910.4(m)
- **Complete Power Supply System.** Section 910.4(o)
- **Junction Box (power and communications).** Section 910.4(a)

SECTION 1202—ATMS ITS DEVICE INTEGRATION

1202.1 DESCRIPTION—This work is the coordination and documentation activities required to facilitate integration of ITS Devices into the Advanced Traffic Management System (ATMS) and to furnish information regarding the characteristics of all relevant ITS devices installed within the project. The ATMS is the common platform used by the Department to monitor, control and utilize all functionalities of ITS devices installed within the Commonwealth.

Work to integrate the ITS device(s) must be a collaborative effort between the Contractor responsible for installation of the ITS device(s) and the ITS Integrator. The ITS Integrator, at no cost to the Contractor, will be responsible for performing the work to integrate the ITS device(s) into the ATMS. The Contractor is responsible for furnishing all information pertaining to the ITS device(s) relevant to integration, as described herein, and as required by the ITS Integrator.

1202.2 MATERIAL—

(a) Protocol Documentation. Furnish protocol documentation for all communication protocols used by the ITS device(s).

(b) Integration Kit. Furnish integration kit (SDK, API, Software), if applicable, that the ATMS vendor will need to integrate device(s). Furnish documentation for integration kit.

(c) Licenses. Furnish licenses, if applicable, to support the integration of the device(s) by the ATMS.

(d) ITS Device Configuration Information. Furnish all information required herein for the respective device(s) being installed. Information must be provided for each device being installed as part of the ITS project. Omission of any information required for integration will be considered incomplete. If information is incomplete at the time of integration activities as identified by the project schedule or plan, it will be considered a delay of the project.

All information must be provided in the format described herein, or as directed by the Representative. Provide information in matrices in Microsoft Excel or comparable format, subject to approval by the Representative. Furnish one matrix per type of device being installed as part of the project.

Transmit information to the Department through the Representative via electronic communications such as email, CD-ROM, or as directed by the Representative.

(e) Device Vendor Point of Contact. Furnish point of contact for each device vendor.

1202.3 CONSTRUCTION—

(a) General. Before the integration activities identified in the project schedule or plan, furnish the information contained herein to ensure the successful integration of the ITS device(s). A template matrix identifying the integration information fields may be available from the Representative. This information is required to be provided to the ITS Integrator as soon as it is available. Systems Acceptance Testing will not commence until all information contained herein has been provided. Failure to provide the information required herein will be considered a delay to the project and be subject to liquidated damages.

(b) ITS Devices. Supply all information as indicated. If information is not readily available, it is the Contractor's responsibility to seek out and obtain the missing information, including performing all necessary coordination with the device(s) manufacturer(s), and performing coordination with the Representative. For fields not applicable to the project, clearly indicate within the matrix the particular cell is not applicable by filling the field with the text "N/A." Provide all latitude and longitude information with accuracy to the nearest 5 feet.

1. CCTV Cameras. Furnish the following information:

Location Information	General Characteristics	Communications
Statewide Device ID	Manufacturer	PTZ Communication Type
Type (permanent vs. portable)	Model	Camera Address
District (Location)	Serial Number/ Manufacturer ID	PTZ Communications Protocol
District (Owner)	Power Type	PTZ Connection Type
Descriptive Location	Encoder Manufacturer (where applicable)	PTZ Connection Parameters (Serial Only)
Roadway		
Roadway Direction		Camera Firmware
Mile Marker (where applicable)		PTZ IP Address
State Route Number		PTZ IP Port Name
Latitude		NTCIP Protocols Supported
Longitude		NTCIP Community String (if NTCIP)
Exit Number (nearest)		Multicast or Unicast
County		Username/ Password (where applicable)
		Video Format
		Video Transport

2. DMS. Furnish the following information:

Location Information	General Characteristics	Communications
Statewide Device ID	Manufacturer	Communication Type
Type (permanent vs. portable vs. semi-permanent)	Model	Communications Protocol (include version if applicable)
Structure Type	Serial Number/ Manufacturer ID	Connection Type
District (Location)	Power Type	Connection Parameters (Serial Only)
District (Owner)	Number of Display Lines	Controller Address
Descriptive Location	Matrix Type (line or full)	Controller Firmware
Roadway	Number of Pages Possible	IP Address
Roadway Direction	Sign Height (by number of pixels)	IP Port Name
Mile Marker (where applicable)	Sign Width (by number of pixels)	NTCIP Protocols Supported
Next Downstream Exit Number	For all available Fonts: <ul style="list-style-type: none"> • Font Dimensions • Font Height • Font Width • Font Character Spacing • Font Line Spacing 	NTCIP Community String (if NTCIP protocol)
State Route Number		Phone Number (if Dialup Communications)
Latitude		
Longitude		
Exit Number (nearest)		
County		

3. HAR Transmitter. Furnish the following information:

Location Information	General Characteristics	Communications
Statewide Device ID	Manufacturer	Communication Type
Type (permanent vs. portable vs. semi-permanent)	Model	Communications Protocol (include version)
District (Location)	Serial Number/ Manufacturer ID	Connection Type
District (Owner)	Power Type	Connection Parameters (Serial Only)
Descriptive Location	Broadcast Radius	Controller Address
Roadway	Vendor Control Software - Type and Version	Controller Firmware
Roadway Direction		IP Address
Mile Marker (where applicable)		IP Port Name
Exit Number (nearest)		NTCIP Protocols Supported
County		NTCIP Community String (if NTCIP)
State Route Number		Phone Number (if Dialup)
Latitude		
Longitude		

4. HAR Beacon. Furnish the following information:

Location Information	General Characteristics	Communications
Statewide Device ID	Manufacturer	Communication Type
Type (permanent vs. portable vs. semi-permanent)	Model	Communications Protocol (include version)
District (Location)	Serial Number/ Manufacturer ID	Connection Type
District (Owner)	Power Type	Connection Parameters (Serial Only)
Descriptive Location	Associated HAR Transmitter Statewide ID	Controller Address
Roadway		Controller Firmware
Roadway Direction		IP Address
Mile Marker (where applicable)		IP Port Name
Exit Number (nearest)		NTCIP Protocols Supported
County		NTCIP Community String (if NTCIP)
State Route Number		Phone Number (if Dialup)
Latitude		On Code (where applicable)
Longitude		Off Code (where applicable)

5. Vehicle Detectors. Furnish the following information for the respective detector types:

5.a Microwave/Radar Detectors, Inductive Loops, and Video Detection units.

Location Information	General Characteristics	Communications
Statewide Device ID	Detector Type	Communication Type
Type (permanent vs. portable vs. semi-permanent)	Manufacturer	Communications Protocol (include version)
District (Location)	Model	Connection Type
District (Owner)	Serial Number/ Manufacturer ID	Connection Parameters (Serial Only)
Roadway		
Descriptive Location	Power Type	Controller Address
Roadway Direction	Vehicle Classification Capable and # of classification bins to be configured and value	Controller Firmware
Mile Marker (where applicable)	Number of Zones/Lanes	IP Address
Exit Number (nearest)	For each Zone/Lane: <ul style="list-style-type: none"> • Lane Number • Lane Type • Direction 	IP Port Name
County		NTCIP Protocols Supported
State Route Number		NTCIP Community String (if NTCIP)
Latitude		Phone Number (if Dialup)
Longitude		

5.b RFID Tag Readers. Applicable only for IAG/Mark 4 manufactured RFID tag readers based upon the E-ZPass electronic toll collection system.

Location Information	General Characteristics	Communications
Statewide Device ID	Detector Type	Communication Type
Type (permanent vs. portable vs. semi-permanent)	Manufacturer	Communications Protocol (include version)
District (Location)	Model	Connection Type
District (Owner)	Serial Number/ Manufacturer ID	Connection Parameters (Serial Only)
Descriptive Location	Power Type	Controller Address
Roadway		Controller Firmware
Roadway Direction		IP Address
Mile Marker (where applicable)		IP Port Name
Exit Number (nearest)		NTCIP Protocols Supported
County		NTCIP Community String (where applicable)
State Route Number		
Latitude		
Longitude		

5.c Bluetooth Readers.

Location Information	General Characteristics	Communications
Statewide Device ID	Detector Type	Communication Type
Type (permanent vs. portable vs. semi-permanent)	Manufacturer	Communications Protocol (include version)
District (Location)	Model	Connection Type
District (Owner)	Serial Number/ Manufacturer ID	Connection Parameters (Serial Only)
Roadway	Power Type	Controller Address
Descriptive Location		Controller Firmware
Roadway Direction		IP Address
Mile Marker (where applicable)		IP Port Name
Exit Number (nearest)		NTCIP Protocols Supported
County		NTCIP Community String (where applicable)
State Route Number		
Latitude		
Longitude		

6. NETWORK Switch. Furnish the following information:

Location Information	General Characteristics	Communications
Statewide Device ID	Manufacturer	WAN Communication Type
Type (permanent vs. portable vs. semi-permanent)	Model	LAN Communication Type
Enclosure ID	Serial Number/ Manufacturer ID	MAC Address
District (Location)	Port Types	Firmware Version
District (Owner)	Port Quantity	Default Gateway
Descriptive Location	Power Type	IP Address
Roadway		IP Port Names
Roadway Direction	.	Time Configuration
Mile Marker (where applicable)		Discovery Protocol
Next Downstream Exit Number		Logging Protocol
State Route Number		
Latitude		
Longitude		
Exit Number (nearest)		
County		

(c) Testing. Section 1201.3(b) and as follows:

1. General. Conduct the System Tests in conjunction with the ITS Integrator. Coordinate with the ITS Integrator to ensure the ITS device(s) installed within the project is(are) integrated into Next Gen ATMS. Furnish all information prescribed herein in addition to all additional information required by the ITS Integrator to perform the integration. The System Test will be considered complete upon completion of the following two tests:

2. System Test. Complete comprehensive test of the subsystem to demonstrate full functionality of the ITS device(s) and subsystem, and compliance with the project specifications. Conduct the test using vendor-provided device control software or other equivalent software installed on a Commonwealth-provided computer or workstation in the TMC with access to the ATMS and the PennDOT WAN. Demonstrate full functionality of the

subsystem including all components, such as the workstation and all communications to and from the field. The Contractor is responsible for demonstrating full compliance with project documents, and full functionality of the ITS device and subsystem from the TMC to the field.

Coordinate with the Department Integrator to demonstrate full ITS device control and functionality using the ATMS platform. The ITS Integrator is responsible for physical integration of the ITS device(s) into the ATMS. Ensure integration occurs within the project schedule and according to the project documents. Provide a minimum of 2 weeks advanced notice to the ITS Integrator before integration of ITS device(s) or subsystem(s). Coordinate integration so as many devices as practical are integrated simultaneously.

1202.4 MEASUREMENT AND PAYMENT—

(a) Integration. Lump Sum

- 100% paid upon completion of System Test

SECTION 1204—ITS COMMUNICATIONS

1204.1 DESCRIPTION—This work is the furnishing and installation of the system equipment for the control of ITS and the furnishing and installation of equipment necessary to provide communication between devices, controllers, assemblies, and other components in the field or RTMC/TMC or both that form a system as indicated on the approved plans.

1204.2 MATERIAL—

(a) **Micro-Fiber Optic Cable.** Provide a fiber optic cable meeting the following:

1. Fiber Optic Distribution Cable.

- Single-mode fiber.
- Mini Loose tubes.
- Dielectric central member.
- Outer Jacket, HDPE.
- Meets Bellcore TR-TSY-000020, REA PE-90 and ANSI/ICEA S-87-640 according to ANSI/TIA/EIA-568A Commercial Building Telecommunications Cabling Standard.
- Reverse oscillation buffer tube stranding.
- Footage markings printed every 2 feet along outer jacket.
- Attenuation at 1310/1550 nm: 0.35/0.25 dB/km (maximum attenuation for every fiber in cable across entire operating temperature range).
- Operating temperature range: -40°C to +70°C.
- Maximum Nominal Outside Diameter - 6.2 mm.

2. Fiber Optic Termination Cable.

- Single-mode fiber.
- Loose tube cable.
- Dielectric central member.
- Medium density polyethylene cable jacket.
- Meets Bellcore TR-TSY-000020, REA PE-90 and ANSI/ICEA S-87-640 according to ANSI/TIA/EIA-568A Commercial Building Telecommunications Cabling Standard.
- Reverse oscillation buffer tube stranding.
- Footage markings printed every 2 feet along outer jacket.
- Attenuation at 1310/1550 nm: 0.35/0.25 dB/km (maximum attenuation for every fiber in cable across entire operating temperature range).
- Operating temperature range: -40°C to +70°C.
- Maximum Nominal Outside Diameter - 10.5 mm.

(b) **Standard Fiber Optic Cable.** Provide a fiber optic cable meeting the following:

1. Fiber Optic Cable.

- Single-mode fiber.
- Loose tube cable.
- Dielectric central member.
- Medium density polyethylene cable jacket.
- Meets Bellcore TR-TSY 000020, REA PE-90 and ANSI/ICEA S-87-640 according to ANSI/TIA/EIA 568A Commercial Building Telecommunications Cabling Standard.
- Reverse oscillation buffer tube stranding.
- Footage markings printed every 2 feet along outer jacket.

- Attenuation at 1310/1550 nm: 0.35/0.25 dB/km (maximum attenuation for every fiber in cable across entire operating temperature range).
- Operating temperature range: -40°C to +70°C.

2. Tracer Wire. Provide a single 24 AWG (minimum) THHN copper cable. The tracer wire is only required for underground installations.

(c) 5 GHz Outdoor Wireless Radio. Provide an environmentally hardened, dual antenna, wireless ethernet radio operating in the license free 5GHz band meeting the following requirements:

1. Security and Encryption.

- 128 bit- AES keys
- WPA2
- TKIP

2. Antenna.

- Internal Dual Polarized Directional.
- Gain: 19 dBi.
- Azimuth: 17 degrees Horizontal/Vertical.
- Elevation: 17 degrees Horizontal/Vertical.

3. Radio Interface.

- EIRP: Up to +36dBm for point to multipoint deployments, +49 dBm for point to point deployments
- RF Output: +30dBm rated transmitter.
- Operating Frequency: 5180 MHz - 5825 MHz.
- Bandwidths: 10, 20, 40, and 80 MHz.
- Receive Sensitivity: Up to 500 Mbps.
- Distance: Up to 2 mile (FCC Class A, Part 15 compliant).
- Distance: Up to 4 mile with MAC lock enabled (FCC Class A, Part 15 compliant).

4. Network Interface.

- Addressing: Static IP, DHCP Client, DHCP Server
- Two RJ-45 10/100/1000 Ethernet ports with sealed cable gland connectors.
- Three layers of Ethernet surge suppression on PD port.
- IEEE 802.3, 802.3u compliant.
- CSMA/CD 10/100 autosense, full-duplex.
- Dynamic Frequency Selection (DFS).
- Transmit Power Control (TPC).
- Quality of Service (QoS 802.1p).
- Internal RF Spectrum Analysis.
- Internal Antenna Alignment.

5. Enclosure.

- Cast aluminum NEMA-4X/IP67 enclosure.
- Two weatherproof Ethernet connectors.
- System LEDs (Power-On, Ethernet Link, Signal Strength).
- Weight: 5.5 pounds (5.4 Kg) with bracket and sunshield.
- Dimensions: No Larger than 12 inch by 12 inch by 3 inch.
- Pole Mounting Assembly.

6. Power.

- Operating Power: 48-57 VDC @ 170 mA.
- Power Consumption: 8 W maximum with no PD load connected.
- Internal overcurrent protection.
- PD Power: IEEE 802.3af/at PD compliant.
- PSE Power: IEEE 802.3af/at PSE compliant.

7. Environmental Specifications.

- Operating temperature: -40 °C to +70 °C.
- Storage temperature: -40 °C to +85 °C.
- Relative humidity (non-condensing): 5% to 95%.

(d) 24 GHz Outdoor Wireless Radio. Provide an environmentally hardened, dual antenna, wireless ethernet radio operating in the license free 24 GHz band meeting the following requirements:

1. Security and Encryption.

- 128 bit- AES keys
- WPA2
- TKIP

2. Antenna.

- Polarity: Dual-Slant Polarization.
- TX Gain: 23 dBi.
- RX Gain: 23 dBi.
- Front to Back Ratio: 70 dB.
- Cross-Polarity Isolation: >28 dB.
- Azimuth: 20 degrees Horizontal/Vertical.
- Elevation: 20 degrees Horizontal/Vertical.

3. Radio Interface.

- EIRP: -50 dBm for point to multipoint deployments, +49 dBm for point to point deployments
- RF Output: +30dBm rated transmitter.
- Operating Frequency: 24.05 GHz, 24.25GHz.
- Bandwidths: 10, 20, 30, 40, and 50 MHz.
- Receive Sensitivity: 1.4+ Gbps.
- Distance: Up to 8 miles (FCC Class A, Part 15 compliant).

4. Network Interface.

- Addressing: Static IP, DHCP Client, DHCP Server
- Data Port: One, RJ-45, 10/100/1000 Ethernet port.
- Configuration Port: One, RJ-45, 10/100 Ethernet port.
- Alignment Port: One, RJ-12, alignment tone port.
- IEEE 802.3, 802.3u compliant.
- CSMA/CD 10/100 autosense, full-duplex.
- Dynamic Frequency Selection (DFS).
- Transmit Power Control (TPC).
- Quality of Service (QoS 802.1p).

- Network Services: Ping Watchdog, SNMP Agent, Web Server, SSH Server, Telnet Server, NTP Client, Dynamic DNS, System Log, Device Discovery
- Internal RF Spectrum Analysis.
- Internal Antenna Alignment.

5. Enclosure.

- Cast aluminum NEMA-4X/IP67 enclosure.
- Three weatherproof Ethernet connectors.
- System LEDs (Power-On, Ethernet Link, Signal Strength).
- Weight: 23.15 pounds (10.5 Kg) with mounting bracket.
- Dimensions: No Larger than 12 inch by 12 inch by 3 inch.
- Pole Mounting Assembly.

6. Power.

- Operating Power: 42-58 VDC.
- Power Method: 50V, 1.2A PoE.
- Power Consumption: 40 W maximum.

7. Environmental Specifications.

- Operating temperature: -40 °C to +55 °C.
- Relative humidity (non-condensing): 5% to 95%.

(e) Cellular Modem - Provide an Industrial grade 4G/LTE Private IP Cellular modem, necessary cabling, and required antenna and connectors to provide a fully functioning cellular data connection. Provide a modem that is compatible with existing District modems, existing SIM cards, spare parts, and District Inventory and meeting or exceeding the following requirements:

1. Security:

- IPsec VPN
- GRE Tunnel
- Friends List

2. Network Technology:

- HSUPA
- With fallback to: HSDPA, UMTS, EDGE, GPRS (MS-12)
- Tri-Band UMTS/HSDPA/HSUPA, 850/1900/2100 Mhz
- Quad-Band GPRS/EDGE, 850/900/1800/1900 MHz
- EV-DO Rev A or later with fallback to: CDMA 1x EV-DO Revision 0, CDMA 1xRTT, CDMA IS-95

3. Radio Interface:

- Operating Frequency: 700/800 Mhz Cellular, 1900 Mhz PCS
- FCC Approved
- PCS Type Certification Review Board (PTCRB)
- Carrier Specific Approvals.

3. Environmental Specifications.

- Operating temperature: -40°C to 70°C, -40F to 158F

- Storage Temperature: -40°C to 85°C, -40F to 185F
- Vibration/Shock: MIL-STD-810G
- ROHS Compliant

4. Electrical Specifications.

- Input Voltage: (9-28V DC)

5. Maximum Device Dimensions.

- Size: 5.6 in x 1.5 in x 4.0 in

6. Host Interfaces

- Ethernet: 10/100 Mbps RJ-45
- RS-232: DB9 DCE (300 – 230400 baud)
- Antenna Connection: Primary 50 Ohm SMA, Rx Diversity 50 Ohm SMA

7. Application Interfaces

- TCP/IP
- UDP/IP
- DHCP
- HTTP
- SNMP
- SMTP
- SMS
- MSCI
- Modbus
- Binary

8. LED Indicators

- Network
- Signal
- Activity
- Service

9. Provide OMNI Directional antenna as follows:

- Support a cellular frequency of 698-960 MHz and 1710-2170 MHz PCS frequency band as well as all 3G and 4G/LTE frequencies used in the United States.
- Max Impedance: 50 Ohms
- Gain: 6 dBd or greater
- Power: 50W
- Vertical Polarization
- Connector: N/Female

Provide necessary low loss N/Female to N/Female connectors. Utilize ultra-low loss coaxial cable for connection between antenna and modem. Provide cable with dB loss less than 1.9 dB and diameter of 7/16". Provide cable length as required to eliminate any cable splicing and eliminate any excess cable to make the length as short as possible.

Provide necessary additional ancillary equipment, hardware and cabling to integrate new modem into the District's communications network.

Modem shall be compatible with the use of an existing SIM card currently in use by the District. Modem shall auto configure based on the installed SIM. See contact information in the project documents for SIM card.

(f) Radio Communication Cables. Provide outdoor rated, industrial grade, shielded CAT 6 Ethernet cable and connectors, properly grounded through the PoE AC/DC ground as recommended by the manufacturer. Supply all cable between wireless radio and related communication's enclosure that are comprised of single continuous runs without splices. Make provisions to keep some slack in the vertical cable run within or around the wireless radio enclosure. Provide cable entrance enclosure fittings to maintain enclosure NEMA/IP rating and strain-relief mechanism to the cable.

(g) Managed Network Switch. Section 1201.2(c)

(h) Power Supply 24 VDC. Section 1201.2 (d)

(i) High PoE (Power over Ethernet) Midspan Injector. Section 1201.2 (g)

(j) Documentation. Section 1201.2 (f)

1204.3 CONSTRUCTION—As directed and as follows:

(a) Micro-Fiber Optic Cable. Install fiber optic cable in new conduit/inner duct as indicated. Use appropriate installation techniques so the optical and mechanical characteristics of the cable are not degraded. Unless otherwise approved, use only the equipment and procedures specified by the manufacturer of the fiber optic cable. Install the cable in such a way the manufacturer's minimum bending radius and force limitations are not violated before, during, or after installation.

Before any fiber optic cable installation is performed, provide the Representative with four copies of the cable manufacturer's recommended installation plan and equipment set up locations and maximum force limitations for each cable size and type. The installation system to be used is to be inspected and approved by the Representative. Provide a list of the minimum allowable cable bending radius and cable manufacturer's approved pulling lubricants and guidelines for their application. Only these lubricants are allowed.

Before installation, verify duct integrity to discover any missing sections, improper couplings, kinks or blockage in the ducts. Use air pressure to test duct connectivity. Use shuttle testing to verify duct path integrity. Use sponge testing to clean out water and debris. Repair, replace or clean duct to ensure cable installation meets or exceeds manufacturer's guidelines.

Establish adequate voice communications between the blower units and receiving end and all intermediate locations. Set up the cable reels on the same side of the junction box as the conduit section in which the cable is to be placed. Make the reel level and bring it into proper alignment with the conduit section so the cable will pass from the top of the reel in a long smooth bend into the duct without twisting. Do not pay off the cable from the bottom of the reel. Feed the cable by manually rotating the wheel.

Install the cable in the duct with a factory installed cable grip and swivel attached to the air carrier unit to prevent twisting during the installation. Use an approved cable feeder guide between the cable reel or storage stack and the face of the duct to protect the cable, and to guide the cable into the duct as it is payed off the reel or from the storage stack. The dimensions and set-up of the feeder guide are to be such that the cable does not bend at any location to a radius less than the cable's minimum allowable bending radius. Do not exceed this minimum-bending radius at any time during cable installation.

Keep cable ends sealed at all times during installation, using an approved cable end cap. Do not use tape to seal the cable end. Keep the cable end sealed until termination takes place. Provide a minimum of 50 feet of slack for cables that are not immediately terminated.

Ensure the blower tractor unit is not allowed to continue to operate if cable motion stops. As the cable reaches any intermediate locations, make sure it is routed properly. Ensure no sharp bends exist that are less than the cable's minimum bend radius. Apply lubricant as required. When the cable reaches the end point, stop the blower and blower tractor according to the blower manufacturer's recommendations. Break down blower units according to the manufacturer's recommendations.

Use an approved lubricant, if needed, in the amount recommended by the cable manufacturer, to facilitate pulling the cable. Lubricate the cable as it is payed off the cable reel or storage stack into the cable feeder. Place an approved

cable lubricator (funnel) around the cable just ahead of the cable feeder to facilitate proper lubrication of the cable. After the cable has been installed, wipe the exposed cable in a junction box or cabinet clean of cable lubricant with a cloth before leaving the junction box or cabinet.

Take every precaution to ensure the cable is not damaged during storage and installation. Do not allow workers to step on the cable or run it over with any vehicle or equipment. Do not pull the cable along the ground, over edges or corners, over or around obstructions, or through unnecessary curves or bends. Use approved cable guides, feeders, shoes, and bushings to prevent damage to the cable during installation. Replace and reinstall all damaged cables at no additional cost to the Department.

Cable runs are to be continuous between allowable termination points in equipment cabinets and multiplexer nodes. Carefully determine the length of cable necessary to reach from termination point to termination point. Do not splice fiber optic cable in conduit or junction boxes.

Cable may be furnished and installed through an intermediate junction box if approved. Intermediate junction boxes will be considered part of cable installation, and no separate payment will be made for this work.

Install the necessary length of cable from one equipment cabinet or multiplexing node to the immediate next downstream equipment cabinet or multiplexing node. Carefully store the remaining length of cable to be installed in the next conduit in a manner that is not hazardous to pedestrian or vehicular traffic yet ensures no damage to the cable occurs. Store the cable in a manner that allows that length of cable to be safely pulled into the next conduit and is approved.

In junction boxes, store 50 feet of slack fiber optic cable for the distribution fiber and 20 feet of slack fiber for the termination fiber spur that passes through the junction box. In addition, provide 50 feet of slack fiber for all fiber types at a junction box adjacent to an equipment field device cabinet. Neatly store slack cable on the side walls of the junction box using racking hardware approved. Optical fibers must be placed inside loose buffer tubes. Each buffer tube must contain 12 fibers. The fibers must not adhere to the buffer tubes.

No separate payment will be made for equipment used to install, terminate and test the fiber optic cable. The unit price for fiber optic cable includes all cable ties, clamps, associated material, and labor required to install the cable.

The firm or subcontractor involved in the installation of the fiber optic cable must meet the requirements of Section 102.01.

1. Termination. Terminate fiber optic cable only in equipment cabinets, multiplexer nodes, splice cabinets, and at the TMC shown on the plans, unless directed otherwise. Splice through all fibers not used at a particular cabinet, and cap unused fibers that end in a cabinet. Provide and install patch cables at the TMC or Multiplexers where connection is to be made from an existing patch panel to a communications device.

At fiber optic termination points provide a fiber optic splice enclosure. Make all fiber terminations by splicing the fiber to factory connected pigtails using fusion splicing only. The pigtails are to be buffered, strengthened with aramid, and meet the requirements for fiber optic cable. All pigtail connectors are to be the ceramic ST type. Use the pigtails to connect the fiber optic cable to the equipment in the cabinet or at the multiplexers. Permanently label all fiber optic connectors, whether on pigtails or equipment, to preclude improper connection. The Representative will approve the labeling method(s) before use.

The cost of terminating, including the cost of splicing kits, pigtails, connectors, fiber optic cable caps, moisture sealants, and mounting hardware is considered incidental to furnishing and installing fiber optic cable, and will not be paid separately.

(b) Standard Fiber Optic Cable. Install fiber optic cable in new conduit as indicated. Use appropriate installation techniques so the optical and mechanical characteristics of the cable are not degraded. Unless otherwise approved, use only the equipment and procedures specified by the manufacturer of the fiber optic cable. Install the cable in such a way neither the minimum bending radius nor the maximum pulling tension are violated before, during, or after installation.

Before any fiber optic cable installation is performed, provide the Representative with four copies of the cable manufacturer's recommended and maximum pulling tensions for each cable size and type. These pulling tensions are to be specified for pulling from the cable's outer jacket. Also provide a list of the minimum allowable cable bending radius and the cable manufacturer's approved pulling lubricants and guidelines for their application. Only these lubricants are allowed.

The installation system to be used is to be inspected and approved by the Representative.

Establish adequate voice communications between the cable feeding location and the cable pulling equipment before starting any pulling operations. Set up the cable reels on the same side of the junction box as the conduit section in which the cable is to be placed. Make the reel level and bring it into proper alignment with the conduit section so

the cable will pass from the top of the reel in a long smooth bend into the duct without twisting. Do not pull the cable from the bottom of the reel. Feed the cable by manually rotating the wheel.

Pull the cable in the conduit with a cable grip designed to provide a firm hold on the exterior covering of the cable. Use an approved cable feeder guide between the cable reel or storage stack and the face of the duct to protect the cable, and to guide the cable into the duct as it is payed off the reel or from the storage stack. The dimensions and set-up of the feeder guide are to be such that the cable does not bend at any location to a radius less than the cable's minimum allowable bending radius. Do not exceed this minimum-bending radius at any time during cable installation.

Keep cable ends sealed at all times during installation, using an approved cable end cap. Do not use tape to seal the cable end. Keep the cable end sealed until termination takes place. Provide a minimum of 50 feet of slack for cables that are not immediately terminated.

At any time, the allowable pulling tension is to be 70% of the manufacturer's maximum pulling tension for pulling by the outer jacket. Ensure the allowable pulling tension is not exceeded at any time during cable installation by using one of the following methods, as approved:

- Pulling the cable by hand.
- Approved mechanical means.

If the cable is pulled by mechanical means, use a clutch device to ensure the allowable pulling tension is not exceeded. Also, attach a strain gauge to the pulling line at the cable exit location, and at a sufficient distance from the take-up device, so the strain gauge can be read throughout the entire cable pulling operation.

Use an approved lubricant if needed, in the amount recommended by the cable manufacturer, to facilitate pulling the cable. Lubricate the cable as it is payed off the cable reel or storage stack into the cable feeder. Place an approved cable lubricator (funnel) around the cable just ahead of the cable feeder to facilitate proper lubrication of the cable. After the cable has been installed, wipe the exposed cable in a junction box or cabinet clean of cable lubricant with a cloth before leaving the junction box or cabinet.

Take every precaution to ensure the cable is not damaged during storage and installation. Do not allow workers to step on the cable or run it over with any vehicle or equipment. Do not pull the cable along the ground, over edges or corners, over or around obstructions, or through unnecessary curves or bends. Use approved cable guides, feeders, shoes, and bushings to prevent damage to the cable during installation. Replace and reinstall all damaged cables at no additional cost to the Department.

Cable runs are to be continuous between allowable termination points in equipment cabinets and multiplexer nodes. Carefully determine the length of cable necessary to reach from termination point to termination point. Do not splice fiber optic cable in conduit or junction boxes.

Cable may be furnished, installed, and pulled through an intermediate junction box if approved. Intermediate junction boxes will be considered part of cable installation, and no separate payment will be made for this work.

Pull the necessary length of cable to be installed from one equipment cabinet or multiplexing node to the immediate next downstream equipment cabinet or multiplexing node. Carefully store the remaining length of cable to be installed in the next conduit in a manner that is not hazardous to pedestrian or vehicular traffic yet ensures no damage to the cable occurs. Store the cable in a manner that allows that length of cable to be safely pulled into the next conduit and is approved.

In junction boxes, store 50 feet of slack fiber optic cable for the distribution fiber and 20 feet of slack fiber for the termination fiber spur that passes through the junction box. In addition, provide 50 feet of slack fiber for all fiber types at a junction box adjacent to an equipment field device cabinet. Neatly store slack cable on the side walls of the junction box using approved racking hardware.

No separate payment will be made for equipment used to install, terminate and test the fiber optic cable. The unit price for fiber optic cable includes all cable ties, clamps, associated material, and labor required to install the cable.

The firm or subcontractor involved in the installation of the fiber optic cable must meet the requirements of Section 102.01.

1. Termination. Terminate fiber optic cable only in equipment cabinets, multiplexer nodes, splice cabinets, and at the TMC shown on the plans, unless directed otherwise. Splice through all fibers not used at a particular cabinet, and cap unused fibers that end in a cabinet. Provide and install patch cables at the TMC or Multiplexers where connection is to be made from an existing patch panel to a communications device.

At fiber optic termination points provide a fiber optic splice enclosure. Make all fiber terminations by splicing the fiber to factory connected pigtails using fusion splicing only. The pigtails are to be buffered, strengthened with aramid, and meet the requirements for fiber optic cable. All pigtail connectors are to be the ceramic ST type. Use the

pigtails to connect the fiber optic cable to the equipment in the cabinet or at the multiplexers. Permanently label all fiber optic connectors, whether on pigtails or equipment, to preclude improper connection. The Representative will approve the labeling method(s) before use.

The cost of terminating, including the cost of splicing kits, pigtails, connectors, fiber optic cable caps, moisture sealants, and mounting hardware is considered incidental to furnishing and installing fiber optic cable, and will not be paid separately.

(c) Outdoor Wireless Radio. Conduct a wireless line of sight analysis measuring existing Radio Spectrum, Received Signal Strength Indicator (RSSI), Link Quality and Performance for each wireless node as shown on the communications plan sheet. Submit results of the analysis to the Department for approval before any repeater pole installation. Any location not meeting the minimum RSSI level will require lateral adjustment to the location in order to achieve a minimum RSSI receive threshold reading as recommended by the manufacturer. Install the radios and panel antennas cable according to the manufacturer's guidelines. Adjust antenna alignment to achieve the maximum RSSI level reading. Configure wireless link radio according to the manufacturer's recommendations before deploying in the field.

(d) Cellular Modem: Install, connect and configure Cellular modem in ITS Device cabinet as shown in the Design Drawings. Install modem in accordance to the manufacturer's recommendations. Coordinate with the Department for installation of the existing SIM card and existing cellular provider to provide service to the proposed Cellular modem. Orient antenna to achieve the best signal possible. This may require multiple attempts. Once connectivity has been established coordinate with the District ITS staff for the integration of the ITS device into the existing RTMC and test accordingly.

(e) ITS Device Testing. As specified in Section 1201.3(b).

(f) ITS Device Integration. As specified in Section 1201.3(c).

(g) ITS Device Training. As specified in Section 1201.3(d).

1204.4 MEASUREMENT AND PAYMENT—

(a) Micro-Fiber Optic Cable. Linear Foot

Measured from junction box to junction box plus the slack cable required. Includes field splices and connectors necessary for the splices made at equipment locations.

Tracer wire installation is incidental to the installation of the Fiber Optic Cable

(b) Standard Fiber Optic Cable. Linear Foot

Measured from junction box to junction box plus the slack cable required. Includes field splices and connectors necessary for the splices made at equipment locations

Tracer wire installation is incidental to the installation of the Fiber Optic Cable

(c) Outdoor Wireless Radio. Each

Includes all material costs, wireless line of sight costs as well as construction costs associated with the installation of a fully functional Wireless Radio site.

- 25% of payment will be made upon installation of the Radio
- 55% of payment will be made upon integration into new or existing link
- 20% of payment will be made upon successful System Acceptance

(d) Cellular Modem. Each

Includes all material costs, cellular field study costs as well as construction costs associated with the installation of a fully functional Wireless Radio Repeater site.

- 25% of payment will be made upon installation of the Cellular Modem
- 55% of payment will be made upon integration into new or existing network

- 20% of payment will be made upon successful System Acceptance

SECTION 1206—MAINTENANCE, ITS DEVICES - GENERAL

1206.1 DESCRIPTION—This work is to furnish, install, modify, repair, replace, and remove non-device specific ITS components and equipment essential to a fully functional and operational system.

1206.2 MATERIAL—Section 1201.2

1206.3 CONSTRUCTION—Section 1201.3 and as follows:

(a) Preventive Maintenance.

1. General. Perform Preventive Maintenance (PM) according to the manufacturer's recommendations, Publication 697, and the following:

Submit, for approval, an annual schedule of all PM activities within 2 weeks of receiving notice to proceed.

Comply with the following example submission schedule:

<u>Preventative Maint. Report No.</u>	<u>Complete Field Inspection</u>	<u>Submit PM Report</u>
1. Through November	November 28	December 15
2. Through December	December 28	January 15
3. Through January	January 28	February 15
4. Through February	February 28	March 15

PM is required before and after the winter season annually. Report all deficiencies on the PM checklist directly to the Department within 24 hours. Report all critical deficiencies directly to the Department immediately while on-site.

Submit one typed hard copy or electronic copy of the monthly status report showing all PM completed during each month. Include the following in the report:

- Detailed description of the PM performed.
- Copies of payroll records and work reports.
- PM Checklists; including test results.

2. Site. Check for proper clearance of tree branches or brush around power and communication lines associated with ITS devices. Provide required tree trimming and brush clearing work. Spray and place weed control measures around each device.

Remove snow and ice buildup around enclosure(s), maintenance area(s), and device(s). This also includes removing snow and ice from solar panels, camera housings, beacons, transmitters, detectors, and wireless communication devices.

3. Enclosures. Inspect all field enclosures, including camera control enclosures, backup or battery powered supply enclosures, hub enclosures, and junction and pull boxes, for damage, corrosion, water damage, and leaks. Verify absence of water from the inside bottom of enclosure. If water is present, ensure the means for drainage have not become obstructed. Remove obstructions, if present. Apply caulking, if required, to prevent water from entering enclosure.

Remove all objects or debris inconsistent with control enclosure materials such as nests made by rodents, birds, or flying insects, etc. Spray for insect prevention. Install or replace rodent control measures as necessary. Ensure conduit openings into the enclosure are sealed with metal meshing material to prevent animals from entering the enclosure. Inspect all connections, all cabling, and the physical appearance of the equipment within the enclosures.

Check gaskets, ground rod clamps, heaters, and all connections. Check anchor bolts for rust and tightness. Repair as necessary. Lubricate hinges, locks, and latches. Remove accumulated dust. Replace burned out light bulbs.

Clean semi-permanent filters during every PM inspection according to the manufacturer's recommendations. Replace semi-permanent filters if media integrity is ripped, torn, punctured, or contaminated beyond normal cleaning methods. Replace disposable filters twice annually with nylon-based filter media. Do not use paper filters.

Perform local diagnostics on all applicable equipment. Tighten loose connections. Service air conditioner, fans, and heater controls. Test ground rods for 25 ohms or less resistance utilizing fall of potential test. Test power, including battery backups, and communications line surge suppressors and replace as necessary. Inspect and test communications systems including transmission devices, modems, pagers, and cables.

If the device's Statewide Device Identification Number is not displayed on the enclosure or is faded, missing, or vandalized, provide the Statewide Device Identification Number as specified in Section 1201.2(b)1.

(b) On-call Maintenance.

1. General. Perform On-call Maintenance (OM) in accordance with the manufacturer's recommendations and Publication 697.

2. Responsiveness. Perform OM activities within the following timelines:

- **Notification:** The Department or the TMC notifies the On-call Responder of an issue.
- **Acknowledgment:** The On-call Responder is to acknowledge the notification within 30 minutes. Phone and email verification by the On-call Responder will be provided to the issuing TMC.
- **Diagnose:** The On-call Responder must arrive at the site and diagnose the issue within 4 hours from the notification by the Department or the TMC.
- **Performance:** The TMC issues a work directive to the On-call Responder, either written or verbal, and the On-call Responder is to complete the repairs within 72 hours from the issuance of work directive.
- **Log:** The On-call Responder is to log the activity within 2 business days after the completion of repairs.

1206.4 MEASUREMENT AND PAYMENT—

(a) PM, Other. Each

All labor, materials, and equipment required for routine preventive maintenance are incidental to this item including, but not limited to, the Statewide Device Identification Number, cleaning materials, caulk, metal meshing, lubricants, filters, lamps, paint, surge suppressors, fuses, circuit breakers, attachment hardware, insect prevention measures, rodent control measures, clearing and grubbing, selective tree trimming, snow and ice removal, and weed control measures. Mobilization is incidental to this item.

(b) On-call, Other Mobilization. Each

Mobilization will not be paid for procurement of parts. Travel to and from the site and district stockpile is incidental to this item.

(c) On-call, Other Repair. Hour

Repair time will not be paid for procurement of parts. Travel to and from the site and district stockpile is incidental to this item. Site specific snow and ice removal requested by the Department is included within this item.

(d) On-call, Other Parts. Dollar

Includes all cables, connectors, equipment racks, grounding rod(s), conductor(s), and other parts necessary for proper installation and configuration.

(e) Maintenance and Protection of Traffic. Section 901.4(a)

SECTION 1210—CLOSED CIRCUIT TELEVISION CAMERA

1210.1 DESCRIPTION—This work is to furnish and install a complete, fully functional Closed Circuit Television (CCTV) camera subsystem.

1210.2 MATERIAL—

(a) **General.** Furnish a CCTV camera subsystem including camera, midspan injectors, power supply, integrated camera housing, housing mounts, CCTV ITS enclosure, wires, connections, grounding system, Camera Lowering Device (CLD), Camera Lowering Tool, CCTV pole, and CCTV pole foundation. Utilize the newest and most current electronics.

(b) **CCTV Camera.** According to Publication 647, NTCIP, AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals, MUTCD, NEMA, and NEC. Manufactured by an ISO-9001 certified facility.

(c) **CCTV Camera Assembly.** Provide a dome style CCTV camera assembly, positioner CCTV camera assembly, or both meeting the following requirements:

1. Camera.

- Sensor: 1/2.8" CMOS.
- HD Standard: SMPTE 274M-2008.
- Aspect Ratio: 16:9.
- Frame Rate: 30 fps.
- Electronic Image Stabilization (EIS) technology integral to the camera body.
- Automatic Day/Night Imaging with IR cut filter.
- Day/Night Modes: Monochrome, Color, Auto
- Minimum Shutter Speed Range – 1/2 to 1/10,000 second.
- Defog Mode, user selectable: Off/Auto/Manual.
- Gain Control, user selectable: AGC (Automatic Gain Control), Fixed
- Back Light Compensation (BLC) user selectable: On/Off/Enhanced or Intelligent Auto Exposure.
- Maximum signal-to-noise ratio of 50dB un-weighted.
- Through-the-lens auto white balancing with manual over-ride and white balance modes for Normal, Mercury and Sodium light sources.
- Provide OSD (On-Screen-Display) camera titles with configurable text colors to display options for text, preset, azimuth/elevation, compass, date/time and zoom for position control at a minimum.

2. Optical.

- Optical zoom power of minimum 30X.
- Digital zoom, minimum 12X, Off/On.
- Field of View (FOV) 2.3°-65°.
- Aperture F1.6-F4.6
- Iris control: Auto/Manual
- Focus control: Auto/Manual
- Generate video images that exhibit no geometric distortion and are free of blemishes as defined by EIA 330.

3. Network Interface.

- Network Format 802.3u 100Base-T, MDI-X.

- Support and comply with the following Network protocol and standards: Internet IPv4 with adjustable device IP address, Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Internet Group Management Protocol (IGMP), Address Resolution Protocol (ARP), Real-Time Transportation Protocol (RTP), , Dynamic Host Configuration Protocol (DHCP), Hypertext Transfer Protocol (HTTP), Simple Network Time Protocol (SNTP), and Simple Network Management Protocol (SNMPv2), National Transportation Communication for Intelligent Transportation System Protocol (NTCIP).
- Support and comply with the following camera control Protocols: NTCIP 1205, ONVIF-S.
- LAN Interface: Ethernet 10-Base T/100 Base-TX, Auto-Sensing, Half/Full Duplex, for connection to the video Local Area Network (LAN). Equip the camera with password protection against unauthorized access. Provide an RJ45 output interface.
- Data Rate: 9.6 kbps to 8Mbps.
- Video Compression: H.264 (ISO/IEC 14496-10), M-JPEG.
- Support NTSC 1080p, 720p, D1, 4CIF and CIF frame size at a frame rate of up to 30 FPS and provides adjustable frame size and frame rate.
- Provides at a minimum, two simultaneous H.264 compression streams, H.264 (MPEG4 part 10), format Baseline Profile or higher and the option of configuring one stream as M-JPEG CIF frame size and at a frame rate of up to 30 FPS.
- Support Real Time Streaming Protocol (RTSP, RFC 2326).
- Support the transmission of video via unicast or multicast.

4. Environmental.

- Environmentally sealed, camera housing which provides an Ingress Protection of IP66, NEMA 4X or better.
- Operate without degradation in performance under temperature range of -30F to +141F, and relative humidity of 100%, condensing, and a storage temperature range of -40F to +140F.
- Equipped with DC resistive heaters for operation down to specified operating temperatures identified above.

5. Mechanical.

- Capable of attachment to a Camera Lowering Device.
- Maximum Weight of 15 pounds.

6. Electrical.

- Provide and terminate two independent power sources for each camera. Provide input voltage of High PoE, midspan injector and power supply as primary or auxiliary or both power sources.
- Power Consumption without Heaters – 40W

Maximum Total Power Consumption – 75W Maximum

7. Pan/Tilt/Zoom (PTZ) Subsystem. Provide an integral PTZ subsystem capable of pan movement between 0 and 360 degrees at speeds between 0.1 and 80 degrees per second in normal operating mode. Also provide a camera which provides a tilt range between 0 and 180 degrees at tilt speeds between 0.1 and 40 degrees per second. Provide a PTZ subsystem capable of at least 64 preset positions, with a positioning accuracy of $\pm 1/2$ degree. Include auto focus, auto iris, pan, tilt, and zoom functions in each preset position.

(d) Camera Housings and Mounts. Provide an environmentally sealed camera housing. Construct housing to be dust and water tight, and fully operational in 100% condensing humidity. Furnish housing to provide the environment needed for camera operation, and keep the viewing window free of fog, snow, and ice. Construct housing of aluminum, stainless steel, or steel with a corrosion-resistant finish. Construct viewing bubble of clear high-resolution acrylic or rugged polycarbonate, all materials optically correct. Provide each camera assembly with sunshield. Provide housing and mounting hardware that can withstand winds according to Publication 647, and to withstand vibration of up to 0.03 inch total excursion from 5 Hz to 30 Hz, and peak random vibrations of 5G's from 30 Hz to 1,000 Hz.

If camera is pole mounted, mount camera on support arm securely attached to the steel pole according to Publication 647.

(e) CCTV Camera Lowering Device (CLD). Provide all pulleys, cabling, suspension contact unit, cable guides, mounting fixtures, mounting arms, weights, cranks, connections and appurtenances necessary to provide a fully functional camera lowering system for a CCTV location. Provide CLD to enable a single maintenance personnel to access a CCTV by lowering the camera to the ground or enclosure-level without the need for a bucket truck or other lifting apparatus. Provide CLD as an integral component of the camera pole structure, where camera is pole-mounted.

Provide CLD capable of locking in place at any desired height, including at the ground level, and locked in position at the top of the pole or structure. When locked at the top of the pole or structure, release all weight from the CLD cables. Equip CLD with a manual crank that facilitates incremental lowering of the camera, lens, housing, PTZ mechanism, all heating/cooling/temperature devices, camera wiring and connections without causing damage or degradation of the camera functions and operations.

Comprise all components of corrosion resistant materials. Powder-coat, galvanize, or otherwise protect all external components from the environment by industry standard coatings to withstand exposure to a corrosive environment. Provide CLD that allows maximum play of ± 5 degrees if locked in raised position under sustained wind speeds of up to 130 miles per hour with a 30% gust factor, with camera housing presenting an effective wind loading surface of maximum 1 square foot.

Provide CLD assembly and connections in accordance with Publication 647, AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaries and Traffic Signals, 2001 (including 2002, 2003, and 2006 interims), fatigue design per Section 11: Fatigue Design, AASHTO Standard Specifications for Highway Bridges, 17th Edition (including interims), and Design Manual, Part 4, Structures, September 2007 Edition, (including Change Numbers).

Provide a heavy-duty suspension contact unit between the pole or structure and the camera apparatus that facilitates physical and electrical connections to the camera. Furnish contact unit that utilizes dual latching arms to connect the CCTV to the CLD. Provide unit with a load capacity of the dual latching arm apparatus of at least 2,400 pounds, including safety factor, and a locking mechanism between the fixed and moveable components of the CLD. Provide a locking mechanism which operates by alternately raising and lowering the assembly using the crank and lowering cable such that when latched, all weight is removed from the CLD cable. Provide the fixed unit with a heavy duty cast tracking guide and means to allow latching in the same position each time. Provide self-aligning contact units and receiver brackets that automatically align the centerline of the camera apparatus with the centerline of the camera pole or structure upon raising and locking into position.

Protect all electrical, video coaxial and other connections between the fixed and moveable portions of the contact block from weather by waterproof seal to prevent degradation of the electrical contacts. Fabricate electrical contacts of corrosion resistant material to prevent degradation of the connections. Provide a weatherproof CLD system housing with at replaceable neoprene gasket provided to seal the interior from dust and moisture without the use of pressurization. Furnish contact block of hypalon or other similar synthetic polymer in order to seal the internal contacts from weather, water, dust and degradation of the electrical contacts while in the raised and locked position.

Provide a connector block with the female and male socket contact halves modular and self-aligning. Provide internal and locking components that are made of stainless steel or aluminum or both. Provide internal connectors capable of supplying electric power of up to 5 A at up to 120 VAC through the connector without damage to the connector, while supplying full amperage draw of the camera assembly and operating with the heater and all electronics powered on. Provide electrical connections between the fixed and movable components to facilitate connection for the conductors typically required for the following signals: serial data signal involving up to eight conductors for camera PTZ control and response, 1-Volt peak to peak analog video signal, and eight-conductor (Cat6) signal for 10 Mbps Ethernet communication.

1. Equipment Connection Box. Provide a heavy-duty equipment connection box for connecting the CCTV or other ITS device to the lowering device. Furnish a 1.5 inch National Pipe Thread (NPT) pipe connection point in the equipment connection box for attaching a camera. Provide equipment connection box that has an ingress protection rating of no less than IP55. Provide CLD that includes a disconnect unit for electrically connecting the equipment installed on the CLD's equipment connection box to the power, data, and video cables (as applicable).

2. Lowering Tool. Provide a CLD that utilizes a portable, detachable lowering tool. Provide a tool consisting of a lightweight metal frame and a crank assembly with a cable as specified in 1210.2(e)3; a quick release cable connector, an adjustable safety clutch and a variable speed reversible industrial duty electric drill motor with maximum

rotations per minute per the manufacturer's recommendations. Provide a tool that is operable using 120V electric power, compatible with accessing the support cable through the hand hole of the pole and which will attach to the pole with one single bolt. If attached to the hand hole, the tool must support itself and the load, assuring lowering operations and providing a means to prevent freewheeling. Equip lowering tool with a positive breaking mechanism to secure the cable reel during raising and lowering operations and to prevent freewheeling.

Furnish a lowering tool which has a reduction gear to reduce the manual effort required to operate the lifting handle to raise and lower a capacity load. Provide the lowering tool with an adapter for operating the CLD by a portable drill with a clutch mechanism. Fabricate lowering tool made of durable and corrosion-resistant materials that are powder coated, galvanized, or otherwise protected from the environment by industry accepted coatings to withstand exposure to corrosive environment. Deliver lowering tool plus all additional tools required to the Representative upon project completion.

Provide all pulleys for the CLD and portable lowering tool with sealed, self-lubricated bearings, oil tight bronze bearings, or sintered bronze brushings. Provide weights and counterweights as necessary to ensure the alignment of pins and connectors are proper for the camera support to be raised into position without binding. Provide the CLD with sufficient weight to disengage the camera and its control components in order that it can be lowered properly.

3. Cabling. Provide lowering cable with a minimum of 0.125 inch diameter stainless steel type 316 aircraft cable with a minimum breaking strength of 1750 pounds with seven strands of 19-gauge wire each. Provide lift unit support subsystem with prefabricated components that preclude the lifting cable from contacting the power or video cabling.

Provide a CLD with only the stainless steel lowering cable permitted to move within the pole or externally-mounted conduit during lowering and raising operations. All other cables must remain stable and secure during lowering and raising operations. If the camera is mounted on a steel pole, contain the camera lowering cable on the inside of the pole. Install pulleys for the lowering device and portable lowering tool that have sealed, self-lubricated bearings, oil-tight bronze bearings, or sintered bronze bushings.

If cabling is contained inside a hollow pole, separate the cabling to prevent it from touching or interfering with other electrical and mechanical cabling within the pole. Make provisions to completely separate all CLD cables from electrical, communications and other cables.

(l) Electrical Service. Section 1201.2(h)

(m) Grounding Rod. Section 1101.11(j) and Publication 647

(n) CCTV Pole. Section 1101.01, 1101.02, 1101.04, 1101.05, and as follows. Furnish CCTV pole according to Publication 647. Aluminum poles are not allowed. Furnish poles of heights less than 50 feet according to the conventional lighting portion of Section 1101. Furnish poles of heights greater than 50 feet according to the high mast lighting portion of Section 1101.

Furnish baseplate of a minimum thickness of 3 inches unless otherwise specified. Provide bottom shaft sections with an 8 inch minimum thickness. Use joint penetration weld to connect the shaft to the baseplate according to AASHTO 2001 Sign Specifications in Table 11-2, Detail 11.

Provide hand holes as shown in the Standard Drawings of height to accommodate CLD.

(o) CCTV Pole Foundation.

1. Class A Cement Concrete. Section 704.

2. Grade 60 Reinforcement Bars. Section 709.1.

3. Conduit. Section 1101.09.

1210.3 CONSTRUCTION—As indicated, as shown on the Standard Drawings, and as follows:

(a) CCTV Subsystem. Configure camera with PTZ functions to return automatically to related “Home” viewing position. Configure the subtitle or sector for each camera view position and preset. Display subtitles with the associated video image. Include the road the camera is on, camera number, and all other information as directed by the Representative.

(b) CLD. Install CLD system as recommended by manufacturer. Install device in conjunction with the CCTV and camera pole structure.

1. Camera Support Arm Orientation. Where camera is pole mounted, orient support arm perpendicular to the adjacent roadway, with the camera positioned closer to the related roadway than the pole, unless otherwise specified.

(c) CCTV System Cables. Use only outdoor rated Cat5e/Cat6 cable for network cable. Utilize only outdoor rated cables for all communications, signal, and power cables. Supply all communications, signal, and power cables between a camera assembly and related communications enclosure that are comprised of single continuous runs without splices. For installation of camera cables through a hollow pole, make provisions to keep some slack in the vertical cable run within the pole. Provide strain-relief mechanism to the cable in vertical runs exceeding 60 feet, at minimum 60-foot interval.

(d) ITS Enclosure. Section 1201.3(a)

1. Midspan Injector. Section 1201.3(a)1. Install the midspan injector in the ITS enclosure, one per camera according to the manufacturer’s recommendations. Install midspan injector in such a manner that it does not interfere with the operation of other equipment in the enclosure. Provide all wiring and cabling to connect the midspan injector to the CCTV communications subsystem. Clearly label, neatly bundle, and attach all wiring within the enclosure.

2. Low Voltage Power Supply. Section 1201.3(a)1. Install the Low Voltage power supply in the ITS enclosure, as required, and according to the manufacturer’s recommendations. Install the Low Voltage power supply in such a manner that it does not interfere with the operation of other equipment in the enclosure. Provide all wiring and cabling to connect the Low Voltage power supply to the CCTV communications subsystem. Clearly label, neatly bundle, and attach all wiring within the enclosure.

(e) ITS Device Integration. Section 1201.3(c)

(f) Grounding. Section 910.3(q)

(g) ITS Device Testing. Section 1201.3(b)

(h) Training. Section 1201.3(d)

(i) Documentation. Section 1201.2(i)

(j) CCTV Pole. Section 910.3

(k) CCTV Pole Foundation. Section 910.3

1210.4 MEASUREMENT AND PAYMENT—**(a) Closed Circuit Television (CCTV) Camera Subsystem.** Each

Includes camera, lens, midspan injectors, power supplies, wires, connectors, grounding rod and conductor, mounting, installation, training, integration work, and documentation for a complete subsystem.

- 50% of payment will be made upon complete installation of CCTV subsystem
- 30% of payment will be made upon completion of the standalone acceptance tests as specified in Section 1201.3(b).
- 20% of payment will be made upon completion of the 60-day test as specified in Section 1201.3(b).

Completion of tests includes completion of training, submission of all manuals and documentation as required, and completion of all final inspections as required by the Representative.

(b) CLD. Each

Includes cabling, connectors, installation, training, pulleys and all equipment.

- 50% to be paid upon complete installation of lowering device
- 30% to be paid upon completion of the standalone acceptance test as specified in Section 1201.3(b).
- 20% to be paid upon completion of the 60-day test as specified in Section 1201.3(b).

Completion of tests includes completion of training, submission of all manuals and documentation as specified in Section 1210, and in the Contract, and completion of all final inspections as required by the Representative.

(c) Camera Lowering Tool. Each

Includes winch and drill attachment mechanism.

(d) ITS Enclosure. Section 1201.4

Includes enclosure, associated appurtenances, mounting hardware and complete installation of the CCTV ITS enclosure.

(e) CCTV Pole. Each

For the height indicated.

Includes pole, baseplate, anchor bolts, installation, and all work to level the pole.

(f) CCTV Pole Foundation. Each

For the type indicated.

The price includes excavation, concrete, anchor bolt assemblies, reinforcement bars, conduit, ground rod, ground rod clamp, grounding conductor, backfill, and satisfactory disposal of surplus material.

SECTION 1211—PORTABLE CLOSED CIRCUIT TELEVISION CAMERA

1211.1 DESCRIPTION—This work is to furnish and install a complete, fully functional Portable Closed Circuit Television (PCCTV) Camera subsystem with integrated IP.

1211.2 MATERIALS—

(a) **General.** Provide a PCCTV in trailer configuration, equipped with wheels for portability. Provide portable devices that meet the physical display and operational requirements of the MUTCD. Provide PCCTV consisting of camera assembly, integrated camera housing and mounts, wireless communications interface, a photovoltaic cell array, battery bank subsystem for powering the PCCTV, telescopic camera mast, enclosure, wires, connections, grounding system, and heavy duty trailer frame.

(b) **CCTV Camera Assembly.** 1210.2(c)

(c) **High Power over Ethernet (PoE) Midspan Injector.** 1210.2(e)

(d) **Power Supply 24 VDC.** 1210.2(f)

(e) **Camera Housings and Mounts.** 1210.2(d)

(f) **Camera Communications.** Provide local and remote control operation of the camera via a wireless communications interface that utilizes the ports specified and locally via a laptop computer. Local connections to a laptop computer must facilitate routine repairs, diagnostics and all other operational functions. In addition to the standard communication ports required for operation, provide, at a minimum, the following interfaces to the PCCTV: USB port, Ethernet port and serial port.

Provide a wireless communications interface, field-hardened for long-term freeway deployment where it is typically subject to wide daily and seasonal temperature swings, wind gusts and typical road vibrations with an extended operating temperature range from -30F to + 165F.

Coordinate wireless communications interface type and configuration with the Representative for network compatibility. The wireless carrier data account will be provided by the Department. Provide the wireless communications interface as a unit detachable from the PCCTV assembly to facilitate easy change out to other communications means.

(g) **Power Supply.** Equip PCCTV with solar array and battery bank to provide power to the CCTV assembly and communications equipment. Using solar array, supply the nominal operating voltage to the CCTV camera assembly and communications equipment. Provide solar array that consists of photovoltaic, single crystal silicon modules. Provide automatic recharging of power supply batteries to normal operating levels with meters showing charge.

Securely mount the solar array to the PCCTV for operation and transport. Provide mounting capable of swiveling, tilting, and reangling the cells to optimize exposure to solar rays. Include capability to lock the solar panels at any angle necessary to optimize solar exposure.

Provide AC/DC battery charger. Provide battery bank that at full charge can power the camera assembly at continuous use for 8 hours without recharging from the solar array. Equip battery bank with a battery controller to prevent overcharging and over-discharging. Provide battery controller with external battery level indicator. Protect the battery, controller, and power panel from the elements and vandalism. Provide battery subsystem with automatic recharging of power supply batteries. Equip battery subsystem with meter to indicate if batteries are being charged or used.

Provide battery bank consisting of low-maintenance, gel batteries. Contain the battery in a NEMA-rated compartment or enclosure that prevents water ingress during operation or transport. Fabricate the compartment to completely contain any spills from damaged or malfunctioning batteries. Provide battery enclosure that is separate from enclosure to house DMS controller.

1. Plug-In AC Power. Provide an AC-to-DC power converter and a power receptacle behind a lockable window at the main frame of the PCCTV, to allow the use of power feed from an alternate power source such as a generator

set on trailer, or road-side power outlet. Provide a selector switch inside the window that connects the internal loads of the PCCTV to the battery-powered subsystem, or the above AC-to-DC power converter. Include provision for the external AC power to charge the batteries when the PCCTV operates using the external AC power. Provide AC-to-DC power converter that converts 120 VAC power to DC power suitable for operating the PCCTV. Protect all data and electrical connections from the PCCTV using transient voltage surge suppression (TVSS) equipment. Provide window with a grommet-lined semi-circular notch at the bottom to allow passage of extension cord with the window closed. Provide twist locking type receptacle. Provide an extension cord with male plugs at both ends that is suitable for outdoor uses, oil resistant, minimum 50 feet long, and equipped with three 12 AWG conductors. Provide cord where one of the plugs is regular type and the other plug is suitable for use with twist locking type receptacle. Deliver cord to location identified by the Representative.

(h) Grounding Terminal. Provide means to connect a grounding conductor to the PCCTV assembly. Provide deliberate grounding connection from the trailer frame and the PCCTV controller frame, to this grounding terminal. Provide grounding terminal suitable for terminating a wire of up to 2 AWG. Provide painted signage next to the grounding terminal, with 1-inch tall black letters on white background, stating “PROVIDE GROUNDING TERMINATION HERE.”

(i) Trailer. Provide a wheeled trailer fabricated of steel. Deburr and finish all metal with a corrosion resistant coating. Equip trailer with tie-down points to facilitate storage and transport by securing the trailer to a utility trailer or flatbed truck. Equip trailer with class-A tail lights, using a plug adaptor.

Furnish trailer that can be set up at the site with its own chassis and outriggers, without being hitched to a vehicle. Equip trailer with fenders over the tires that are made from heavy-duty material sufficient to allow a person to stand and operate or perform maintenance on the unit. Delineate the trailers on a permanent basis by affixing retroreflective material in a continuous line on the face of the trailer as seen by oncoming road users. Finish trailer with a glossy federal safety aliphatic acrylic urethane finish. Provide orange color to conform to the MUTCD requirements for portable changeable message signs (PCMS).

Provide a trailer mounting structure for the Camera housing, mounting bracket and peripherals (camera assembly). Provide accessible mechanism to easily raise and lower the assembly. Provide a locking device to lock the camera assembly in the raised or lowered position. Provide a single metal telescoping mast pole to mount the camera assembly that is an integral piece of the body of the trailer. Provide support capable of adjusting the height of the camera assembly, and allows the camera assembly to rotate 360 degrees around the vertical axis of the support beam, without requiring more than a single operator to perform height or angle adjustments. Provide capability to elevate the center-point of the camera assembly to a minimum height of 20 feet. The locking mechanisms must prevent the camera assembly from changing angles during windy conditions or vibrations.

Equip trailer with a hitch for connection to a towing vehicle. Provide hitch with a towing capacity of 5,000 pounds. All trailer hitch components must conform to SAE J684 Standards for Class II trailers. Equip hitch with a 1/4 inch safety chain for secure attachment to towing vehicle. Provide trailer with sealed, flush-mounted, combination stop, tail and turn lights, and front and rear sided marker lights. Provide a rear license plate display holder, and a rear center identification light bar for illuminating the trailer license plate. Provide a rear fender.

Provide four hydraulically or mechanically adjustable outrigger leveling pads permanently installed at each of the four corners of the sign trailer for leveling and support functions. Provide leveling pads with a minimum capacity of 2,000 pounds each. Provide leveling pads that are adjustable using a single operator, and without any special tools. The leveling pads must be capable of lifting the trailer so the tires do not touch the ground. Equip trailer with tires according to ST225/75R15 Load Range C. Provide 5-lug pattern wheel configuration. Affix the manufacturer’s name and the trailer make and model to trailer. Provide an operator’s manual within the control enclosure of each unit.

Equip the PCCTV trailer with a metallic enclosure to house the wireless communications interface. Provide a weatherproof and rust resistant enclosure securely fastened to the trailer structure. Equip the enclosure with a door with a key locking mechanism, and provisions for externally locking the door using a typical pad lock.

1211.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) PCCTV. Section 1210.3(a)

1. Camera Support Arm Orientation. Section 1210.3(b)1

2. Video Cables. Use only outdoor rated Cat5e/Cat6 cable for network cable. Supply all cable between a camera assembly and related communications enclosure that are comprised of single continuous runs without splices. Make provisions to keep some slack in the vertical cable run within or around the telescoping pole. Provide strain-relief mechanism to the cable.

3. Integration. Section 1201.3(c)

4. Grounding. Section 910.3(q)

5. Testing. Section 1201.3(b)

6. Training. Section 1201.3(d)

7. Documentation. Section 1201.2(f)

(b) Trailer Unit. Install trailer unit as specified in contract documents. Ensure the trailer is located in an area free of debris so a maintainer can access the unit and be protected from most vehicular traffic. Configure all outriggers to equally support the weight of the trailer and ensure the unit is completely level.

1211.4 MEASUREMENT AND PAYMENT—

(a) PCCTV Camera Subsystem. Each

Includes camera, lens, communications equipment, wires, connectors, grounding rod and conductor, trailer, mounting and installation, training, integration work, and documentation for a complete subsystem.

- 50% of payment will be made upon complete installation of PCCTV
- 30% of payment will be made upon completion of the standalone acceptance tests as specified in Section 1201.3(b).
- 20% of payment will be made upon completion of the 60-day test as specified in Section 1201.3(b).

Completion of tests includes completion of training, submission of all manuals and documentation as required, and completion of all final inspections as required by the Representative.

SECTION 1216—MAINTENANCE, CLOSED CIRCUIT TELEVISION (CCTV) CAMERA

1216.1 DESCRIPTION—This work is to furnish, install, modify, repair, replace, and remove components of a CCTV Camera subsystem.

1216.2 MATERIAL—Section 1210.2

1216.3 CONSTRUCTION—Section 1210.3 and as follows:

(a) Preventive Maintenance.

1. General. Section 1206.3(a)1

2. Site. Section 1206.3(a)2

3. Enclosures. Section 1206.3(a)3

4. Camera Poles and Structures. Inspect camera poles for wear, rust, cracks, and missing, damaged or bent sections. Inspect and test lowering device. Check bolts for rust and tightness. Install or replace screening at the base plate as necessary.

5. Pan/Tilt Drives and Housings. Inspect for wear, rust, cracks, missing, damaged, or bent parts, loose connections, frayed cables, lowering device, and general condition. Ensure proper ventilation. Check attachment hardware. Clean, repaint, and repair as necessary. Thoroughly clean solar panels that power the battery packs. Test communications system. Test power and communications line surge suppressors and replace as necessary. Test and verify communications system with TMC.

6. Portable Lowering Tool. Hoist inspections, maintenance, and repairs will be performed only by trained, experienced, and qualified hoist inspection, maintenance, and repair personnel. The hoist operator will not perform frequent and periodic inspections, maintenance, or repairs on a manually operated hoist, unless the operator has been trained to perform such inspections, maintenance, or repairs on a manually operated hoist and is designated by the hoist manufacturer to perform such inspections, maintenance, and repairs. For information on hoist inspection, maintenance and repairs, always refer to the manual furnished by the manufacturer of the hoist, or contact the manufacturer directly.

(b) On-call Maintenance.

1. General. Section 1206.3(b)1

After On-call Maintenance (OM) has been completed, perform Preventive Maintenance (PM) as specified in Section 1216.3(a).

2. Responsiveness. Section 1206.3(b)2

1216.4 MEASUREMENT AND PAYMENT—

(a) Preventive Maintenance, CCTV Camera Subsystem. Each

All labor, materials, and equipment required for routine preventive maintenance are incidental to this item including, but not limited to, the Statewide Device Identification Number, cleaning materials, caulk, metal meshing, lubricants, filters, lamps, paint, surge suppressors, fuses, circuit breakers, attachment hardware, insect prevention measures,

rodent control measures, clearing and grubbing, selective tree trimming, snow and ice removal, and weed control measures. Mobilization is incidental to this item.

(b) On-call, CCTV Camera Subsystem Mobilization. Each

Mobilization will not be paid for procurement of parts. Travel to and from the site and district stockpile is incidental to this item.

(c) On-call, CCTV Camera Subsystem Repair. Hour

Repair time will not be paid for procurement of parts. Travel to and from the site and district stockpile is incidental to this item. Site specific snow and ice removal requested by the Department is included within this item.

(d) On-call, CCTV Camera Subsystem Parts. Dollar

Includes all cables, connectors, equipment racks, conductor(s), and other parts necessary for proper installation and configuration of a CCTV Camera subsystem.

(e) Maintenance and Protection of Traffic. Section 901.4(a).

SECTION 1217—MAINTENANCE, PORTABLE CLOSED CIRCUIT TELEVISION (PCCTV) CAMERA

1217.1 DESCRIPTION—This work is to furnish, install, modify, repair, replace, and remove components of a Portable Closed Circuit Television (PCCTV) Camera subsystem.

1217.2 MATERIAL—Section 1211.2

1217.3 CONSTRUCTION—Section 1211.3 and as follows:

(a) Preventive Maintenance.

1. General. Section 1206.3(a)1

2. Site. Section 1206.3(a)2

3. Enclosures. Section 1206.3(a)3

4. Trailer and Mount Structure. Lubricate all hinges, jacks stands, mast, and trailer hitches. Inspect for wear, rust, cracks, missing, damaged or bent parts, loose connections, frayed cables and general condition. Check attachment hardware and tighten if necessary to the appropriate parameters. Clean, repaint and repair as necessary.

5. Pan/Tilt Drives and Housings. Inspect for wear, rust, cracks, missing, damaged, or bent parts, loose connections, frayed cables, lowering device, and general condition. Ensure proper ventilation. Check attachment hardware. Clean, repaint, and repair as necessary. Thoroughly clean solar panels that power the battery packs. Test communications system. Test power and communications line surge suppressors and replace as necessary.

(b) On-call Maintenance.

1. General. Section 1206.3(b)1.

After On-call Maintenance (OM) has been completed, perform Preventive Maintenance (PM) as specified in Section 1217.3(a).

2. Responsiveness. Section 1206.3(b)2

1217.4 MEASUREMENT AND PAYMENT—

(a) Preventive Maintenance, Portable Closed Circuit Television (PCCTV) Camera Subsystem. Each

All labor, materials, and equipment required for routine preventive maintenance are incidental to this item including, but not limited to, the Statewide Device Identification Number, cleaning materials, caulk, metal meshing, lubricants, filters, lamps, paint, surge suppressors, fuses, circuit breakers, attachment hardware, insect prevention measures, rodent control measures, clearing and grubbing, selective tree trimming, snow and ice removal, and weed control measures. Mobilization is incidental to this item.

(b) On-call, Portable Closed Circuit Television (PCCTV) Camera Subsystem Mobilization. Each

Mobilization will not be paid for procurement of parts. Travel to and from the site and/or district stockpile is incidental to this item.

(c) On-call, Portable Closed Circuit Television (PCCTV) Camera Subsystem Repair. Hour

Repair time will not be paid for procurement of parts. Travel to and from the site and/or district stockpile is incidental to this item. Site specific snow and ice removal requested by the Department is included within this item.

(d) On-call, Portable Closed Circuit Television (PCCTV) Camera Subsystem Parts. Dollar

Includes all cables, connectors, equipment racks, conductor(s), and other parts necessary for proper installation and configuration of a PCCTV Camera subsystem.

(e) Maintenance and Protection of Traffic. Section 901.4(a).

SECTION 1220—HIGHWAY ADVISORY RADIO SUBSYSTEM

1220.1 DESCRIPTION—This work is to furnish and install a Highway Advisory Radio (HAR) subsystem with the capability to locally store and broadcast audio messages to traveling motorists from the transmitter over a programmable amplitude modulated (AM) frequency, and to alert motorists of the message using flashing beacons and advisory sign.

1220.2 MATERIAL—

(a) General. Provide transmitter subsystem that includes AM transmitter, field enclosure, digital recorder/player, National Oceanic and Atmospheric Administration's (NOAA) weather receiver, digital recorder/playback module, digital communications controller, Global Positioning System (GPS) synchronization unit, an integrated AC/DC power supply, wood pole, mounting apparatuses, and all necessary cables, connectors and wiring to provide a fully functional HAR subsystem.

Provide HAR transmitter subsystem with the capability to communicate with flashing beacon sign subsystems that alert motorists to a message being broadcast. Transmitter must be fully compatible with HAR beacon subsystem specified in Section 1220.2(h). Provide HAR subsystem that includes software and hardware to configure, operate and monitor the HAR transmitter locally in the field using a portable laptop computer and remotely using a personal computer.

Furnish HAR transmitter subsystem compliant with CFR Title 47, Section 2.901 (Part 2, Subpart J); Section 68, Connection of Terminal Equipment to the Telephone Network; and Section 90.242, Travelers' Information Stations.

(b) Transmitter. Furnish field-hardened, high-efficiency Class D, AM broadcast band to meet the rigorous demands of HAR use. Provide an FCC approved and certified traveler information station transmitter that meets the following requirements:

- Operating frequency in accordance with the FCC license application and research (530-1700kHz inclusive)
- Class D common source amplifier
- Adjustable Radio Frequency (RF) output power up to 10 watts, nominal, using a 12-volt power supply
- Remotely adjustable output power level
- Frequency tolerance: 100 Hz or better
- Harmonic attenuation: Greater than FCC specification of 53 dB with approved antenna subsystem
- Operating Voltage Standing Wave Ratio (VSWR): 1.5 to 1 or less
- Modulator: 20 watt bridge amplifier with transformer coupling; capable of 100% modulation up to 15 watts RF output
- Audio distortion: Less than 1.5% from 200 Hz to 3.5 kHz
- Noise level: At least 70 dB below 80% modulation level
- Automatic modulation limiter on modulation peaks above 80% including a maximum limit of 100% modulation; 12 dB overload range
- Built-in FCC compliance audio filter (-3dB at 3kHz, 18 dB/octave roll off)
- Audio Inputs: Line input adjustable from +12dBm to -20dBm; telephone input adjustable from 0dBm to -20dBm; selector switch
- Power consumption: 1.5 A at 12 VDC
- Power operating range: 10 VDC to 14 VDC
- Temperature operating range: -40F to +165F
- Humidity operating range: 95% (non-condensing)
- Unbalanced RF output impedance of 50 ohms
- Transmitter power efficiency of 80% or greater

- Integrated Light Emitting Diode (LED) indicators on the front panel of the transmitter that displays power on/off, transmit on/off, and VSWR statuses
- Self-supporting and capable of withstanding wind gusts of up to 80 miles per hour and 1/2 inch of radial ice
- Buffered from transmitter through lightning protection circuitry
- Transmission Control Protocol (TCP)/IP capable

(c) Digital Recorder/Playback Module. Provide a digital recorder/player meeting the following requirements:

- FCC certified under Part 68 for dial-up operations
- Local and remote control of all functions
- Multiple modes of operation including: Playlist, Emergency, Auxiliary (Weather Radio), Go Live, and Off
- User-definable time period up to 1,440 minutes (1 day) for the “Auxiliary” Mode, after which it must revert to the previous HAR mode. Provide module with the capability to operate in “Auxiliary” Mode for an indefinite period
- User-definable time period for the “Go Live” mode up to 1,440 minutes (1 day), after which the subsystem must revert to the previous HAR mode. Provide module with the capability to operate in “Go Live” Mode for an indefinite period
- Simultaneous record/playback of messages
- 999 distinct, variable length messages, 25 playlists (each with up to 100 messages), and master schedule with up to 200 events
- Message retention subsystem that does not require a battery to retain messages in the event of main power loss. Stores messages indefinitely
- Use of an external time source with an accuracy of at least 50 nanoseconds
- Capability to simultaneously launch the audio broadcast such that the audio is synchronized to other adjacent HAR transmitters. Use of “master” and “slave” HAR transmitters, where one transmitter disseminates a message to adjacent transmitters, is not acceptable
- Programmable by day of the week, date and time
- Security code access
- 28 MIP 16-bit Digital Signal Processor (DSP) microprocessor
- Firmware programmable in the event new features are later added
- Memory to support 80 minutes of messaging at 5 kHz audio bandwidth
- Built-in voice prompts for ease of use
- Switch selectable inputs for telephone, local handset, line, and microphone; automatic reset to telephone after period of inactivity from other inputs; 4 expansion audio input channels
- RS-232 and parallel digital interfaces
- Broadcast of messages from the NOAA weather receiver at programmable times and intervals, or on command from the control software
- Built-in local microphone for field recording of messages
- TCP/IP capable
- Control Methods. Provide two methods of HAR control:
 - Dual Tone Multi-Frequency (DTMF) tones (via standard analog telephone line or digital cellular telephone)
 - Digital commands
- Download Methods. Provide two methods of downloading messages to the HAR transmitter:
 - Real time audio (e.g. voice or playing recorded audio)
 - Transfer of digitized audio files (.wav files)
- Closed Loop Control & System/Health Monitoring. Provide the following capabilities:
 - Verification that commands entered by the user have been successfully or unsuccessfully processed
 - Verification that the HAR Mode and playlist have not changed since the last connection with the HAR

- Verification of the current HAR mode (Off, Playlist, Emergency, Live, Auxiliary, Weather)
- When updated, the HAR subsystem records a time stamp indicating the last time the HAR was updated. Each time the HAR is accessed, the HAR subsystem verifies that this recorded time stamp has not changed unexpectedly to assure the user that the subsystem has remained intact and has not been accessed by an unknown user
- Seven analog instrument inputs for expansion options
- Audio Quality – 5 kHz bandwidth, less than 1% distortion, greater than 80 dB dynamic range
- Manual and automatic level control
- Audio Outputs – Transmitter, telephone, headphones, line, local
- Programming Controls – Local: handset; Remote; touch-tone keypad
- Instrumentation input lines with Transistor-transistor logic (TTL) Interfaces: 7 A/D channels, 8-bits, 0-2.5 volt levels, 16 digital
- Power consumption: 0.35 A at 12 VDC
- Temperature: -40F to +165F
- Humidity: 95% (non-condensing).
- The Following Operational Statuses:
 - Status of Battery voltage (if battery back-up system is used or if it is solar-powered system)
 - Status of AC Power vs. DC Power operation
 - Current HAR mode (Off, Playlist, Emergency, Live, Auxiliary)
 - Absence of Broadcast (from a silence sensor)
 - Audio Broadcast (demodulated broadcast available when remotely accessed by an operator or computer through an analog telephone line)
- Upon detection of a fault condition for any of the above parameters, the HAR must send notifications to the TMC/RTMC using the following methods:
 - To the Central Software Subsystem
 - By e-mail notification
 - By pager notification
 - By telephone notification (to landline or digital cellular telephones)

(d) Weather Receiver Module. Provide a weather receiver module that receives up-to-the-minute information directly from the National Weather Service (NWS). Include all seven selectable frequency bands, including split channels. Include a built-in speaker and headphone jack for monitoring weather information on site. Provide unit that works in conjunction with the digital recorder/player to automatically interrupt the current message being broadcast upon receipt of an emergency alert from the NWS. Provide Alert feature (on/off) as well as the feature to set the duration for broadcasting the alert that is selectable from within the digital recorder/player's voice prompts. Provide weather receiver with the following characteristics:

- Frequency: seven selectable frequencies; selectable through a series of dip switches; Internal speaker and headphone jack.
- Sensitivity: Better than 0.2μV; S/N better than 12 dB
- Selectivity: ±10 KHz at -6Db; ±20 KHz at -70 Db
- Weather Alert: Detects 1050 Hz tone; LED & TTL outputs
- Antenna: External 50Ω BNC connector
- Power Input: less than 0.4 A at 12 VDC
- Operating Temperature: -40F to +165F; Humidity 95% (non-condensing)
- TCP/IP capable

(e) Global Positioning System (GPS) Synchronization Unit. Furnish GPS synchronization unit to synchronize radio frequency signals broadcast by multiple HAR transmitter units. Provide unit to tune the operating frequency of the transmitter to a high precision using phase locking to timing signals received from GPS satellites.

Display power, GPS reception quality, satellite lock, and HAR transmitter frequency lock indicators on the front panel display of the unit. Size GPS unit to fit in the rack or chassis included in the ITS enclosure specified in Section 1201.2(b). Provide field hardened unit with ambient operating temperature range of -40F to +165F.

(f) Grounding Rod. Utilize manufacturer recommended grounding system at the transmitter location. Where no manufacturer recommendations exist, utilize Section 1101.11(j). Obtain Representative approval before installing grounding system.

(g) Transmitter Pole. Section 1101.11(a) and as follows: Size pole in accordance with HAR subsystem manufacturer's recommendations. Furnish minimum 30 foot pole height.

(h) HAR Flashing Beacon and Sign. Provide an HAR beacon subsystem consisting of HAR advisory sign equipped with dual flashing beacons that are activated upon the broadcast of a radio message from nearby HAR Transmitters. A HAR Beacon subsystem is comprised flashing beacon unit, reflective advisory sign, foundation, structure, breakaway system, complete power subsystem (via solar power or power point of service), flashing beacons, field enclosures, an integrated AC/DC power supply, battery backup subsystem, and all necessary cables, connectors and wiring to provide a fully functional HAR beacon subsystem.

Provide HAR beacon subsystem with flashing beacons that activate at preset flashing intervals when a message is broadcast from a nearby transmitter. Provide compatibility to fully control beacons with existing central control software used to control HAR transmitter. Where no software exists at the TMC/RTMC, provide software as specified herein.

1. Beacons. Furnish two 12-inch amber, LED single section heads with maximum power consumption per each signal head not exceeding 15 Watts. Provide LED rated for 100,000 hours of continuous operation, in the operating temperature range of -31F to +167F. Wire individual LEDs in at least six parallel groupings of equal quantity, such that the failure of a single LED will at most deactivate only its grouping. Arrange individual LED's in concentric circles, with denser packing towards the center, to more closely represent a typical incandescent signal. Provide ultraviolet (UV) stabilized polycarbonate signal heads to withstand direct sunlight exposure for a minimum of 5 years without exhibiting evidence of deterioration. Coordinate with the LED signal head manufacturer to select the wavelengths of the LED in order to maximize visibility of the LED signal heads.

Furnish one NEMA-Rated dual circuit flasher along with an additional seven position terminal strip, barrier type rated at 20 A, 600 V RMS minimum, to support wire connections to second signal head and to flasher control circuitry. Provide a similar three position terminal strip in the signal head. Provide interface to enable capability to activate, control, and monitor the HAR beacons via a communication method specified.

Furnish beacon mounting hardware constructed of stainless steel. Fabricate brackets of aluminum alloy ASTM B221, Alloy 6061-T6 or equal with a load concentrating boss of stainless steel ASTM A582, type 416 or equal. Fabricate coupling bolt of ASTM A325 galvanized in accordance with ASTM A153. Fabricate couplings of alloy steel AISI-4130H or 4340H and capable of withstanding a minimum tensile force of 47 KIPS. Provide adequate insulation between dissimilar metals to minimize the possibility of galvanic reactions.

Provide secure connections between the LED beacons and sign supports in accordance with the manufacturer's recommendations.

2. Type A Advisory Sign. Section 930.2

3. Type E Advisory Sign. Section 934.2

4. Advisory Sign Legend. Section 1103.02 and as follows: Provide sign with two-sections, a top and a bottom section, each with border and legend. Color background of top section high-intensity, reflectorized yellow, and color legend and border of non-reflectorized black. Provide the top section with legend that reads "TRAFFIC ADVISORY WHEN FLASHING." Color background of bottom section reflectorized blue, and legend and border of reflectorized white. Provide the bottom section (advisory sign frequency panel) with legend of "HIGHWAY INFO TUNE RADIO TO XXXX AM". Utilize AM frequency identified by Representative, and as approved by the FCC permit. Verify the station frequency and sign text before finalizing sign. Provide sign with 1 1/4 inch border with 6 inch corner radii. Use Series E letters and numbers for all legends.

Provide separate frequency panel sized only to display the licensed AM radio frequency. Fabricate frequency panel of the same material as the advisory sign.

5. Power Supply. Provide complete solar power supply to the HAR beacon sign, if indicated. Provide complete power management subsystem for the HAR flashing beacons in accordance with Section 1201.2(e).

5.a Solar Installations. For solar panel powered installations, provide photovoltaic, single crystal silicon solar panel modules and battery bank subsystem to operate the flashing beacons continuously at full power for a minimum of 8 consecutive hours without solar array exposure to sunlight. Provide solar panel array that is compliant with International Electrotechnical Commission's (IEC) 61215 standard. Provide subsystem with DC output power is nominal 13.6 V direct current at 5 A, with maximum 15 VDC and maximum 10 A. Provide maintenance-free 12 volt gel batteries that are rated at a minimum of 180 A-hours, and are deep cycle. Furnish trickle charger to charge batteries for use.

Furnish beacon and solar panel mounting hardware constructed of stainless steel. Fabricate brackets of aluminum alloy ASTM B221, Alloy 6061-T6 or equal with a load concentrating boss of stainless steel ASTM A582, type 416 or equal. Fabricate coupling bolt of ASTM A325 galvanized in accordance with ASTM A153. Fabricate couplings of alloy steel AISI-4130H or 4340H and capable of withstanding a minimum tensile force of 47 kips. Provide adequate insulation between dissimilar metals to minimize the possibility of galvanic reactions.

Provide NEMA 3R rated enclosure to house battery bank. Provide NEMA rated enclosure that prevents water ingress during operation. Utilize rigid galvanized steel conduit to house all wires between the solar array, battery bank and ITS enclosure. Furnish a NEMA enclosure that completely contains any spills from damaged or malfunctioning batteries.

5.b Hard-Wire Installations. Section 954.3(f),

6. Control Software. Section 1220.2(j)

7. Grounding Rod. Section 1101.11(j)

(i) ITS Enclosure. Section 1201.2(b)

(j) Control Software. Provide HAR transmitter and flashing beacon subsystem that is fully compatible with existing software utilized to remotely control the HAR subsystem. Provide integration of HAR subsystem and all components into existing software.

Provide full remote monitoring capabilities of HAR transmitters, including the operational status of all equipment as defined in Sections 1220.2(a) 1220.2(b) and 1220.2(c). Provide synchronization of broadcasted messages among multiple HAR transmitter stations as needed based on proximity to other HAR transmitters. Provide control, operation, and monitoring of all HAR beacons specified in Section 1220.2(h). Provide capability to associate individual HAR beacons with the HAR transmitter location within the software.

1220.3 CONSTRUCTION—

(a) General. Install HAR subsystem field equipment, including the field enclosure and HAR beacons, per the manufacturer's recommendations. Install control software or integrate into existing software on PCs, Laptop computers and network servers as identified by the Representative. Install software and hardware in the TMC/RTMC without disturbing TMC/RTMC operations. No down time will be allowed of any TMC/RTMC workstation, unless otherwise indicated by the Representative.

(b) HAR Flashing Beacon. Install HAR beacon, sign assembly and all field equipment per the manufacturer's recommendations. Integrate beacons into control software at the TMC/RTMC. Integrate into software on all PCs, laptop computers and network servers that already contain the central control software. Integrate beacons at the TMC/RTMC without disturbing TMC/RTMC operations.

Configure the two circuits in the dual circuit flasher to flash alternately, at intervals between 50 flashes per minute and 60 flashes per minute, upon activation.

1. Solar Panels. Mount solar panels at the top of the sign structure at the proper angle for optimum performance, in accordance with the recommendation of the solar panel manufacturer. Mount solar panels on steel

post that is farthest from trees and trim/remove trees in order to subject solar array direct sunlight for 75% of the day. Provide mounting capable of swiveling, tilting, and re-angling the cells in order to optimize exposure to solar rays. Include capability to lock the solar panels at any angle necessary to optimize solar exposure.

2. ITS Enclosure. Section 1201.3(a) and as follows: Mount ITS enclosure on HAR sign structure, on the support that is farthest from the roadway.

3. Conduit. Install conduit supports in accordance with NEC 347-8 and table 347-8.

(c) Type A Advisory Sign. Section 930.3

(d) Type E Advisory Sign. Section 934.3

(e) Advisory Sign Frequency Panel. Mount frequency panel to the advisory sign in the location that indicates the AM radio frequency. Fasten frequency panel to advisory sign in a manner such that it is easily removable and changeable.

(f) Transmitter Pole. Install HAR antenna and control enclosure on a minimum 30 foot wooden utility pole using secure connections.

(g) Permits and Licenses. Acquire FCC license, or adjust existing FCC license for the use of the HAR transmitter at each deployment site, at the frequency band specified or as directed by the Representative. These services include all preparations necessary to complete all required application forms, and coordination to make certain that all parts of the HAR subsystem comply with existing FCC rules. All related FCC fees are incidental to the cost of this item.

(h) Submissions. Section 1201.2(f)

(i) ITS Enclosure. Section 1201.3(a)

(j) Grounding. Install manufacturer recommended grounding system at the transmitter location. Where no manufacturer recommendations exist, utilize Section 910.3(q). Obtain Representative approval of grounding system before installation. Terminate the core conductor of the antenna cable at a transient voltage surge suppressor in the related enclosure, before further connections to the transmitter or any electronic device in the enclosure. Ground the surge suppressor to the adjacent grounding electrode system. Terminate the shield (metallic armor) of the antenna cable to the grounding electrode system of the antenna pole. Provide this grounding to the part of the antenna cable near the base of the related pole, outside the related transmitter enclosure.

(k) Testing. Section 1201.3(b)

(l) Integration. Section 1201.3(c)

(m) Training. Section 1201.3(d)

1220.4 MEASUREMENT AND PAYMENT—

(a) HAR Transmitter Subsystem. Each

Includes transmitter, weather receiver, digital recorder/playback module, wires, connectors, permit acquisition, grounding, installation, mounting, documentation, FCC permits and licenses, integration, training, and work for a complete HAR transmitter subsystem.

- 50% of payment will be made upon complete installation of HAR pole and transmitter equipment.
- 30% of payment will be made upon completion of the standalone acceptance tests as specified in Section 1201.3(b).
- 20% of payment will be made upon completion of the 60-day test as specified in Section 1201.3(b).

Completion of tests includes completion of training, submission of all manuals and documentation as required herein, and in the Contract, and completion of all final inspections, as required by the Representative.

(b) HAR Flashing Beacon Subsystem. Each

Includes beacons, connections, wiring, cabling, grounding, mounting, installation, integration, training, and related equipment to provide a fully functional subsystem.

- 50% of payment will be made upon complete installation of HAR beacon equipment,
- 30% of payment will be made upon completion of the standalone acceptance tests as described in Section 1201.3(b).
- 20% of payment will be made upon completion of the 60-day test as specified in Section 1201.3(b).

Completion of tests includes completion of training, submission of all manuals and documentation as required herein, and in the Contract, and final inspections as required by the Representative.

(c) GPS Synchronization Unit. Each

Includes wiring, cabling, installation and integration.

(d) Type A Advisory Sign. Section 930.4

(e) Type E Advisory Sign. Section 934.4

(f) Transmitter Pole. Each

For the type indicated. Includes mounting equipment used to mount transmitter and related transmitter cables and equipment.

SECTION 1226—MAINTENANCE, HIGHWAY ADVISORY RADIO (HAR) SUBSYSTEM

1226.1 DESCRIPTION—This work is to furnish, install, modify, repair, replace, and remove components of a Highway Advisory Radio (HAR) subsystem.

1226.2 MATERIAL—Section 1220.2

1226.3 CONSTRUCTION—Section 1220.3 and as follows:

(a) Preventive Maintenance.

1. General. Section 1206.3(a)1

2. Site. Section 1206.3(a)2

3. Enclosures. Section 1206.3(a)3

4. Transmitters. Inspect for wear, rust, cracks, missing, damaged or bent parts, loose connections, frayed cables, damage caused by lightning, leaning, car impacts, or vandalism, and general condition. Check batteries. Clean, repaint, and repair as necessary.

Verify the broadcast signal strength of the HAR transmitter via the dials located on the front panel. Verify that the HAR transmitter is clearly transmitting a signal by utilizing a car radio and turning the dial to the appropriate channel. Test communication system, including pager systems.

Test power and communications line surge suppressors and replace as necessary. Test all static signing flashing warning devices associated with the HAR systems, check batteries, clean controller enclosure and solar panels that power the battery packs.

5. Flashing Warning Beacons. Verify the operation and inspect, clean, and repair the components of the system including, but not limited to: flashing LED yellow lights, supports, signage legend, aluminum sheet, foundation, connections, field enclosure, dual circuit flasher controller, modems, communications, programming, services, conduit, junction boxes, wiring, sign luminaries, solar panels, and battery back-up if applicable along with any other related system equipment.

(b) On-call Maintenance.

1. General. Section 1206.3(b)1.

After On-call Maintenance (OM) has been completed, perform Preventive Maintenance (PM) as described in Section 1226.3(a).

2. Responsiveness. Section 1206.3(b)2

1226.4 MEASUREMENT AND PAYMENT—

(a) Preventive Maintenance, HAR Subsystem Transmitter. Each

All labor, materials, and equipment required for routine preventive maintenance are incidental to this item including, but not limited to, the Statewide Device Identification Number, cleaning materials, caulk, metal meshing, lubricants, filters, lamps, paint, surge suppressors, fuses, circuit breakers, attachment hardware, insect prevention measures, rodent control measures, clearing and grubbing, selective tree trimming, snow and ice removal, and weed control measures. Mobilization is incidental to this item.

(b) Preventive Maintenance, HAR Subsystem Beacon. Each

All labor, materials, and equipment required for routine preventive maintenance are incidental to this item including, but not limited to, the Statewide Device Identification Number, cleaning materials, caulk, metal meshing, lubricants, filters, lamps, paint, surge suppressors, fuses, circuit breakers, attachment hardware, insect prevention measures, rodent control measures, clearing and grubbing, selective tree trimming, snow and ice removal, and weed control measures. Mobilization is incidental to this item.

(c) On-call, HAR Subsystem Transmitter Mobilization. Each

Mobilization will not be paid for procurement of parts. Travel to and from the site and/or district stockpile is incidental to this item.

(d) On-call, HAR Subsystem Beacon Mobilization. Each

Mobilization will not be paid for procurement of parts. Travel to and from the site and/or district stockpile is incidental to this item.

(e) On-call, HAR Subsystem Transmitter Repair. Hour

Repair time will not be paid for procurement of parts. Travel to and from the site and/or district stockpile is incidental to this item. Site specific snow and ice removal requested by the Department is included within this item.

(f) On-call, HAR Subsystem Beacon Repair. Hour

Repair time will not be paid for procurement of parts. Travel to and from the site and/or district stockpile is incidental to this item. Site specific snow and ice removal requested by the Department is included within this item.

(g) On-call, HAR Subsystem Transmitter Parts. Dollar

Includes all cables, connectors, equipment racks, conductor(s), and other parts necessary for proper installation and configuration of a HAR subsystem.

(h) On-call, HAR Subsystem Beacon Parts. Dollar

Includes all cables, connectors, equipment racks, conductor(s), and other parts necessary for proper installation and configuration of a HAR subsystem.

(i) Maintenance and Protection of Traffic. Section 901.4(a).

SECTION 1230—DYNAMIC MESSAGE SIGNS

1230.1 DESCRIPTION—This work is to furnish and install a light emitting diode (LED) based, full color, full matrix Dynamic Message Sign (DMS) subsystem. The DMS will be utilized to disseminate traveler information to motorists that may include, but is not limited to, road closure information, adverse weather and roadway conditions, detour routes, and travel times.

1230.2 MATERIAL—

(a) Shop Drawing Approval. Submit the following (as a minimum) to the Department before purchase of the DMS Subsystem:

- A letter from the manufacturer certifying the sign has been designed and furnished according to all AASHTO guidelines and requirements.
- Sign housing shop drawings.
- Certification verifying the ambient operating temperature range of the DMS.
- LED brightness and color bins that are used in each pixel. Provide a letter of certification from the LED manufacturer that demonstrates testing and binning according to the International Commission on Illumination (CIE) 127 (1997) standard.
- A list of the character fonts and samples of the fonts.

(b) General. Provide DMS with full-color, full-matrix, RGB LED displays, complete with a minimum cone of vision of 15 degrees around the vertical axis of any pixel on the sign. Provide DMS with front-panel or walk-in accessible to maintenance crews. Furnish a DMS subsystem complete with all individual units, components, software modules, cabling, connectors, etc. that are completely compatible with each other and the existing Advanced Traffic Management Software (ATMS) at the Traffic TMC/RTMC. Provide Ethernet (copper Cat.6) or fiber optic connection between the DMS Controller in the ITS Node Cabinet and the DMS enclosure communications interface electronics. Provide single mode (or multi-mode) fiber connections between the controller cabinet and the DMS cabinet according to the manufacturer's recommendations. Provide power conductors between the DMS cabinet and the controller cabinet, according to the manufacturer's recommendations in separate conduit. Provide two spare Ethernet(copper) ports, or combo fiber/copper ports at the communications interface. Provide a DMS subsystem where all exposed material on the DMS, enclosure, and other exposed appurtenances is corrosion-resistant. Prevent ambient magnetic and electronic fields, including fields generated by the DMS itself, from interfering with or disrupting subsystem performance. Prevent magnetic and electronic fields generated by the DMS subsystem from interfering with other electronic systems near the DMS.

Fabricate, weld, and inspect DMS according to ANSI/AWS. Seal or otherwise make indelible all identifications, including labels, markings, and engravings, on the sign and its components.

Furnish all equipment to allow maintenance access from the front panels or from the central corridor of a walk-in sign for ease of maintenance. Require no special tools to access the sign or its components. Enable all equipment to be accessible without disassembly for inspection and maintenance purposes. Orient all equipment indicator lights, LEDs, and user interfaces in a manner that is readily visible to maintenance or inspection crews accessing the sign. Provide readily accessible and clearly labeled test points for maintenance or inspection crews to test voltage at essential locations. Terminate all external connections using industry standard, safe, tamper resistant connectors. Key connectors to resist improper hookups.

Provide the capability to store at least 132 pre-programmed messages (100 permanent and 32 temporary) locally at the DMS or in the device TMC/RTMC software or both.

Furnish DMS meeting the criteria of the following codes and standards:

- NEC

- AASHTO - Standard Specifications for Structural Supports for Highway Signs, Luminaries, and Traffic Signals (ITE publication No. LP-321), with current addendums.
- AWS D 1.2 Structural Welding Code – Aluminum and AWS A 5.1 & A 5.5 Structural Welding Code - Steel
- ASTM International
 - ASTM A 36 Steel
 - ASTM B 209 Aluminum and Aluminum Alloy Sheet and Plate
 - ASTM A 325 High Strength Bolts
 - ASTM B 686 Aluminum Alloy Castings, High Strength
- Electrical Testing Laboratories, Inc. (ETL)
- Electronic Institute of America (EIA). EIA/ TIA-232- E Interface Between Data Terminal Equipment and Data Circuit Terminating Equipment Employing Serial Binary Data Interchange; and EIA-422- A Electrical Characteristics Of Balanced Voltage Digital Interface Circuits
- MUTCD and Standard Alphabets for Highway Signs and Pavement Markings most current version adopted by the Department
- NEMA – TS4 Standard
- TS4-2005 Hardware Standards for Dynamic Message Signs with NTCIP requirements
- NTCIP Standards (most recent approved versions):
 - NTCIP 1101 - Signal Transportation Management Framework (STMF)
 - NTCIP 1102 - Base Standard: Octet Encoding Rules (OER)
 - NTCIP 1103 - Simple Transportation Management Protocol (STMP)
 - NTCIP 1201 - Global Object Definitions
 - NTCIP 1203 - Object Definitions for DMS – (Section 0 for full list of Functional Requirements for DMS) NTCIP 2001 - Class B Profile
 - NTCIP 2101 - Point to Multi-Point Protocol Using RS-232 Subnet Profile
 - NTCIP 2102 - Subnet Profile for PPP over FSK Modems
 - NTCIP 2103 - Subnet Profile for Point-to-Point Protocol using RS 232
 - NTCIP 2104 - Subnet Profile for Ethernet
 - NTCIP 2201 - Transportation Transport Profile
 - NTCIP 2202 - Internet (TCP/IP and UDP/IP) Transport Profile
 - NTCIP 2301 - Application Profile for Simple Transportation Management Framework (STMF)
 - NTCIP 2303 - Application Profile for File Transfer Protocol (FTP)
- Standards for Enclosures for Electrical Equipment (Publication No. 250)
- Standards for Wiring Devices - Dimensional Requirements (Publication No. WD6)
- NFPA-70
- OSHA
- UL
- ANSI
- IEEE
- International Standards Organization (ISO)

(c) Sign Housing. Furnish DMS Sign and housing rated for continuous usage of at least 20 years. Furnish DMS sign to withstand wind loads defined in Publication 647 without deformation, damage, or unreasonable fatigue.

Fabricate external skin of the sign housing of aluminum alloy 5052 H32, a minimum of 0.125 inches thick. Attach all external cables to the sign housing using clamps, or by other means as directed; adhesive attachment is not acceptable. Encase external cabling in rigid galvanized steel (RGS) conduit. Continuously weld all external seams, joints, excluding the sign face panels or display, using inert gas welding method. The maximum number of seams at the top of the sign housing is three. Stitch weld the external sign housing to the internal housing structure to form a single, unitized structure.

Fabricate all external sign mounting assembly components from aluminum alloy 6061-T6 extrusions, with minimum size of W6x15 according to Publication 647. Provide Z-Brackets according to Publication 647, each of a minimum thickness of 0.25-inch. Attach all structural members to the internal framework of the sign.

Provide a minimum of four drain holes on the bottom of the sign housing that are centered from the front to back edges of the bottom sign panel, and spaced evenly across the sign's full length. Screen all drain holes to prevent the

entrance of small insects and animals. Slope the bottom of the sign housing panel towards the drain holes in order to prevent the accumulation of water at the bottom of the sign.

On the top panel of the sign housing, provide multiple steel lifting eyebolts or other equivalent hoisting points to be used during transport and installation. Lifting bolts or hoisting points are to be connected directly to the sign housing internal structure. The hoist points must enable the sign to be lifted evenly during transport and installation. On the top panel of the sign housing, make provisions to prevent the pooling or collecting of water on the top of the sign housing.

1. External Sign Face Panels. Furnish weather-resistant sign face panels. Provide panels to prevent moisture, dirt, dust or other foreign objects to permeate the sign face at the seams or at the edges of pixel holes. Construct sign face panels of aluminum, and coat with a matte-black coating system according to or exceeding American Architectural Manufacturers Association (AAMA) Specification 2605. Provide sign face panels that do not limit the cone of vision of the individual LED pixels, or the sight distance of the sign as a whole.

2. Lens Panel Assembly. Incorporate lens panel assemblies with sign face panels. Furnish lens panels that are modular in design, and allow for ease of removal, and interchangeability.

2.a Lens Panel. Provide lens panel mask fabricated of aluminum. Finish mask with a matte-black coating system according to or exceeding AAMA Specification 2605. Perforate the panel to provide an aperture for each pixel on the display modules. Each aperture must be as small as possible, without blocking the LED light output at the required viewing angle.

Provide lens panel glazing that is 90% ultraviolet (UV) opaque polycarbonate, clear in color, and laminated to the inside surface of the lens panel aluminum mask to form lens panel assembly.

(d) Interior Structure.

1. Internal Structural Members. Construct internal structural members including the structural frame out of aluminum alloy 6061-T6 or 6063-T5. Provide internal structural members to accommodate all LED mounting and air distribution subsystems as applicable. Provide internal structural members to retain the display modules in a manner that facilitates ease of maintenance, including the rapid removal of individual display modules. Enable the removal of individual display modules without interfering with adjacent or surrounding modules.

2. Sign Housing Surface Finish. Finish sign face with a matte-black fluoropolymer coating system according to or exceeding AAMA Specification 2605. Provide certification from the licensed coating manufacturer for all aluminum face materials.

3. Sign Housing Access Door for Walk-In DMS. Where a walk-in sign is utilized, provide a sign housing door that is fabricated from aluminum. Equip sign with a minimum of two vertically hinged access doors located at the right and left sides (while facing the front of the sign) of the DMS housing. Mount doors to door frames that are integral to the sign housing. Provide stainless steel hinges to support the door, and enable the door to open outwards. Furnish access door to be a minimum of 2 feet wide and 80 inches high. Equip door with a handle-operated locking mechanism, closed-cell neoprene gasket, and stainless steel hinges. Locate door release levers so a person without keys and tools cannot become trapped inside the housing. Furnish doors with a hinge/stop mechanism that retains the door in a 90-degree open position.

Furnish a Grade 1 three-point center-case dead bolt locking mechanism that conforms to ANSI/Builders Hardware Manufacturers Association (BHMA) Standard A156.2 and utilizes a zinc finish. Provide a handle on both the inside and outside of the door. Furnish industrial-strength, corrosion-resistant handles. Equip door with electronic monitoring subsystem that provides an alert to TMC/RTMC personnel if the door is opened.

Equip DMS housing with an OSHA compliant anchor point at each entrance location for the connection of a personal fall arrest system. Provide anchorages strong enough to withstand a force of 5,000 pounds, as required by OSHA. Locate anchorages so they will not allow a person to free-fall more than 6 feet if a 6-foot lifeline is used. Locate anchorages just inside each access door within easy reach from the outside, and just outside the access door within easy reach from the doorway.

4. Sign Housing Access for Front Access Signs. For front access signs, provide unobstructed access that allows servicing of internal components. Access must not require specialized tools or excessive force.

5. Sign Housing Operating Environment. Provide sign housing that conforms to the operating environment requirements established in NEMA TS4. Provide sign housing that ensures functionality of all DMS equipment in the ambient operating temperature range of -29F to +165F, or as defined in the most recent version of NEMA TS4.

Where ventilation subsystem is utilized to ensure conformance to NEMA TS4, provide positive pressure, filtered, forced air sign housing ventilation subsystem that distributes air over all LEDs, power supplies, communications equipment and other electronic devices contained in the DMS housing. Evenly distribute circulation across display modules, in the cavity between each display module, across lens panels and the back of the display modules. Submit ventilation subsystem design calculations to the Representative for acceptance before sign installation.

Provide screened or filtered intake holes to feed ventilation subsystem. Provide holes large enough to accommodate the air intake necessary to provide ventilation to the entire sign housing.

Provide ventilation subsystem capable of being tested automatically once each day, and capable of being tested on command from remote and local control access locations. If a failure occurs, send an error message to the TMC/RTMC or a laptop computer through the DMS controller. Provide ventilation subsystem capable of operating without decrease in performance over an ambient operating temperature range of -29F to +165F as per NEMA TS 4, Subsection 2.1.5.1, with a maximum relative humidity of 100%.

Provide a fail-safe ventilation subsystem that includes a snap disk thermostat that is independent of the sign controller. Preset the thermostat at 130F. If the sign housing's interior reaches 130F, activate the thermostat to override the normal ventilation subsystem, bypassing the sign controller and turning on all sign ventilation fans. The fans will remain under the control of the thermostat until the internal sign housing temperature falls to 115F, at which time the fail-safe subsystem will return control of the ventilation subsystem to the sign controller.

Include a manual override timer switch located just inside the access door to manually activate the ventilation subsystem. The switch must be adjustable to run for up to 4 hours.

Furnish a sensor or a sensor assembly to monitor airflow volume to predict the need for a filter change and capable of being tested on command from remote and local control access locations. If a failure occurs, send an error message to the TMC/RTMC or a laptop computer through the DMS controller. The ventilation subsystem fans must possess a 100,000-hour L10 life rating.

Provide inlet and exhaust filters which are 1-inch thick, permanent, reusable, electrostatic filters that require no electrical attachment. Provide filters which are easily removable from within the sign housing without the use of tools.

Provide blower that is capable of providing a minimum of one sign housing volume change per minute. Position the blowers to provide a balanced airflow to the ventilation subsystem in the event of failure of any blower.

Make all ductwork that impedes access to any sign components to be easily removable, without tools, for servicing of these components. Fabricate all ductwork from minimum 0.040 inches aluminum. Furnish ducts that are extremely efficient with minimal pressure drop throughout the subsystem.

6. Sign Housing Temperature Sensor. Provide a temperature sensor in the sign housing that is controlled and monitored by the sign controller. Provide the capability for the sign to blank itself if a user-defined critical temperature threshold is exceeded. Provide the capability for the user defined critical temperature threshold to be monitored and changed remotely from the TMC/RTMC or other location, using the sign controller.

7. Sign Housing Humidity Sensor. Provide a humidity sensor that detects from 0% to 100% relative humidity in 1% or smaller increments. Provide interface between the sensor and the controller. Allow for the humidity to be monitored remotely from the TMC/RTMC. Provide a sensor with accuracy better than plus or minus 5% relative humidity. A humidistat is not acceptable.

8. Photoelectric Sensor Devices. Provide sensors with the capability to monitor ambient light levels. Furnish sensors that employ a sufficient number of photocells in the appropriate locations to measure ambient light conditions. Position photocells to measure light levels on both the front and rear of the sign, and light levels at the sign location.

Furnish sensor that provides the DMS controller with accurate ambient light conditions at the sign location and can be monitored remotely from the TMC/RTMC. Configure controller to react to the light conditions by brightening or dimming the sign LEDs. Reduce the brightness of the pixels in low ambient light, and increase in high ambient lighting. Avoid pixel blooming in low-light conditions. Automatically adjust LED brightness in small enough increments so the brightness of the sign changes smoothly, with no perceivable brightness change between adjacent levels. Make provision to prevent perceivable brightening of the sign due to stray headlights shining upon the photo sensors at night.

Provide brightness and color of each pixel that is uniform over the sign's entire face within a minimum 15-degree viewing angle in all lighting conditions. Non-uniformity of brightness or color over the sign's face is justification for rejection of the sign by the Representative.

9. Sign Housing Internal Lighting and Electrical Outlets for Walk-In DMS. Furnish a sign housing with a minimum of four internal light fixtures. Near the door, locate a 12-hour timer without hold feature for the lights. Make certain that all fixtures are spaced evenly above the walkway and fully enclosed in shatter-proof protective fixtures. Furnish emergency lighting that automatically illuminates the interior in the event of a power outage.

Prevent light produced from the internal lighting fixtures from being visible from outside the sign during nighttime or dark conditions, and prevent light from interfering with normal visible operation of the sign. Equip sign housing with at least three 15 A, 120 volt rated ground fault interrupter (GFI) outlets that include protected duplex electrical receptacles. Locate one duplex receptacle at each end of the sign housing and one at the center of the sign housing. Space the duplex receptacles evenly on the rear wall of the housing at a height of between 1.5 feet and 3 feet above the walkway.

(e) Display Modules. Provide display modules manufactured by one source and fully interchangeable throughout the manufacturer's sign subsystem(s). Removal or replacement of a complete display module or LED board must be able to be accomplished without the use of special tools. Furnish display modules containing solid-state electronics to control pixel data and read pixel status.

1. Full Matrix Display Module. Assemble display modules to form a full color, full matrix configuration suitable for displaying three lines of characters. Provide a minimum of 18 characters per line, and a maximum of 24 characters per line, as indicated. Provide 12-inch or 18-inch-high display characters with a standard character size ratio of 5:7, width vs. height. Standard Font character spacing will follow MUTCD guidelines for inter-character and inter-line spacing.

2. LED and Pixel Specifications. Provide LEDs based on AlInGaP technology. Provide diodes with a minimum 15 degree viewing angle centered around the optical axis, or zero point, of the pixel, with an amber color and a peak wavelength of 590 nanometers. The peak wavelength must not vary by more than ± 2 nanometers. Provide pixels on the DMS and in the spare parts to have equal color and on-axis intensity.

Provide sign display to produce an overall luminous intensity of at least 7440 candelas per square meter when operating at maximum intensity. Measure brightness according to the International Commission on Illumination's (CIE) requirements as detailed in the Test Method A of the CIE 127 (1997) standard.

Provide capability to test pixel operational status remotely from the TMC/RTMC, or at the site using a laptop computer pixel test. Provide subsystem capable of producing a log file that includes the pixel status, module number, column number, and pixel number. Provide pixel status test to determine the functional status of the pixel as stuck-on or stuck-off and does not affect the displayed message for more than half a second.

Individually mount each LED directly on a printed circuit board (PCB). Provide LEDs that are individually removable and replaceable using conventional electronic repair methods. Prevent the failure of one pixel from affecting the functionality of any other LED on the PCB.

3. Optical, Electrical, and Mechanical Specifications for Display Modules. Provide display modules with connectors for power, controls, and data; contains display module control electronics and memory elements; and provides the signals to switch the LED pixels.

Furnish display modules that have identical vertical and horizontal center-to-center distances (i.e., pitch) between adjacent pixels ranging from 0.59 inches to 1.00 inches. Provide separation between the last column of one display module and the first column of the next module that is equal to the horizontal distance between the columns of a single display module.

Provide NEMA FR4-rated black LED PCB. Alternate LED PCB configurations are to be submitted to and accepted by the Representative before installation. Provide PCBs that allow components to be removed and replaced without damage to PCB, traces, or tracks. Finish all PCBs with a solder mask and a component-identifying silk screen.

Provide all PCBs, except for the power supply and the pixels on the front of the PCB, with a complete and uniform coating of silicone resin with a minimum thickness of 0.01 inch. Meet the material requirements of MIL-I-46058C Military Standard, United States Department of Defense (USDOD).

Mount all LEDs so the mechanical axis of the LED is ± 1 degree to the sign's face to ensure uniformity of brightness over the sign's face. Ensure LEDs are secured perpendicular to the display module within 0.5 degrees.

Prevent devices used to secure LEDs from blocking air flow to the LED leads or blocking the LED light output at the required viewing angle. Provide all-black components on the LED side of PCBs.

Provide multiple power supplies to provide power to each display module. Power supplies must be redundant and rated so if one supply fails, the remaining supply will be able to operate 100% of the pixels in that display region at maximum brightness.

Furnish sign controller that continuously measures and monitors all LED module power supply voltages and provides power readings that indicate to the TMC/RTMC or a laptop computer if the power is sufficient or insufficient on command. Automatically generate an error message to be sent to the TMC/RTMC or a laptop computer if it polls the sign controller and voltages measured are outside nominal values.

Protect LEDs from external environmental conditions, including moisture, snow, ice, wind, dust, dirt, and UV rays. Do not use hoods, louvers, cylinders or visors that could impede the free flow of air over all surfaces of each individual LED. Do not use epoxy to encapsulate the LEDs.

(f) Character Displays. Provide signs capable of displaying American Standard Code for Information Interchange (ASCII) characters 32 through 126, including all uppercase and lowercase letters and digits 0 through 9, at any location in the message line.

Display uppercase alphanumeric characters over the complete height of the matrix. Provide characters legible under all light conditions within the minimum 15-degree cone of vision centered on the pixel's vertical and horizontal optical axes. In addition to the standard character size ratio of 5:7, width vs. height, provide sign capable of displaying compressed ratio (i.e., 4:7), expanded ratio (i.e., 6:7), or double-stroke ratio (i.e., 7:7) character fonts, and capable of changing the default spacing between characters. Provide spacing options to include 1-, 2-, or 3-pixel columns between the characters. Provide font that conforms to the local District's requirements, including height, style, boldness, and font type. If there is no District-required standard font, load the subsystem with a default font according to the Standard Font set described in NEMA TS4-2005 (section 5.6). Font types incompatible with existing District central control software or Advanced Traffic Management System (ATMS) software may be grounds for rejection of the sign. Configure subsystem to allow the assignment of font access privileges. Provide sign controller capable of a self-updating time or date display or both on the sign.

Provide sign capable of showing additional graphics or characters.

(g) Sign Controller. Provide a sign controller with operational firmware stored in non-volatile memory. Provide controller to receive sign control commands from TMC/RTMC and a local, on-site laptop. Program controller to transmit responses, as requested, to the TMC/RTMC, and to control sign operation, message displays, and maintenance polls and statuses. Provide sign controller to control the following operations:

- Message displays
- Sign blanking
- Logic or data error logging
- Error reporting to the TMC/RTMC and local laptop
- Providing operational status of the sign and all its components, including each individual pixel, to the TMC/RTMC and local laptop via polling, or real-time transmissions
- Provide all sensor readings including internal and external temperature, photocell, airflow, humidity, LED power supply, and sign door opening to the TMC/RTMC and local laptop
- Temperature thresholds to activate temperature control devices
- Specified as recommended by District TMC/RTMC Personnel per ECMS contracted project
- Provide Option, as determined by the Department, to provide three dry contact inputs that can be used for two Emergency Messages and one to put the unit into "local" if remote contacts are closed.

Transmit each sign function control to the TMC/RTMC using related communications media. Provide controller capable of being polled on command and on a user-definable schedule. Provide controller with the capability of storing a minimum of 100 logs locally in the event of communications failure.

Utilize ambient environmental conditions collected by the sensors in an algorithm that activates the temperature control devices within the sign, including the ventilation subsystem, fans, and heating devices, if the temperature exceeds or dips below the temperature thresholds set in the sign controller.

Furnish sign controller that consists of, at a minimum, local control panel status indicators, including power on/off, TMC/RTMC communications status, laptop computer communications status, communications status with the electronics in the walk-in housing (as applicable), and sign diagnostics and error status.

Provide sign controller that provides automatic power-up commands that blank-out the sign automatically when recovering from power off conditions, and automatically returns to standby conditions in the event power is removed then restored. During power-up procedures, the sign must return to a preprogrammed message, is blanked, or can display graphics or characters as desired by the TMC/RTMC. Provide a hardware watchdog circuit to provide automatic recovery from critical errors, and automatic shutdown in the event of critical hardware failure. Provide a DMS controller that blanks the display in user-definable situations including, but not limited to, pixel failure, extended communications failure, or extended power failure.

Provide a ground-level access point and an in-sign access point at the sign location that allows the sign to be programmed and controlled via a local laptop.

Prevent pedestrians from accessing the sign controller, or changing displayed messages without permissions. Protect access to sign controller using security authentication or login if accessing the sign locally via a laptop computer.

Provide a controller containing:

- Clearly Labeled Manual On/Off Switch
- Momentary contact switch that resets the sign controller

Provide electrical field connections by barrier type terminal connection blocks as defined in NEMA TS1. Identify all terminal block connections and locate so readily accessible for maintenance. Provide all wire and cable terminations made with insulated spade terminals as defined in NEMA TS1. Soldering of field terminal connections is not permitted.

Provide the latest version of the DMS client/server software on the DMS controller. Provide software that is compatible with the existing ATMS software and hardware at the TMC/RTMC. The software must, at a minimum, provide password protection to restrict access to the program and the sign control functions, and the ability to fully control all programmable functions of the DMS.

1. Display Subsystem Hardware. Provide data interface circuit to enable communications between the display modules and the sign controller. Contain the following display subsystem components in the sign housing or the field enclosure:

- DMS controller
- Display subsystem interface circuits
- Display modules
- Power supplies
- Local and remote control switches
- LED indicators
- Electronic Industries Alliance (EIA)-232 plug-in connection for laptop computers, EIA-232 null modem cables (minimum of 4 feet for connection of laptop and controller)
- Workspace and convenient outlet for a laptop computer
- Communications equipment for communications with the TMC/RTMC
- Transient voltage surge suppressors

2. Sign Controller Communications Interface. Furnish DMS controller that includes at least two 9-pin EIA 232 serial interfaces, and one Ethernet Local Area Network (LAN) RJ45 port. The interfaces must accommodate communications to the TMC/RTMC, the managed network switch, and to a local laptop. Provide serial interfaces to support:

- Data bits: 7 bit or 8 bit
- Parity: even, odd, none, mark, or spare
- Number stop bits: 1 bit or 2 bit

Terminate all cables for Ethernet connection over copper media according to EIA/TIA-568-C standard.

Configure one EIA-232 serial interface to drive asynchronous modems for full duplex communication with the TMC/RTMC over point-to-point dial-up lines or a multidrop fiber or copper network. Switching between dial-up, Ethernet, and multidrop operation must not require sign controller software or hardware modifications. Configure the second EIA-232 serial port for local communication with a laptop computer.

The charges acquired for installing and connecting communications cables and for all deployments involving cable services from outside service supplier are at no additional cost to the Department. Provide modems to be retained by the Department at each location. For dial-up operations, provide a user-selectable data transmission rate of up to 19.2 kbps.

Configure sign controller and software to display single-page and multi-page messages, with mixed fonts and spacing. Provide message page times and text flashing rates that are programmable between 0.5 seconds and 5 seconds in 0.1-second increments.

Provide subsystem to log and report errors and failures, including data transmission errors, receipt of invalid data, communication failure recoveries, alternating current power failures, power recoveries, pixel status reads, fan and filter airflow status where applicable, temperature status, power supply status, and information on the operational status of the temperature, photocell, airflow, humidity, sign door opening and LED power supply sensors. Report airflow and humidity sensor information using the objects from the dmsClimateCtrlStatusTable of the NTCIP 1203 V2 standard.

Fiber Optic modules or Fiber Optic Small Form Factor electronics, or fiber optic-to-copper (Cat.6) media converters, and their associated power supplies, shall be temperature hardened and meet the environmental operating requirements as specified in 1230.2(d)5.

3. Message Status and Monitoring. Provide DMS supporting two modes of operation:

- Master operation, where the TMC/RTMC commands and controls the sign and determines the appropriate message or test pattern.
- Local operation, where the sign controller or a laptop computer commands and controls the sign and determines the appropriate message or test pattern.

For walk-in signs, keep electronic components away from the access door to protect them from the elements. For front and rear-access signs, keep electronic components away from the access panels where possible to protect them from damage or corrosion due to exposure to the elements. Provide DMS capable of performing the following functions:

- Control Selection – Provide local/remote switch on the local control panel that functions in parallel with the local/remote switch located in the ground control box. Provide a LED indicator near the local/remote switch to indicate if either switch has selected the local mode. The operating mode is determined by the position of the mode switch on the local control panel. If the local control panel's switch is set to local, the operating mode is local. Otherwise, the operating mode is master.
- Message Selection – Use keypad to select a blank message or any one of the messages stored in the sign controller's nonvolatile memory if the control mode is set to local.
- Message Implementation – Activate the selected message.

Provide sign controller that transmits a return message to the TMC/RTMC whenever it receives a valid status request. Return messages must contain an Internet Protocol (IP) address for the sign controller, the actual message that is visibly displayed on the sign, the displayed message's transmission origin (i.e., the TMC/RTMC, laptop computer, manual entry, etc.), remote or local control status, error and failure reports, temperature readings, access alarms, power supply voltage levels, line voltage, and Uninterrupted Power Supply (UPS) status.

In the event of a sign controller failure, blank any displayed message. During power loss, provide capability to display a user-defined message, including a blank page.

Message additions, deletions, and sign controller changes must be made either remotely from the TMC/RTMC or a local laptop computer. Provide capability to activate messages with specified run-time duration. Upon expiration of a run-time duration, display a user-defined message, including a blank page. Prevent perceivable flicker or ghosting of the pixels during sign erasure and writing periods.

In the event of an AC power loss retain all non-volatile memory for a minimum of 30 calendar days. Provide controller that monitors messages downloaded from the TMC/RTMC or laptop computer to ensure the message will

fit in the display area of the sign. Provide internal time clock that is integral to the controller to provide for message deactivation at the correct time, even in the event of a communication loss. Maintain internal clock time during power outages and automatically display the proper message if power is restored.

4. Traffic Management Center Communications. Provide all communications equipment, cables, wires, interfaces, and appurtenances to establish a connection to the District TMC/RTMC using a specified communications method.

Provide DMS that complies with the NTCIP 1201 v01, 1203 v01, 2101 v01.19, 2102, 2103 v01.13, 2201 v01.14, 2202 v01.05, and 2301 v01.08 standards. Provide documentation NTCIP testing has been completed at the factory for each DMS provided by the manufacturer.

Furnish DMS meeting all mandatory requirements contained in NTCIP 1203 v02 Protocol Requirements List (PRL) contained in sections 3.3.8 and 3.3.9. Provide additional conformance to the following “Optional” User Needs (UN) and Functional Requirements (FR), as described in NTCIP 1203 v02:

UN	FR	Description
2.3.2.1.3.	N/A	DMS Type: Variable Message Sign (VMS)
2.3.2.2.2.	N/A	DMS Technology: LED
2.3.2.3.2.1.	N/A	DMS Display Matrix Configuration: Full Matrix
2.4.2.2.	All Mandatory Items	Logged Data Exchange
2.5.1.2.	All Mandatory Items	Determine the Sign Display Capabilities
	3.5.3.2.1	Monitor Information about the Currently Displayed Message
2.5.1.3.	All Mandatory Items	Manage Fonts
	3.5.1.3.5	Configure a Font
	3.5.1.3.6	Delete a Font
	3.5.1.3.7	Validate a Font
2.5.1.4.	All Mandatory Items	Manage Graphics
	3.5.1.4.5	Store a Graphic Definition
	3.5.1.4.6	Delete a Graphic
	3.5.1.4.7	Validate a Graphic
2.5.1.5.	All Mandatory Items	Manage Automatic Brightness
2.5.2.2.	All Mandatory Items	Remotely Reset the Sign Controller
2.5.2.3.3.	Mandatory	Define a Message
	3.5.1.2.4	Delete All Messages of a Message Type with One Command
	3.5.2.3.2.3	Configure Default Flash-On and Flash-Off Times
	3.5.2.3.2.4	Configure Default Font
	3.5.2.3.2.5	Configure Default Line Justification
	3.5.2.3.2.6	Configure Default Page Justification
	3.5.2.3.2.7	Configure Default Page On-Time and Page Off-Time
	3.5.2.3.2.8	Configure Default Character Set
	H.2.2.1.	Set Time
2.5.2.3.5.	All Mandatory Items	Schedule Messages for Display
2.5.3.1.1.	Mandatory	Determine Sign Error Conditions - High Level Diagnostics
	3.5.3.1.1.3	Execute Climate Control Equipment Testing
2.5.3.1.2.	Mandatory	Monitor System Subsystem Features - Mid-Level Diagnostics
	3.5.3.1.3.8	Monitor Humidity Warnings
2.5.3.1.3.	All Mandatory Items	Monitor Subsystem Failure Details - Low-Level Diagnostics
	3.5.3.1.4.8	Monitor Sign Housing Humidity
2.5.3.1.8.	All Mandatory Items	Monitor Door Status
2.5.3.1.9.	All Mandatory Items	Monitor Controller Software Operations
2.5.3.1.10.	All Mandatory Items	Monitor Automatic Blanking of Sign
	3.5.3.2.1.	Monitor Information about the Currently Displayed Message
2.5.3.1.11.	All Mandatory Items	Monitor Power Source
2.5.3.1.12.	All Mandatory Items	Monitor Power Voltage
2.5.3.2.	Mandatory	Monitor Current Message
	3.5.3.2.1.	Monitor Information about the Currently Displayed Message

Requirement ID	Specific Requirement ID	
3.6.6.	Mandatory	Supplemental Requirements for Message Definition
	3.6.6.2.1	Support Multi-Page Messages
	3.6.6.2.2	Support Page Justification
	3.6.6.2.2.1	Support for One Page Justification Within a Message
	3.6.6.2.2.2	Support for Multiple Page Justification Within a Message
	3.6.6.2.3	Support Multiple Line Messages
	3.6.6.2.4	Support Line Justification
	3.6.6.2.4.1	Support for a Single Line Justification within a Message
	3.6.6.2.4.2	Support Line Justification on a Page-by-Page Basis
	3.6.6.2.4.3	Support Line Justification on a Line-by-Line Basis
	3.6.6.2.6	Support Font Commands
	3.6.6.2.6.1	Support One Font within a Message
	3.6.6.2.6.2	Support One Font per Page within a Message
	3.6.6.2.10	Support Flashing
	3.6.6.2.10.3	Support Page-by-Page Flashing
3.6.6.	3.6.6.2.14	Support of Graphics
3.6.13	All Mandatory Items	Supplemental Requirements for Line Justification
	3.6.13.1	Support Left Line Justification
	3.6.13.2	Support Center Line Justification
	3.6.13.3	Support Right Line Justification
	3.6.13.4	Support Full Line Justification

(h) Control Enclosure. Section 1201.2(b) and as follows: Provide a one-door or two-door NEMA 3R control enclosure to house communications and power connections to the DMS. Mount enclosure on the DMS structure or on a concrete pad as indicated. The front panel of all equipment in the enclosure must be visible from at least one of the enclosure openings. Where necessary, provide a two-door enclosure to meet this criterion. The enclosure is to be used for the installation of control and communications equipment, as well as a standard duplex receptacle, convenience light, surge protection and other ancillary equipment.

Provide an enclosure equipped with EIA standard 19 inch racks with fixed front frame. Provide a pull-out shelf of sufficient size to support a laptop computer.

Provide all enclosure accessories powered from a power distribution panel to be furnished and installed as an integral part of the enclosure. Size the power distribution panel, circuit breaker and all power system components according to the loads required to operate the DMS. Feed the power distribution panel from the main circuit breaker. Provide a power distribution panel that has the following ratings:

- 120/240 V
- Single Phase
- Three Wire
- 10 KAIC (Symmetrical)*
- 60 A Main Lugs (Minimum)
- Four Single Pole Circuit Breaker Capacity (Minimum)
- Isolated Neutral Bus
- Ground Bus

*-Fault Duty to be confirmed with the Utility Company and increased as required

Provide power distribution panel containing the following circuit breakers. Provide single pole, 120 Volt Rated, 10 KAIC (Symmetrical) circuit breakers with the following current capacity:

- 20 A spare circuit breaker
- 15 A circuit breaker for heating system and cooling fan
- 20 A circuit breaker for lamp and duplex convenience outlet
- 20 A circuit breaker (minimum) for ITS field equipment

(i) Main Power Supply and Energy Distributions. Provide a nominal single-phase power line voltage of 120/240 VAC protected by one 60 A, two-pole main circuit breaker for the sign and its controller. Limit subsystem operation to a voltage range of 97 VAC to 135 VAC as specified in NEMA TS4, Subsection 2.1.3.1.

Supply all service lines inside the sign by 120 VAC independently protected by a thermomagnetic circuit breaker at the sign housing's entry point. Locate all 120 VAC wiring in conduit, pull boxes, raceways, or control enclosures as required by the NEC. Prevent exposure of 120 VAC wiring inside or outside of the sign housing. Do not use the sign housing as a wiring raceway or control enclosure.

Provide sign and controller with an operating frequency of 60 hertz (Hz), ± 3.0 Hz, as stated in NEMA TS4, Subsection 2.1.3.2. Prevent a drop in the unit's voltage between no-load and full-load during normal operations from exceeding 10% of the nominal voltage. Provide power protection through the use of a thermomagnetic circuit breaker connected to a 5-milliamper GFI device that protects all service outlets. Provide a 100 A 120/240 VAC two-pole load center with mounting space for at least 20 breakers. Provide separate circuit breakers for each sign circuit.

Provide power cables with insulation material fabricated specifically for damp and moist conditions. Size power cables as required by the NEC for acceptable voltage drops while supplying alternating current to the sign. Prevent sign power consumption from exceeding 7,000 VA under any circumstance, including operation of the fans, heaters (if provided within the sign), sign controllers and communication equipment, and all pixels illuminated at maximum brightness.

Provide protection devices such as surge suppressors and lightning arrestors installed or incorporated in the sign subsystem by the manufacturer to guard against lightning, transient voltage surges, and induced current. Use transient voltage surge suppression devices on all electric power and data communication connections entering and exiting the DMS housing and in the DMS enclosure.

Surge suppression units must meet the following criteria:

- Maximum clamp voltage: 340V;
- Peak Current: 20,000 A;
- Response Time: 5 nanoseconds;
- Occurrences: 20 times at peak current;
- Minimum Series Inductance: 200 microhenries;
- Temperature Range: -40F to +165F.

Provide surge suppression units for AC circuit configured for both normal mode (L N) and common mode (L+N G) protection. Provide Underwriters Laboratories (UL) 1449 listed surge protectors.

Provide DC and AC voltage ratings and dissipation factors of capacitors used in the sign subsystem that exceed the worst-case design parameters of the circuitry by 50%. Mechanically mount all capacitors using a clamp or fastener that is resistant to cracking, peeling, and discoloration.

Provide resistors within 5% of the tolerance of the specified temperature range and, if operated in excess of 50% of its power rating, have an adequate heat sink. Provide standard type transistors, integrated circuits, and diodes that are listed by the EIA and clearly identifiable.

(j) Uninterruptible Power Supply (UPS). Section 1201.2(d) and as follows: Provide DMS with an UPS subsystem that is capable of powering critical components at the DMS, including all related communications equipment for a minimum of 0.5 hours. Provide sealed Absorbed Glass Mat (AGM) type batteries that are maintenance free. Install UPS within the sign housing or in the DMS enclosure so it does not obstruct regular maintenance efforts or access to indicator lights or panels.

(k) Ground Rod. Section 1101.11(j)

(l) **DMS Structure.** Section 930 and Section 948

1230.3 CONSTRUCTION—As indicated and specified by IT or District TMC Personnel according to ECMS contracted project documents. Coordinate work with PennDOT and the proposed DMS Manufacturer on final configuration and options. Install DMS as shown on the Standard Drawings, and as follows:

(a) **Installation and Mounting.** Install DMS at a location that provides maximum visibility of the DMS message as outlined in PennDOT Publication 646, Section 3. Install DMS on structure as indicated so the structure does not interfere with the visibility requirements. Configure DMS to automatically test the operational status of each pixel in the sign once per day.

(b) **DMS Communications Enclosure.** Install the DMS enclosure in a location that adheres to the guidelines for DMS enclosures contained in Publication 647. Properly secure all electronic equipment contained within the DMS or DMS enclosures from damage due to weather, moisture, dust, dirt and corrosion.

1. Enclosure Foundation. For base mounted enclosures, construct the foundation as specified in Sections 951.3(a) and (b).

2. Maintainer Pad. Section 1201.3(a)9

(c) **Integration.** Section 1201.3(c)

(d) **DMS Structure and Foundation.** Section 948.3

(e) **Grounding.** Section 910.3(q)

(f) **Testing.** Section 1201.3(b)

(g) **Training.** Section 1201.3(d)

(h) **Documentation.** Section 1201.2(f)

1230.4 MEASUREMENT AND PAYMENT—

(a) **Dynamic Message Sign (DMS) Subsystem.** Each

Includes the DMS sign, sign housing, controller, enclosure, enclosure foundation, maintainer pad, grounding, mounting, documentation, installation, training, integration and all related equipment.

- 70% of payment will be made upon complete installation of DMS sign.
- 20% of payment will be made upon completion of the standalone acceptance tests as specified in Section 1201.3(b).
- 10% of payment will be made upon completion of the 60-day test as specified in Section 1201.3(b).

Completion of tests includes completion of training, submission of all manuals and documentation as required, and completion of all final inspections, as required by the Representative.

(b) **Class 3 Excavation.** Section 204.4(a)

(c) **Class A Concrete.** Section 1001.4(a)

(d) **Reinforcement Bars.** Section 1002.4(a)

SECTION 1231—PORTABLE DYNAMIC MESSAGE SIGNS

1231.1 DESCRIPTION—This work is to furnish and install a portable dynamic message sign (PDMS) subsystem for use in temporary and semi-permanent installations, and construction zones.

1231.2 MATERIAL—

(a) **General.** Provide a PDMS in trailer configuration, equipped with wheels for portability. Provide portable devices according to the physical display and operational requirements of the MUTCD. Provide PDMS consisting of a display panel, controller, support structure for sign display panel, a photovoltaic cell array, battery bank subsystem for powering the PDMS, an electronic control console, wireless communications interface, remote control software, and a heavy-duty trailer frame.

Equip PDMS with a hitch to facilitate towing of the trailer. Provide capability of displaying a variety of messages using Light Emitting Diode (LED) matrices. Provide PDMS that functions in two mechanical modes, one mode for sign use and message display, and another for safely and securely transporting the sign. Provide PDMS capable of operating continuously on the solar power subsystem without regular maintenance for minimum of 3 month intervals. Furnish PDMS to meet a minimum 10 year lifespan.

Furnish a sign according to NTCIP requirements for dynamic message signs. Fabricate all nuts, bolts, washers and other fasteners of corrosion resistant material. Provide a PDMS with the following components:

- DMS
- Trailer and DMS mount structure
- DMS controller and Wireless Communications Interface
- Solar power supply subsystem including solar array and battery bank

(b) **PDMS.** Provide a DMS for mounting to the PDMS trailer frame. Provide DMS display capable of displaying messages with minimum of two phases, with each phase consisting of up to three lines of eight characters per line. Provide sign face that is colored black, and complies with Federal Specification TT-E-489. Equip sign display panel with an ultraviolet (UV) resistant, scratch resistant, glare reducing protective cover. Provide display panel protective cover with a glare-eliminating feature that prevents blurring and obstruction of the DMS messages. Provide DMS that is modular in design to facilitate easy repair.

Equip display assembly with an automatic dimming operational mode capable of a minimum of 50% dimming under varying light conditions and a separate manual dimmer switch. Provide ambient light sensor to interface with automatic dimming functionality. Provide DMS display with minimum dimensions of 74 inches high by 126 inches wide, including the sign housing. Furnish DMS panel and mounting capable of rotating 360 degrees on its support mast. Provide capability to lock into position at any angle about the vertical axis to allow for optimizing viewing angle to oncoming motorists. Provide DMS enclosure that is weatherproof, dust proof, and rated for continuous operation or storage under the following conditions:

- Temperature of -30F and +165F
- Relative humidity of 20% to 95%, non-condensing
- Maintain physical integrity of equipment when subjected to a vibration of 5Hz to 30 Hz up to 0.5 gravity applied in each of three mutually perpendicular planes.
- Prevent equipment from suffering permanent mechanical deformation or any change rendering the unit inoperable if subjected to a shock of 10 gravities applied in each of three mutually perpendicular planes.

Ensure PDMS operation is unaffected by radio frequency interference (RFI) or electro-magnetic interference (EMI). Provide PDMS able to withstand constant wind speeds of 80 miles per hour in operating position and 70 miles per hour in transporting position. Equip DMS display with a sighting device to assist the operators in orienting the DMS display to provide maximum viewing capacity to motorists approaching the sign.

1. LED and Pixel Specifications. Provide all pixels containing at minimum three LED arranged in a circular or triangular pattern to produce the appearance of a round dot to oncoming motorists. Provide 592 nanometer wavelength, amber-colored LEDs. Provide minimum DMS display brightness of 10,000 candela per square meter at maximum intensity. Provide pixels with a minimum viewing angle of 15 degrees about the vertical and horizontal axes, with no loss in intensity, color, or legibility within this cone of vision. Furnish interchangeable display modules that are mounted to the DMS using simple tools and nominal force, and provide for easy replacement or changeability without the need for special tools.

2. Character Displays – Text and Graphics. Provide DMS display capable of displaying three lines of 8 characters per line with a minimum separation of 3 pixels between characters. Provide minimum 12 inch high characters. Present each displayed character using minimum 5 horizontal pixels and minimum 7 vertical pixels.

Provide capability to display simple graphics on the DMS, including, but not limited to individual and series of vertical arrows with maximum height that matches the height of the full-matrix sign face, individual and series of horizontal arrows with maximum width that matches the width of the full-matrix sign face. Ensure line of sight is optimized according to Publication 646.

(c) Trailer. Provide a wheeled trailer fabricated of steel. Deburr and finish all metal with a corrosion resistant coating. Equip trailer with tie-down points to facilitate storage and transport by securing the trailer to a utility trailer or flatbed truck. Equip trailer with class-A tail lights, using a plug adaptor.

Furnish trailer that can be set up at the site with its own chassis and outriggers, without being hitched to a vehicle. Equip trailer with fenders over the tires that are made from heavy-duty material sufficient to allow a person to stand and operate or perform maintenance on the unit. Delineate the trailers on a permanent basis by affixing retroreflective material in a continuous line on the face of the trailer as seen by oncoming road users. Finish trailer with a glossy federal safety aliphatic acrylic urethane finish. Provide orange color to conform to the MUTCD requirements for portable changeable message signs (PCMS).

Provide a trailer mounting structure for the PDMS. Provide accessible mechanism to easily raise and lower the display assembly. Provide a locking device to lock the display panel in the raised or lowered position. Provide a single metal telescoping mast pole to mount the DMS that is an integral piece of the body of the trailer. Provide support capable of adjusting the height of the sign, and allows the sign to rotate 360 degrees around the vertical axis of the support beam, without requiring more than a single operator to perform height or angle adjustments. Equip DMS with locking mechanisms that enable the DMS to be locked at any angle of rotation. Provide capability to elevate the center-point of the sign face to a minimum height of 10 feet. The locking mechanisms must prevent the DMS from changing angles during windy conditions or vibrations.

Equip trailer with a hitch for connection to a towing vehicle. Provide hitch with a towing capacity of 5,000 pounds. All trailer hitch components must conform to SAE J684 Standards for Class II trailers. Equip hitch with a 1/4 inch safety chain for secure attachment to towing vehicle. Provide trailer with sealed, flush-mounted, combination stop, tail and turn lights, and front and rear sided marker lights. Provide a rear license plate display holder, and a rear center identification light bar for illuminating the trailer license plate. Provide a rear fender.

Provide four hydraulically or mechanically adjustable outrigger leveling pads permanently installed at each of the four corners of the sign trailer for leveling and support functions. Provide leveling pads with a minimum capacity of 2,000 pounds each. Provide leveling pads that are adjustable using a single operator, and without any special tools. The leveling pads must be capable of lifting the trailer so the tires do not touch the ground. Equip trailer with tires according to ST225/75R15 Load Range C. Provide 5-lug pattern wheel configuration. Affix the manufacturer's name and the trailer make and model to trailer. Provide an operator's manual within the control enclosure of each unit.

(d) PDMS Controller. Equip PDMS with a sign controller containing all the necessary hardware and software to control the DMS. Provide electrical and communications connections to the controller of locking-type connectors to permit quick and simple removal of connections. Provide sign controller with a liquid crystal display (LCD) console for programming and operations. All DMS functions must be programmable and operable locally at the controller, using a built-in graphical user interface (GUI) that is integral to the controller. Provide controller that displays an on-site graphical representation that visibly depicts the message displayed on the sign face. Provide controller and associated on-board circuitry to meet the requirements of the FCC Title 47, Subpart B, Section 15 regulations concerning the emission of electronic noise by Class A digital devices.

Provide capability of remote control operation of the sign via a wireless communications interface that utilizes the ports specified, or locally via a laptop computer. Local connections to a laptop computer must facilitate routine repairs,

diagnostics and all other operational functions. Provide, at a minimum, the following interfaces to the sign controller: a USB port, Ethernet port, and serial port.

Provide a wireless communications interface, field-hardened for long-term freeway deployment where it is typically subject to wide daily and seasonal temperature swings, wind gusts and typical road vibrations with an extended operating temperature range from -30F to + 165F. Coordinate wireless communications interface type and configuration with the Representative for network compatibility. The wireless carrier data account will be provided by the Department. Provide the wireless interface as a unit detached from the PDMS controller to facilitate easy change out to other communications means.

Equip controller with interface to accommodate a portable keyboard for inputting sign messages. Furnish portable keyboard that is compatible with the PDMS controller, and deliver keyboard to location identified by the Representative. If Representative does not identify delivery location for the portable keyboard, place keyboard in the PDMS controller enclosure. Facilitate static and dynamic Internet Protocol (IP) network connections in addition to serial dial-up modem connection and cellular 4G data modem connection. Protect all data and electrical connections from the DMS controller using transient voltage surge suppression (TVSS) equipment.

Furnish controller capable of retaining time and date information and utilizing time and date information to facilitate an operational schedule for the display and removal of messages. Provide capability of storing 50 distinct messages locally in a message library. Furnish controller that is unaffected by mobile radio, or any other ambient radio transmissions.

Provide software for the control, monitoring, maintenance and operation of the PDMS from a remote location. Include provision in the controller software that enforces authentication of operator credentials for control of the PDMS, for both local and remote controls. Include provision in the controller firmware that disallows the display of words contained in a user-defined list of disallowed words. Provide controller to monitor and display battery voltage levels on the GUI. The controller must provide battery voltage levels at any remote monitoring location and the ability to alert the system computer of a power failure or low battery voltage condition. Unacknowledged alerts will be resent a minimum of three times.

Provide PDMS that is NTCIP compatible, supporting the following NTCIP standards:

- NTCIP 1201 (v3.03b) – Global Object Definitions
- NTCIP 1203 (v3A-SE.06) – Object Definitions for Dynamic Message Signs (comply with all mandatory User Need and Protocol Requirements as specified in section 3.3.8)
- NTCIP 2101 (v1.19) – Subnetwork Profile: PMPP over RS232
- NTCIP 2104 (v1.11) – Subnetwork Profile: Ethernet
- NTCIP 2201 (v1.15) – Transport Profile: Transportation
- NTCIP 2202 (v1.05) – Transport Profile: Internet

Equip the PDMS trailer with a metallic enclosure to house the sign controller. Provide a weatherproof and rust resistant enclosure that is securely fastened to the trailer structure. Equip the enclosure with a door with a key locking mechanism, and provisions for externally locking the door using a typical pad lock.

(e) Solar Array and Battery Bank. Equip PDMS with solar array and battery bank to provide power to the sign and sign equipment. Using solar array, supply nominal voltage 12V DC. Provide solar array consisting of photovoltaic, single crystal silicon modules. Provide automatic recharging of power supply batteries to normal operating levels with meters showing charge.

Securely mount the solar array to the PDMS for operation and transport. Provide mounting capable of swiveling, tilting, and re-angling the cells in order to optimize exposure to solar rays. Include capability to lock the solar panels at any angle necessary to optimize solar exposure.

Provide AC/DC battery charger. Provide battery bank that at full charge is able to power 20% of the PDMS pixels at continuous use for 7 days without recharging from the solar array. Equip battery bank with a battery controller to prevent overcharging and over-discharging. Provide battery controller with external battery level indicator. Protect the battery, controller, and power panel from the elements and vandalism. Provide battery subsystem with automatic recharging of power supply batteries. Equip battery subsystem with meter to indicate if batteries are being charged or used.

Provide battery bank consisting of low-maintenance, gel batteries. Contain the battery in a NEMA-rated compartment or enclosure that prevents water ingress during operation or transport. Fabricate the compartment to

completely contain all spills from damaged or malfunctioning batteries. Provide battery enclosure that is separate from enclosure to house DMS controller.

1. Plug-In AC Power. Provide an AC-to-DC power converter and a power receptacle behind a lockable window at the main frame of the PDMS, to allow the use of power feed from an alternate power source such as a generator set on trailer, or road-side power outlet. Provide a selector switch inside the window that connects the internal loads of the PDMS to the battery-powered subsystem, or the above AC-to-DC power converter. Include provision for the external AC power to charge the batteries if the PDMS operates using the external AC power. Provide AC-to-DC power converter that converts 120 VAC power to DC power suitable for operating the PDMS. Provide window with a grommet-lined semi-circular notch at the bottom to allow passage of extension cord with the window closed. Provide twist locking type receptacle. Provide an extension cord with male plugs at both ends that is suitable for outdoor uses, oil resistant, minimum 50 feet long, and equipped with three 12 AWG conductors. Provide cord if one of the plugs is regular type and the other plug is suitable for use with twist locking type receptacle. Deliver cord to the location identified by the Representative.

(f) Grounding Terminal. Provide means to connect a grounding conductor to the PDMS assembly. Provide deliberate grounding connection from the trailer frame and the PDMS controller frame, to this grounding terminal. Provide grounding terminal suitable for terminating a wire of up to 2 AWG. Provide painted signage next to the grounding terminal, with 1-inch tall black letters on white background, stating "PROVIDE GROUNDING TERMINATION HERE."

1231.3 CONSTRUCTION—As shown on the Standard Drawings and as follows:

(a) PDMS. Install DMS on trailer and DMS mount structure as indicated so the mount structure does not interfere with the visibility requirements.

1. PDMS Controller. Configure PDMS controller to display messages. Enable activation and editing of messages using a typical keyboard and GUI of the control software.

2. Solar Array and Battery Bank. Orient and lock solar panels in a position to optimize exposure to sunlight.

3. Integration. Section 1201.3(c)

4. Testing. Section 1201.3(b)

5. Training. Section 1201.3(d)

6. Documentation. Section 1201.2(f)

(b) Trailer Unit. Install trailer unit as specified in contract documents. Ensure the trailer is located in an area free of debris so a maintainer can access the unit and be protected from most vehicular traffic. Configure all outriggers to equally support the weight of the trailer and ensure the unit is completely level.

1231.4 MEASUREMENT AND PAYMENT—

(a) PDMS Subsystem. Each

Includes trailer, DMS mount, DMS display, batteries, solar array, wires, connectors, integration, training, documentation, and all work for a complete subsystem.

- 50% of payment will be made upon delivery of the PDMS.
- 30% of payment will be made upon demonstration of full functionality of the sign locally (not from the TMC/RTMC). Full functionality is demonstrated upon successful completion of standalone acceptance test as specified in Section 1201.3(b).

- 20% of payment will be made upon successful integration of PDMS controls at the TMC/RTMC and completion of system test as specified in Section 1201.3(b), as required.

SECTION 1236—MAINTENANCE, DYNAMIC MESSAGE SIGNS (DMS)

1236.1 DESCRIPTION—This work is to furnish, install, modify, repair, replace, and remove components of a DMS subsystem.

1236.2 MATERIAL—Section 1230.2

1236.3 CONSTRUCTION—Section 1230.3 and as follows:

(a) Preventive Maintenance (PM).

1. General. Section 1206.3(a)1

2. Site. Section 1206.3(a)2

3. Enclosures. Section 1206.3(a)3

4. Structure. Perform a visual inspection for wear, rust, cracks, missing, damaged or bent parts, loose connections, frayed cables, and general condition. Check attachment hardware and anchor bolts for rust and tightness. Check welds for cracks and rust. Notify the Representative immediately upon discovery of any structural or electrical abnormalities.

5. Sign. Test operation of sign, all lamps and LED clusters, fiber bundle and pixels, fiber optic shutters, and perform diagnostic tests. Verify that all LED and fiber pixels are functioning from the control enclosure. Visually inspect and ensure all LEDs are illuminated, and check brightness to ensure photocell is properly functioning. Do this according to the manufacturer's testing procedure by using the keyboard and display in the DMS control enclosure or using a laptop computer and connecting to a communications/data connector in the control enclosure. Pixel test can also be performed remotely from the TMC. Software will be provided by the Department if necessary.

Clean surface of signs. Clean semi-permanent filters during every PM inspection according to the manufacturer's recommendations. Replace semi-permanent filters if media integrity is ripped, torn, punctured, or contaminated beyond normal cleaning methods. Replace disposable filters twice annually with nylon-based filter media. Use of paper filters is not acceptable. Test ground rods for 25 ohms or less resistance utilizing fall of potential test. Test communication system to verify communications between DMS and TMC. Test power and communications line surge suppressors and replace as necessary.

(b) On-call Maintenance.

1. General. Section 1206.3(b)1

After On-call Maintenance (OM) has been completed, perform PM as described in Section 1236.3(a).

2. Responsiveness. Section 1206.3(b)2

1236.4 MEASUREMENT AND PAYMENT—

(a) PM, DMS Subsystem. Each

All labor, materials, and equipment required for routine preventive maintenance are incidental to this item including, but not limited to, the Statewide Device Identification Number, cleaning materials, caulk, metal meshing, lubricants, filters, lamps, paint, surge suppressors, fuses, circuit breakers, attachment hardware, insect prevention measures, rodent control measures, clearing and grubbing, selective tree trimming, snow and ice removal, and weed control measures. Mobilization is incidental to this item.

(b) OM, DMS Subsystem Mobilization. Each

Mobilization will not be paid for procurement of parts. Travel to and from the site and district stockpile is incidental to this item.

(c) OM, DMS Subsystem Repair. Hour

Repair time will not be paid for procurement of parts. Travel to and from the site and district stockpile is incidental to this item. Site specific snow and ice removal requested by the Department is included within this item.

(d) OM, DMS Subsystem Parts. Dollar

Includes all cables, connectors, equipment racks, conductor(s), and other parts necessary for proper installation and configuration of a DMS subsystem.

(e) Maintenance and Protection of Traffic. Section 901.4(a)

SECTION 1237—MAINTENANCE, PORTABLE DYNAMIC MESSAGE SIGN (PDMS)

1237.1 DESCRIPTION—This work is to furnish, install, modify, repair, replace, and remove components of a portable Dynamic Message Sign (PDMS) subsystem.

1237.2 MATERIAL—Section 1231.2

1237.3 CONSTRUCTION—Section 1231.3 and as follows:

(a) Preventive Maintenance.

1. General. Section 1206.3(a)1

2. Site. Section 1206.3(a)2

3. Enclosures. Section 1206.3(a)3

4. Trailer and Mount Structure. Lubricate all hinges, jacks stands, mast and trailer hitches. Inspect for wear, rust, cracks, missing, damaged or bent parts, loose connections, frayed cables, and general condition. Check attachment hardware and tighten if necessary to the appropriate parameters. Clean, repaint, and repair as necessary.

5. Sign. Test operation of sign, all lamps and LED clusters, fiber bundle and pixels, fiber optic shutters, and perform diagnostic tests. Verify that all LED and fiber pixels are functioning from the control enclosure. Do this by following the manufacturer's testing procedure by using the keyboard and display in the PDMS control enclosure or using a laptop computer and connecting to a RS 232 connector in the control enclosure. Pixel test can also be performed by the TMC. Software will be provided by the Department where necessary. Visually ensure that all LEDs are illuminated and bright.

Check batteries and add distilled water (record group voltage, split voltage, specific gravity). Check and thoroughly clean solar panels and power the battery packs. Clean surface of signs. Clean filters during every Preventive Maintenance (PM) inspection. Replace filters (twice annually). Test ground rods for 25 ohms or less resistance utilizing fall of potential test. Test communication system. Test power and communications line surge suppressors and replace as necessary

(b) On-call Maintenance.

1. General. Section 1206.3(b)1

After On-call Maintenance (OM) has been completed, perform PM as described in Section 1237.3(a).

2. Responsiveness. Section 1206.3(b)2

1237.4 MEASUREMENT AND PAYMENT—

(a) Preventive Maintenance, Portable Dynamic Message Sign (PDMS) Subsystem. Each

All labor, materials, and equipment required for routine preventive maintenance are incidental to this item including, but not limited to, the Statewide Device Identification Number, cleaning materials, caulk, metal meshing, lubricants, filters, lamps, paint, surge suppressors, fuses, circuit breakers, attachment hardware, insect prevention measures, rodent control measures, clearing and grubbing, selective tree trimming, snow and ice removal, and weed control measures. Mobilization is incidental to this item.

(b) On-call, Portable Dynamic Message Sign (PDMS) Subsystem Mobilization. Each

Mobilization will not be paid for procurement of parts. Travel to and from the site and/or district stockpile is incidental to this item.

(c) On-call, Portable Dynamic Message Sign (PDMS) Subsystem Repair. Hour

Repair time will not be paid for procurement of parts. Travel to and from the site and/or district stockpile is incidental to this item. Site specific snow and ice removal requested by the Department is included within this item.

(d) On-call, Portable Dynamic Message Sign (PDMS) Subsystem Parts. Dollar

Includes all cables, connectors, equipment racks, conductor(s), and other parts necessary for proper installation and configuration of a PDMS subsystem.

(e) Maintenance and Protection of Traffic. Section 901.4(a)

SECTION 1240—VEHICLE DETECTOR SUBSYSTEM

1240.1 DESCRIPTION—This work is to furnish and install a complete Vehicle Detector Subsystem (VDS) consisting of a microwave vehicle detector, Bluetooth vehicle detector, or radio-frequency identification (RFID) tag reader vehicle detector.

1240.2 MATERIAL—

(a) **General.** Furnish a complete, functional VDS that includes a vehicle detection device, mounting hardware, cables and conduits, installation, and integration. Provide field-hardened subsystems for long-term freeway deployment where it is typically subject to wide daily and seasonal temperature swings, wind gusts, typical road vibrations. Provide all solid state electronic components and circuits. Minimize the possibility that failure of any one component or module causes total subsystem failure. Failure of one component or module must not cause the failure of any other component or module.

(b) **Microwave Vehicle Detector (MVD).** Furnish a MVD that uses frequency modulated continuous wave principle (FMCW), and determines vehicle presence by the return or reflection of radar output waves, which are converted to a data signal that corresponds to vehicle presence. Provide MVD that is easy to install and remove, and is fully programmable to support a variety of applications. Comply with all applicable mandatory NTCIP-1209 requirements, and optional requirements defined by the following User-Need (UN) or Functional Requirement (FR) section numbers:

UN section #	FR section #	Description
2.5.5.1	3.5.1.1	Get sample end time
2.5.5.1	3.5.1.2	Get volume
2.5.5.1	3.5.1.3	Get percent occupancy
2.5.5.1	3.5.1.4	Get speed
2.5.5.1	3.5.1.5	Get zone status

Provide all solid state electronic components and circuits. Provide MVD to operate without degradation in performance under temperature range of -40F to +165F, and relative humidity of lower than 95%, non-condensing, without auxiliary heating or cooling.

Provide a true presence MVD, which can provide presence, volume, lane occupancy and speed information on a minimum of eight detection zones. Make information available via serial communications lines. Provide user-defined 7-foot resolution for each zone range limit. Provide MVD with area of detection defined as an oval shaped beam, with minimum detection range and coverage angles as follows:

- Elevation Beam Width 45 degrees.
- Azimuth Beam Width 12 degrees.
- Range 10 feet to 200 feet.

Furnish a MVD that complies with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules or the appropriate Spectrum Management Authority. Provide MVD that does not interfere with any adjacent equipment. Where measurement energy is radiated, the radiated power must not exceed 10 milli-Watts.

Furnish MVD with processor that performs and generates, at minimum, the following statistical calculations over a set time duration: average speed, percent occupancy, vehicle count. Provide MVD that is capable of resolving closely spaced vehicles, and does not detect vehicles that remain stationary for over 5 minutes within a detection zone. Enable the operator to select if data is output as contact closures emulating standard loop detector outputs, and/or as accumulated statistical data using detector serial ports. Provide time duration for the statistical calculations that are user-adjustable from 10 seconds to 3600 seconds. Provide MVD that produces data in ASCII format. Provide full description of the protocol used for packaging the transmitted data, and full listing of what and how certain information may be queried. Store all VDS configurations data and all traffic parameters data within an internal, nonvolatile

memory. Store all collected data within the MVD unit for a minimum of 7 days, regardless of whether or not the data was already transmitted.

Furnish MVD that meets or exceeds the following accuracy requirements:

- Identify vehicle presence within each detection zone with a minimum accuracy of 95%
- Detect average travel speed with a minimum accuracy of 90%, independent of the vehicle's direction of travel through the detection zone.
- Maximum permissible error of 5% in the detection of the direction and magnitude of radial speed and 10% in the case of transverse speed.

Provide MVD that operates using nominal input voltage of 12 VDC to 24 VDC and less than 8 watts and is compatible with all power requirements in Section 1201.2(b).

1. Communication. Provide MVD that generates and transmits data in serial RS-232 or RS-422 format. Furnish terminal server to convert signals to Ethernet format where required.

(c) RFID Tag Reader Vehicle Detector (RTVD). Furnish a complete RFID transponder based RTVD. Detection targets are the vehicle-mounted RFID transponder tags used in the E-ZPass Interagency Group (IAG) Electronic Toll Collection (ETC) systems.

Provide RTVD that operates on 120 VAC, or is provided with relevant power conversion module that accepts 120 VAC power supply and is compatible with Section 1201.2(b).

Provide a RTVD that polls the transponder tags in vehicles passing through related detection zone, detects the transponder identification information responded by the transponder tags, time-stamps and transmits the detected information to the TMC/RTMC for further processing.

Provide detection antenna, related antenna cable, and related processing unit that operates without degradation in performance under temperature range of -40F to +165F, and relative humidity of lower than 95%, non-condensing, in absence of auxiliary heating or cooling. Provide detection antenna that radiates polling signal of no more than 4 milli-Watts per square centimeter, has a detection range of minimum 15 feet when placed above the center of a 12 foot wide lane, and has a coverage angle of greater than 60 degrees to allow detection from both lanes when placed above the center of two 12 foot wide lanes. Provide detection antenna with front surface measuring not more than 20 inches at each side, and is not more than 3 inches thick. Unless other length is specifically required, provide antenna cable that supports connection distance between a detection antenna and related processing unit of up to 200 feet.

Furnish a RTVD that complies with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules or the appropriate Spectrum Management Authority. Provide detector that does not interfere with any adjacent equipment.

Furnish RTVD that meets or exceeds the following accuracy requirements:

- Identify vehicle presence within each detection zone with a minimum accuracy of 95%
- Detect average travel speed with a minimum accuracy of 90%, independent of the vehicle's direction of travel through the detection zone.
- Maximum permissible error of 5% in the detection of the direction and magnitude of radial speed and 10% in the case of transverse speed.

1. Processing Unit. Provide processing unit to interface with and process data from up to eight detection antennas; provide blank cover plate on opening for all unused module slots. Provide RTVD that supports F2C data rate of up to 500Kbps, and properly interacts with and processes data from up to eight streams of transponder tags all moving at up to 100 miles per hour and spaced as close as 50 feet apart, within respective lanes. Provide processing unit that is equipped with at least one EIA RS232 port for configuration and monitoring, and at least one RJ45 ports for 10Mbps IP-based F2C communication.

2. Communication. Furnish RTVD that supports at least serial (RS-232) communications (or preferred serial and internet protocol (IP) communications platform) for field-to-center (F2C) communication. Provide RTVD that includes one or more microwave transponder based vehicle detection antennas and a related processing unit (tag reader).

(d) Bluetooth Vehicle Detector (BVD). Furnish a BVD capable of detecting vehicles with active Bluetooth signals along the roadway. Provide BVD equipped with a standard Class 1 Bluetooth Antenna at minimum and able to simultaneously detect at least four lanes of traffic when placed along the shoulder of the roadway. Provide BVD with the ability to be powered through utility power, solar power, battery power, and PoE as outlined in the contract documents. Provide a BVD having a minimum operating range of -22F to +145F and be able to connect to an existing network or communicate over a cellular (CDMA) network. The BVD must have onboard storage which can store all collected data for a minimum of 1 year. Provide a BVD which has the capability of GPS location. The BVD must have a MTBF of 90,000 hours, minimum.

(e) Detector Housings and Mounts. If detector is not provided as a weatherproof unit, enclose detector in a rugged weatherproof box and seal to protect the unit from wind, dust and airborne particles, and exposure to moisture. Weatherproof any control cable connection from the housing. The maximum total weight of the detector assembly is 20 pounds, excluding any batteries.

Provide mounting assembly consisting of all painted steel, stainless steel, or aluminum construction, and supporting a load of a minimum 20 pounds. Excluding the sensing surface, construct housing of aluminum, stainless steel, NEMA 4X rated polycarbonate, or steel with a corrosion-resistant finish. Furnish housing and mounting arrangement to withstand winds of 100 miles per hour with a 30-percent gust factor, and to withstand vibration of up to 0.03 inch total excursion from 5 Hz to 30 Hz, and peak random vibrations of 5G's from 30 Hz to 1,000 Hz.

For MVD, provide mounting hardware assembly to incorporate a ball-and-socket joint, or other approved mechanism, that can be tilted in both axes, then locked into place, to provide the optimum area of coverage.

Provide mounting for MVD to be installed in either a "side-fire" orientation, whereby the detector is mounted on the side of the roadway and projects a detection area perpendicular to the roadway, or "forward-looking" orientation, whereby the detector is mounted above the roadway, aimed downward, and projects a detection area parallel to the roadway.

For BVDs, provide a sealed, waterproof and tamperproof enclosure with has a locking mechanism and is capable of being chained or banded to structures along the roadway if necessary.

(f) Software. Where no vehicle detector software exists at the TMC/RTMC, furnish software to be installed on a PC or laptop computer at a TMC/RTMC. Furnish software to allow an operator to program, operate, and read current status of all VDS features and functions using the laptop, PC or TMC/RTMC workstation. Provide software to display detection zones and allow control of all detection zone parameters using a simple graphical user interface (GUI). Provide software that enables operators to configure, maintain, operate, setup, calibrate, and perform diagnostics for each detector location. Save all configuration data on the PC or laptop at the TMC/RTMC workstation. Provide detector with the capability to self-tune, and to allow manual calibration via vendor-supplied software. Provide software with the capability to perform autocalibration and autoconfiguration.

(g) Grounding. Section 1101.11(j)

1240.3 CONSTRUCTION—

(a) MVD. Where installing MVD in forward-looking orientation above the roadway, mount the MVD at a minimum height of 17 feet 6 inches above road surface. Where installing MVD in side-fire orientation, mount the detector at a height that minimizes the masking of vehicles. Install MVD in accordance with the manufacturer's recommendations, such that all detection zones are contained within the specified elevation angle. Provide mechanical means to adjust vertical and horizontal detector aiming angles, and to lock the detector aiming position securely. Provide means to double lock the final aiming position which is not prone to loosening or drifting when subject to road vibration.

For Side-Fire applications configure the MVDs to collect and send traffic data for traffic in both directions, for at least eight traffic lanes or as indicated, and within the coverage limitations of the MVD at the installed position. For overhead, forward looking configurations, mount the MVD over the center of the desired lane, or as directed. Configure and integrate the MVD into the Transportation Sensor System (TSS), travel time, or central control software at the related TMC/RTMC and any additional PCs or Laptops as directed by the Representative.

1. Detector Cables. Provide nominal 12-inch cable slack in drip loop configuration at the MVD to allow for aiming adjustments. Provide detector cable that is flexible and rated for outdoor use. Provide weatherproof connectors

for external connections between the cable and the detector. Install single, continuous run signal and control cable without splice between a detector assembly and related ITS enclosure.

(b) **RTVD.** Install the RTVD at a height of minimum 17 feet 6 inches, maximum 20 feet above road surface, or as specified. Provide mechanical means to adjust vertical and horizontal detector aiming angles, and to lock the detector aiming position securely. Provide means to double lock the final aiming position which is not prone to loosening or drifting when subject to road vibration.

1. Detector Cables. Provide nominal 24-inch cable slack in drip loop configuration at the RTVD to allow for aiming and height mounting adjustments. Install single, continuous run antenna cable without splice between a detector antenna and related communications enclosure. Provide detector cable that is flexible and rated for outdoor use. Provide weatherproof connectors for external connections between the cable and the detector antenna.

2. Permission. Acquire written permission from the E-ZPass IAG for the use of related transponder technology. This permission is a requirement for the procurement of the related products. Provide provisions to address any and all privacy concerns as identified by the E-ZPass IAG, and as required to obtain permission to utilize the RFID tag reading equipment. Coordinate with the Representative to obtain permission before procurement of RTVD.

(c) **BVD.** Install the BVD at the location indicated in the contract documents. Follow all manufacturers' recommendations for maximum detection along the roadway, including height, distance from farthest travel lane and security. Ensure all cabling is terminated according to the contract documents and as specified by the manufacturer.

(d) **Integration.** Section 1201.3(c)

(e) **Grounding.** Section 910.3(q)

(f) **Testing.** Section 1201.3(b)

(g) **Training.** Section 1201.3(d)

(h) **Documentation.** Section 1201.2(f)

1240.4 MEASUREMENT AND PAYMENT—

(a) **Vehicle Detector Subsystem (VDS).** Each

Includes wiring, connectors, detector, mounting, housing, cabling, software, terminal server, grounding, installation and integration work for a complete subsystem.

- 50% of payment will be made upon complete installation of VDS
- 30% of payment will be made upon completion of the standalone acceptance tests as specified in Section 1201.3(b).
- 20% of payment will be made upon successful completion of the 60-day test as specified in Section 1201.3(b).

Completion of test includes completion of training, submission of all manuals and documentation as required, and completion of all final inspections as required by the Representative.

SECTION 1246—MAINTENANCE, VEHICLE DETECTOR SUBSYSTEM

1246.1 DESCRIPTION—This work is to furnish, install, modify, repair, replace, and remove components of a Vehicle Detector Subsystem (VDS).

1246.2 MATERIAL—Section 1240.2

1246.3 CONSTRUCTION—Section 1240.3 and as follows:

(a) Preventive Maintenance.

1. General. Section 1206.3(a)1

2. Site. Section 1206.3(a)2

3. Enclosures. Section 1206.3(a)3

4. Structure. Inspect for wear, rust, cracks, missing, damaged or bent parts, loose connections, frayed cables, and general condition. Check attachment hardware and tighten if necessary to the appropriate parameters. Clean, repaint, and repair as necessary. Check anchor bolts for rust and tightness. Tighten if necessary to the appropriate parameters. Check welds. Install or replace screening at the base plate as necessary.

5. Detector. Inspect for wear, rust, cracks, missing, damaged or bent parts, loose connections, frayed cables, and general condition. Check housing and attachment hardware. Clean, repaint, and repair as necessary. Test communications system. Inspect and realign detector zone and range, as necessary, to ensure that presence is being recorded. Test power and communications line surge suppressors and replace as necessary.

(b) On-call Maintenance.

1. General. Section 1206.3(b)1

After On-call Maintenance (OM) has been completed, perform Preventive Maintenance (PM) as described in Section 1246.3(a).

2. Responsiveness. Section 1206.3(b)2

1246.4 MEASUREMENT AND PAYMENT—

(a) Preventive Maintenance, Vehicle Detector Subsystem (VDS). Each

All labor, materials, and equipment required for routine preventive maintenance are incidental to this item including, but not limited to, the Statewide Device Identification Number, cleaning materials, caulk, metal meshing, lubricants, filters, lamps, paint, surge suppressors, fuses, circuit breakers, attachment hardware, insect prevention measures, rodent control measures, clearing and grubbing, selective tree trimming, snow and ice removal, and weed control measures. Mobilization is incidental to this item.

(b) On-call, Vehicle Detector Subsystem (VDS) Mobilization. Each

Mobilization will not be paid for procurement of parts. Travel to and from the site and/or district stockpile is incidental to this item.

(c) On-call, Vehicle Detector Subsystem (VDS) Repair. Hour

Repair time will not be paid for procurement of parts. Travel to and from the site and/or district stockpile is incidental to this item. Site specific snow and ice removal requested by the Department is included within this item.

(d) On-call, Vehicle Detector Subsystem (VDS) Parts. Dollar

Includes all cables, connectors, equipment racks, conductor(s), and other parts necessary for proper installation and configuration of a Vehicle Detector subsystem.

(e) Maintenance and Protection of Traffic. Section 901.4(a)

APPENDIX A METRIC (SI) INFORMATION

General: This Appendix provides guidance on the selection of metric (SI) units and how they relate to their counterparts in English or I-P units. Topics include definitions, dual units, conversion rules, basic units of measure, commonly used SI prefixes, SI measurements, and conversion tables. The conversion tables show multiplication values to change I-P units to SI units.

Several additional tables in this Appendix provide specific I-P / SI relationships. These tables include:

- **Table A-1.** mm² Equivalents of American Wire Gage
- **Table A-2.** NEMA Metric Non-Metallic and Metallic Conduit and Fittings
- **Table A-3.** Reinforcing Bar Information
- **Table A-4.** Standard Test Sieves (U.S.A. Standard Sieves)

Definitions: Important terms include the following:

- **SI Units**—Units belonging to the International System of Units, which is abbreviated SI, as interpreted or modified for use in the United States by the Secretary of Commerce.
- **English or I-P Units**—Units based upon the yard and the pound, commonly used in the United States, and defined by the National Institute of Standards and Technology.
- **Soft Conversion**—An I-P measurement that is mathematically converted to its exact SI equivalent. (Example: Lane Width = 12 feet (I-P) = 3.658 m (SI).)
- **Hard Conversion**—A close approximation of the I-P unit but is rounded logically in the SI system. (Example: Lane Width = 12 feet (I-P) or 3.6 m (SI).)
- **SI Base Units**—The SI system consists of seven base units of measurement, six of which are used in design and construction. (The seventh, mole, is the amount of molecular substance and is used in physics.)

Quantity	Unit	Symbol
length	meter	m
mass	kilogram	kg
time	second	s
electric current	ampere	A
temperature	kelvin	K
luminous intensity	candela	cd

- **SI Derived Units**—Derived units are formed by combining base units, supplementary units, and other derived units according to the algebraic relations linking the corresponding quantities. The symbols for derived units are obtained by means of the mathematical signs for multiplication, division, and use of exponents. See the list entitled “Basic Units of Measure” for examples of SI derived units.

Dual Units: Measurements in these Specifications may be stated in dual units—SI units followed by I-P units in parentheses. Dual units may be found in references to SI or dual unit codes and standards (e.g., ASTM, AASHTO, etc.). In other situations, where references to other sources are not available, logical “Conversion Rules” are applied.

Many SI measurements in these Specifications are soft conversions of the I-P measurements. Over time, these SI measurements will be changed, through the consensus process, into hard conversions—rationalized, rounded SI dimensions of the I-P measurements.

Situations may occur where specifications are stated in SI units only or in I-P units only. These situations may occur when:

- Existing specifications have not been fully converted.
- The specification was developed exclusively using I-P units only or SI units only.
(i.e., Specified products may be available exclusively in SI sizes or I-P sizes.)

Conversion Rules: The *Metric Guide for Federal Construction*, published by the National Institute of Building Sciences, provides further direction about developing specifications. The publication presents “Conversion Rules” which aids in developing construction specifications. The “Conversion Rules” include the following:

- Use ASTM E 621, *Standard Practice for the Use of Metric (SI) Units in Building Design and Construction*, as a basic reference.
- Follow the rules for usage, conversion, and rounding in IEEE/ASTM SI 10-1997, *Standard for Use of International System of Units (SI): The Modern Metric System*, Annex B, or ANSI/IEEE 268, *American National Standard Metric Practice*, Sections 3.5 and 4.
- Wherever possible, convert measurements to rounded, rationalized, “hard” SI numbers. For instance, if anchor bolts are to be imbedded to a depth of 10 inches, the exact converted length (i.e., soft conversion) of 254 mm might be rounded to either 250 mm (9.84 inches) or 260 mm (10.24 inches). The less critical the number, the “rounder” it can be, but ensure that allowable tolerances or safety factors are not exceeded. When in doubt, stick with the exact “soft” conversion.
- Round to “preferred” SI numbers (i.e., hard conversion). While the preferred numbers for the “1 foot = 12 inches” system are, in order of preference, those divisible by 12, 6, 4, 3, 2, and 1, preferred SI numbers are, in order of preference, those divisible by 10, 5, 2, and 1 or decimal multiples thereof.
- Use hand calculators or software conversion programs that convert I-Ps to SI. They are readily available and are indispensable to the conversion process. Simply check with any store or catalogue source that sells calculators or software.
- Be careful with the decimal marker when converting areas and volumes; SI numbers can be significantly larger than I-P numbers (a cubic meter, for instance, is one billion cubic millimeters).

Basic Units of Measure

micrometer	(μm)
millimeter	(mm)
meter	(m)
square meter	(m ²)

mega (M)	10 ⁶	one million
giga (G)	10 ⁹	one billion

*Not in SI system

SI Measurements

Apparent Power = volt-amperes (V×A)
 Length = millimeters, meters, kilometers
 Area = square meters or hectares (10,000 square meters)
 Volume = Liters or cubic meters
 Mass = kilograms, tonnes
 Force = newton ($N = (kg \times m)/s^2$)
 Pressure, Stress = Pascal ($Pa = N/m^2$)
 Energy, Work = Joule ($J = N \times m$)
 Torque = Newton meter ($N \times m$)
 Speed, Velocity = meter/second, kilometers/hour
 Acceleration = meters/second squared, kilometers/hours squared
 Density = kilograms/cubic meter
 Temperature = degrees Celsius
 Power = Watt ($W = (N \times m)/s$)
 Viscosity (Dynamic) = Pascal second ($Pa \times s$)
 Viscosity (Kinematic) = square meter per second (m^2/s)
 Luminous Flux = lumen
 Illuminance = lux
 Luminous Intensity = candela

- (1) PennDOT has not added the "M" suffix appearing in some standard literature to SI bar numbers.
- (2) Grade is equivalent to Min. Yield Designation, f_y .
- (3) ASTM A 615/A 615 M billet-steel.
- (4) ASTM A 616/A 616 M rail-steel.
- (5) ASTM A 617/A 617 M axle-steel.
- (6) ASTM A 706/A 706 M low-alloy steel.
- (7) Equivalent MPa values for I-P grades follow: 40 ksi = 276 MPa, 50 ksi = 345 MPa, 60 ksi = 414 MPa, and 75 ksi = 517 MPa.

(1) These sieves are not in the standard series but they have been included because they are in common usage.

APPENDIX B STANDARD SPECIAL PROVISIONS TO PUBLICATION 408

General: This Appendix contains an explanation of the seven Standard Special Provision (SSP) Indices (C, D, G, I, N, P, and S) relating to Publication 408. These indices and the full text of their SSP can be found on the ECMS Website. SSPs contain instructions, standards, requirements or directions applying to a project, as set forth in the bid proposal, but not contained within Publication 408. In many applications they must be further tailored by designers and reviewers for use on specific projects.

Internet Access: Internet access to all SSPs and their contents may be obtained on the ECMS website. Once at the ECMS homepage select “Construction Projects”, then “Resources”, then “Special Provisions”.

Revisions: Revisions will occur to the indices and their associated contents. Changes and updates to SSPs may be identified by new versions (example: A to B) or by their “From” dates. As SSP entries are revised they will be retained in their original format with an appropriate notation to indicate documents that might have replaced them or their effective “To” dates. Thus entries will not be deleted, only annotated and added. Therefore, it will always be possible to determine what SSPs were in effect at a certain point in time.

SSP Indices. Following is an explanation of the seven indices relating to the series of SSPs to Publication 408, found in ECMS:

- **C INDEX.** This index addresses *Changes to Specifications Related* SSPs. This index includes changes that will be included in the next change to Publication 408 and are included on all projects. They will exist until the next change to Publication 408 becomes effective and then they will become inactive.
- **D INDEX.** This index addresses *Design Build Related* SSPs. This index includes SSPs that are specific to Design Build Projects only.
- **G INDEX.** This index includes *General Provision Related* SSPs. The index associated with this series addresses issues that apply to Publication 408 General Provisions, contract terms and conditions. General Provision related issues that apply to numbered sections within Publication 408 are found in the S Index.
- **I INDEX.** This index includes standard and non-standard Construction *Item Related* SSPs. All Non-Standard “9000” Construction Items and many Standard Master Construction Items cannot be included in bid proposals without reference to SSPs found in this index.
- **N INDEX.** This index includes *Non-pay Item Related* SSPs relating to those issues not paid for separately.
- **P INDEX.** This index addresses *Provisional Specification Related* SSPs that are to be used on a case-by-case or trial basis, and require close monitoring when used in conjunction with construction projects. They may be removed at any time, but they also have the potential for being incorporated into the text of Publication 408. An appropriate Strike-Off Letter further addresses each provision within this index.
- **S INDEX.** This index includes *Section Related* SSPs. This particular index addresses issues and conditions that apply to Publication 408 numbered sections.

APPENDIX C DESIGNATED SPECIAL PROVISIONS

General: This appendix to Publication 408 contains standard documents previously included in PennDOT Bid Proposals. Effective with the publication of Publication 408 they will be maintained within this Appendix in all versions and will be referenced in bid proposals. Governing Specifications, the applicable Designated Special Provisions, and other details will be specified in a single Standard Special Provision to each bid proposal. This Standard Special Provision is entitled: “GOVERNING SPECIFICATIONS AND APPLICABLE DESIGNATED SPECIAL PROVISIONS.”

Standard Documents: Designated Special Provisions (DSPs) that are referenced to this Appendix in PennDOT Bid Proposals are:

- DSP1. Offset Provision for State Contracts. See page C1-1.
- DSP2. Contractor Responsibility Provisions. See page C2-1.
- DSP3. Provisions for State Contracts Concerning the Americans with Disabilities Act. See page C3-1.
- DSP4. Diverse Business (DB) Requirements For Non-Federally Funded Construction Projects. See page C4-1.
- DSP7. Disadvantaged Business Enterprise (DBE) Requirements For Federally-Funded Construction Projects. See page C7-1.
- DSP8. F. A. R.—Required Contract Provisions Federal-Aid Construction Contracts – FHWA-1273 (Revised May1, 2012). See attachments to the Proposal. See C8-1.
- DSP9. Special Supplement—Anti-Pollution Measures – August 26, 1999. See page C9-1.
- DSP10. Nondiscrimination/Sexual Harassment Clause. See page C10-1.
- DSP11. Contractor Integrity Provisions. See page C11-1.
- DSP12. Executive Order 11246, with Appendices A and B. See page C12-1.
- DSP13. Buy America. This is used on a project when any phase of the project was completed using Federal funds. See page C13-1.
- DSP14. Enhanced Minimum Wage Provisions. See page C14-1.

**APPENDIX C
DESIGNATED SPECIAL PROVISION 1 (DSP1)
OFFSET PROVISION FOR STATE CONTRACTS**

The Contractor agrees that the Commonwealth of Pennsylvania (Commonwealth) may set off the amount of any state tax liability or other obligation of the Contractor or its subsidiaries to the Commonwealth against any payments due the Contractor under any contract with the Commonwealth.

APPENDIX C DESIGNATED SPECIAL PROVISION 2 (DSP2)

CONTRACTOR RESPONSIBILITY PROVISIONS

For the purpose of these provisions, the term Contractor is defined as any person, including, but not limited to, a bidder, offeror, loan recipient, grantee or lessor, who has furnished or performed or seeks to furnish or perform, goods, supplies, services, leased space, construction or other activity, under a contract, grant, lease, purchase order or reimbursement agreement with the Commonwealth of Pennsylvania (Commonwealth). The term Contractor includes a permittee, licensee, or any agency, political subdivision, instrumentality, public authority, or other public entity in the Commonwealth.

1. The Contractor certifies, in writing, for itself and its subcontractors required to be disclosed or approved by the Commonwealth, that as of the date of its execution of this Bid/Contract, that neither the Contractor, nor any such subcontractors, are under suspension or debarment by the Commonwealth or any governmental entity, instrumentality, or authority and, if the Contractor cannot so certify, then it agrees to submit, along with its Bid/Contract, a written explanation of why such certification cannot be made.
2. The Contractor also certifies, in writing, that as of the date of its execution of this Bid/Contract it has no tax liabilities or other Commonwealth obligations, or has filed a timely administrative or judicial appeal if such liabilities or obligations exist, or is subject to a duly approved deferred payment plan if such liabilities exist.
3. The Contractor's obligations pursuant to these provisions are ongoing from and after the effective date of the Contract through the termination date thereof. Accordingly, the Contractor shall have an obligation to inform the Commonwealth if, at any time during the term of the Contract, it becomes delinquent in the payment of taxes, or other Commonwealth obligations, or if it or, to the best knowledge of the Contractor, any of its subcontractors are suspended or debarred by the Commonwealth, the federal government, or any other state or governmental entity. Such notification shall be made within 15 days of the date of suspension or debarment.
4. The failure of the Contractor to notify the Commonwealth of its suspension or debarment by the Commonwealth, any other state, or the federal government shall constitute an event of default of the Contract with the Commonwealth.
5. The Contractor agrees to reimburse the Commonwealth for the reasonable costs of investigation incurred by the Office of State Inspector General for investigations of the Contractor's compliance with the terms of this or any other agreement between the Contractor and the Commonwealth that results in the suspension or debarment of the Contractor. Such costs shall include, but shall not be limited to, salaries of investigators, including overtime; travel and lodging expenses; and expert witness and documentary fees. The Contractor shall not be responsible for investigative costs for investigations that do not result in the Contractor's suspension or debarment.
6. The Contractor may search the current list of suspended and debarred Commonwealth contractors by visiting the Marketplace website at <http://www.emarketplace.state.pa.us> and clicking the Debarment List tab.

APPENDIX C DESIGNATED SPECIAL PROVISION 3 (DSP3)

PROVISIONS FOR STATE CONTRACTS CONCERNING THE AMERICANS WITH DISABILITIES ACT

For the purpose of these provisions, the term Contractor is defined as any person, including, but not limited to, a bidder, offeror, supplier, or grantee, who will furnish or perform or seeks to furnish or perform, goods, supplies, services, construction or other activity, under a purchase order, contract, or grant with the Commonwealth of Pennsylvania (State).

During the term of this contract, the Contractor agrees as follows:

1. Pursuant to federal regulations promulgated under the authority of the *Americans with Disabilities Act*, 28 C.F.R. §, 35.101 et seq., the Contractor understands and agrees that no individual with a disability is, on the basis of the disability, to be excluded from participation in this contract or from activities provided for under this contract. As a condition of accepting and executing this contract, the Contractor agrees to comply with the "General Prohibitions Against Discrimination," 28 C.F.R. §, 35.130, and all other regulations promulgated under Title II of the *Americans with Disabilities Act* which are applicable to the benefits, services, programs, and activities provided by the State through contracts with outside contractors.
2. The Contractor is to be responsible for and agrees to indemnify and hold harmless the State from all losses, damages, expenses, claims, demands, suits, and actions brought by any party against the State as a result of the Contractor's failure to comply with the provisions of paragraph 1.

APPENDIX C DESIGNATED SPECIAL PROVISION 4 (DSP4)

DIVERSE BUSINESS (DB) REQUIREMENTS For Non-Federally Funded Construction Projects

NOTE: For use in non-federally funded construction contracts administered and issued by the Pennsylvania Department of Transportation (Department).

I. GENERAL GOOD FAITH EFFORT REQUIREMENTS—

Section 303 of Title 74 of the Pennsylvania Consolidated Statutes, 74 Pa.C.S. §303, requires bidders on contracts funded pursuant to the provisions of Title 74 (Transportation) and 75 (Vehicle Code) administered and issued by the Department to make good faith efforts to solicit subcontractors that are Diverse Businesses (DBs) as defined in Section 303. The DB requirements of Section 303 apply to this contract.

Under the statute, bidders must make good faith efforts as set forth below to ensure that DBs have the opportunity to compete for and perform contracts. Do not discriminate on the basis of race, color, national origin, or sex in the award and performance of contracts. Failure to exert good faith efforts in the solicitation of subcontractors that are DBs may result in the bidder being declared ineligible for the contract.

Document and submit to the Department all good faith efforts to solicit subcontractors that are DBs as more fully described below. Bidders are encouraged to utilize and give consideration to second-tier or lower-tier subcontractors offering to utilize DBs in the selection and award of contracts.

When declared the low bidder provide to the Department within 7 calendar days of being declared the low bidder, the name and business address of each subcontractor that is a DB and will provide the contractor with construction or professional services in connection with the performance of the contract, all as set forth below.

If it becomes necessary to replace a subcontractor that is a DB at any time during the evaluation of a bid or construction of a project the bidder or contractor, as appropriate, immediately notify the Department of the need to replace the DB. Include the reasons for the replacement in the notice.

Good faith efforts to solicit and use DBs are in addition to all other equal opportunity requirements of the contract.

Failure to comply with requirements of Section 303 or as specified may constitute a breach of contract and may result in imposition of sanctions as appropriate under Section 531 of the Procurement Code, 62 Pa.C.S. §531 (relating to debarment and suspension).

The Department requires that all prime contractors including DB prime contractors perform at least 50% of the work on a Department construction project. The Department strongly encourages DB prime contractors to make additional outreach efforts to solicit DBs to perform subcontracting work on the project.

If there is a conflict between any term or condition of this special provision and the Department's Publication 408 Specifications, the term or condition of this special provision applies, including but not limited to the definition of subcontractor and the prompt payment requirements in subsection V(f).

II. DEFINITIONS—

The following definitions apply for terms used in this specification:

- (a) **Disadvantaged Business.** A business that is owned or controlled by a majority of persons, not limited to members of minority groups, who are subject to racial or ethnic prejudice or cultural bias.

- (b) **Diverse Business (DB).** A disadvantaged business, minority-owned or women-owned business or service-disabled veteran-owned or veteran-owned small business that has been certified by a third-party certifying organization and is both an ECMS Business Partner and pre-qualified, if required.
- (c) **ECMS.** The Department’s Engineering and Construction Management System.
- (d) **ECMS Business Partner.** An individual, firm, partnership, or corporation that has a valid Registered Business Partner Identification issued by the Department through ECMS.
- (e) **Good Faith Effort Review Officer.** The Department’s Executive Deputy Secretary for Administration or his/her designee, who reviews good faith efforts submitted by bidders.
- (f) **Minority-owned Business.** A business owned and controlled by a majority of individuals who are African Americans, Hispanic Americans, Native Americans, Asian Americans, Alaskans or Pacific Islanders.
- (g) **Professional Services.** An industry of infrequent, technical or unique functions performed by independent contractors or consultants whose occupation is the rendering of the services, including design professional services as defined in Section 901 of the Procurement Code, 62 Pa.C.S. §901 (relating to definitions); legal services; advertising or public relations services; accounting, auditing or actuarial services; security consulting services; computer and information technology services; and insurance underwriting services.
- (h) **Service-disabled Veteran.** Being in possession of a disability rating letter issued by the United States Department of Veterans Affairs or a disability determination from the United States Department of Defense or, if approved by the Department of General Services, a surviving spouse or permanent caregiver of a such a service-disabled veteran.
- (i) **Service-disabled Veteran-owned Small Business.** A business in the United States which is independently owned and controlled by a service-disabled veteran or veterans, not dominant in its field of operation, and employs 100 or fewer employees.
- (l) **Subcontractor.** Any individual, partnership, firm, or corporation entering into a contract with the prime contractor for work under the contract, including those providing professional and other services.
- (m) **Third-party Certifying Organization.** An organization that certifies a small business, minority-owned business, women-owned business or veteran-owned small business as a DB, including the National Minority Supplier Development Council; the Women’s Business Enterprise Council, the Small Business Administration; the Department of Veterans Affairs; and the Pennsylvania Unified Certification Program.
- (o) **Veteran.** An individual who served on active duty in the United States Armed Forces, including a reservist or member of the National Guard who was discharged or released from the service under honorable conditions, a reservist or member of the National Guard who completed an initial term of enlistment or qualifying period of service, and a reservist or member of the National Guard who was disabled in the line of duty during training.
- (p) **Veteran-owned Small Business.** A business in the United States which is independently owned and controlled by a veteran or veterans, is not dominant in its field of operation, and employs 100 or fewer employees.

III. ACTIONS REQUIRED BY THE BIDDER AT THE BIDDING STAGE AND PRIOR TO AWARD—

- (a) **Submission Requirements.** The apparent low bidder that will self-perform 100% of its contract is required to submit paper documentation by 3:00 P.M. prevailing local time within 7 calendar days after the bid opening. Submit paper documentation by email to minorityparticipation@pa.gov or by fax to (717) 705-1504. This paper documentation will become part of the contract.

The apparent low bidder that will not self-perform 100% of its contract is required to demonstrate its good faith efforts to solicit subcontractors that are DBs through the Department's ECMS website by 3:00 P.M. prevailing local time within 7 calendar days after the bid opening. Present good faith efforts by either completing the commitment and solicitation screens in ECMS or submitting paper documentation by email to minorityparticipation@pa.gov or by fax to (717) 705-1504 for all DBs that are not listed in ECMS. The good faith efforts will become part of the contract.

The paper documentation of good faith efforts must include the business name and business address of each DB that is not an ECMS Business Partner, as well as all good faith efforts to solicit other DBs that are not ECMS Business Partners. Supporting documentation must also include a DB acknowledgment for each DB providing construction or professional services, proof of certification for DBs that are not ECMS Business Partners, and any explanation of good faith efforts the bidder would like the Department to consider. Any services to be performed by a DB are required to be readily identifiable to the project.

If you have any questions on using a DB not listed on the ECMS DB Listing, contact the ECMS help desk at 855-783-8330 or at 717-783-8330.

When the seventh (7th) calendar day after the bid opening falls on a day that the Department offices are closed, submit the good faith efforts by 3:00 P.M. prevailing local time on the next business day. If assistance with the DB submission is needed, contact the ECMS Help Desk at 855-783-8330 or at 717-783-8330. ECMS Help Desk assistance is available 24 hours a day, 7 days a week.

Failure to electronically submit good faith efforts (including the commitment and solicitation screens as well as all supporting paper documentation) within 7 calendar days of the bid opening by the 3:00 P.M. deadline will result in rejection of the bid. The apparent next lowest bidder will be notified by email to electronically submit good faith efforts in the manner described above by 3:00 P.M. prevailing local time within 7 calendar days notification.

- (b) **Good Faith Efforts Requirements.** Good faith efforts are demonstrated by seeking out DB participation in the project given all relevant circumstances. The following illustrate the types of efforts that may be taken, but they are not deemed to be exclusive or exhaustive. The Good Faith Review Officer may consider other factors and types of efforts included in a bidder's submission of good faith efforts if deemed relevant.
1. Efforts made to solicit through all reasonable and available means (e.g., use of the DB Directory, attendance at pre-bid meetings, advertising and/or written notices) the interest of all certified DBs with the capability to perform subcontracted work. The bidder should provide written notification, at least 15 calendar days before the bid opening, to allow the DBs to respond to the solicitation. The bidder must determine with certainty if the DBs are interested by taking appropriate steps to follow up initial solicitations.
 2. Efforts made to select portions of the work to be performed by DBs. This includes, where appropriate, breaking out contract work items into economically feasible units to facilitate DB participation.
 3. Efforts made to provide interested DBs with adequate information about the plans, specifications, and requirements of the contract in a timely manner to assist them in responding to a solicitation.
 4. Efforts made to negotiate in good faith with interested DBs. Bidders are encouraged to make a portion of the work available to DBs and to select those portions of the work needs consistent with the available DBs so as to facilitate participation of DBs. Evidence of such negotiation includes the names, addresses, and telephone numbers of DBs that were considered; a description of the information provided regarding the plans and specifications for the work selected for subcontracting; and evidence as to why additional agreements could not be reached for DBs to perform the work. A bidder using good business judgment would consider a number of factors in negotiating with subcontractors, including DB subcontractors, and would take a firm's price and capabilities into consideration as well as its own ability or desire to perform the work with its own work force.
 5. Efforts made to thoroughly investigate DBs for qualification based on their capabilities. Bidders cannot

reject or withhold solicitation of DBs as being unqualified without sound reasons based on this investigation of their capabilities. The DB's standing within its industry, membership in specific groups, organizations, or associations and political or social affiliations (for example union vs. non-union employee status) are not legitimate causes for the rejection or non-solicitation of bids in the contractor's efforts to meet the good faith efforts requirement.

6. Efforts to assist interested DBs in obtaining bonding, lines of credit, or insurance.
7. Efforts to assist interested DBs in obtaining necessary equipment, supplies, materials, or related assistance or services.
8. Efforts to effectively use existing databases and the resources of supportive services to assist in finding DBs.

IV. ACTIONS TO BE TAKEN BY THE DEPARTMENT BEFORE AWARD—

- (a) **Approval.** If the apparent low bidder submits acceptable good faith efforts by the deadline and meets all other contract requirements, the Department will approve the submission. The Good Faith Review Officer will make the determination of whether the good faith efforts are acceptable. The contractor may be contacted for clarifications during the review.
- (b) **Conditional Approval.** The Department will issue a conditional approval of the good faith efforts to the apparent low bidder if any DB listed is not prequalified, if required, or not an ECMS Business Partner at the time the Department desires to award the contract.
- (c) **Rejection of Bid.** If the Good Faith Review Officer determines that the apparent low bidder has failed to make acceptable good faith efforts, the bid will be rejected and the apparent low bidder will be notified of the rejection. The Department will then notify, by email, the apparent next lowest bidder on the project to electronically submit good faith efforts through ECMS by 3:00 P.M. prevailing local time within 7 calendar days after notification. When the seventh (7th) calendar day after the notification falls on a day the Department offices are closed, submit good faith efforts by 3:00 P.M. prevailing local time on the next business day.

V. ACTIONS REQUIRED BY THE CONTRACTOR DURING CONSTRUCTION—

- (a) **DB Participation.** Continue good faith efforts for the life of the project.
- (b) **Subcontractor Approval.** Firms are not to commence work until they are approved.

All firms listed in the good faith efforts submission, including those providing professional and other services, must be submitted for subcontractor approval after the contract is executed and approved before the DB's actual performance of work. Submit for subcontractor approval any DB to be utilized whether or not they are listed in the good faith efforts submission approved by the Good Faith Review Officer.

For a contractor that declared that it will self-perform 100% of its project, adding a subcontractor requires a good faith effort. Attach the good faith effort documentation along with the Public Works Employment Verification Form to the ECMS subcontractor request.

When submitting a request for subcontractor approval, provide, in accordance with Section 108.01(e), a copy of the subcontract or agreement or:

- A copy of the executed signature page,
- A copy of the description of the scope of work, and

- A copy of the unit prices as they appear in the subcontract or agreement.
- (c) **Conditional Approval Resolution.** Continually monitor conditional approval of DB subcontractors. Examples of these conditional approvals may include prequalification requirements.
- (d) **Replacement of DB.** If it becomes necessary to replace a subcontractor that is a DB at any time during construction of the project immediately notify the Department of the need to replace the DB. Include the reasons for the replacement in the notice.
- (e) **Additional Work.** The obligation to make good faith efforts to solicit subcontractors that are DBs extends to additional work required for any classification of work which is identified as to be performed by a DB.
- (f) **Progress Payments.** Make payments to DB subcontractors in accordance with the prompt payment requirements of Chapter 39, Subchapter D of the Procurement Code, 62 Pa.C.S. §§3931 et seq. Performance of work by a DB subcontractor in accordance with the terms of the contract entitles the subcontractor to payment. Enter DB progress payments into ECMS monthly. The payments cannot be entered into ECMS until there is an approved subcontractor request. Bring to the attention of the Department, in writing, any situation in which regularly scheduled progress payments are not made to DB subcontractors.
- (g) **Records and Reports.** Keep such project records as are necessary to perform the reporting function discussed below. These records can be used as documentation of good faith efforts. Design these records to indicate:
1. The number of DB and non-DB subcontractors and the type of work or services performed on the project.
 2. The progress and efforts made in seeking out DB contractor organizations and individual DBs for work on the project.
 3. Documentation of all correspondence, personal contacts, telephone calls, etc., to obtain the services of DBs for the project. Submit reports, as required by the Department. Certify that the amounts were actually paid to the DB for work performed on the project and keep cancelled checks on file in the home office to reflect payment for the specific project and for inspection and audit by the Department. Enter the payment information in ECMS “DB Payments” within 5 business days after the end of the month and include the following:
 - a. The number of contracts awarded (with approved subcontractor requests) to DBs, noting the type of work and amount of each contract executed with each firm and including the execution date of each contract.
 - b. The amount paid to each DB during the month and the amount paid to date. If no payments are made to a DB during the month, enter a zero (\$0.00) payment.
 - c. Paid invoices or a certification attesting to the actual amount paid to each firm, upon completion of the individual DBs work. In the event the actual amount paid is less than the award amount, provide a complete explanation of the difference.

Maintain all such records for a period of 3 years following acceptance of final payment. Make these records available for inspection by the Department.

VI. ACTIONS REQUIRED BY THE CONTRACTOR FOLLOWING COMPLETION OF CONSTRUCTION—

When requested, or within 30 days of the end of the contract submit a report to the Department summarizing the use of approved subcontractors not on the ECMS DB Listing.

Identify in the report the name of the subcontractor; the nature of the work performed by the subcontractor (i.e. prime contractor, direct or tiered subcontractor; who certified the subcontractor as a DB; the subcontractor's ECMS Business Partner number; the subcontractor's ECMS contract number; and the amount of their subcontract.

For direct and tiered subcontractors, provide the amount of the contract that is performed, managed and supervised by the DB's own forces. Include the cost of supplies and materials obtained by the DB for the work of the subcontract, including supplies purchased or equipment leased by the DB. The amount a DB subcontracts or leases to another non-DB firm must be excluded. The value of the subcontracted work may be counted only if the DB's subcontractor is itself a DB; work that a DB subcontracts to a non-DB firm does not count.

VII. ACTIONS TO BE TAKEN BY THE DEPARTMENT FOLLOWING CONSTRUCTION—

Upon completion of the work the Department will review the actual DB participation and make a determination regarding the contractor's compliance with Section 303 and this special provision. Sanctions may be imposed for noncompliance.

APPENDIX C DESIGNATED SPECIAL PROVISION 7 (DSP7)

DISADVANTAGED BUSINESS ENTERPRISE (DBE) REQUIREMENTS For Federally-Funded Construction Projects

NOTE: Requires special provision for participation DBE goal percentage.

I. DBE GOAL—

The Department has established, in connection with this contract, a DBE goal as specified in the proposal of the original contract amount for the utilization of firms owned and controlled by socially and economically disadvantaged individuals certified as DBEs. If the DBE goal is zero, make an effort to identify and use DBEs. This DBE goal remains in effect for the life of the project.

Include the following provisions (paragraphs a through d) in every subcontract, so that such provisions will be binding not only upon the prime contractor but also upon each subcontractor, supplier, service provider or consultant.

- (a) **Policy for Federally-Funded Projects.** It is the policy of the U.S. Department of Transportation (DOT) and the Department that DBEs, as defined in 49 CFR Part 26, as amended, (Part 26) and this specification, be given the opportunity to participate in the performance of contracts financed in whole or in part with Federal funds under this contract. Consequently, the DBE requirements of Part 26, as amended, apply to this contract.
- (b) **DBE Obligation.** Take all necessary and reasonable steps to ensure that all DBEs have the opportunity to compete for and perform contracts. Do not discriminate on the basis of race, color, national origin, or sex in the award and performance of PennDOT and DOT-assisted contracts.
- (c) **Failure to Comply with DBE Requirements.** Failure to carry out the requirements as specified constitutes a breach of contract and may result in termination of the contract, being barred from bidding on Department contracts for up to three (3) years, withholding progress payments, assessing sanctions, assessing liquidated damages, or any other remedy that the Department deems appropriate. Failure to comply with DBE requirements may include, but is not limited to, failure to submit DBE Minority Participation and Commitment within the time period specified, failure to exert a reasonable Good Faith Effort to meet the established DBE goal, or failure to realize the approved DBE participation level set forth may result in the bidder being declared ineligible for the contract.
- (d) **Small Business Enterprise (SBE) Participation.** Recruitment and utilization of certified SBEs is in addition to all other equal opportunity requirements of the contract. There is no SBE goal.

II. DEFINITIONS—

The following definitions apply for terms used in this specification:

- (a) **Disadvantaged Business Enterprise (DBE).** A for-profit small business concern:
 - 1. An entity certified by the Pennsylvania Unified Certification Program (PAUCP) as listed on www.paucp.com.
 - 2. That meets the ownership and control requirements of the DBE certification program.
 - 3. That meets the Personal Net Worth requirements of the DBE certification program.
- (b) **Small Business Enterprise (SBE).** A for-profit small business concern:
 - 1. An entity certified by the PennDOT as listed on www.dotsbe.pa.gov.
 - 2. That meets the ownership and control requirements of the Small Business Element (SBE) certification

- program.
3. That meets the Personal Net Worth requirements of the SBE certification program.
- (c) **Commercially Useful Function.** A DBE performs a Commercially Useful Function (CUF) when it is responsible for execution of the work of the contract and is carrying out its responsibilities by actually performing, managing, and supervising the work involved. To perform a CUF, the DBE must also be responsible, with respect to materials and supplies used on the contract, for negotiating price, determining quality and quantity, ordering the material, installing (where applicable), and paying for the material itself.
 - (d) **Interdisciplinary Review Team (IRT).** A team of three representing both the Bureau of Equal Opportunity and the Bureau of Project Delivery (Contract Management Section) that performs the initial review of the Good Faith Effort documentation and makes the recommendation to the Director.
 - (e) **Committee.** The Good Faith Effort Review Committee.
 - (f) **Days.** Calendar days. In computing any period of time described in this specification, the day from which the period begins to run is not counted, and when the last day of the period is a Saturday, Sunday, or state holiday, the period extends to the next day that is not a Saturday, Sunday, or state holiday. Similarly, in circumstances where the PennDOT offices are closed for all or part of the last day, the period extends to the next day on which the PennDOT offices are open.
 - (g) **Director.** Director, Bureau of Equal Opportunity.
 - (h) **DBE Participation.** Minority Participation and Commitment that is accessed by the Department's ECMS website (www.dot14.state.pa.us/ECMS).
 - (i) **Revised DBE Participation.** Minority Participation and Commitment that is accessed by the Department's ECMS website which includes new DBE firm(s) as well as those not affected by the revision.
 - (j) **Supplier.** A manufacturer, regular dealer, or transaction expeditor/broker.
 1. **Manufacturer.** A DBE/SBE that operates or maintains a factory or establishment that produces, on the premises, the materials, supplies, articles, or equipment required under the contract and of the general character described by the specifications.
 2. **Regular Dealer.** A DBE/SBE that owns, operates, or maintains a store, warehouse, or other establishment in which the materials, supplies, articles or equipment of the general character described by the specifications and required under the contract are bought, kept in stock, and regularly sold or leased to the public in the usual course of business. To be a regular dealer, the firm must be an established, regular business that engages, as its principal business and under its own name, in the purchase and sale or lease of the products in question. A person may be a regular dealer in such bulk items as petroleum products, steel, cement, gravel, stone, or asphalt without owning, operating, or maintaining a place of business as provided above if the person both owns and operates distribution equipment for the products. Any supplementing of regular dealers' own distribution equipment shall be by a long-term lease agreement and not on an ad hoc or contract-by-contract basis. Whether a DBE/SBE firm meets the criteria for being treated as a regular dealer is a contract-by-contract determination to be made by the Department.
 3. **Transaction Expeditor/Broker.** A DBE/SBE packager, broker, manufacturers' representatives, or other persons who arrange or expedite transactions and who arrange for material drop-shipments.
 - (k) **Service Provider.** A DBE/SBE that performs work that does not have a prequalification requirement on a project.
 - (l) **Shortfall.** The difference between the dollar amount on the approved DBE commitment in ECMS and the amount of payments to the approved DBE entities as listed in ECMS.

III. COUNTING PARTICIPATION—

COUNTING DBE PARTICIPATION TOWARD THE DBE GOAL

Utilization of certified DBEs is in addition to all other equal opportunity requirements of the contract.

Count DBE participation toward meeting the DBE goal for federal projects as follows: If a firm is a certified DBE contractor or subcontractor at the time that submission of DBE Minority Participation and Commitment documents are due, the total dollar value of the contract awarded to the certified DBE is counted toward the applicable DBE goal as provided below. Any services to be performed by a DBE are required to be readily identifiable to the project.

(a) Construction.

1. **Prime Contractor.** The Department requires that all prime contractors including DBE prime contractors perform at least 50% of the work on a Department project. A DBE prime contractor will receive credit for all work performed with its own forces. The Department strongly encourages DBE prime contractors to make additional outreach efforts to solicit DBEs to perform subcontracting work on the project.
2. **Subcontractor.** When a DBE participates in a contract directly as a subcontractor or as a second-tier or lower-tier subcontractor, count only the value of the work actually performed by the DBE.

Count the entire amount of that portion of a construction contract that is performed by the DBE's own forces. Include the cost of supplies and materials obtained by the DBE for the work of the subcontract, including supplies purchased or equipment leased by the DBE.

When a DBE subcontracts part of the work of its contract to another firm, the value of the subcontracted work may be counted only if the DBE's subcontractor is itself a DBE. Work that a DBE subcontracts to a non-DBE firm does not count.

Count expenditures to a DBE contractor only if the DBE is performing a CUF on that contract.

Count expenditures to a DBE only if the DBE is certified at the time the Subcontractor Request has been approved.

(b) Materials and Supplies.

1. **DBE Manufacturer.** If the materials or supplies are obtained from a DBE manufacturer, count 100% of the cost of the materials or supplies.
2. **DBE Regular Dealer.** If the materials or supplies are purchased from a DBE regular dealer, count 60% of the cost of the materials or supplies. There is no North American Industry Classification System (NAICS) code for regular dealer.
3. **DBE Transaction Expediter/Broker.** If the materials or supplies are purchased from a DBE which is neither a manufacturer nor a regular dealer, count the entire amount of fees or commissions charged for assistance in the procurement of the materials and supplies, or fees or transportation charges for the delivery of materials or supplies required on a job site, provided the fees are determined to be reasonable and not excessive as compared with fees customarily allowed for similar services. Do not count any portion of the cost of the materials and supplies themselves.

- (c) **Service Providers.** Count the entire amount of fees or commissions charged by a DBE firm for providing a bona fide service, such as professional, technical, consultant, or managerial services, or for providing bonds or insurance specifically required for the performance the contract, provided the fee is reasonable and not excessive as compared with fees customarily allowed for similar services.

- (d) **Trucking Firms.** Count 100% of trucking costs using the following factors to determine what can be counted:
1. Count if the DBE is responsible for the management and supervision of the entire trucking operation for which it is responsible on a particular contract, and there cannot be a contrived arrangement for the purpose of meeting DBE goals.
 2. Count if the DBE owns and operates at least one fully licensed, insured, and operational truck used on the contract.
 3. Count the total value of the transportation services the DBE provides on the contract using trucks it owns, insures, and operates using drivers it employs.
 4. The DBE may lease trucks from another DBE firm, including an owner-operator who is a certified DBE. If the DBE leases trucks from another DBE, count the total value of the transportation services the lessee DBE provides on the contract.
 5. The DBE may also lease trucks from a non-DBE firm, including an owner-operator. If the DBE leases trucks from a non-DBE firm and the DBE operates these leased trucks (with its own forces), count the total value of the transportation services the lessee non-DBE provides on the contract. If the DBE leases trucks from a non-DBE owner-operator, count only the fee or commission it paid as a result of the lease arrangement. Do not count the total value of the transportation services provided by the lessee (non-DBE owner-operator), since these services are not provided by a DBE.
 6. For purposes of this provision, a lease must indicate that the DBE has exclusive use of and control over the truck. This does not preclude the leased truck from being used for work for others during the term of the lease with the consent of the DBE, so long as the lease gives the DBE absolute priority for use of the leased truck. Leased trucks must display the name and identification number of the DBE.
- (e) **Specialty Items.** In cases where specialty items and DBE involvement overlap, follow the requirements specified in Section 108.01(c).

COUNTING SBE PARTICIPATION

- (a) Recruitment and utilization of certified SBEs is in addition to all other equal opportunity requirements of the contract.
- (b) There is no SBE goal.
- (c) Count SBE participation the same as DBE participation.

IV. ACTIONS REQUIRED BY THE DBE AT THE BIDDING STAGE AND PRIOR TO AWARD FOR PROJECTS WITH A DBE GOAL—

Include the applicable North American Industry Classification System (NAICS) code(s) for each type of work that the DBE firms quotes and intends to perform on the contract.

V. ACTIONS REQUIRED BY BIDDERS AT THE BIDDING STAGE AND PRIOR TO AWARD FOR PROJECTS WITH A DBE GOAL—

- (a) **Submission Preparation.** All bidders are obligated to obtain and to provide all applicable NAICS codes for each proposed DBE and type of work that it will perform on the contract.
- (b) **Submission Requirements.** When the DBE goal established by the Department is met or exceeded, the

bidders are required to electronically submit evidence of such commitments, by accessing the Department's ECMS website to complete and submit the DBE Minority Participation and Commitment including DBE acknowledgement by 3:00 P.M. prevailing local time within five (5) calendar days after the bid opening. The DBE Minority Participation and Commitment Detail Screen must include the applicable NAICS code(s) for each proposed DBE and type of work that it will perform on the contract. If the DBE Minority Participation and Commitment Detail Screen is not sufficient to provide all DBE NAICS information, email the remaining DBE NAICS information to minorityparticipation@pa.gov or fax the remaining DBE NAICS information to (717) 705-1504 so that it is received by the time specified below for consideration. DBE Minority Participation and Commitment Screen completed in ECMS regarding commitments to certified DBEs will become part of the contract. When the fifth (5th) calendar day after the bid opening falls on a day that the PennDOT offices are closed, submit the DBE Minority Participation and Commitment by 3:00 P.M. prevailing local time on the next business day. If assistance with the DBE submission is needed, contact the ECMS Help Desk at 855-783-8330 or at 717-783-8330. ECMS Help Desk assistance is available 24 hours a day, 7 days a week.

When the DBE goal established by the Department is not met (the Department will not round up), demonstrate a Good Faith Effort (GFE) to meet the contract DBE goal. Demonstrate that the efforts made were those that a bidder seeking to meet the DBE goal established by the Department would make, given all relevant circumstances. Email the GFE documentation to minorityparticipation@pa.gov or upload or fax to (717) 705-1504 so that it is received by the time specified above for consideration. All submissions must include, as a part of the GFE documentation, copies of each DBE and non-DBE subcontractor quote when a non-DBE subcontractor was selected over a DBE subcontractor for work on the contract due to the apparent low bidders' determination that the DBE's quote was too high or unreasonable. Also, indicate on the DBE Minority Participation and Commitment screen that the Good Faith Effort is being submitted for consideration.

Failure to electronically submit the DBE Minority Participation and Commitment Screen including DBE acknowledgement completed in ECMS or upload or email or fax any applicable GFE documentation for consideration within five (5) calendar days of the bid opening by the 3:00 P.M. deadline will result in the rejection of the bid.

- (c) **Good Faith Effort Requirements.** The demonstration of GFEs is accomplished by seeking out DBE participation in the project given all relevant circumstances. The following illustrate the types of efforts that may be taken, but they are not deemed to be exclusive or exhaustive (for more guidance on GFE requirements, refer to 49 CFR Part 26 Appendix C). The Director and/or Committee will consider other factors and types of efforts that may be relevant:

- Efforts made to conduct market research to identify small business contractors and suppliers and solicit through all reasonable and available means (e.g., use of the DBE Directory, attendance at pre-bid meetings, advertising and/or written notices) the interest of all certified DBEs who have the capability to perform the work of the contract. The bidder should provide written notification, at least 15 calendar days before the bid opening, to allow the DBEs to respond to the solicitation. The bidder must determine with certainty if the DBEs are interested by taking appropriate steps to follow up initial solicitations.
- Efforts made to select portions of the work to be performed by DBEs in order to increase the likelihood that the DBE goal will be achieved. This includes, where appropriate, breaking out contract work items into economically feasible units to facilitate DBE participation, even when the prime contractor might otherwise prefer to perform these work items with its own forces.
- Efforts made to provide interested DBEs with adequate information about the plans, specifications, and requirements of the contract in a timely manner to assist them in responding to a solicitation.
- Efforts made to negotiate in good faith with interested DBEs. It is the bidder's responsibility to make a portion of the work available to DBE subcontractors and suppliers and to select those portions of the work or material needs consistent with the available DBE subcontractors and suppliers, so as to facilitate DBE participation. Evidence of such negotiation includes the names, addresses, and telephone numbers

of DBEs that were considered; a description of the information provided regarding the plans and specifications for the work selected for subcontracting; and evidence as to why additional agreements could not be reached for DBEs to perform the work. A bidder using good business judgment would consider a number of factors in negotiating with subcontractors, including DBE subcontractors, and would take a firm's price and capabilities as well as contract DBE goals into consideration. However, the fact that there may be some additional costs involved in finding and using DBEs is not in itself sufficient reason for a bidder's failure to meet the contract DBE goal, as long as such costs are reasonable. Also, the ability or desire of a bidder to perform the work of a contract with its own work force does not relieve the bidder of the responsibility to make a GFE. Bidders are not, however, required to accept quotes from DBEs if the price difference is too high or unreasonable.

- Bidder's determination of a DBE as being unqualified without sound reasons based on a thorough investigation of their capabilities. The contractor's standing within its industry, membership in specific groups, organizations, or associations and political or social affiliations (for example union vs. non-union employee status) are not legitimate causes for the rejection or non-solicitation of bids in the contractor's efforts to meet the contract DBE goal. Another practice considered an inadequate GFE is the rejection of a DBE because its quotation for the work was not the lowest received. However, nothing in this paragraph shall be construed to require the bidder or prime contractor to accept unreasonable quotes in order to satisfy the contract DBE goal.
- Efforts to assist interested DBEs in obtaining bonding, lines of credit, or insurance.
- Efforts to assist interested DBEs in obtaining necessary equipment, supplies, materials, or related assistance or services.
- Efforts to effectively use the services of the Department's DBE Supportive Services Center; services of the Department's SBE Supportive Services Center; services of available minority/women community organizations; minority/women contractors' groups; local, State, and Federal minority/women business assistance offices; and other organizations as allowed on a case-by-case basis to provide assistance in the recruitment and placement of DBEs.

VI. ACTIONS TO BE TAKEN BY THE DEPARTMENT BEFORE AWARD—

- (a) **Approval.** If the apparent low bidder submits the DBE Minority Participation and Commitment by the deadline and meets the contract DBE goal and all other contract requirements, the Department will approve the submission.
- (b) **Conditional Approval.** The Department will issue a conditional approval of the DBE Minority Participation and Commitment to the apparent low bidder if (1) any DBE listed on the DBE Minority Participation and Commitment is not prequalified, if required, at the time the Department desires to award the contract or (2) the distinction between regular dealer and transaction expeditor/broker is unclear.
- (c) **Good Faith Effort Review.** If the apparent low bidder submits the DBE submission by the deadline but fails to meet the contract DBE goal and requests a GFE review, the Department will review the GFE documentation. If, during the review of the Contractor's GFE information, the reviewers have questions, the Contractor may be contacted for clarification. The GFE steps are as follows:
 1. IRT reviews and makes a recommendation to the Director.
 2. The Director either
 - a. Approves recommendation that the GFE was met and the DBE Minority Participation and Commitment will be approved, or
 - b. Recommends that the Committee make a determination.
 3. If forwarded to them, the Committee meets and makes the final determination. If the Committee

determines that the apparent low bidder met the GFE, the DBE Minority Participation and Commitment will be approved. If the Committee determines that the apparent low bidder has failed to make a GFE, the bid will be rejected and the apparent low bidder will be notified of the rejection.

VII. ACTION TO BE TAKEN BY THE DEPARTMENT DURING CONSTRUCTION—

To ensure that all obligations awarded to DBEs under this contract are met, the Department will review the Contractor's DBE involvement efforts during the performance of the project whether or not the DBE is listed on the approved DBE Minority Participation and Commitment. The review will include a CUF review and analysis.

Sanctions. Upon completion of the work the Department will review the actual DBE participation and make a determination regarding the Contractor's compliance with the applicable requirements. Sanctions may be imposed for noncompliance or unwarranted shortfalls in the approved DBE goal.

VIII. ACTIONS REQUIRED BY THE CONTRACTOR DURING CONSTRUCTION—

- (a) **DBE Participation.** Must continue to make GFEs for the life of the project. When DBE Minority Participation and Commitment is approved with a DBE participation less than the contract DBE goal, continue GFE toward meeting the contract DBE goal. Ensure that the Commitment is attained. Proof of attainment is provided by payments to DBEs and documented in ECMS.
- (b) **DBE Subcontractor Approval.** Firms listed on DBE Minority Participation and Commitment are not to commence work until they are approved.

All firms listed on the approved DBE Minority Participation and Commitment, including those business types other than subcontractor (i.e. dealers, truckers, service providers), must be submitted for subcontractor approval after the contract is executed and approved before DBEs actual performance of work. The subcontractor request must be equal to or greater than the committed amount. Submit for subcontractor approval any other DBE whether or not they are listed on the approved DBE Minority Participation and Commitment. When submitting request for subcontractor approval, attach a copy of the DBE subcontract or agreement or:

- A copy of the executed signature page,
 - A copy of the description of the scope of work, and
 - A copy of the unit prices as they appear in the DBE's subcontract or agreement.
- (c) **Conditional Approval Resolution.** Continually monitor conditional approval of DBE subcontractors. Examples of these conditional approvals may include prequalification requirements and distinction between dealer and broker.
 - (d) **Substitution.** Obtain written approval from the Department before substituting an approved DBE subcontractor or making any change to the DBE participation listed on the approved DBE Minority Participation and Commitment. Immediately request substitution authorization from the District in writing. The request must include documentation supporting the substitution and written agreement from the DBE to the change. Include proof that a certified letter giving the DBE five (5) days to respond with acceptance or to notify the Department of non-acceptance. Demonstrate that every effort has been made to allow the DBE to perform. The District will contact the Bureau of Project Delivery, Contract Awards.

A prime contractor may not self-perform any work committed to a DBE without prior written approval from the Department. Any work committed to a DBE that is instead self-performed by a prime contractor without obtaining prior written approval from the Department will result in non-payment for the specified work. The

Department may also seek additional remedies as stated in Part I(c) - Failure to Comply with DBE Requirements.

1. If the DBE agrees to be removed by the Contractor and the Department approves, document the following procedures:
 - Make a GFE in accordance with V.(b) to subcontract the work with another DBE, or subcontract other work items to DBE firms, to make up the DBE shortfall. A prime contractor's inability to find a replacement DBE at the contract price is not, in and of itself, adequate to support a finding that GFEs have been made to replace the original DBE. The fact that the prime contractor has the ability and/or desire to perform the contract work with its own forces does not relieve the prime contractor of the obligation to make GFEs to find a replacement DBE, and it is not a sound basis for rejecting a prospective replacement DBE's reasonable quote.
 - When the substitution results in meeting the DBE goal, complete a revised DBE Minority Participation and Commitment with DBE acknowledgement and/or a revised subcontractor approval request within five (5) days of a revision being opened in ECMS. If the DBE performed on the project, the Revised DBE Minority Participation and Commitment and/or subcontractor approval request should include the total amount paid to the DBE before the DBE substitution.
 - When the substitution does not result in meeting the DBE goal, complete a revised DBE Minority Participation and Commitment with DBE acknowledgement and/or a revised subcontractor approval request within five (5) days of a revision being opened in ECMS and provide additional GFE documentation, including (1) a statement of efforts made to negotiate with DBEs for specific work or supplies, including the names, addresses, telephone numbers, and emails of those DBEs that were contacted; (2) the time and date each DBE was contacted; (3) a description of the information provided to DBEs regarding plans and specifications for portions of the work to be performed or the materials supplied; and (4) an explanation of why an agreement between the prime contractor and DBE was not reached. If the DBE performed on the project, the Revised DBE Minority Participation and Commitment and/or subcontractor approval request should include the total amount paid to the DBE before the DBE substitution.

Good Faith Effort Review. The Department will review the GFE documentation for substitution. If, during the review of the Contractor's GFE information, the reviewers have questions, the Contractor may be contacted for clarification. The GFE steps are as follows:

- a. Contract Awards reviews and, if acceptable, approves the GFE and DBE revision or recommends that the IRT made the determination.
- b. The IRT either
 - Approves recommendation that the GFE was met and the Minority Participations substitution will be approved, or
 - Disapproves the GFE resulting in a shortfall requiring the contractor to continue GFEs.
- c. If forwarded to them, the IRT makes a final determination.

Do not perform any of the DBE work included in the substitution request without prior approval from the Department.

If the projected DBE participation on an approved DBE Minority Participation and Commitment meets or exceeds the DBE goal amount for the contract without replacing the DBE, then no contract shortfall exists. A Revised DBE Minority Participation and Commitment and/or subcontractor approval request must be submitted to reflect the decreased dollar amount.

2. If the arrangement to be replaced is not agreeable between the Contractor and the DBE, the following procedures are required:
 - Until a determination is made, do not perform the DBE work without prior approval.
 - The IRT will review and make a determination and the District will notify both the Contractor and the DBE.
 - The Contractor or the DBE may request a meeting with the Department by contacting the District Office.
- (e) **SBE Participation.** SBE Firms are not to commence work until they are approved. The SBE, including those business types other than subcontractor (i.e. supplier, trucking, service provider), must be submitted for subcontractor approval after the contract is executed and approved before the SBEs actual performance of work.
- (f) **Additional Work.** When additional work is required for any classification of work which is identified on the DBE Minority Participation and Commitment to be performed by the DBE, at least 50% of this additional work will be performed by the same DBE unless the DBE submits, in writing, that it cannot perform the work due to its own limitations.
- (g) **Progress Payments.** Make payments in accordance with Section 110.05. Enter DBE and SBE progress payments into ECMS monthly. Bring to the attention of the Department, in writing, any situation in which regularly scheduled progress payments are not made to DBE/SBE subcontractors, suppliers, service provider or consultant.
- (h) **Records and Reports.** Keep such project records as are necessary to determine compliance with DBE Requirements. These records can be used as GFE documentation. Design these records to indicate:
 - The number of disadvantaged and non-disadvantaged subcontractors, small businesses, regular dealers, manufacturers, consultants, and service providers, and the type of work or services performed on or materials incorporated in this project.
 - The progress and efforts made in seeking out DBE and SBE contractor organizations and individual DBEs and SBEs for work on this project.
 - Documentation of all correspondence, personal contacts, telephone calls, etc., to obtain the services of DBEs and SBEs for this project. Submit reports, as required by the Department. Certify that the amounts were actually paid to the DBE and SBE for work performed on the project and keep cancelled checks on file in the home office to reflect payment for the specific project and for inspection and audit by the Department. Enter the payment information in ECMS “DBE Payments” within 5 business days after the end of the month and include the following:
 - The number of contracts awarded to DBEs and SBEs, noting the type of work and amount of each contract executed with each firm and including the execution date of each contract.
 - The amount paid to each DBE and SBE during the month and the amount paid to date. If no payments are made to a DBE/SBE during the month, enter a zero (\$0.00) payment.
 - Paid invoices or a certification attesting to the actual amount paid to each firm, upon completion of the individual DBE's and SBEs work. In the event the actual amount paid is less than the award amount, provide a complete explanation of the difference.

Maintain all such records for a period of three (3) years following acceptance of final payment. Make these records available for inspection by the Department and FHWA.

If DBE credit is being claimed for material costs included in a DBE subcontract or agreement, submit purchase orders for the material to the Inspector-in-Charge on a monthly basis.

APPENDIX C DESIGNATED SPECIAL PROVISION 8 (DSP8)

REQUIRED CONTRACT PROVISIONS FEDERAL-AID CONSTRUCTION CONTRACTS

- I. General
- II. Nondiscrimination
- III. Nonsegregated Facilities
- IV. Davis-Bacon and Related Act Provisions
- V. Contract Work Hours and Safety Standards Act Provisions
- VI. Subletting or Assigning the Contract
- VII. Safety: Accident Prevention
- VIII. False Statements Concerning Highway Projects
- IX. Implementation of Clean Air Act and Federal Water Pollution Control Act
- X. Compliance with Governmentwide Suspension and Debarment Requirements
- XI. Certification Regarding Use of Contract Funds for Lobbying

ATTACHMENTS

A. Employment and Materials Preference for Appalachian Development Highway System or Appalachian Local Access Road Contracts (included in Appalachian contracts only)

I. GENERAL

1. Form FHWA-1273 must be physically incorporated in each construction contract funded under Title 23 (excluding emergency contracts solely intended for debris removal). The contractor (or subcontractor) must insert this form in each subcontract and further require its inclusion in all lower tier subcontracts (excluding purchase orders, rental agreements and other agreements for supplies or services).

The applicable requirements of Form FHWA-1273 are incorporated by reference for work done under any purchase order, rental agreement or agreement for other services. The prime contractor shall be responsible for compliance by any subcontractor, lower-tier subcontractor or service provider.

Form FHWA-1273 must be included in all Federal-aid design-build contracts, in all subcontracts and in lower tier subcontracts (excluding subcontracts for design services, purchase orders, rental agreements and other agreements for supplies or services). The design-builder shall be responsible for compliance by any subcontractor, lower-tier subcontractor or service provider.

Contracting agencies may reference Form FHWA-1273 in bid proposal or request for proposal documents, however, the Form FHWA-1273 must be physically incorporated (not referenced) in all contracts, subcontracts and lower-tier subcontracts (excluding purchase orders, rental agreements and other agreements for supplies or services related to a construction contract).

2. Subject to the applicability criteria noted in the following sections, these contract provisions shall apply to all work performed on the contract by the contractor's own organization and with the assistance of workers under the contractor's immediate superintendence and to all work performed on the contract by piecework, station work, or by subcontract.

3. A breach of any of the stipulations contained in these Required Contract Provisions may be sufficient grounds for withholding of progress payments, withholding of final payment, termination of the contract, suspension / debarment or any other action determined to be appropriate by the contracting agency and FHWA.

4. Selection of Labor: During the performance of this contract, the contractor shall not use convict labor for any purpose within the limits of a construction project on a Federal-aid highway unless it is labor performed by convicts who are on parole, supervised release, or probation. The term Federal-aid highway does not include roadways functionally classified as local roads or rural minor collectors.

II. NONDISCRIMINATION

The provisions of this section related to 23 CFR Part 230 are applicable to all Federal-aid construction contracts and to all related construction subcontracts of \$10,000 or more. The provisions of 23 CFR Part 230 are not applicable to material supply, engineering, or architectural service contracts.

In addition, the contractor and all subcontractors must comply with the following policies: Executive Order 11246, 41 CFR 60, 29 CFR 1625-1627, Title 23 USC Section 140, the Rehabilitation Act of 1973, as amended (29 USC 794), Title VI of the Civil Rights Act of 1964, as amended, and related regulations including 49 CFR Parts 21, 26 and 27; and 23 CFR Parts 200, 230, and 633.

The contractor and all subcontractors must comply with: the requirements of the Equal Opportunity Clause in 41 CFR 60-1.4(b) and, for all construction contracts exceeding \$10,000, the Standard Federal Equal Employment Opportunity Construction Contract Specifications in 41 CFR 60-4.3.

Note: The U.S. Department of Labor has exclusive authority to determine compliance with Executive Order 11246 and the policies of the Secretary of Labor including 41 CFR 60, and 29 CFR 1625-1627. The contracting agency and the FHWA have the authority and the responsibility to ensure compliance with Title 23 USC Section 140, the Rehabilitation Act of 1973, as amended (29 USC 794), and Title VI of the Civil Rights Act of 1964, as amended, and related regulations including 49 CFR Parts 21, 26 and 27; and 23 CFR Parts 200, 230, and 633.

The following provision is adopted from 23 CFR 230, Appendix A, with appropriate revisions to conform to the U.S. Department of Labor (US DOL) and FHWA requirements.

1. Equal Employment Opportunity: Equal employment opportunity (EEO) requirements not to discriminate and to take affirmative action to assure equal opportunity as set forth under laws, executive orders, rules, regulations (28 CFR 35, 29 CFR 1630, 29 CFR 1625-1627, 41 CFR 60 and 49 CFR 27) and orders of the Secretary of Labor as modified by the provisions prescribed herein, and imposed pursuant to 23 U.S.C. 140 shall constitute the EEO and specific affirmative action standards for the contractor's project activities under this contract. The provisions of the Americans with Disabilities Act of 1990 (42 U.S.C. 12101 et seq.) set forth under 28 CFR 35 and 29 CFR 1630 are incorporated by reference in this contract. In the execution of this contract, the contractor agrees to comply with the following minimum specific requirement activities of EEO:

a. The contractor will work with the contracting agency and the Federal Government to ensure that it has made every good faith effort to provide equal opportunity with respect to all of its terms and conditions of employment and in their review of activities under the contract.

b. The contractor will accept as its operating policy the following statement:

"It is the policy of this Company to assure that applicants are employed, and that employees are treated during employment, without regard to their race, religion, sex, color, national origin, age or disability. Such action shall include: employment, upgrading, demotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation; and selection for training, including apprenticeship, pre-apprenticeship, and/or on-the-job training."

2. EEO Officer: The contractor will designate and make known to the contracting officers an EEO Officer who will have the responsibility for and must be capable of effectively administering and promoting an active EEO program and who must be assigned adequate authority and responsibility to do so.

3. Dissemination of Policy: All members of the contractor's staff who are authorized to hire, supervise, promote, and discharge employees, or who recommend such action, or who are substantially involved in such action, will be made fully cognizant of, and will implement, the contractor's EEO policy and contractual responsibilities to provide EEO in each grade and classification of employment. To ensure that the above agreement will be met, the following actions will be taken as a minimum:

a. Periodic meetings of supervisory and personnel office employees will be conducted before the start of work and then not less often than once every six months, at which time the contractor's EEO policy and its implementation will be reviewed and explained. The meetings will be conducted by the EEO Officer.

b. All new supervisory or personnel office employees will be given a thorough indoctrination by the EEO Officer, covering all major aspects of the contractor's EEO obligations within thirty days following their reporting for duty with the contractor.

c. All personnel who are engaged in direct recruitment for the project will be instructed by the EEO Officer in the contractor's procedures for locating and hiring minorities and women.

d. Notices and posters setting forth the contractor's EEO policy will be placed in areas readily accessible to employees, applicants for employment and potential employees.

e. The contractor's EEO policy and the procedures to implement such policy will be brought to the attention of employees by means of meetings, employee handbooks, or other appropriate means.

4. Recruitment: When advertising for employees, the contractor will include in all advertisements for employees the notation: "An Equal Opportunity Employer." All such advertisements will be placed in publications having a large circulation among minorities and women in the area from which the project work force would normally be derived.

a. The contractor will, unless precluded by a valid bargaining agreement, conduct systematic and direct recruitment through public and private employee referral sources likely to yield qualified minorities and women. To meet this requirement, the contractor will identify sources of potential minority group employees, and establish with such identified sources procedures whereby minority and women applicants may be referred to the contractor for employment consideration.

b. In the event the contractor has a valid bargaining agreement providing for exclusive hiring hall referrals, the contractor is expected to observe the provisions of that agreement to the extent that the system meets the contractor's compliance with EEO contract provisions. Where implementation of such an agreement has the effect of discriminating against minorities or women, or obligates the contractor to do the same, such implementation violates Federal nondiscrimination provisions.

c. The contractor will encourage its present employees to refer minorities and women as applicants for employment. Information and procedures with regard to referring such applicants will be discussed with employees.

5. Personnel Actions: Wages, working conditions, and employee benefits shall be established and administered, and personnel actions of every type, including hiring, upgrading, promotion, transfer, demotion, layoff, and termination, shall be taken without regard to race, color, religion, sex, national origin, age or disability. The following procedures shall be followed:

a. The contractor will conduct periodic inspections of project sites to insure that working conditions and employee facilities do not indicate discriminatory treatment of project site personnel.

b. The contractor will periodically evaluate the spread of wages paid within each classification to determine any evidence of discriminatory wage practices.

c. The contractor will periodically review selected personnel actions in depth to determine whether there is evidence of discrimination. Where evidence is found, the contractor will promptly take corrective action. If the review indicates that the discrimination may extend beyond the actions reviewed, such corrective action shall include all affected persons.

d. The contractor will promptly investigate all complaints of alleged discrimination made to the contractor in connection with its obligations under this contract, will attempt to resolve such complaints, and will take appropriate corrective action within a reasonable time. If the investigation indicates that the discrimination may affect persons other than the complainant, such corrective action shall include such other persons. Upon completion of each investigation, the contractor will inform every complainant of all of their avenues of appeal.

6. Training and Promotion:

a. The contractor will assist in locating, qualifying, and increasing the skills of minorities and women who are applicants for employment or current employees. Such efforts should be aimed at developing full journey level status employees in the type of trade or job classification involved.

b. Consistent with the contractor's work force requirements and as permissible under Federal and State regulations, the contractor shall make full use of training programs, i.e., apprenticeship, and on-the-job training programs for the geographical area of contract performance. In the event a special provision for training is provided under this contract, this subparagraph will be superseded as indicated in the special provision. The contracting agency may reserve training positions for persons who receive welfare assistance in accordance with 23 U.S.C. 140(a).

c. The contractor will advise employees and applicants for employment of available training programs and entrance requirements for each.

d. The contractor will periodically review the training and promotion potential of employees who are minorities and women and will encourage eligible employees to apply for such training and promotion.

7. Unions: If the contractor relies in whole or in part upon unions as a source of employees, the contractor will use good faith efforts to obtain the cooperation of such unions to increase opportunities for minorities and women. Actions by the contractor, either directly or through a contractor's association acting as agent, will include the procedures set forth below:

a. The contractor will use good faith efforts to develop, in cooperation with the unions, joint training programs aimed toward qualifying more minorities and women for membership in the unions and increasing the skills of minorities and women so that they may qualify for higher paying employment.

b. The contractor will use good faith efforts to incorporate an EEO clause into each union agreement to the end that such union will be contractually bound to refer applicants without regard to their race, color, religion, sex, national origin, age or disability.

c. The contractor is to obtain information as to the referral practices and policies of the labor union except that to the extent such information is within the exclusive possession of the labor union and such labor union refuses to furnish such information to the contractor, the contractor shall so certify to the contracting agency and shall set forth what efforts have been made to obtain such information.

d. In the event the union is unable to provide the contractor with a reasonable flow of referrals within the time limit set forth in the collective bargaining agreement, the contractor will, through independent recruitment efforts, fill the employment vacancies without regard to race, color, religion, sex, national origin, age or disability; making full efforts to obtain qualified and/or qualifiable minorities and women. The failure of a union to provide sufficient referrals (even though it is obligated to provide exclusive referrals under the terms of a collective bargaining agreement) does not relieve the contractor from the requirements of this paragraph. In the event the union referral practice prevents the contractor from meeting the obligations pursuant to Executive Order 11246, as amended, and these special provisions, such contractor shall immediately notify the contracting agency.

8. Reasonable Accommodation for Applicants / Employees with Disabilities: The contractor must be familiar with the requirements for and comply with the Americans with Disabilities Act and all rules and regulations established there under. Employers must provide reasonable accommodation in all employment activities unless to do so would cause an undue hardship.

9. Selection of Subcontractors, Procurement of Materials and Leasing of Equipment: The contractor shall not discriminate on the grounds of race, color, religion, sex, national origin, age or disability in the selection and retention of subcontractors, including procurement of materials and leases of equipment. The contractor shall take all necessary and reasonable steps to ensure nondiscrimination in the administration of this contract.

a. The contractor shall notify all potential subcontractors and suppliers and lessors of their EEO obligations under this contract.

b. The contractor will use good faith efforts to ensure subcontractor compliance with their EEO obligations.

10. Assurance Required by 49 CFR 26.13(b):

a. The requirements of 49 CFR Part 26 and the State DOT's U.S. DOT-approved DBE program are incorporated by reference.

b. The contractor or subcontractor shall not discriminate on the basis of race, color, national origin, or sex in the performance of this contract. The contractor shall carry out applicable requirements of 49 CFR Part 26 in the award and administration of DOT-assisted contracts. Failure by the contractor to carry out these requirements is a material breach of this contract, which may result in the termination of this contract or such other remedy as the contracting agency deems appropriate.

11. Records and Reports: The contractor shall keep such records as necessary to document compliance with the EEO requirements. Such records shall be retained for a period of three years following the date of the final payment to the contractor for all contract work and shall be available at reasonable times and places for inspection by authorized representatives of the contracting agency and the FHWA.

a. The records kept by the contractor shall document the following:

(1) The number and work hours of minority and non-minority group members and women employed in each work classification on the project;

(2) The progress and efforts being made in cooperation with unions, when applicable, to increase employment opportunities for minorities and women; and

(3) The progress and efforts being made in locating, hiring, training, qualifying, and upgrading minorities and women;

b. The contractors and subcontractors will submit an annual report to the contracting agency each July for the duration of the project, indicating the number of minority, women, and non-minority group employees currently engaged in each work classification required by the contract work. This information is to be reported on Form FHWA-1391. The staffing data should represent the project work force on board in all or any part of the last payroll period preceding the end of July. If on-the-job training is being required by special provision, the contractor will be required to collect and report training data. The employment data should reflect the work force on board during all or any part of the last payroll period preceding the end of July.

III. NONSEGREGATED FACILITIES

This provision is applicable to all Federal-aid construction contracts and to all related construction subcontracts of \$10,000 or more.

The contractor must ensure that facilities provided for employees are provided in such a manner that segregation on the basis of race, color, religion, sex, or national origin cannot result. The contractor may neither require such segregated use by written or oral policies nor tolerate such use by employee custom. The contractor's obligation extends further to ensure that its employees are not assigned to perform their services at any location, under the contractor's control, where the facilities are segregated. The term "facilities" includes waiting rooms, work areas, restaurants and other eating areas, time clocks, restrooms, washrooms, locker rooms, and other storage or dressing areas, parking lots, drinking fountains, recreation or entertainment areas, transportation, and housing provided for employees. The contractor shall provide separate or single-user restrooms and necessary dressing or sleeping areas to assure privacy between sexes.

IV. DAVIS-BACON AND RELATED ACT PROVISIONS

This section is applicable to all Federal-aid construction projects exceeding \$2,000 and to all related subcontracts and lower-tier subcontracts (regardless of subcontract size). The requirements apply to all projects located within the right-of-way of a roadway that is functionally classified as Federal-aid highway. This excludes roadways functionally classified as local roads or rural minor collectors, which are exempt. Contracting agencies may elect to apply these requirements to other projects.

The following provisions are from the U.S. Department of Labor regulations in 29 CFR 5.5 "Contract provisions and related matters" with minor revisions to conform to the FHWA-1273 format and FHWA program requirements.

1. Minimum wages

a. All laborers and mechanics employed or working upon the site of the work, will be paid unconditionally and not less often than once a week, and without subsequent deduction or rebate on any account (except such payroll deductions as are permitted by regulations issued by the Secretary of Labor under the Copeland Act (29 CFR part 3)), the full amount of wages and bona fide fringe benefits (or cash equivalents thereof) due at time of payment computed at rates not less than those contained in the wage determination of the Secretary of Labor which is attached hereto and made a part hereof, regardless of any contractual relationship which may be alleged to exist between the contractor and such laborers and mechanics.

Contributions made or costs reasonably anticipated for bona fide fringe benefits under section 1(b)(2) of the Davis-Bacon Act on behalf of laborers or mechanics are considered wages paid to such laborers or mechanics, subject to the provisions of paragraph 1.d. of this section; also, regular contributions made or costs incurred for more than a weekly period (but not less often than quarterly) under plans, funds, or programs which cover the particular weekly period, are deemed to be constructively made or incurred during such weekly period. Such laborers and mechanics shall be paid the appropriate wage rate and fringe benefits on the wage determination for the classification of work actually performed, without regard to skill, except as provided in 29 CFR 5.5(a)(4). Laborers or mechanics performing work in more than one classification may be compensated at the rate specified for each classification for the time actually worked therein: Provided, That the employer's payroll records accurately set forth the time spent in each classification in which work is performed. The wage determination (including any additional classification and wage rates conformed under paragraph 1.b. of this section) and the Davis-Bacon poster (WH-1321) shall be posted at all times by the contractor and its subcontractors at the site of the work in a prominent and accessible place where it can be easily seen by the workers.

b. (1) The contracting officer shall require that any class of laborers or mechanics, including helpers, which is not listed in the wage determination and which is to be employed under the contract shall be classified in conformance with the wage determination. The contracting officer shall approve an additional classification and wage rate and fringe benefits therefore only when the following criteria have been met:

(i) The work to be performed by the classification requested is not performed by a classification in the wage determination; and

(ii) The classification is utilized in the area by the construction industry; and

(iii) The proposed wage rate, including any bona fide fringe benefits, bears a reasonable relationship to the wage rates contained in the wage determination.

(2) If the contractor and the laborers and mechanics to be employed in the classification (if known), or their representatives, and the contracting officer agree on the classification and wage rate (including the amount designated for fringe benefits where appropriate), a report of the action taken shall be sent by the contracting officer to the Administrator of the Wage and Hour Division, Employment Standards Administration, U.S. Department of Labor, Washington, DC 20210. The Administrator, or an authorized representative, will approve, modify, or disapprove every additional classification action within 30 days of receipt and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(3) In the event the contractor, the laborers or mechanics to be employed in the classification or their representatives, and the contracting officer do not agree on the proposed classification and wage rate (including the amount designated for fringe benefits, where appropriate), the contracting officer shall refer the questions, including the views of all interested parties and the recommendation of the contracting officer, to the Wage and Hour Administrator for determination. The Wage and Hour Administrator, or an authorized representative, will issue a determination within 30 days of receipt and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(4) The wage rate (including fringe benefits where appropriate) determined pursuant to paragraphs 1.b.(2) or 1.b.(3) of this section, shall be paid to all workers performing work in the classification under this contract from the first day on which work is performed in the classification.

c. Whenever the minimum wage rate prescribed in the contract for a class of laborers or mechanics includes a fringe benefit which is not expressed as an hourly rate, the contractor shall either pay the benefit as stated in the wage determination or shall pay another bona fide fringe benefit or an hourly cash equivalent thereof.

d. If the contractor does not make payments to a trustee or other third person, the contractor may consider as part of the wages of any laborer or mechanic the amount of any costs reasonably anticipated in providing bona fide fringe benefits under a plan or program, Provided, That the Secretary of Labor has found, upon the written request of the contractor, that the applicable standards of the Davis-Bacon Act have been met. The Secretary of Labor may require the contractor to set aside in a separate account assets for the meeting of obligations under the plan or program.

2. Withholding

The contracting agency shall upon its own action or upon written request of an authorized representative of the Department of Labor, withhold or cause to be withheld from the contractor under this contract, or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to Davis-Bacon prevailing wage requirements, which is held by the same prime contractor, so much of the accrued payments or advances as may be considered necessary to pay laborers and mechanics, including apprentices, trainees, and helpers, employed by the contractor or any subcontractor the full amount of wages required by the contract. In the event of failure to pay any laborer or mechanic, including any apprentice, trainee, or helper, employed or working on the site of the work, all or part of the wages required by the contract, the contracting agency may, after written notice to the contractor, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds until such violations have ceased.

3. Payrolls and basic records

a. Payrolls and basic records relating thereto shall be maintained by the contractor during the course of the work and preserved for a period of three years thereafter for all laborers and mechanics working at the site of the work. Such records shall contain the name, address, and social security number of each such worker, his or her correct classification, hourly rates of wages paid (including rates of contributions or costs anticipated for bona fide fringe benefits or cash equivalents thereof of the types described in section 1(b)(2)(B) of the Davis-Bacon Act), daily and weekly number of hours worked, deductions made and actual wages paid. Whenever the Secretary of Labor has found under 29 CFR 5.5(a)(1)(iv) that the wages of any laborer or mechanic include the amount of any costs reasonably

anticipated in providing benefits under a plan or program described in section 1(b)(2)(B) of the Davis-Bacon Act, the contractor shall maintain records which show that the commitment to provide such benefits is enforceable, that the plan or program is financially responsible, and that the plan or program has been communicated in writing to the laborers or mechanics affected, and records which show the costs anticipated or the actual cost incurred in providing such benefits. Contractors employing apprentices or trainees under approved programs shall maintain written evidence of the registration of apprenticeship programs and certification of trainee programs, the registration of the apprentices and trainees, and the ratios and wage rates prescribed in the applicable programs.

b. (1) The contractor shall submit weekly for each week in which any contract work is performed a copy of all payrolls to the contracting agency. The payrolls submitted shall set out accurately and completely all of the information required to be maintained under 29 CFR 5.5(a)(3)(i), except that full social security numbers and home addresses shall not be included on weekly transmittals. Instead the payrolls shall only need to include an individually identifying number for each employee (e.g., the last four digits of the employee's social security number). The required weekly payroll information may be submitted in any form desired. Optional Form WH-347 is available for this purpose from the Wage and Hour Division Web site at <http://www.dol.gov/esa/whd/forms/wh347instr.htm> or its successor site. The prime contractor is responsible for the submission of copies of payrolls by all subcontractors. Contractors and subcontractors shall maintain the full social security number and current address of each covered worker, and shall provide them upon request to the contracting agency for transmission to the State DOT, the FHWA or the Wage and Hour Division of the Department of Labor for purposes of an investigation or audit of compliance with prevailing wage requirements. It is not a violation of this section for a prime contractor to require a subcontractor to provide addresses and social security numbers to the prime contractor for its own records, without weekly submission to the contracting agency.

(2) Each payroll submitted shall be accompanied by a "Statement of Compliance," signed by the contractor or subcontractor or his or her agent who pays or supervises the payment of the persons employed under the contract and shall certify the following:

(i) That the payroll for the payroll period contains the information required to be provided under §5.5 (a)(3)(ii) of Regulations, 29 CFR part 5, the appropriate information is being maintained under §5.5 (a)(3)(i) of Regulations, 29 CFR part 5, and that such information is correct and complete;

(ii) That each laborer or mechanic (including each helper, apprentice, and trainee) employed on the contract during the payroll period has been paid the full weekly wages earned, without rebate, either directly or indirectly, and that no deductions have been made either directly or indirectly from the full wages earned, other than permissible deductions as set forth in Regulations, 29 CFR part 3;

(iii) That each laborer or mechanic has been paid not less than the applicable wage rates and fringe benefits or cash equivalents for the classification of work performed, as specified in the applicable wage determination incorporated into the contract.

(3) The weekly submission of a properly executed certification set forth on the reverse side of Optional Form WH-347 shall satisfy the requirement for submission of the "Statement of Compliance" required by paragraph 3.b.(2) of this section.

(4) The falsification of any of the above certifications may subject the contractor or subcontractor to civil or criminal prosecution under section 1001 of title 18 and section 231 of title 31 of the United States Code.

c. The contractor or subcontractor shall make the records required under paragraph 3.a. of this section available for inspection, copying, or transcription by authorized representatives of the contracting agency, the State DOT, the FHWA, or the Department of Labor, and shall permit such representatives to interview employees during working hours on the job. If the contractor or subcontractor fails to submit the required records or to make them available, the FHWA may, after written notice to the contractor, the contracting agency or the State DOT, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds. Furthermore, failure to submit the required records upon request or to make such records available may be grounds for debarment action pursuant to 29 CFR 5.12.

4. Apprentices and trainees

a. Apprentices (programs of the USDOL).

Apprentices will be permitted to work at less than the predetermined rate for the work they performed when they are employed pursuant to and individually registered in a bona fide apprenticeship program registered with the U.S. Department of Labor, Employment and Training Administration, Office of Apprenticeship Training, Employer and Labor Services, or with a State Apprenticeship Agency recognized by the Office, or if a person is employed in his or her first 90 days of probationary employment as an apprentice in such an apprenticeship program, who is not individually registered in the program, but who has been certified by the Office of Apprenticeship Training, Employer and Labor Services or a State Apprenticeship Agency (where appropriate) to be eligible for probationary employment as an apprentice.

The allowable ratio of apprentices to journeymen on the job site in any craft classification shall not be greater than the ratio permitted to the contractor as to the entire work force under the registered program. Any worker listed on a payroll at an apprentice wage rate, who is not registered or otherwise employed as stated above, shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any apprentice performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. Where a contractor is performing construction on a project in a locality other than that in which its program is registered, the ratios and wage rates (expressed in percentages of the journeyman's hourly rate) specified in the contractor's or subcontractor's registered program shall be observed.

Every apprentice must be paid at not less than the rate specified in the registered program for the apprentice's level of progress, expressed as a percentage of the journeymen hourly rate specified in the applicable wage determination. Apprentices shall be paid fringe benefits in accordance with the provisions of the apprenticeship program. If the apprenticeship program does not specify fringe benefits, apprentices must be paid the full amount of fringe benefits listed on the wage determination for the applicable classification. If the Administrator determines that a different practice prevails for the applicable apprentice classification, fringes shall be paid in accordance with that determination.

In the event the Office of Apprenticeship Training, Employer and Labor Services, or a State Apprenticeship Agency recognized by the Office, withdraws approval of an apprenticeship program, the contractor will no longer be permitted to utilize apprentices at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

b. Trainees (programs of the USDOL).

Except as provided in 29 CFR 5.16, trainees will not be permitted to work at less than the predetermined rate for the work performed unless they are employed pursuant to and individually registered in a program which has received prior approval, evidenced by formal certification by the U.S. Department of Labor, Employment and Training Administration.

The ratio of trainees to journeymen on the job site shall not be greater than permitted under the plan approved by the Employment and Training Administration.

Every trainee must be paid at not less than the rate specified in the approved program for the trainee's level of progress, expressed as a percentage of the journeyman hourly rate specified in the applicable wage determination. Trainees shall be paid fringe benefits in accordance with the provisions of the trainee program. If the trainee program does not mention fringe benefits, trainees shall be paid the full amount of fringe benefits listed on the wage determination unless the Administrator of the Wage and Hour Division determines that there is an apprenticeship program associated with the corresponding journeyman wage rate on the wage determination which provides for less than full fringe benefits for apprentices. Any employee listed on the payroll at a trainee rate who is not registered and participating in a training plan approved by the Employment and Training Administration shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any trainee

performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed.

In the event the Employment and Training Administration withdraws approval of a training program, the contractor will no longer be permitted to utilize trainees at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

c. Equal employment opportunity. The utilization of apprentices, trainees and journeymen under this part shall be in conformity with the equal employment opportunity requirements of Executive Order 11246, as amended, and 29 CFR part 30.

d. Apprentices and Trainees (programs of the U.S. DOT).

Apprentices and trainees working under apprenticeship and skill training programs which have been certified by the Secretary of Transportation as promoting EEO in connection with Federal-aid highway construction programs are not subject to the requirements of paragraph 4 of this Section IV. The straight time hourly wage rates for apprentices and trainees under such programs will be established by the particular programs. The ratio of apprentices and trainees to journeymen shall not be greater than permitted by the terms of the particular program.

5. Compliance with Copeland Act requirements. The contractor shall comply with the requirements of 29 CFR part 3, which are incorporated by reference in this contract.

6. Subcontracts. The contractor or subcontractor shall insert Form FHWA-1273 in any subcontracts and also require the subcontractors to include Form FHWA-1273 in any lower tier subcontracts. The prime contractor shall be responsible for the compliance by any subcontractor or lower tier subcontractor with all the contract clauses in 29 CFR 5.5.

7. Contract termination: debarment. A breach of the contract clauses in 29 CFR 5.5 may be grounds for termination of the contract, and for debarment as a contractor and a subcontractor as provided in 29 CFR 5.12.

8. Compliance with Davis-Bacon and Related Act requirements. All rulings and interpretations of the Davis-Bacon and Related Acts contained in 29 CFR parts 1, 3, and 5 are herein incorporated by reference in this contract.

9. Disputes concerning labor standards. Disputes arising out of the labor standards provisions of this contract shall not be subject to the general disputes clause of this contract. Such disputes shall be resolved in accordance with the procedures of the Department of Labor set forth in 29 CFR parts 5, 6, and 7. Disputes within the meaning of this clause include disputes between the contractor (or any of its subcontractors) and the contracting agency, the U.S. Department of Labor, or the employees or their representatives.

10. Certification of eligibility.

a. By entering into this contract, the contractor certifies that neither it (nor he or she) nor any person or firm who has an interest in the contractor's firm is a person or firm ineligible to be awarded Government contracts by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

b. No part of this contract shall be subcontracted to any person or firm ineligible for award of a Government contract by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

c. The penalty for making false statements is prescribed in the U.S. Criminal Code, 18 U.S.C. 1001.

V. CONTRACT WORK HOURS AND SAFETY STANDARDS ACT

The following clauses apply to any Federal-aid construction contract in an amount in excess of \$100,000 and subject to the overtime provisions of the Contract Work Hours and Safety Standards Act. These clauses shall be inserted in addition to the clauses required by 29 CFR 5.5(a) or 29 CFR 4.6. As used in this paragraph, the terms laborers and mechanics include watchmen and guards.

1. Overtime requirements. No contractor or subcontractor contracting for any part of the contract work which may require or involve the employment of laborers or mechanics shall require or permit any such laborer or mechanic in any workweek in which he or she is employed on such work to work in excess of forty hours in such workweek unless such laborer or mechanic receives compensation at a rate not less than one and one-half times the basic rate of pay for all hours worked in excess of forty hours in such workweek.

2. Violation; liability for unpaid wages; liquidated damages. In the event of any violation of the clause set forth in paragraph (1.) of this section, the contractor and any subcontractor responsible therefor shall be liable for the unpaid wages. In addition, such contractor and subcontractor shall be liable to the United States (in the case of work done under contract for the District of Columbia or a territory, to such District or to such territory), for liquidated damages. Such liquidated damages shall be computed with respect to each individual laborer or mechanic, including watchmen and guards, employed in violation of the clause set forth in paragraph (1.) of this section, in the sum of \$10 for each calendar day on which such individual was required or permitted to work in excess of the standard workweek of forty hours without payment of the overtime wages required by the clause set forth in paragraph (1.) of this section.

3. Withholding for unpaid wages and liquidated damages. The FHWA or the contracting agency shall upon its own action or upon written request of an authorized representative of the Department of Labor withhold or cause to be withheld, from any moneys payable on account of work performed by the contractor or subcontractor under any such contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to the Contract Work Hours and Safety Standards Act, which is held by the same prime contractor, such sums as may be determined to be necessary to satisfy any liabilities of such contractor or subcontractor for unpaid wages and liquidated damages as provided in the clause set forth in paragraph (2.) of this section.

4. Subcontracts. The contractor or subcontractor shall insert in any subcontracts the clauses set forth in paragraph (1.) through (4.) of this section and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for compliance by any subcontractor or lower tier subcontractor with the clauses set forth in paragraphs (1.) through (4.) of this section.

VI. SUBLETTING OR ASSIGNING THE CONTRACT

This provision is applicable to all Federal-aid construction contracts on the National Highway System.

1. The contractor shall perform with its own organization contract work amounting to not less than 30 percent (or a greater percentage if specified elsewhere in the contract) of the total original contract price, excluding any specialty items designated by the contracting agency. Specialty items may be performed by subcontract and the amount of any such specialty items performed may be deducted from the total original contract price before computing the amount of work required to be performed by the contractor's own organization (23 CFR 635.116).

a. The term "perform work with its own organization" refers to workers employed or leased by the prime contractor, and equipment owned or rented by the prime contractor, with or without operators. Such term does not include employees or equipment of a subcontractor or lower tier subcontractor, agents of the prime contractor, or any other assignees. The term may include payments for the costs of hiring leased employees from an employee leasing firm meeting all relevant Federal and State regulatory requirements. Leased employees may only be included in this term if the prime contractor meets all of the following conditions:

- (1) the prime contractor maintains control over the supervision of the day-to-day activities of the leased employees;
- (2) the prime contractor remains responsible for the quality of the work of the leased employees;
- (3) the prime contractor retains all power to accept or exclude individual employees from work on the project; and
- (4) the prime contractor remains ultimately responsible for the payment of predetermined minimum wages, the submission of payrolls, statements of compliance and all other Federal regulatory requirements.

b. "Specialty Items" shall be construed to be limited to work that requires highly specialized knowledge, abilities, or equipment not ordinarily available in the type of contracting organizations qualified and expected to bid or propose on the contract as a whole and in general are to be limited to minor components of the overall contract.

2. The contract amount upon which the requirements set forth in paragraph (1) of Section VI is computed includes the cost of material and manufactured products which are to be purchased or produced by the contractor under the contract provisions.

3. The contractor shall furnish (a) a competent superintendent or supervisor who is employed by the firm, has full authority to direct performance of the work in accordance with the contract requirements, and is in charge of all construction operations (regardless of who performs the work) and (b) such other of its own organizational resources (supervision, management, and engineering services) as the contracting officer determines is necessary to assure the performance of the contract.

4. No portion of the contract shall be sublet, assigned or otherwise disposed of except with the written consent of the contracting officer, or authorized representative, and such consent when given shall not be construed to relieve the contractor of any responsibility for the fulfillment of the contract. Written consent will be given only after the contracting agency has assured that each subcontract is evidenced in writing and that it contains all pertinent provisions and requirements of the prime contract.

5. The 30% self-performance requirement of paragraph (1) is not applicable to design-build contracts; however, contracting agencies may establish their own self-performance requirements.

VII. SAFETY: ACCIDENT PREVENTION

This provision is applicable to all Federal-aid construction contracts and to all related subcontracts.

1. In the performance of this contract the contractor shall comply with all applicable Federal, State, and local laws governing safety, health, and sanitation (23 CFR 635). The contractor shall provide all safeguards, safety devices and protective equipment and take any other needed actions as it determines, or as the contracting officer may determine, to be reasonably necessary to protect the life and health of employees on the job and the safety of the public and to protect property in connection with the performance of the work covered by the contract.

2. It is a condition of this contract, and shall be made a condition of each subcontract, which the contractor enters into pursuant to this contract, that the contractor and any subcontractor shall not permit any employee, in performance of the contract, to work in surroundings or under conditions which are unsanitary, hazardous or dangerous to his/her health or safety, as determined under construction safety and health standards (29 CFR 1926) promulgated by the Secretary of Labor, in accordance with Section 107 of the Contract Work Hours and Safety Standards Act (40 U.S.C. 3704).

3. Pursuant to 29 CFR 1926.3, it is a condition of this contract that the Secretary of Labor or authorized representative thereof, shall have right of entry to any site of contract performance to inspect or investigate the matter of compliance with the construction safety and health standards and to carry out the duties of the Secretary under Section 107 of the Contract Work Hours and Safety Standards Act (40 U.S.C.3704).

VIII. FALSE STATEMENTS CONCERNING HIGHWAY PROJECTS

This provision is applicable to all Federal-aid construction contracts and to all related subcontracts.

In order to assure high quality and durable construction in conformity with approved plans and specifications and a high degree of reliability on statements and representations made by engineers, contractors, suppliers, and workers on Federal-aid highway projects, it is essential that all persons concerned with the project perform their functions as carefully, thoroughly, and honestly as possible. Willful falsification, distortion, or misrepresentation with respect to any facts related to the project is a violation of Federal law. To prevent any misunderstanding regarding the seriousness of these and similar acts, Form FHWA-1022 shall be posted on each Federal-aid highway project (23 CFR 635) in one or more places where it is readily available to all persons concerned with the project:

18 U.S.C. 1020 reads as follows:

"Whoever, being an officer, agent, or employee of the United States, or of any State or Territory, or whoever, whether a person, association, firm, or corporation, knowingly makes any false statement, false representation, or false report as to the character, quality, quantity, or cost of the material used or to be used, or the quantity or quality of the work performed or to be performed, or the cost thereof in connection with the submission of plans, maps, specifications, contracts, or costs of construction on any highway or related project submitted for approval to the Secretary of Transportation; or

Whoever knowingly makes any false statement, false representation, false report or false claim with respect to the character, quality, quantity, or cost of any work performed or to be performed, or materials furnished or to be furnished, in connection with the construction of any highway or related project approved by the Secretary of Transportation; or

Whoever knowingly makes any false statement or false representation as to material fact in any statement, certificate, or report submitted pursuant to provisions of the Federal-aid Roads Act approved July 1, 1916, (39 Stat. 355), as amended and supplemented;

Shall be fined under this title or imprisoned not more than 5 years or both."

IX. IMPLEMENTATION OF CLEAN AIR ACT AND FEDERAL WATER POLLUTION CONTROL ACT

This provision is applicable to all Federal-aid construction contracts and to all related subcontracts.

By submission of this bid/proposal or the execution of this contract, or subcontract, as appropriate, the bidder, proposer, Federal-aid construction contractor, or subcontractor, as appropriate, will be deemed to have stipulated as follows:

1. That any person who is or will be utilized in the performance of this contract is not prohibited from receiving an award due to a violation of Section 508 of the Clean Water Act or Section 306 of the Clean Air Act.
2. That the contractor agrees to include or cause to be included the requirements of paragraph (1) of this Section X in every subcontract, and further agrees to take such action as the contracting agency may direct as a means of enforcing such requirements.

X. CERTIFICATION REGARDING DEBARMENT, SUSPENSION, INELIGIBILITY AND VOLUNTARY EXCLUSION

This provision is applicable to all Federal-aid construction contracts, design-build contracts, subcontracts, lower-tier subcontracts, purchase orders, lease agreements, consultant contracts or any other covered transaction requiring FHWA approval or that is estimated to cost \$25,000 or more – as defined in 2 CFR Parts 180 and 1200.

1. Instructions for Certification – First Tier Participants:

a. By signing and submitting this proposal, the prospective first tier participant is providing the certification set out below.

b. The inability of a person to provide the certification set out below will not necessarily result in denial of participation in this covered transaction. The prospective first tier participant shall submit an explanation of why it cannot provide the certification set out below. The certification or explanation will be considered in connection with the department or agency's determination whether to enter into this transaction. However, failure of the prospective first tier participant to furnish a certification or an explanation shall disqualify such a person from participation in this transaction.

c. The certification in this clause is a material representation of fact upon which reliance was placed when the contracting agency determined to enter into this transaction. If it is later determined that the prospective participant knowingly rendered an erroneous certification, in addition to other remedies available to the Federal Government, the contracting agency may terminate this transaction for cause of default.

d. The prospective first tier participant shall provide immediate written notice to the contracting agency to whom this proposal is submitted if any time the prospective first tier participant learns that its certification was erroneous when submitted or has become erroneous by reason of changed circumstances.

e. The terms "covered transaction," "debarred," "suspended," "ineligible," "participant," "person," "principal," and "voluntarily excluded," as used in this clause, are defined in 2 CFR Parts 180 and 1200. "First Tier Covered Transactions" refers to any covered transaction between a grantee or subgrantee of Federal funds and a participant (such as the prime or general contract). "Lower Tier Covered Transactions" refers to any covered transaction under a First Tier Covered Transaction (such as subcontracts). "First Tier Participant" refers to the participant who has entered into a covered transaction with a grantee or subgrantee of Federal funds (such as the prime or general contractor). "Lower Tier Participant" refers any participant who has entered into a covered transaction with a First Tier Participant or other Lower Tier Participants (such as subcontractors and suppliers).

f. The prospective first tier participant agrees by submitting this proposal that, should the proposed covered transaction be entered into, it shall not knowingly enter into any lower tier covered transaction with a person who is debarred, suspended, declared ineligible, or voluntarily excluded from participation in this covered transaction, unless authorized by the department or agency entering into this transaction.

g. The prospective first tier participant further agrees by submitting this proposal that it will include the clause titled "Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion-Lower Tier Covered Transactions," provided by the department or contracting agency, entering into this covered transaction, without modification, in all lower tier covered transactions and in all solicitations for lower tier covered transactions exceeding the \$25,000 threshold.

h. A participant in a covered transaction may rely upon a certification of a prospective participant in a lower tier covered transaction that is not debarred, suspended, ineligible, or voluntarily excluded from the covered transaction, unless it knows that the certification is erroneous. A participant is responsible for ensuring that its principals are not suspended, debarred, or otherwise ineligible to participate in covered transactions. To verify the eligibility of its principals, as well as the eligibility of any lower tier prospective participants, each participant may, but is not required to, check the Excluded Parties List System website (www.epls.gov), which is compiled by the General Services Administration.

i. Nothing contained in the foregoing shall be construed to require the establishment of a system of records in order to render in good faith the certification required by this clause. The knowledge and information of the prospective participant is not required to exceed that which is normally possessed by a prudent person in the ordinary course of business dealings.

j. Except for transactions authorized under paragraph (f) of these instructions, if a participant in a covered transaction knowingly enters into a lower tier covered transaction with a person who is suspended, debarred, ineligible, or voluntarily excluded from participation in this transaction, in addition to other remedies available to the Federal Government, the department or agency may terminate this transaction for cause or default.

2. Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion – First Tier Participants:

a. The prospective first tier participant certifies to the best of its knowledge and belief, that it and its principals:

(1) Are not presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from participating in covered transactions by any Federal department or agency;

(2) Have not within a three-year period preceding this proposal been convicted of or had a civil judgment rendered against them for commission of fraud or a criminal offense in connection with obtaining, attempting to obtain, or performing a public (Federal, State or local) transaction or contract under a public transaction; violation of Federal or State antitrust statutes or commission of embezzlement, theft, forgery, bribery, falsification or destruction of records, making false statements, or receiving stolen property;

(3) Are not presently indicted for or otherwise criminally or civilly charged by a governmental entity (Federal, State or local) with commission of any of the offenses enumerated in paragraph (a)(2) of this certification; and

(4) Have not within a three-year period preceding this application/proposal had one or more public transactions (Federal, State or local) terminated for cause or default.

b. Where the prospective participant is unable to certify to any of the statements in this certification, such prospective participant shall attach an explanation to this proposal.

2. Instructions for Certification - Lower Tier Participants:

(Applicable to all subcontracts, purchase orders and other lower tier transactions requiring prior FHWA approval or estimated to cost \$25,000 or more - 2 CFR Parts 180 and 1200)

a. By signing and submitting this proposal, the prospective lower tier is providing the certification set out below.

b. The certification in this clause is a material representation of fact upon which reliance was placed when this transaction was entered into. If it is later determined that the prospective lower tier participant knowingly rendered an erroneous certification, in addition to other remedies available to the Federal Government, the department, or agency with which this transaction originated may pursue available remedies, including suspension and/or debarment.

c. The prospective lower tier participant shall provide immediate written notice to the person to which this proposal is submitted if at any time the prospective lower tier participant learns that its certification was erroneous by reason of changed circumstances.

d. The terms "covered transaction," "debarred," "suspended," "ineligible," "participant," "person," "principal," and "voluntarily excluded," as used in this clause, are defined in 2 CFR Parts 180 and 1200. You may contact the person to which this proposal is submitted for assistance in obtaining a copy of those regulations. "First Tier Covered Transactions" refers to any covered transaction between a grantee or subgrantee of Federal funds and a participant (such as the prime or general contract). "Lower Tier Covered Transactions" refers to any covered transaction under a First Tier Covered Transaction (such as subcontracts). "First Tier Participant" refers to the participant who has entered into a covered transaction with a grantee or subgrantee of Federal funds (such as the prime or general contractor). "Lower Tier Participant" refers any participant who has entered into a covered transaction with a First Tier Participant or other Lower Tier Participants (such as subcontractors and suppliers).

e. The prospective lower tier participant agrees by submitting this proposal that, should the proposed covered transaction be entered into, it shall not knowingly enter into any lower tier covered transaction with a person who is debarred, suspended, declared ineligible, or voluntarily excluded from participation in this covered transaction, unless authorized by the department or agency with which this transaction originated.

f. The prospective lower tier participant further agrees by submitting this proposal that it will include this clause titled "Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion-Lower Tier Covered Transaction," without modification, in all lower tier covered transactions and in all solicitations for lower tier covered transactions exceeding the \$25,000 threshold.

g. A participant in a covered transaction may rely upon a certification of a prospective participant in a lower tier covered transaction that is not debarred, suspended, ineligible, or voluntarily excluded from the covered transaction, unless it knows that the certification is erroneous. A participant is responsible for ensuring that its principals are not suspended, debarred, or otherwise ineligible to participate in covered transactions. To verify the eligibility of its principals, as well as the eligibility of any lower tier prospective participants, each participant may, but is not required

to, check the Excluded Parties List System website (www.epls.gov), which is compiled by the General Services Administration.

h. Nothing contained in the foregoing shall be construed to require establishment of a system of records in order to render in good faith the certification required by this clause. The knowledge and information of participant is not required to exceed that which is normally possessed by a prudent person in the ordinary course of business dealings.

i. Except for transactions authorized under paragraph e of these instructions, if a participant in a covered transaction knowingly enters into a lower tier covered transaction with a person who is suspended, debarred, ineligible, or voluntarily excluded from participation in this transaction, in addition to other remedies available to the Federal Government, the department or agency with which this transaction originated may pursue available remedies, including suspension and/or debarment.

Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion--Lower Tier Participants:

1. The prospective lower tier participant certifies, by submission of this proposal, that neither it nor its principals is presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from participating in covered transactions by any Federal department or agency.

2. Where the prospective lower tier participant is unable to certify to any of the statements in this certification, such prospective participant shall attach an explanation to this proposal.

XI. CERTIFICATION REGARDING USE OF CONTRACT FUNDS FOR LOBBYING

This provision is applicable to all Federal-aid construction contracts and to all related subcontracts which exceed \$100,000 (49 CFR 20).

1. The prospective participant certifies, by signing and submitting this bid or proposal, to the best of his or her knowledge and belief, that:

a. No Federal appropriated funds have been paid or will be paid, by or on behalf of the undersigned, to any person for influencing or attempting to influence an officer or employee of any Federal agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with the awarding of any Federal contract, the making of any Federal grant, the making of any Federal loan, the entering into of any cooperative agreement, and the extension, continuation, renewal, amendment, or modification of any Federal contract, grant, loan, or cooperative agreement.

b. If any funds other than Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any Federal agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with this Federal contract, grant, loan, or cooperative agreement, the undersigned shall complete and submit Standard Form-LLL, "Disclosure Form to Report Lobbying," in accordance with its instructions.

2. This certification is a material representation of fact upon which reliance was placed when this transaction was made or entered into. Submission of this certification is a prerequisite for making or entering into this transaction imposed by 31 U.S.C. 1352. Any person who fails to file the required certification shall be subject to a civil penalty of not less than \$10,000 and not more than \$100,000 for each such failure.

3. The prospective participant also agrees by submitting its bid or proposal that the participant shall require that the language of this certification be included in all lower tier subcontracts, which exceed \$100,000 and that all such recipients shall certify and disclose accordingly.

ATTACHMENT A - EMPLOYMENT AND MATERIALS PREFERENCE FOR APPALACHIAN DEVELOPMENT HIGHWAY SYSTEM OR APPALACHIAN LOCAL ACCESS ROAD CONTRACTS

This provision is applicable to all Federal-aid projects funded under the Appalachian Regional Development Act of 1965.

1. During the performance of this contract, the contractor undertaking to do work which is, or reasonably may be, done as on-site work, shall give preference to qualified persons who regularly reside in the labor area as designated by the DOL wherein the contract work is situated, or the subregion, or the Appalachian counties of the State wherein the contract work is situated, except:

- a. To the extent that qualified persons regularly residing in the area are not available.
- b. For the reasonable needs of the contractor to employ supervisory or specially experienced personnel necessary to assure an efficient execution of the contract work.
- c. For the obligation of the contractor to offer employment to present or former employees as the result of a lawful collective bargaining contract, provided that the number of nonresident persons employed under this subparagraph (1c) shall not exceed 20 percent of the total number of employees employed by the contractor on the contract work, except as provided in subparagraph (4) below.

2. The contractor shall place a job order with the State Employment Service indicating (a) the classifications of the laborers, mechanics and other employees required to perform the contract work, (b) the number of employees required in each classification, (c) the date on which the participant estimates such employees will be required, and (d) any other pertinent information required by the State Employment Service to complete the job order form. The job order may be placed with the State Employment Service in writing or by telephone. If during the course of the contract work, the information submitted by the contractor in the original job order is substantially modified, the participant shall promptly notify the State Employment Service.

3. The contractor shall give full consideration to all qualified job applicants referred to him by the State Employment Service. The contractor is not required to grant employment to any job applicants who, in his opinion, are not qualified to perform the classification of work required.

4. If, within one week following the placing of a job order by the contractor with the State Employment Service, the State Employment Service is unable to refer any qualified job applicants to the contractor, or less than the number requested, the State Employment Service will forward a certificate to the contractor indicating the unavailability of applicants. Such certificate shall be made a part of the contractor's permanent project records. Upon receipt of this certificate, the contractor may employ persons who do not normally reside in the labor area to fill positions covered by the certificate, notwithstanding the provisions of subparagraph (1c) above.

5. The provisions of 23 CFR 633.207(e) allow the contracting agency to provide a contractual preference for the use of mineral resource materials native to the Appalachian region.

6. The contractor shall include the provisions of Sections 1 through 4 of this Attachment A in every subcontract for work which is, or reasonably may be, done as on-site work.

**PART I, SECTION B
PENNSYLVANIA REGULATIONS**

Pursuant to the above statutes, regulations are promulgated by State agencies and are published in the Pennsylvania Code (PA. Code). The following are the sections of the PA. Code that are assigned to the following State agencies:

Pennsylvania Department of Environmental Protection—Title 25 of the PA. Code;

Pennsylvania Department of Conservation and Natural Resources—Title 17 of the PA. Code;

Pennsylvania Department of Transportation—Title 67 of the PA. Code;

Pennsylvania Department of Labor and Industry—Title 34 of the PA. Code;

Pennsylvania Department of Agriculture—Title 7 of the PA. Code;

Pennsylvania Historical and Museum Commission—Title 46 of the PA. Code;

Public Utility Commission—Title 52 of the PA. Code;

Pennsylvania Fish and Boat Commission—Title 58, Part II of the PA. Code;

Pennsylvania Game Commission—Title 58, Part III of the PA. Code;

Delaware River Commission—Title 4 of the PA. Code.

**PART II
FEDERAL STATUTES AND REGULATIONS**

Abandoned Mine Reclamation Act of 1990, 30 U.S.C.² §§ 1231 et seq.

Acid Precipitation Act of 1980, 42 U.S.C. §§ 8901-8905, 8911, 8912.

APPENDIX C
DESIGNATED SPECIAL PROVISION 10 (DSP10)
NONDISCRIMINATION/SEXUAL HARASSMENT CLAUSE

The Contractor agrees:

1. In the hiring of any employee(s) for the manufacture of supplies, performance of work, or any other activity required under the contract or any subcontract, the Contractor, each subcontractor, or any person acting on behalf of the Contractor or subcontractor shall not discriminate by reason of race, gender, creed, color, sexual orientation, gender identity or expression, or in violation of the *Pennsylvania Human Relations Act* (PHRA) and applicable federal laws, against any citizen of this Commonwealth who is qualified and available to perform the work to which the employment relates.
2. Neither the Contractor nor any subcontractor nor any person on their behalf shall in any manner discriminate by reason of race, gender, creed, color, sexual orientation, gender identity or expression, or in violation of the PHRA and applicable federal laws, against or intimidate any employee involved in the manufacture of supplies, the performance of work, or any other activity required under the contract.
3. Neither the Contractor nor any subcontractor nor any person on their behalf shall in any manner discriminate by reason of race, gender, creed, color, sexual orientation, gender identity or expression, or in violation of the PHRA and applicable federal laws, in the provision of services under the contract.
4. Neither the Contractor nor any subcontractor nor any person on their behalf shall in any manner discriminate against employees by reason of participation in or decision to refrain from participating in labor activities protected under the *Public Employee Relations Act*, *Pennsylvania Labor Relations Act* or *National Labor Relations Act*, as applicable and to the extent determined by entities charged with such Acts' enforcement, and shall comply with any provision of law establishing organizations as employees' exclusive representatives.
5. The Contractor and each subcontractor shall establish and maintain a written nondiscrimination and sexual harassment policy and shall inform their employees in writing of the policy. The policy must contain a provision that sexual harassment will not be tolerated and employees who practice it will be disciplined. Posting this Nondiscrimination/Sexual Harassment Clause conspicuously in easily-accessible and well-lighted places customarily frequented by employees and at or near where the contracted services are performed shall satisfy this requirement for employees with an established work site.
6. The Contractor and each subcontractor shall not discriminate by reason of race, gender, creed, color, sexual orientation, gender identity or expression, or in violation of PHRA and applicable federal laws, against any subcontractor or supplier who is qualified to perform the work to which the contract relates.
7. The Contractor and each subcontractor represents that it is presently in compliance with and will maintain compliance with all applicable federal, state, and local laws, regulations and policies relating to nondiscrimination and sexual harassment. The Contractor and each subcontractor further represents that it has filed a Standard Form 100 Employer Information Report ("EEO-1") with the U.S. Equal Employment Opportunity Commission ("EEOC") and shall file an annual EEO-1 report with the EEOC as required for employers' subject to *Title VII of the Civil Rights Act of 1964*, as amended, that have 100 or more employees and employers that have federal government contracts or first-tier subcontracts and have 50 or more employees. The Contractor and each subcontractor shall, upon request and within the time periods requested by the Commonwealth, furnish all necessary employment documents and records, including EEO-1 reports, and permit access to their books, records, and accounts by the contracting agency and the Bureau of Diversity,

Inclusion and Small Business Opportunities for purpose of ascertaining compliance with provisions of this Nondiscrimination/Sexual Harassment Clause.

8. The Contractor shall include the provisions of this Nondiscrimination/Sexual Harassment Clause in every subcontract so that those provisions applicable to subcontractors will be binding upon each subcontractor.
9. The Contractor's and each subcontractor's obligations pursuant to these provisions are ongoing from and after the effective date of the contract through the termination date thereof. Accordingly, the Contractor and each subcontractor shall have an obligation to inform the Commonwealth if, at any time during the term of the contract, it becomes aware of any actions or occurrences that would result in violation of these provisions.
10. The Commonwealth may cancel or terminate the contract and all money due or to become due under the contract may be forfeited for a violation of the terms and conditions of this Nondiscrimination/Sexual Harassment Clause. In addition, the agency may proceed with debarment or suspension and may place the Contractor in the Contractor Responsibility File.

APPENDIX C DESIGNATED SPECIAL PROVISION 11 (DSP11)

CONTRACTOR INTEGRITY PROVISIONS

It is essential that those who seek to contract with the Commonwealth of Pennsylvania (“Commonwealth”) observe high standards of honesty and integrity. They must conduct themselves in a manner that fosters public confidence in the integrity of the Commonwealth contracting and procurement process.

1. DEFINITIONS. For purposes of these Contractor Integrity Provisions, the following terms shall have the meanings found in this Section:

- a. **“Affiliate”** means two or more entities where (a) a parent entity owns more than fifty percent of the voting stock of each of the entities; or (b) a common shareholder or group of shareholders owns more than fifty percent of the voting stock of each of the entities; or (c) the entities have a common proprietor or general partner.
- b. **“Consent”** means written permission signed by a duly authorized officer or employee of the Commonwealth, provided that where the material facts have been disclosed, in writing, by prequalification, bid, proposal, or contractual terms, the Commonwealth shall be deemed to have consented by virtue of the execution of this contract.
- c. **“Contractor”** means the individual or entity, that has entered into this contract with the Commonwealth.
- d. **“Contractor Related Parties”** means any affiliates of the Contractor and the Contractor’s executive officers, Pennsylvania officers and directors, or owners of 5 percent or more interest in the Contractor.
- e. **“Financial Interest”** means either:
 - (1) Ownership of more than a five percent interest in any business; or
 - (2) Holding a position as an officer, director, trustee, partner, employee, or holding any position of management.
- f. **“Gratuity”** means tendering, giving, or providing anything of more than nominal monetary value including, but not limited to, cash, travel, entertainment, gifts, meals, lodging, loans, subscriptions, advances, deposits of money, services, employment, or contracts of any kind. The exceptions set forth in the *Governor’s Code of Conduct, Executive Order 1980-18*, the 4 Pa. Code §7.153(b), shall apply.
- g. **“Non-bid Basis”** means a contract awarded or executed by the Commonwealth with Contractor without seeking bids or proposals from any other potential bidder or offeror.

2. In furtherance of this policy, Contractor agrees to the following:

- a. Contractor shall maintain the highest standards of honesty and integrity during the performance of this contract and shall take no action in violation of state or federal laws or regulations or any other applicable laws or regulations, or other requirements applicable to Contractor or that govern contracting or procurement with the Commonwealth.
- b. Contractor shall establish and implement a written business integrity policy, which includes, at a minimum, the requirements of these provisions as they relate to the Contractor activity with the Commonwealth and Commonwealth employees, and which is and made known to all Contractor employees. Posting these Contractor Integrity Provisions conspicuously in easily-accessible and well-lighted places customarily

frequented by employees and at or near where the contract services are performed shall satisfy this requirement.

- c. Contractor, its affiliates, agents, employees and anyone in privity with Contractor shall not accept, agree to give, offer, confer, or agree to confer or promise to confer, directly or indirectly, any gratuity or pecuniary benefit to any person, or to influence or attempt to influence any person in violation of any federal or state law, regulation, executive order of the Governor of Pennsylvania, statement of policy, management directive or any other published standard of the Commonwealth in connection with performance of work under this contract, except as provided in this contract.
- d. Contractor shall not have a financial interest in any other contractor, subcontractor, or supplier providing services, labor, or material under this contract, unless the financial interest is disclosed to the Commonwealth in writing and the Commonwealth consents to Contractor's financial interest prior to Commonwealth execution of the contract. Contractor shall disclose the financial interest to the Commonwealth at the time of bid or proposal submission, or if no bids or proposals are solicited, no later than Contractor's submission of the contract signed by Contractor.
- e. Contractor certifies to the best of its knowledge and belief that within the last five (5) years Contractor or Contractor Related Parties have not:
 - (1) been indicted or convicted of a crime involving moral turpitude or business honesty or integrity in any jurisdiction;
 - (2) been suspended, debarred or otherwise disqualified from entering into any contract with any governmental agency;
 - (3) had any business license or professional license suspended or revoked;
 - (4) had any sanction or finding of fact imposed as a result of a judicial or administrative proceeding related to fraud, extortion, bribery, bid rigging, embezzlement, misrepresentation or anti-trust; and
 - (5) been, and is not currently, the subject of a criminal investigation by any federal, state or local prosecuting or investigative agency and/or civil anti-trust investigation by any federal, state or local prosecuting or investigative agency.

If Contractor cannot so certify to the above, then it must submit along with its bid, proposal or contract a written explanation of why such certification cannot be made and the Commonwealth will determine whether a contract may be entered into with the Contractor. The Contractor's obligation pursuant to this certification is ongoing from and after the effective date of the contract through the termination date thereof. Accordingly, the Contractor shall have an obligation to immediately notify the Commonwealth in writing if at any time during the term of the contract it becomes aware of any event which would cause the Contractor's certification or explanation to change. Contractor acknowledges that the Commonwealth may, in its sole discretion, terminate the contract for cause if it learns that any of the certifications made herein are currently false due to intervening factual circumstance or were false or should have been known to be false when entering into the contract.

- f. Contractor shall comply with the requirements of the *Lobbying Disclosure Act (65 Pa.C.S. §13A01 et seq.)*, regardless of the method of award. If this contract was awarded on a Non-bid Basis, Contractor must also comply with the requirements of the *Section 1641 of the Pennsylvania Election Code (25 P.S. §3260a)*.
- g. When Contractor has reason to believe that any breach of ethical standards as set forth in law, the Governor's Code of Conduct, or these Contractor Integrity Provisions has occurred or may occur, including but not limited to contact by a Commonwealth officer or employee which, if acted upon, would violate such ethical standards, Contractor shall immediately notify the Commonwealth contracting officer or the Office of the State Inspector General in writing.

- h.** Contractor, by submission of its bid or proposal and/or execution of this contract and by the submission of any bills, invoices or requests for payment pursuant to the contract, certifies and represents that it has not violated any of these Contractor Integrity Provisions in connection with the submission of the bid or proposal, during any contract negotiations or during the term of the contract, to include any extensions thereof. Contractor shall immediately notify the Commonwealth in writing of any actions for occurrences that would result in a violation of these Contractor Integrity Provisions. Contractor agrees to reimburse the Commonwealth for the reasonable costs of investigation incurred by the Office of the State Inspector General for investigations of the Contractor's compliance with the terms of this or any other agreement between the Contractor and the Commonwealth that results in the suspension or debarment of the Contractor. Contractor shall not be responsible for investigative costs for investigations that do not result in the Contractor's suspension or debarment.
- i.** Contractor shall cooperate with the Office of the State Inspector General in its investigation of any alleged Commonwealth agency or employee breach of ethical standards and any alleged Contractor non-compliance with these Contractor Integrity Provisions. Contractor agrees to make identified Contractor employees available for interviews at reasonable times and places. Contractor, upon the inquiry or request of an Inspector General, shall provide, or if appropriate, make promptly available for inspection or copying, any information of any type or form deemed relevant by the Office of the State Inspector General to Contractor's integrity and compliance with these provisions. Such information may include, but shall not be limited to, Contractor's business or financial records, documents or files of any type or form that refer to or concern this contract. Contractor shall incorporate this paragraph in any agreement, contract or subcontract it enters into in the course of the performance of this contract/agreement solely for the purpose of obtaining subcontractor compliance with this provision. The incorporation of this provision in a subcontract shall not create privity of contract between the Commonwealth and any such subcontractor, and no third party beneficiaries shall be created thereby.
- j.** For violation of any of these Contractor Integrity Provisions, the Commonwealth may terminate this and any other contract with Contractor, claim liquidated damages in an amount equal to the value of anything received in breach of these Provisions, claim damages for all additional costs and expenses incurred in obtaining another contractor to complete performance under this contract, and debar and suspend Contractor from doing business with the Commonwealth. These rights and remedies are cumulative, and the use or non-use of any one shall not preclude the use of all or any other. These rights and remedies are in addition to those the Commonwealth may have under law, statute, regulation, or otherwise.

APPENDIX C DESIGNATED SPECIAL PROVISION 12 (DSP12)

EXECUTIVE ORDER 11246 (WITH APPENDIX A AND B)

NOTICE OF REQUIREMENT FOR AFFIRMATIVE ACTION TO ENSURE EQUAL EMPLOYMENT OPPORTUNITY

- (a) The Offeror's or Bidder's attention is called to the "Equal Opportunity Clause" and the "Standard Federal Equal Employment Opportunity Construction Contract Specifications" set forth herein.
- (b) The goals and timetables for minority and female participation, expressed in percentage terms for the Contractor's aggregate workforce in each trade on all construction work in the covered area, are as follows:

Timetables	*Goals for minority participation in each trade	*Goals for female participation in each trade
	SEE ATTACHED APPENDIX B	SEE ATTACHED APPENDIX A

* The hours of minority and female employment is to be reported monthly, by the Contractor, on Standard Form 257 (to be supplied by PENNDOT) and expressed in percentage terms of the Contractor's aggregate workhours for each trade (craft).

These goals are applicable to all the Contractor's construction work (whether or not it is Federal or federally assisted) performed in the covered area. If the Contractor performs construction work in a geographical area located outside of the covered area, it shall apply the goals established for such geographical area where the work is actually performed. With regard to this second area, the Contractor also is subject to the goals for both its federally involved and non-federally involved construction.

The Contractor's compliance with the Executive Order and the regulations in 41 CFR Part 60-4 shall be based on its implementation of the Equal Opportunity Clause, specific affirmative action obligations required by the specifications set forth in 41 CFR 60-4.3(a), and its efforts to meet the goals. The hours of minority and female employment and training must be substantially uniform throughout the length of the contract, and in each trade, and the Contractor shall make a good faith effort to employ minorities and women evenly on each of its projects. The transfer of minority or female employees or trainees from contractor to contractor or from project to project for the sole purpose of meeting the Contractor's goals shall be a violation of the contract, the Executive Order and the regulations in 41 CFR Part 60-4. Compliance with the goals will be measured against the total work hours performed.

- (c) The Contractor shall provide written notification to PENNDOT within 10 working days of award of any construction subcontract in excess of \$10,000 at any tier for construction work under the contract resulting from this solicitation. The notification shall list the name, address, and telephone number of the subcontractor; employer identification number of the subcontractor; estimated dollar amount of the subcontract; estimated starting and completion dates of the subcontract; and the geographical area in which the subcontract is to be performed.
- (d) As used in this Notice, and in the contract resulting from this solicitation, the "covered area" is indicated in the special provision entitled "E.E.O. Covered Area". Goals for females are listed in Appendix A, and for minorities includes the areas listed in Appendix B.

**STANDARD FEDERAL EQUAL EMPLOYMENT OPPORTUNITY CONSTRUCTION CONTRACT
SPECIFICATIONS (EXECUTIVE ORDER 11246)**

(a) As used in these Specifications:

1. "Covered area" means the geographical area described in the solicitation from which this contract resulted;
2. "Director" means Director, Office of Federal Contract Compliance Programs, U.S. Department of Labor (DOL), or any person to whom the Director delegates authority;
3. "Employer identification number" means the Federal Social Security number used on the Employer's Quarterly Federal Tax Return, U.S. Treasury Department Form 941; and
4. "Minority" includes:
 - Black (all persons having origins in any of the Black African racial groups not of Hispanic origin);
 - Hispanic (all persons of Mexican, Puerto Rican, Cuban, Central or South American or other Spanish Culture or origin, regardless of race);
 - Asian and Pacific Islander (all persons having origins in any of the original peoples of the Far East, Southeast Asia, the Indian Subcontinent, or the Pacific Islands); and
 - American Indian or Alaskan Native (all persons having origins in any of the original peoples of North America and maintaining identifiable tribal affiliations through membership and participation or community identification).

(b) Whenever the Contractor, or any subcontractor at any tier, subcontracts a portion of the work involving any construction trade, it shall physically include in each subcontract in excess of \$10,000 the provisions of these Specifications and the Notice which contains the applicable goals for minority and female participation and which is set forth in the solicitation from which this contract resulted.

(c) If the Contractor is participating (pursuant to 41 CFR 60-4.5) in a Hometown Plan approved by the U.S. DOL in the covered area either individually or through an association, its affirmative action obligations on all work in the Plan area (including goals and timetables) shall be according to that Plan for those trades which have unions participating in the Plan. Contractors must be able to demonstrate their participation in and compliance with the provisions of any such Hometown Plan. Each contractor or subcontractor participating in an approved Plan is individually required to comply with its obligations under the EEO clause, and to make a good faith effort to achieve each goal under the Plan in each trade in which it has employees. The overall good faith performance by other contractors or subcontractors toward a goal in an approved Plan does not excuse any covered contractor's or subcontractor's failure to take good faith efforts to achieve the Plan goals and timetables.

(d) The Contractor shall implement the specific affirmative action standards provided in paragraphs (g)1 through (g)16 of these Specifications. The goals set forth in the solicitation from which this contract resulted are expressed as percentages of the total hours of employment and training of minority and female utilization the Contractor should reasonably be able to achieve in each construction trade in which it has employees in the covered area. Covered construction contractors performing construction work in geographical areas where they do not have a Federal or Federally assisted construction contract shall apply the minority and female goals established for the geographical area where the work is being performed. Goals are published periodically in the Federal Register in notice form, and such notices may be obtained from any Office of Federal Contract Compliance Programs office or from Federal procurement contracting officers. The Contractor is expected to make substantially uniform progress toward its goals in each craft during the period specified.

- (e) Neither the provisions of any collective bargaining agreement, nor the failures by a union with whom the Contractor has a collective bargaining agreement, to refer either minorities or women shall excuse the Contractor's obligations under these Specifications, Executive Order 11246, or the regulations promulgated pursuant thereto.
- (f) In order for the nonworking training hours of apprentices and trainees to be counted in meeting the goals, such apprentices and trainees must be employed by the Contractor during the training period, and the Contractor must have made a commitment to employ the apprentices and trainees at the completion of their training, subject to the availability of employment opportunities. Trainees must be trained pursuant to training programs approved by the U.S. DOL.
- (g) The Contractor shall take specific affirmative actions to ensure equal employment opportunity. The evaluation of the Contractor's compliance with these Specifications shall be based upon its efforts to achieve maximum results from its actions. The Contractor shall document these efforts fully, and shall implement affirmative action steps at least as extensive as the following:
 - 1. Ensure and maintain a working environment free of harassment, intimidation, and coercion of all sites, and in all facilities at which the Contractor's employees are assigned to work. The Contractor, where possible, will assign two or more women to each construction project. The Contractor shall specifically ensure that all foremen, superintendents, and other on-site supervisory personnel are aware of and carry out the Contractor's obligation to maintain such a working environment, with specific attention to minority or female individuals working at such sites or in such facilities.
 - 2. Establish and maintain a current list of minority and female recruitment sources, provide written notification to minority and female recruitment sources and to community organizations when the Contractor or its unions have employment opportunities available and maintain a record of the organizations' responses.
 - 3. Maintain a current file of the names, addresses, and telephone numbers of each minority and female off-the-street applicant and minority or female referral from a union, a recruitment source or community organization and of what action was taken with respect to each such individual. If such individual was sent to the union hiring hall for referral and was not referred back to the Contractor by the union or, if referred, not employed by the Contractor, this shall be documented in the file with the reason therefore, along with whatever additional actions the Contractor may have taken.
 - 4. Provide immediate written notification to PENNDOT when the union or unions with which the Contractor has a collective bargaining agreement has not referred to the Contractor a minority person or woman sent by the Contractor, or when the Contractor has other information that the union referral process has impeded the Contractor's efforts to meet its obligations.
 - 5. Develop on-the-job training opportunities and/or participate in training programs for the area which expressly include minorities and women, including upgrading programs and apprenticeship and trainee programs relevant to the Contractor's employment needs, especially those programs funded or approved by the DOL. The Contractor shall provide notice of these programs to the sources compiled under (g)2 above.
 - 6. Disseminate the Contractor's EEO policy by providing notice of the policy to unions and training programs and requesting their cooperation in assisting the Contractor in meeting its EEO obligations; by including it in any policy manual and collective bargaining agreement; by publicizing it in the company newspaper, annual report, etc.; by specific review of the policy with all management personnel and with all minority and female employees at least once a year; and by posting the company EEO policy on bulletin boards accessible to all employees at each location where construction work is performed.
 - 7. Review, at least annually, the company's EEO policy and affirmative action obligations under these Specifications with all employees having any responsibility for hiring, assignment, layoff, termination or other employment decisions including specific review of these items with on-site supervisory

personnel such as superintendents, general foreman, etc., prior to the initiation of construction work at any job site. A written record shall be made and maintained identifying the time and place of these meetings, persons attending, subject matter discussed, and disposition of the subject matter.

8. Disseminate the Contractor's EEO policy externally by including it in any advertising in the news media, specifically including minority and female news media, and providing written notification to and discussing the Contractor's EEO policy with other contractors and subcontractors with whom the Contractor does or anticipates doing business.
 9. Direct its recruitment efforts, both oral and written, to minority, female and community organizations, to schools with minority and female students and to minority and female recruitment and training organizations serving the Contractor's recruitment area and employment needs. Not later than 1 month prior to the date for the acceptance of applications for apprenticeship or other training by any recruitment source, the Contractor shall send written notification to organizations such as the above, describing the openings, screening procedures, and tests to be used in the selection process.
 10. Encourage present minority and female employees to recruit other minority persons and women and, where reasonable, provide after school, summer, and vacation employment to minority and female youth both on the site and in other areas of the Contractor's workforce.
 11. Validate all tests and other selection requirements where there is an obligation to do so under 41 CFR Part 60-3.
 12. Conduct, at least annually, an inventory and evaluation at least of all minority and female personnel for promotional opportunities and encourage these employees to seek or to prepare for, through appropriate training, etc.; such opportunities.
 13. Ensure that seniority practices, job classifications, work assignments, and other personnel practices, do not have a discriminatory effect by continually monitoring all personnel and employment related activities to ensure that the EEO policy and the Contractor's obligations under these Specifications are being carried out.
 14. Ensure that all facilities and company activities are nonsegregated except that separate or single-user toilet and necessary changing facilities shall be provided to ensure privacy between the sexes.
 15. Document and maintain a record of all solicitations of offers for subcontracts from minority and female construction contractors and suppliers, including circulation of solicitations to minority and female contractor associations and other business associations.
 16. Conduct a review, at least annually of all supervisors' adherence to and performance under the Contractor's EEO policies and affirmative action obligations.
- (h) Contractors are encouraged to participate in voluntary associations that assist in fulfilling one or more of their affirmative action obligations ((g)1 through (g)16). The efforts of a contractor association, joint contractor-union, contractor-community, or other similar group of which the Contractor is a member and participant, may be asserted as fulfilling any one or more of its obligations under (g)1 through (g)16 or these Specifications provided that the Contractor actively participates in the group, makes every effort to ensure that the group has a positive impact on the employment of minorities and women in the Industry, ensures that the concrete benefits of the program are reflected in the Contractor's minority and female

workforce and can provide access to documentation which demonstrates the effectiveness of actions taken on behalf of the Contractor. The obligation to comply, however, is the Contractor's and failure of such a group to fulfill an obligation shall not be a defense for the Contractor's noncompliance.

- (i) A single goal for minorities and a separate single goal for women have been established. The Contractor, however, is required to provide equal employment opportunity and to take affirmative action for all minority groups, both male and female, and all women, both minority and non-minority. Consequently, the Contractor may be in violation of the Executive Order if a particular group is employed in a substantially disparate manner (for example, even though the Contractor has achieved its goals for women generally, the Contractor may be in violation of the Executive Order if a specific minority group of women is underutilized).
- (j) The Contractor shall not use the goals and timetables or affirmative action standards to discriminate against any person because of race, color, religion, sex, or national origin.
- (k) The Contractor shall not enter into any subcontract with any person or firm debarred from Government contracts pursuant to Executive Order 11246.
- (l) The Contractor shall carry out such sanctions and penalties for violation of these Specifications and of the Equal Opportunity Clause, including suspension, termination, and cancellation of existing subcontracts as may be imposed or ordered pursuant to Executive Order 11246, as amended, and its implementing regulations, by the Office of Federal Contract Compliance Programs. Any contractor who fails to carry out such sanctions and penalties shall be in violation of these Specifications and Executive Order 11246, as amended.
- (m) The Contractor, in fulfilling its obligations under these Specifications, shall implement specific affirmative action steps, at least as extensive as those standards prescribed in paragraph (g) of these Specifications, so as to achieve maximum results from its efforts to ensure equal employment opportunity. If the Contractor fails to comply with the requirements of the Executive Order, regulations, or these Specifications, PENNDOT shall proceed according to 41 CFR 60-4.8.
- (n) The Contractor shall designate a responsible official to monitor all employment related activity to ensure that the company EEO policy is being carried out to submit reports relating to the provisions hereof as may be required by the Government and to keep records. Records shall at least include for each employee the name, address, telephone numbers, construction trade, union affiliation if any, employee identification number when assigned, social security number, race, sex, status (e.g., mechanic, apprentice, trainee, helper, or laborer), dates of changes in status, hours worked per week in the indicated trade, rate of pay, and locations at which the work was performed. Records shall be maintained in an easily understandable and retrievable form; however, to the degree that existing records satisfy this requirement, contractors shall not be required to maintain separate records.
- (o) Nothing herein provided shall be construed as a limitation upon the application of other laws which establish different standards of compliance or upon the application of requirements for the hiring of local or other area resident (e.g., those under the Public Works Employment Act of 1977 and the Community Development Block Grant Program).

APPENDIX A

The following goals and timetables for female utilization shall be included in all Federal and federally assisted construction contracts and subcontracts in excess of \$10,000. The goals are applicable to the Contractor's aggregate on-site construction workforce (public and private) whether or not part of that workforce is performing work on a Federal or federally assisted construction contract or subcontract.

AREA COVERED: See special provision entitled "E.E.O. Covered Area".

Goals and Timetables

Timetable	Goals (Percent)
From April 1, 1980, until further notice	6.9
Goals are applicable in each construction craft employed by the Contractor in the covered area.	

APPENDIX B

Until further notice, the following goals for minority utilization in each construction craft shall be included in Federal or federally assisted construction contracts and subcontracts in excess of \$10,000 to be performed in the respective covered areas in the State. The goals are applicable to the Contractor's aggregate on-site construction workforce regardless of whether that workforce is performing work on a Federal, federally assisted, or non-federally related construction contract or subcontract. This Appendix B shall be used jointly with Appendix A.

**APPENDIX C
DESIGNATED SPECIAL PROVISION 13 (DSP13)**

BUY AMERICA

Section 106.10(a) applies to this project.

**APPENDIX C
DESIGNATED SPECIAL PROVISION 14 (DSP14)**

ENHANCED MINIMUM WAGE PROVISIONS

- 1. Enhanced Minimum Wage.** Contractor/Lessor agrees to pay no less than \$12.00 per hour to its employees for all hours worked directly performing the services called for in this Contract/Lease, and for an employee's hours performing ancillary services necessary for the performance of the contracted services or lease when such employee spends at least twenty per cent (20%) of their time performing ancillary services in a given work week.
- 2. Adjustment.** Beginning July 1, 2019, and annually thereafter, the minimum wage rate shall be increased by \$0.50 until July 1, 2024, when the minimum wage reaches \$15.00. Thereafter, the minimum wage rate would be increased by an annual cost-of-living adjustment using the percentage change in the Consumer Price Index for All Urban Consumers (CPI-U) for Pennsylvania, New Jersey, Delaware and Maryland. The applicable adjusted amount shall be published in the Pennsylvania Bulletin by March 1 of each year to be effective the following July 1.
- 3. Exceptions.** These Enhanced Minimum Wage Provisions shall not apply to employees:
 - a. exempt from the minimum wage under the Minimum Wage Act of 1968;
 - b. covered by a collective bargaining agreement;
 - c. required to be paid a higher wage under another state or federal law governing the services, including the Prevailing Wage Act and Davis-Bacon Act; or
 - d. required to be paid a higher wage under any state or local policy or ordinance.
- 4. Notice.** Contractor/Lessor shall post these Enhanced Minimum Wage Provisions for the entire period of the contract conspicuously in easily-accessible and well-lighted places customarily frequented by employees at or near where the contracted services are performed.
- 5. Records.** Contractor/Lessor must maintain and, upon request and within the time periods requested by the Commonwealth, furnish all employment and wage records necessary to document compliance with these Enhanced Minimum Wage Provisions.
- 6. Sanctions.** Failure to comply with these Enhanced Minimum Wage Provisions may result in the imposition of sanctions, which may include, but shall not be limited to, termination of the contract or lease, nonpayment, debarment or referral to the Office of General Counsel for appropriate civil or criminal referral.
- 7. Subcontractors.** Contractor/Lessor shall include the provisions of these Enhanced Minimum Wage Provisions in every subcontract so that these provisions will be binding upon each subcontractor.

TRANSMITTAL LETTER

PUBLICATION:

Publication 408, 2020 Edition

DATE:

November 20, 2019

SUBJECT:

PennDOT Publication 408/2020 Initial Edition - Specifications

INFORMATION AND SPECIAL INSTRUCTIONS:

Applicability: This Transmittal Letter and its attachment constitute the Initial Edition to PennDOT Specifications, Publication 408/2020. The Initial Edition to Pub 408/2020 is hereby referred to as Pub 408/2020-IE. It is new and complete in its entirety, and is effective on projects let after April 10, 2020.

Change Format: All subsequent changes to Pub 408/2020 will be made using a "new page" format. To relate changes and conditions that are in effect each bid proposal will contain a SSP named: "GOVERNING SPECIFICATIONS AND APPLICABLE DESIGNATED SPECIAL PROVISIONS". This SSP exists in ECMS format. It will specify the Initial Edition or Numbered Change of the Pub 408, the Measurement Standard, levels/goals, and the Designated Special Provisions that apply to the particular project.

**INDEX OF CHANGES
TO
PUBLICATION 408/2020**

General: The Index of Changes has been created to assist Publication 408/2020 users in determining the specifics of semiannual changes that have been made since the release of the Initial Edition. The Index below contains the specifics of all Changes, which includes where revisions have been made and why.

The Change Process: Changes to Publication 408/2020 will be issued biannually. *Numbered Changes* will consist of a Transmittal Letter with instructions for posting of revisions, an updated version of this Index, and the “new pages” containing the revisions. All *Numbered Changes* will also be filed electronically in sequential order on the PennDOT Website. *Numbered Changes* will be incorporated into the Publication 408/2020 and filed under the *Change Letters and Indices* portion of the Publication.

The Researching of Revisions. It is critical to many users of Publication 408 to be able to determine the point in time revisions were made and what specifically the changes were. This is particularly important from a contractual perspective when researching specifications that were applicable to projects previously awarded. To assist in this process users should refer to the Change Index that follows. If revisions have been made, users can then refer to the specifics found in the Initial Edition or subsequent Numbered Change.

**CHANGE INDEX
OF REVISIONS
THROUGH CHANGE NO. 1**

Section and Portion Changed		Revised w/ Change No.	Effective Dates From	Explanation
Section	Part or Paragraph			Nature and Rationale for Change
Preface				
TOC				
	705, 1047, 1072	1	October 2, 2020	To revise the page number; and to include new Sections 1047 and 1072.
100				
107	107.01(a)	1	October 2, 2020	To allow the use of a newly created Bulletin Board Acknowledgement Signature Sheet as an alternative to requiring a bulletin board on site for Federally funded mobile operations.
200				
207	207.2(a)1	1	October 2, 2020	To include a reference to Type A, AASHTO No. 8.
300				
400				
405	405.1, 405.3(a), 405.4	1	October 2, 2020	To remove references to corrective action.
412	412.3(a)1	1	October 2, 2020	To update references to CS-409 to CS-413.
413	413.3(a)1, 413.3(b)1	1	October 2, 2020	To update references to CS-409 to CS-413.

Section and Portion Changed		Revised w/ Change No.	Effective Dates	Explanation
Section	Part or Paragraph		From	Nature and Rationale for Change
419	419.3(a)1	1	October 2, 2020	To update references to CS-409 to CS-413.
500				
520	520.2(b)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
545	545.2(a)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
600				
601	601.4(d)	1	October 2, 2020	To revise measurement and payment section to replace Cubic Yard with Section 204.4.
619	619.2, 619.3(b), 619.4	1	October 2, 2020	To update the Department's policy for guide rail delineation.
620	620.4(c)	1	October 2, 2020	To include terminal section, single in the price of Type 31 Strong Post Anchor Terminal.
633	633.4(c)	1	October 2, 2020	To remove subbase and add Plain Cement Concrete Pavement to the measurement and payment section.
659	659.1, 659.2(a), 659.2(b), Table 1, Table 2, 659.3, Table 4, Table 6	1	October 2, 2020	To add the requirement to use an AASHTO Certified Laboratory. To add criteria to construction methods based on population. To add language to include cleanup of shoulders.
665	665.4(d)	1	October 2, 2020	To replace Cubic Yard with Section 204.4 for reference to measurement and payment of Class 2 Excavation.
676	676.4(b), 676.4(c)	1	October 2, 2020	To replace Cubic Yard with Section 203.4 for reference to measurement and payment of Class 1A and Class 1B Excavation.
679	679.2(a)4, 679.2(a)6	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
681	681.2(a)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
700				
705	705.3(a)1, 705.3(b), 705.3(f), Table A, 705.4(a), 705.4(b), 705.4(f), 705.5(c)2	1	October 2, 2020	To allow the use of tubular steel for regular and high performance dowel bars in concrete pavements.
713	713.2(b)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
800				

Section and Portion Changed		Revised w/ Change No.	Effective Dates	Explanation
Section	Part or Paragraph		From	Nature and Rationale for Change
875	875.2(c)	1	October 2, 2020	To provide reference for stainless steel anchor bolts to mount the trash rack on the concrete outlet structure. Stainless steel was removed as an option and the references for the galvanized anchor bolts were revised.
900				
910	910.4(s), 910.4(t), 910.4(u)	1	October 2, 2020	To revise the measurement and payment section to add pay items.
948	948.4(b), 948.4(c), 948.4(d)	1	October 2, 2020	To replace Cubic Yard with Section 204.4 for Class 3 Excavation, replace Cubic Yard with Section 1001.4 for Class A Cement Concrete, and replace Pound with Section 1002.4 for Reinforcement Bars.
1000				
1001	1001.2(i), 1001.3(b)2, 1001.3(k)	1	October 2, 2020	To provide consistency associated with the new pay items created for Deformed Welded Wire Fabric. A change was made to clarify manual tining is to be done transversely to be consistent with changes made in Section 501.
1005	1005.4(a)	1	October 2, 2020	To revise the measurement and payment unit of test piles from lump sum to each.
1018	1018.3(a), 1018.3(b), 1018.3(c), 1018.3(d)	1	October 2, 2020	To revise the construction section to remove non-structural items attached to the structure before demolition. Procedures for removing non-structural items will be included in the demolition plans.
1040	1040.2(c)	1	October 2, 2020	To provide consistency in referencing Section 1001 for curing materials. Penetrating sealer was removed from the measurement and payment section.
1042	1042.3(b)4	1	October 2, 2020	To revise the construction section to indicate the texture/tine should be transverse.
1046	Table B, 1046.3(e), 1046.3(f), 1046.3(g), 1046.3(k), 1046.3(l) Table E	1	October 2, 2020	To revise language for reduced payment when the epoxy application rate is not achieved. To clarify when a Structure Control Engineer is needed. To update requirements for shotblasting. To update requirements when placing the Epoxy Overlay.

Section and Portion Changed		Revised w/ Change No.	Effective Dates	Explanation
Section	Part or Paragraph		From	Nature and Rationale for Change
1047	New Section	1	October 2, 2020	To detail cleaning and preparing the entire deck surface and applying a PPC overlay system with High Molecular Weight Methacrylate (HMWM) resin primer on concrete surfaces.
1072	New Section	1	October 2, 2020	To ensure waste is properly collected, handled stored, classified, transported, and disposed of according to applicable EPA and Pennsylvania DEP regulations To ensure containment systems are installed to control harmful emissions. To detail programs to help keep workers protected from over exposure to lead and other toxic metals.
1085	1085.4(a)	1	October 2, 2020	To reference Section 1001.4 for measurement and payment of deformed welded wire fabric.
1100				
1107	1107.03(a)	1	October 2, 2020	To correct a typo.
1200				
1210	1210.4(d)	1	October 2, 2020	To revise the measurement and payment section to replace Each with Section 1201.4.

**INDEX OF CHANGES
TO
PUBLICATION 408/2020**

General: The Index of Changes has been created to assist Publication 408/2020 users in determining the specifics of semiannual changes that have been made since the release of the Initial Edition. The Index below contains the specifics of all Changes, which includes where revisions have been made and why.

The Change Process: Changes to Publication 408/2020 will be issued biannually. *Numbered Changes* will consist of a Transmittal Letter with instructions for posting of revisions, an updated version of this Index, and the “new pages” containing the revisions. All *Numbered Changes* will also be filed electronically in sequential order on the PennDOT Website. *Numbered Changes* will be incorporated into the Publication 408/2020 and filed under the *Change Letters and Indices* portion of the Publication.

The Researching of Revisions. It is critical to many users of Publication 408 to be able to determine the point in time revisions were made and what specifically the changes were. This is particularly important from a contractual perspective when researching specifications that were applicable to projects previously awarded. To assist in this process users should refer to the Change Index that follows. If revisions have been made, users can then refer to the specifics found in the Initial Edition or subsequent Numbered Change.

**CHANGE INDEX
OF REVISIONS
THROUGH CHANGE NO. 2**

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
Preface				
TOC				
	104, 419, 502, 529, 609, 620, 1044, 1045, 1060	2	April 9, 2021	To revise the page numbers; and to include new Sections 529 and 1045.
	705, 1047, 1072	1	October 2, 2020	To revise the page number; and to include new Sections 1047 and 1072.
100				
104	104.04	2	April 9, 2021	To address the recommendations contained within FHWA’s Construction Value Engineering Tier 1 Program Review Final Report.
107	107.01(a)	1	October 2, 2020	To allow the use of a newly created Bulletin Board Acknowledgement Signature Sheet as an alternative to requiring a bulletin board on site for Federally funded mobile operations.
110	110.07, 110.10(d)1	2	April 9, 2021	To increase payment for defective concrete pavement left in place from 5% to 50%. To address the recommendations contained within FHWA’s Construction Value Engineering Tier 1 Program Review Final Report.
200				

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
207	207.2(a)1	1	October 2, 2020	To include a reference to Type A, AASHTO No. 8.
300				
301	301.4(a), 301.4(b)	2	April 9, 2021	To increase payment for defective concrete and defective concrete pavement left in place from 5% to 50%.
323	323.4(b)	2	April 9, 2021	To increase payment for defective concrete pavement left in place from 5% to 50%.
400				
405	405.1, 405.3(a), 405.4	1	October 2, 2020	To remove references to corrective action.
412	412.3(a)1	1	October 2, 2020	To update references to CS-409 to CS-413.
413	413.3(a)1, 413.3(b)1	1	October 2, 2020	To update references to CS-409 to CS-413.
419	419.1, 419.2(e)1, 419.2(f)1, 419.3(c), 419.3(c)4, 419.3(g), 419.3(i)1, 419.3(i)2, 419.3(k), 419.4(a)3	2	April 9, 2021	To allow the use of HOLA acceptance with Stone Matrix Asphalt.
419	419.3(a)1	1	October 2, 2020	To update references to CS-409 to CS-413.
500				
501	501.2(e), 501.4(a), 501.4(b)	2	April 9, 2021	To increase payment for defective concrete and defective concrete pavement left in place from 5% to 50%. To change Expansion Joint Filler to Premolded Expansion Joint Filler.
502	502.4(b)	2	April 9, 2021	To increase payment for defective concrete pavement left in place from 5% to 50%.
506	506.4(b)	2	April 9, 2021	To increase payment for defective concrete pavement left in place from 5% to 50%.
518	518.2, 518.3(b), 518.3(c)	2	April 9, 2021	To reference Section 516.2 with modifications for required materials. To add no saw cuts will be allowed to extend into the adjacent pavement or shoulders that is to remain in place. To require the placement of two layers of 4.0 mil minimum polyethylene sheeting to be used as a new bond breaker before placing concrete.
520	520.2(b)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
529	New Section	2	April 9, 2021	To provide an alternative to traditional cast-in-place concrete slab repairs.
530	530.4(b)	2	April 9, 2021	To increase payment for defective concrete pavement left in place from 5% to 50%.
545	545.2(a)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
600				
601	601.4(a)	2	April 9, 2021	To clarify the measurement and payment for pipe culverts. To correct various section references to PTM No. 450.
601	601.4(d)	1	October 2, 2020	To revise measurement and payment section to replace Cubic Yard with Section 204.4.
604	604.3(c), 604.4(a)	2	April 9, 2021	To add language to reference the Standard Drawings for backfilling trench. To clarify the measurement and payment for pipe culverts.
609	609.2(a), 609.2(d), 609.2(e), 609.2(f), 609.4(a) Appendix Table A	2	April 9, 2021	To address Microsoft no longer supporting Windows 7 software and other electronic equipment needs for construction field offices based on recommendations from the Bureau of Infrastructure and Operations (BIO).
619	619.3(b), 619.3(c), 619.4	2	April 9, 2021	To add traffic barrier training requirements for construction projects. To add Permanent Impact Attenuating Device and Flowable Backfill, Type B to the Measurement and Payment Section.
619	619.2, 619.3(b), 619.4	1	October 2, 2020	To update the Department's policy for guide rail delineation.
620	620.3(g)	2	April 9, 2021	To add traffic barrier training requirements for construction projects.
620	620.4(c)	1	October 2, 2020	To include terminal section, single in the price of Type 31 Strong Post Anchor Terminal.
627	627.3(a)	2	April 9, 2021	To add Publication 213, Appendix C as a reference for reuse of temporary barrier.
633	633.4(c)	1	October 2, 2020	To remove subbase and add Plain Cement Concrete Pavement to the measurement and payment section.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
659	659.1, 659.2(a), 659.2(b), Table 1, Table 2, 659.3, Table 4, Table 6	1	October 2, 2020	To add the requirement to use an AASHTO Certified Laboratory. To add criteria to construction methods based on population. To add language to include cleanup of shoulders.
665	665.4(d)	1	October 2, 2020	To replace Cubic Yard with Section 204.4 for reference to measurement and payment of Class 2 Excavation.
676	676.4(b), 676.4(c)	1	October 2, 2020	To replace Cubic Yard with Section 203.4 for reference to measurement and payment of Class 1A and Class 1B Excavation.
679	679.3(a)	2	April 9, 2021	To correct a typo.
679	679.2(a)4, 679.2(a)6	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
681	681.2(a)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
688	688.1, 699.2	2	April 9, 2021	To address Microsoft no longer supporting Windows 7 software and other electronic equipment needs for construction field offices based on recommendations from the Bureau of Infrastructure and Operations (BIO).
696	696.3(c)	2	April 9, 2021	To add traffic barrier training requirements for construction projects.
700				
704	704.1(c)4, 704.1(d)6, 704.1(d)7	2	April 9, 2021	To bring the concrete Independent Assurance procedure in compliance with FHWA regulations.
705	705.3(a)1, 705.3(b), 705.3(f), Table A, 705.4(a), 705.4(b), 705.4(f), 705.5(c)2	1	October 2, 2020	To allow the use of tubular steel for regular and high performance dowel bars in concrete pavements.
713	713.2(b)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
800				
875	875.2(c)	1	October 2, 2020	To provide reference for stainless steel anchor bolts to mount the trash rack on the concrete outlet structure. Stainless steel was removed as an option and the references for the galvanized anchor bolts were revised.
900				
910	910.4(s), 910.4(t), 910.4(u)	1	October 2, 2020	To revise the measurement and payment section to add pay items.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
948	948.4(b), 948.4(c), 948.4(d)	1	October 2, 2020	To replace Cubic Yard with Section 204.4 for Class 3 Excavation, replace Cubic Yard with Section 1001.4 for Class A Cement Concrete, and replace Pound with Section 1002.4 for Reinforcement Bars.
1000				
1001	1001.2(i), 1001.3(b)2, 1001.3(k)	1	October 2, 2020	To provide consistency associated with the new pay items created for Deformed Welded Wire Fabric. A change was made to clarify manual tining is to be done transversely to be consistent with changes made in Section 501.
1005	1005.4(a)	1	October 2, 2020	To revise the measurement and payment unit of test piles from lump sum to each.
1018	1018.3(a), 1018.3(b), 1018.3(c), 1018.3(d)	1	October 2, 2020	To revise the construction section to remove non-structural items attached to the structure before demolition. Procedures for removing non-structural items will be included in the demolition plans.
1040	1040.2(c)	1	October 2, 2020	To provide consistency in referencing Section 1001 for curing materials. Penetrating sealer was removed from the measurement and payment section.
1042	1042.3(b)4	1	October 2, 2020	To revise the construction section to indicate the texture/tine should be transverse.
1044	1044.2(b), 1044.3(b), 1044.3(d)1.b, 1044.3(e)	2	April 9, 2021	To include Test Panel and Mock-Up requirements, and Bulletin 15 approval requirements. To add pH ranges and electronic impedance meter usage.
1045	New Section	2	April 9, 2021	To address the preparation and coating of new concrete surfaces with a coating system for protective purposes.
1046	Table B, 1046.3(e), 1046.3(f), 1046.3(g), 1046.3(k), 1046.3(l) Table E	1	October 2, 2020	To revise language for reduced payment when the epoxy application rate is not achieved. To clarify when a Structure Control Engineer is needed. To update requirements for shotblasting. To update requirements when placing the Epoxy Overlay.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
1047	New Section	1	October 2, 2020	To detail cleaning and preparing the entire deck surface and applying a PPC overlay system with High Molecular Weight Methacrylate (HMWM) resin primer on concrete surfaces.
1060	1060.2(g), 1060.3(b)6, 1060.3(c)	2	April 9, 2021	To replace outdated references. To include the addition of coatings for Thermal Spray Coatings (Metallizing). To remove dry film thickness requirements and replace with references to follow the manufacturer recommendations.
1072	New Section	1	October 2, 2020	To ensure waste is properly collected, handled stored, classified, transported, and disposed of according to applicable EPA and Pennsylvania DEP regulations To ensure containment systems are installed to control harmful emissions. To detail programs to help keep workers protected from over exposure to lead and other toxic metals.
1085	1085.4(a)	1	October 2, 2020	To reference Section 1001.4 for measurement and payment of deformed welded wire fabric.
1100				
1107	1107.03(a)	1	October 2, 2020	To correct a typo.
1200				
1210	1210.4(d)	1	October 2, 2020	To revise the measurement and payment section to replace Each with Section 1201.4.

INDEX OF CHANGES TO PUBLICATION 408/2020

General: The Index of Changes has been created to assist Publication 408/2020 users in determining the specifics of semiannual changes that have been made since the release of the Initial Edition. The Index below contains the specifics of all Changes, which includes where revisions have been made and why.

The Change Process: Changes to Publication 408/2020 will be issued biannually. *Numbered Changes* will consist of a Transmittal Letter with instructions for posting of revisions, an updated version of this Index, and the “new pages” containing the revisions. All *Numbered Changes* will also be filed electronically in sequential order on the PennDOT Website. *Numbered Changes* will be incorporated into the Publication 408/2020 and filed under the *Change Letters and Indices* portion of the Publication.

The Researching of Revisions. It is critical to many users of Publication 408 to be able to determine the point in time revisions were made and what specifically the changes were. This is particularly important from a contractual perspective when researching specifications that were applicable to projects previously awarded. To assist in this process users should refer to the Change Index that follows. If revisions have been made, users can then refer to the specifics found in the Initial Edition or subsequent Numbered Change.

CHANGE INDEX OF REVISIONS THROUGH CHANGE NO. 3

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
Preface

	107, 341, 627, 935, 950, 951, 952, 953, 954, 955, 956, 957, 958, 976, 1016, 1087, 1088, 1103, 1104, 1124	3	October 8, 2021	To revise the page numbers; to remove Sections 1087, 1104, 1124; and to include new Sections 950, 957, 958, and 976.
	104, 419, 502, 529, 609, 620, 1044, 1045, 1060	2	April 9, 2021	To revise the page numbers; and to include new Sections 529 and 1045.
	705, 1047, 1072	1	October 2, 2020	To revise the page number; and to include new Sections 1047 and 1072.
100				
104	104.04	2	April 9, 2021	To address the recommendations contained within FHWA’s Construction Value Engineering Tier 1 Program Review Final Report.
107	107.28	3	October 8, 2021	To implement the Compliance Management Program (CMP) to deal with construction stormwater runoff as part of an agreement with the United States Environmental Protection Agency.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
107	107.01(a)	1	October 2, 2020	To allow the use of a newly created Bulletin Board Acknowledgement Signature Sheet as an alternative to requiring a bulletin board on site for Federally funded mobile operations.
110	110.07, 110.10(d)1	2	April 9, 2021	To increase payment for defective concrete pavement left in place from 5% to 50%. To address the recommendations contained within FHWA's Construction Value Engineering Tier 1 Program Review Final Report.
200				
202	202.2(f)	3	October 8, 2021	To update reference for caulking compound from 705.8 to 705.7.
207	207.2(a)1	1	October 2, 2020	To include a reference to Type A, AASHTO No. 8.
300				
301	301.4(a), 301.4(b)	2	April 9, 2021	To increase payment for defective concrete and defective concrete pavement left in place from 5% to 50%.
323	323.4(b)	2	April 9, 2021	To increase payment for defective concrete pavement left in place from 5% to 50%.
341	341.1, 341.2, 341.3(a), 341.3(b), 341.3(c), 341.3(f), 341.3(h), 341.4(d), 341.4(e)	3	October 8, 2021	To allow foamed asphalt to be used for cold recycling in addition to emulsified asphalt.
342	342.1, 342.3(a), 342.3(c), 342.3(h), 342.4(b), 342.4(d), 342.4(e)	3	October 8, 2021	To allow foamed asphalt to be used for cold recycling in addition to emulsified asphalt.
400				
405	405.3(e)	3	October 8, 2021	To reflect the change in the TR-447 form.
405	405.1, 405.3(a), 405.4	1	October 2, 2020	To remove references to corrective action.
412	412.3(a)1	1	October 2, 2020	To update references to CS-409 to CS-413.
413	413.3(h)2.a	3	October 8, 2021	To clarify that once the subplot size for a specific JMF has been established based on the project's plan quantity, the subplot size for the JMF will remain unchanged throughout project completion.
413	413.3(a)1, 413.3(b)1	1	October 2, 2020	To update references to CS-409 to CS-413.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
419	419.1, 419.2(e)1, 419.2(f)1, 419.3(c), 419.3(c)4, 419.3(g), 419.3(i)1, 419.3(i)2, 419.3(k), 419.4(a)3	2	April 9, 2021	To allow the use of HOLA acceptance with Stone Matrix Asphalt.
419	419.3(a)1	1	October 2, 2020	To update references to CS-409 to CS-413.
500				
501	501.2(o)	3	October 8, 2021	To update reference for joint backing material from 705.9 to 705.8.
501	501.2(e), 501.4(a), 501.4(b)	2	April 9, 2021	To increase payment for defective concrete and defective concrete pavement left in place from 5% to 50%. To change Expansion Joint Filler to Premolded Expansion Joint Filler.
502	502.4(b)	2	April 9, 2021	To increase payment for defective concrete pavement left in place from 5% to 50%.
506	506.4(b)	2	April 9, 2021	To increase payment for defective concrete pavement left in place from 5% to 50%.
513	513.2(b)	3	October 8, 2021	To update reference for joint backing material from 705.9 to 705.8.
518	518.2, 518.3(b), 518.3(c)	2	April 9, 2021	To reference Section 516.2 with modifications for required materials. To add no saw cuts will be allowed to extend into the adjacent pavement or shoulders that is to remain in place. To require the placement of two layers of 4.0 mil minimum polyethylene sheeting to be used as a new bond breaker before placing concrete.
520	520.2(b)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
521	521.2	3	October 8, 2021	To update reference for joint backing material from 705.9 to 705.8.
529	New Section	2	April 9, 2021	To provide an alternative to traditional cast-in-place concrete slab repairs.
530	530.3(a)1	3	October 8, 2021	To include nondestructive verification of dowel bar alignment to the paving quality control plan and perform nondestructive inspection of the dowel bar alignment.
530	530.4(b)	2	April 9, 2021	To increase payment for defective concrete pavement left in place from 5% to 50%.
540	540.2	3	October 8, 2021	To update reference for joint backing material from 705.9 to 705.8.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
545	545.2(e)	3	October 8, 2021	To update reference for joint backing material from 705.9 to 705.8.
545	545.2(a)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
600				
601	601.4(a)	2	April 9, 2021	To clarify the measurement and payment for pipe culverts. To correct various section references to PTM No. 450.
601	601.4(d)	1	October 2, 2020	To revise measurement and payment section to replace Cubic Yard with Section 204.4.
604	604.3(c), 604.4(a)	2	April 9, 2021	To add language to reference the Standard Drawings for backfilling trench. To clarify the measurement and payment for pipe culverts.
605	605.2(f)	3	October 8, 2021	To update references for mortar and caulking compound.
609	609.2(c)	3	October 8, 2021	To specify that Multifunctional Devices must be Windows 10 compatible. To remove Cellular Phone from Communications Equipment subsection.
609	609.2(a), 609.2(d), 609.2(e), 609.2(f), 609.4(a) Appendix Table A	2	April 9, 2021	To address Microsoft no longer supporting Windows 7 software and other electronic equipment needs for construction field offices based on recommendations from the Bureau of Infrastructure and Operations (BIO).
619	619.2, 619.3(b), 619.4(a)	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
619	619.3(b), 619.3(c), 619.4	2	April 9, 2021	To add traffic barrier training requirements for construction projects. To add Permanent Impact Attenuating Device and Flowable Backfill, Type B to the Measurement and Payment Section.
619	619.2, 619.3(b), 619.4	1	October 2, 2020	To update the Department's policy for guide rail delineation.
620	620.2(b), 620.3(a)2, 620.3(a)5, 620.3(b), 620.4(b), 620.4(r), 620.4(s), 620.4(t)	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
620	620.3(g)	2	April 9, 2021	To add traffic barrier training requirements for construction projects.
620	620.4(c)	1	October 2, 2020	To include terminal section, single in the price of Type 31 Strong Post Anchor Terminal.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
627	627.2, 627.4	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
627	627.3(a)	2	April 9, 2021	To add Publication 213, Appendix C as a reference for reuse of temporary barrier.
628	628.4	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
630	630.2	3	October 8, 2021	To update reference for caulking compound from 705.8 to 705.7.
633	633.4(c)	1	October 2, 2020	To remove subbase and add Plain Cement Concrete Pavement to the measurement and payment section.
640	640.2	3	October 8, 2021	To update reference for caulking compound from 705.8 to 705.7.
641	641.2	3	October 8, 2021	To update reference for caulking compound from 705.8 to 705.7.
659	659.1, 659.2(a), 659.2(b), Table 1, Table 2, 659.3, Table 4, Table 6	1	October 2, 2020	To add the requirement to use an AASHTO Certified Laboratory. To add criteria to construction methods based on population. To add language to include cleanup of shoulders.
665	665.4(d)	1	October 2, 2020	To replace Cubic Yard with Section 204.4 for reference to measurement and payment of Class 2 Excavation.
673	673.2	3	October 8, 2021	To update reference for caulking compound from 705.8 to 705.7.
676	676.4(b), 676.4(c)	1	October 2, 2020	To replace Cubic Yard with Section 203.4 for reference to measurement and payment of Class 1A and Class 1B Excavation.
679	679.3(a)	2	April 9, 2021	To correct a typo.
679	679.2(a)4, 679.2(a)6	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
681	681.2(a)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
688	Table A	3	October 8, 2021	To update requirements for Minimum Specifications under Table A.
688	688.1, 699.2	2	April 9, 2021	To address Microsoft no longer supporting Windows 7 software and other electronic equipment needs for construction field offices based on recommendations from the Bureau of Infrastructure and Operations (BIO).

Section and Portion Changed		Revised w/ Change No.	Effective Dates	Explanation
Section	Part or Paragraph		From	Nature and Rationale for Change
696	696.2, 696.3(b), 696.4(a)	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
696	696.3(c)	2	April 9, 2021	To add traffic barrier training requirements for construction projects.
697	697.4	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
700				
704	704.1(d)5	3	October 8, 2021	To revise Table B to indicate maximum lot sizes.
704	704.1(c)4, 704.1(d)6, 704.1(d)7	2	April 9, 2021	To bring the concrete Independent Assurance procedure in compliance with FHWA regulations.
705	705.3(a)1, 705.3(b), 705.3(f), Table A, 705.4(a), 705.4(b), 705.4(f), 705.5(c)2	1	October 2, 2020	To allow the use of tubular steel for regular and high performance dowel bars in concrete pavements.
713	713.2(b)	1	October 2, 2020	To replace pozzolan with supplementary cementitious material.
738	Table A, 738.2, Table B, 738.3, Table C, 738.5	3	October 8, 2021	To update test methods and provide additional clarification as a result of laboratory testing.
800				
875	875.2(f)	3	October 8, 2021	To update reference for mortar from 705.7 to 705.6.
875	875.2(c)	1	October 2, 2020	To provide reference for stainless steel anchor bolts to mount the trash rack on the concrete outlet structure. Stainless steel was removed as an option and the references for the galvanized anchor bolts were revised.
900				
901	901.1, 901.2, 901.3(x), 901.4(a), 901.4(b),	3	October 8, 2021	To conform with current national standards and industrial requirements. To update Section 1124 references to new section 958.
910	910.2(b)	3	October 8, 2021	To update reference for caulking compound from 705.8 to 705.7.
910	910.4(s), 910.4(t), 910.4(u)	1	October 2, 2020	To revise the measurement and payment section to add pay items.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
935	935.1, 935.2, 935.3, 935.4	3	October 8, 2021	To conform with current national standards and industrial requirements. To add new requirements and standards for electronically powered traffic signs.
936	936.1, 936.2, 936.3, 936.4	3	October 8, 2021	To conform with current national standards and industrial requirements. To add new requirements and standards for electronically powered traffic signs.
948	948.4(b), 948.4(c), 948.4(d)	1	October 2, 2020	To replace Cubic Yard with Section 204.4 for Class 3 Excavation, replace Cubic Yard with Section 1001.4 for Class A Cement Concrete, and replace Pound with Section 1002.4 for Reinforcement Bars.
950	New Section	3	October 8, 2021	To conform with current national standards and industrial requirements. To include general requirements from deleted Section 1104. To add measurement and payment for TSAMS updates, signal removal, and unforeseen traffic signal work.
951	951.1, 951.2, 951.3, 951.4	3	October 8, 2021	To conform with current national standards and industrial requirements. To add requirements and master items for span wire replacement, span tether wire replacement, span sag adjustment, tether wire sag adjustment, and painting of existing traffic signal supports.
952	952.2, 952.3, 952.4	3	October 8, 2021	To conform with current national standards and industrial requirements. To reflect advances in controller technology and to remove type 170 controllers. To revise GPS time clocks, LED lighting, fans, surge protection, and cabinet assemblies.
953	953.1, 953.2, 953.3, 953.4	3	October 8, 2021	To conform with current national standards and industrial requirements. To add new information for traffic signal systems including managed network switches, railroad interconnects, networking of school zone flashes, and other system components.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
954	954.2, 954.3, 954.4	3	October 8, 2021	To conform with current national standards and industrial requirements. To update standards for electrical work installing traffic signals. To add requirements for battery backup systems, junction boxes, conduit, and automatic transfer switches.
955	955.2, 955.3, 955.4(e)	3	October 8, 2021	To conform with current national standards and industrial requirements. To add requirements and new item for backplate retrofit.
956	956.2, 956.3, 956.4	3	October 8, 2021	To conform with current national standards and industrial requirements. To add performance-based specifications for detection systems at traffic signals. To add language for new technologies.
957	New Section	3	October 8, 2021	To conform with current national standards and industrial requirements. To provide specifications for Advanced Traffic Signal Technology.
958	New Section	3	October 8, 2021	To conform with current national standards and industrial requirements. To provide specifications for Temporary Traffic Control Signals.
975	975.1, 975.3	3	October 8, 2021	To conform with current national standards and industrial requirements. To update the description of work and requirements for removing post mounted signs.
976	New Section	3	October 8, 2021	To conform with current national standards and industrial requirements. To provide specifications for removing structure mounted signs.
1000				
1001	1001.2(i)	3	October 8, 2021	To update reference for Epoxy Binder Resin and caulking compound.
1001	1001.2(i), 1001.3(b)2, 1001.3(k)	1	October 2, 2020	To provide consistency associated with the new pay items created for Deformed Welded Wire Fabric. A change was made to clarify manual tining is to be done transversely to be consistent with changes made in Section 501.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
1005	1005.4(a)	1	October 2, 2020	To revise the measurement and payment unit of test piles from lump sum to each.
1007	1007.1(h), 1007.1(i), 1007.2(f), 1007.3(b), 1007.3(e), 1007.3(f), 1007.3(j), 1007.4(b), 1007.4(c), 1007.4(d), 1007.4(e)	3	October 8, 2021	To clarify the requirements for load test frames and grouting quality. To add a redrilling item in measurement and payment. To remove mobilization pay item.
1012	1012.2(c)	3	October 8, 2021	To update reference for caulking compound from 705.8 to 705.7.
1013	1013.2(c)	3	October 8, 2021	To update reference for caulking compound from 705.8 to 705.7.
1014	1014.2(c)	3	October 8, 2021	To update reference for caulking compound from 705.8 to 705.7.
1015	1015.2(c), 1015.2(d),	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
1016	1016.1, 1016.2(a), 1016.2(c), 1016.3(a), 1016.3(b)	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
1018	1018.3(a), 1018.3(b), 1018.3(c), 1018.3(d)	1	October 2, 2020	To revise the construction section to remove non-structural items attached to the structure before demolition. Procedures for removing non-structural items will be included in the demolition plans.
1022	1022.2(e)	3	October 8, 2021	To update reference for caulking compound from 705.8 to 705.7.
1023	1023.2(a), 1023.3	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
1025	1025.2	3	October 8, 2021	To update reference for caulking compound and joint backing material.
1040	1040.2(c)	1	October 2, 2020	To provide consistency in referencing Section 1001 for curing materials. Penetrating sealer was removed from the measurement and payment section.
1042	1042.3(f)3.b	3	October 8, 2021	To clarify the required number of 4-inch diameter by 8-inch height cylinders needed for compressive strength acceptance testing of latex modified concrete or mortar.
1042	1042.3(b)4	1	October 2, 2020	To revise the construction section to indicate the texture/tine should be transverse.

Section and Portion Changed		Revised w/	Effective Dates	Explanation
Section	Part or Paragraph	Change No.	From	Nature and Rationale for Change
1044	1044.2(b), 1044.3(b), 1044.3(d)1.b, 1044.3(e)	2	April 9, 2021	To include Test Panel and Mock-Up requirements, and Bulletin 15 approval requirements. To add pH ranges and electronic impedance meter usage.
1045	New Section	2	April 9, 2021	To address the preparation and coating of new concrete surfaces with a coating system for protective purposes.
1046	Table B, 1046.3(e), 1046.3(f), 1046.3(g), 1046.3(k), 1046.3(l) Table E	1	October 2, 2020	To revise language for reduced payment when the epoxy application rate is not achieved. To clarify when a Structure Control Engineer is needed. To update requirements for shotblasting. To update requirements when placing the Epoxy Overlay.
1047	New Section	1	October 2, 2020	To detail cleaning and preparing the entire deck surface and applying a PPC overlay system with High Molecular Weight Methacrylate (HMWM) resin primer on concrete surfaces.
1060	1060.2(g), 1060.3(b)6, 1060.3(c),	2	April 9, 2021	To replace outdated references. To include the addition of coatings for Thermal Spray Coatings (Metallizing). To remove dry film thickness requirements and replace with references to follow the manufacturer recommendations.
1072	New Section	1	October 2, 2020	To ensure waste is properly collected, handled stored, classified, transported, and disposed of according to applicable EPA and Pennsylvania DEP regulations To ensure containment systems are installed to control harmful emissions. To detail programs to help keep workers protected from over exposure to lead and other toxic metals.
1085	1085.4(a)	1	October 2, 2020	To reference Section 1001.4 for measurement and payment of deformed welded wire fabric.
1086	1086.2(j)	3	October 8, 2021	To update reference for joint backing material from 705.9 to 705.8.
1087	Whole Section	3	October 8, 2021	To remove from Publication 408.
1088	1088.2, 1088.3, 1088.4	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.

Section and Portion Changed		Revised w/ Change No.	Effective Dates	Explanation
Section	Part or Paragraph		From	Nature and Rationale for Change
1089	1089.2(a), 1089.2(d), 1089.2(e), 1089.3, 1089.4	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
1100				
1103	1103.05, 1103.12(c), 1103.12(d), 1103.12(f), 1103.12(h)	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions. To conform with current national standards and industrial requirements.
1104	Whole Section	3	October 8, 2021	To remove from Publication 408.
1107	1107.03(c)6.i.5	3	October 8, 2021	To correct a BC reference from BC-755M to BC-775M.
1107	1107.03(a)	1	October 2, 2020	To correct a typo.
1108	1108.03(f)1.a	3	October 8, 2021	To correct typos to ASTM references.
1109	1109.01(b), 1109.02(b), 1109.03(a), 1109.03(b), 1109.05(b), 1109.05(c),	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
1119	1119.02(a), 1119.03(a), 1119.05(b),	3	October 8, 2021	To reflect the changes from BC, BD, and RC-50M Standard Drawings related to guide rail to bridge barrier transitions.
1124	Whole Section	3	October 8, 2021	To remove from Publication 408.
1200				
1210	1210.4(d)	1	October 2, 2020	To revise the measurement and payment section to replace Each with Section 1201.4.
